4755. *The Doves* are of beautiful colours. The magnificent Argus Pheasant, the pride of the Malayan forests, in elegance of form and richness of attire, is, perhaps, unequalled in the feathered race. They are found, generally in pairs, in the deep forests of Sumatra, and are said, by the natives, to dance and strut about each other, in the manner of peacocks: four other species of this splendid family inhabit the same situations, besides numerous Thrushes, Warblers, Flycatchers, Barbuts, and other birds whose scientific names have not yet been ascertained. There are, of course, no true Humming-birds in India.

4756. *Of Serpents*, twenty species have been discovered; the most venomous being the well-known Cobra de Capello, or Hooded Snake. Another, much resembling the Coluber mysterizans, has the terrifying power of suddenly elevating the scales of the neck, and thus producing a variation of colours which disappear when the animal is at rest. The gigantic Python, long considered the same as the Boa Constrictor of America, is occasionally met with of an immense size. One sent to England measured eleven feet and a half long; but they are sometimes more than twenty inches in circumference. Crocodiles, as might be expected, are abundant, and often attain to a fearful size.

4757. BORNEO. — *The Zoology of this little-known island* presents a vast field for future discovery; nor do we believe any region on the face of the earth would furnish more novel, splendid, or extraordinary forms than the unexplored islands in the eastern range of the

HEAD OF THE PROBOSCIS MONKEY.

Indian Archipelago. Ignorance, therefore, compels us to be concise. The forests of Borneo are said to be the principal habitation of the famous Orang Utan (*Simia satyrus*), which is here reported to attain to the human size; while the Pongo Ape, supposed by former writers to be the same, is stated to be considerably larger, and much more powerful. The singular Nasalis larvatus, or Proboscis Monkey (fig. 725.), is distinguished from all others, by having a long and projecting nose, giving to the head of the animal the appearance of a ludicrous mask.

4758. *The Pongo Ape* of Buffon has been proved to be an imaginary animal; but much light has recently been thrown on the nature of another, probably the true Pongo of Baron Wurmb, by an observing naturalist of our own country. Dr. Harewood has recently stated the existence, in the Hull museum, of a pair of gigantic feet (or hind hands), belonging to some extraordinary ape of this kind. These feet were presented, in 1821, to an individual by the native sultan of Pontianna, in Borneo, "in whose family they had remained, as a great curiosity, during 154 years." Notwithstanding considerable contraction in their circumference over the knuckles, Dr. Harewood found that the middle toe of these feet, when measured from the knuckle, were of the enormous length of seven inches and three quarters. The adult animal must, therefore, have been considerably larger than the largest Orang Utan described by Dr. Abel, which yet measured seven feet and a half in height. In short, the further details of Dr. Harewood clearly prove that these feet belonged to some enormous ape, truly distinct from any which has yet been recorded; but which, in all probability, still exists in the impenetrable forests of Borneo.

4759. AMBOYNA. — *The Zoology of Amboyna*, notwithstanding the old accounts of Valentin, is involved in much obscurity, and even fable. Although the vast botanical labours of the old writers in this island are not only comprehensible, but useful to modern naturalists, we can scarcely assign one quadruped to this immense island as an authen-

726

SUS BABYROUSSA.

from one island to another. The tusks (fig. 727.) are enormous, and appear more like curled horns, rising out of the jaws, than teeth.

ticated native: we once, indeed, received from thence many skulls of the Babyroussa Hog, a highly curious animal, but of which there is no complete specimen in Europe.

4760. *The Sus Babyroussa* (fig. 726.) has much of the manners of the pig: it is said to swim remarkably well, and even to pass, in the Indian Archipelago,

727

TUSKS OF THE SUS BABYROUSSA.

4761. *The Conchology* appears richer and more splendid than that of any part of India. Here is found the beautiful and rare *Rostellaria rectirostris*, of which only two perfect specimens are known in British cabinets, one of which we ourselves received from this island. The Paper nautilus grows to an astonishing size. The variety of beautiful Cones, Cowries, Pectens, and other Oriental genera, are almost innumerable: and we have been told that the pearl fisheries are not inconsiderable.

4762. *The Insects are splendid*, and exhibit the most singular forms, and the most surpassing brilliancy of colours. The matchless *Amphrisius Priamus* Sw. (fig. 728.), the glory of Orien-

728

AMPHRISIUS PRIAMUS.

tal entomology, seems a peculiar native of this island; some of the Locusts (as *L. amboinensis* Don) (fig. 729.), are near five inches long, and of a lovely citron green colour; while the Mantis *siccifolia* more resembles a leaf than an insect. Another species, the Giant Mantis (*M. gigas*), exceeds seven inches in length, exclusive of its antennæ. Such are a few of the riches which lie for the most part hidden from scientific research.

729

LOCUST OF AMBOYNA.

4763. TIMOR. — *The Zoology of Timor* presents us with several animals which have not yet been discovered in the neighbouring islands. The following list, supplied by the researches of the famous navigator and naturalist Peron, is therefore interesting: —

Ronolpus speoris. Pitnosed Bat.
Ronolpus diadema. Diadem Bat.
Plecotus timoriensis. Timor Bat.

Pteropus griseus. Grey Rousette Bat.
Pteropus amplexicaudatus. Long-tailed Bat.

Pteropus stramineus. Lesser Ternate Bat.
Cephalotes Peronii. Peron's Bat.
Cervus Peronii. Timor Stag.

4764. *The Rousette Bats*, commonly called Vampires, are principally from Timor, where they appear to inhabit either the trunks of trees, or the hollows of rocks: but the larger species retire to the deepest and most obscure caverns. The Timor Stag is but imperfectly known, the head only having been brought to Paris by the French navigators; judging from this, the animal must be rather smaller than our fallow deer.

4765. *Timor is proverbial for its innumerable shells and marine productions*, which strew the shores at low water, and present an endless variety of forms and colours. Nor are the land shells insignificant: a most elegant species of *Bulimus*, banded with buff and purple, is thought to be peculiar to this island.

4766. NEW GUINEA. — *The Zoology of New Guinea* and its neighbouring islands has long been the astonishment and delight of the naturalist; while its surpassing splendour must awaken corresponding feelings, even among the ordinary observers of nature. These regions may, indeed, be termed the Elysium, the earthly Paradise, the fairyland of the ornithologist; for they have given to the ravished eye forms of such exquisite beauty, that the imagination cannot conceive things more lovely or more gorgeous. Here, in truth, are birds of gold, and of every coloured gem; for in these "spicy islands of the East" are found the whole family of Paradise Birds, literally so called; to describe which, both the pen and the pencil become insufficient. Strange, that the most beautiful of nature's works should be assigned to countries whose natives are the most savage and ferocious of the human race!

4767. *The native quadrupeds*, in such a vast and uncleared island, must be numerous; but so imperfectly are they known, that we can scarcely extend the following meagre list: —

Phalangister papuensis. Papuan Phalangister.
Phalangister ursina. Bear-like Phalangister.

Phalangister chrysorrhos. Yellow-tufted Phalangister.
Sus papuensis. New-Guinea Pig.

Cuscus maculatus. Spotted Cuscus.
Cuscus macrourus. Long-tailed Cuscus.
Cuscus albus. White Cuscus.

The four latter quadrupeds have just been figured in the splendid atlas of zoological subjects discovered during the short stay of the French expedition at this island, by MM. Garnot and Lesson. The completion of this valuable work, now in course of publication, will put us in possession of those details which we are now obliged to omit.

4768. *Many new and highly interesting birds* were for the first time discovered by these zealous naturalists: among these may be mentioned, as the most remarkable, the following:—

Barita Keraudrenii Lesson, of the size of a crow, with the contorted windpipe of a gallinaceous bird: it has a small horn-like crest of pointed feathers over each eye, and its whole plumage is black, with green and blue glossy reflections of metallic brightness. The Whiskered Swift (*Macropteryx mystaceus* Swains.) is nearly the largest of its tribe, being almost double the length of the European swallow: the wings are excessively long. The beautiful Tiger Bittern of New Guinea (*Ardea heliosyla* Lesson) is banded all over with brown, upon a very pale ground; and is the most lovely species of its tribe. To these new acquisitions may be added *Megapodius Duperreyi*, *Eurylamus Blainvillii*, *Psittacus Desmarestii*, *Mino Dumontii*, *Corvus senex*, *Talegallus Cuvieri*, and several small but most superb Flycatchers and Honeysuckers.

4769. *The true Paradise Birds* (*Paradisidæ* Swains.) deserve a more particular notice. To this magnificent family the following species, described by authors, appear strictly to belong; several others have been named, but they are now referred to distinct families.

Paradisæa major. Great Paradise Bird.
Paradisæa minor. Smaller Paradise Bird.
Paradisæa sanguinea. Sanguine Paradise Bird.
Paradisæa niger. Black Paradise Bird.

Paradisæa nigricans. Black-bodied Paradise Bird.
Paradisæa magnifica. Magnificent Paradise Bird.

Paradisæa superba. Superb Paradise Bird.
Paradisæa sexsetacea. Six-shafted Bird.
Paradisæa regia. Royal or King Paradise Bird.

4770. *The King Bird of Paradise* (fig. 730.) is the smallest, not exceeding the size of a starling: it is a much rarer species than the Great Paradise Bird, but, like all those that are supposed to breed in New Guinea, it migrates thence into the small isle of Arua, or Aroo, during the dry monsoons. The upper part of its plumage is a most intense and beautiful red or purplish chestnut: on the breast is a broad gold green zone, and immediately on each side is a bunch of lengthened feathers tipped with the same brilliant colour; there are two long wire-like feathers in the tail, curling round at the ends, where they are emerald green.

KING BIRD OF PARADISE.

SIX-SHAFTED BIRD OF PARADISE.

4771. *The Six-shafted Paradise Bird* (fig. 731.) is still more extraordinary: the general colour is velvet-black, but the breast is of the most splendid gold green, changing in different directions of light into every colour of the rainbow: on each side of the head are three long feathers with naked shafts, but tipped with a rich metallic lustre of deep violet purple: the side-feathers of the body are excessively lengthened.

4772. **CEYLON.**—*The Zoology* presents some few characters different from those belonging to the continent, and which deserve notice.

4773. *The following quadrupeds* seem peculiar to this island:—

Cercocebus Silenus. Lion-tailed Baboon.
Cercocebus sinicus. Chinese Monkey.
Stenops gracilis. Slender Loris (fig. 732.).

Stenops ceylonicus. Ceylon Loris.
Vespertilio pictus. Painted Bat.
Sciurus ceylonensis. Ceylon Squirrel.

Moschus Memina. Ceylon Musk.
Cervus unicolor. Ceylon Stag.

SLENDER LORIS.

4774. *The Slender Loris*, as its name implies, is remarkable for the delicacy of its body and limbs; and is stated to be possessed of great agility and liveliness. The Lion-tailed Monkey is so called from the tail being tufted at its extremity; and there is a white ruff of long hairs on each side of the forehead. It is a rare animal, and has been said to be excessively malicious. The Memina, or Ceylon Musk Deer, has never been found beyond the jungles of this island: it is a pretty animal, about seventeen inches long, greyish-olive above, and white beneath, with the tail very short. The Ceylon Stag is a remarkable and little known species, of which no specimen has yet reached Europe. Major Smith describes it, from the drawings and notes of that excellent artist the late Mr. Daniell, as the largest species on the island, surpassing the European stag in size. It is called by the natives *Gona*; they describe it as very bold and fierce, and as living only in the deepest forests.

4775. *Among the Birds* we may notice an extraordinary species of wild cock, called the Tailless Cock (*Gallus ecaudatus* Tem.) (fig. 733.), as being destitute of even the rudiments of that member; the comb on the head is not toothed. It seems confined to the deep forests of Ceylon, and to be very wild. There are besides many small birds of elegant plumage, as the *Phœnicornis malabaricus* Sw. *Muscipeta paradisæa*, &c.

TAILLESS COCK.

4776. *The pearl fishery*

734

CEYLON PEARL OYSTER.

of Ceylon has long been famous: The shell furnishing this precious gem is the *Margarita sinensis?* of Dr. Leach (*fig.* 734.). The fishery lasts from February to April. The divers go down by fives, and usually remain under water two minutes; but some have been known to continue four or even five. The shells are all placed in pits, where the fish are left to die and rot before the pearls are searched for; these, as is well known, are morbid concretions formed in the shell by the animal when diseased. The divers are hired, and are either paid in money, or by a portion of Pearl Oysters before they are opened: they generally prefer the latter. Besides the Pearl Oyster, Ceylon is particularly rich in other shells, particularly those called chanks, which are much worn by the Hindoos as rings and ornaments.

SECT. III. *Historical Geography.*

4777. *The condition of these islands during the classic ages*, appears enveloped in impenetrable obscurity. Ptolemy, who shows some knowledge even of China and the continent beyond India, describes indeed some islands scattered through this sea, and, in particular, Jaba-diu, which is probably Java; but his delineation corresponds with the real position and magnitude neither of this nor the other islands. The deficiency is not supplied by any native records.

4778. *Considerable revolutions* seem to have taken place, about the twelfth century, in the principal of these islands. Hindoo colonies had by this time introduced into Java the religion and literature of Boodh, mixed with that of Brahma, and several powerful empires, ruled by Hindoo sovereigns, were, during this and the following centuries, established in different parts of the island. Among these, Brambanan, Janggolo, and Pajajaran appear to have been at different periods extensive and powerful; but the dynasty of Mojapahit, both from tradition and surviving monuments, must have been extensive beyond all the others, stretching its sway even over part of Sumatra. About the twelfth century, also, the Malays, making an extensive migration from the plain of Menangkabao, in the interior of Sumatra, spread themselves over Malacca, Singapore, and Borneo, and rendered themselves, what they have ever since been, the most conspicuous people in the Archipelago.

4779. *The conversion to the Mahometan faith* of Sumatra and Java, the two most important and improved of the India islands, made an important change in their political condition. It appears to have taken place, in the former island about the beginning of the fourteenth century; but, in Java, not till about 150 years later. This conversion was effected, not by priests or warriors, but by merchants from Arabia, who had been long attracted to these islands by the commerce in spices. Having settled there in considerable numbers, they at length began propagating their faith, first by persuasion, but, when a number of converts had once been made, they spread it, as usual with the votaries of this faith, by persecution and the sword. These mercantile apostles became chieftains and princes, and, after a series of bloody struggles, had established in both islands a number of petty kingdoms, in all of which they either ruled or held a considerable influence.

4780. *The arrival of the Portuguese* by the Cape of Good Hope caused a memorable revolution in the whole Eastern world, and was peculiarly felt by the islands of this archipelago. In 1511, fourteen years after the voyage of Gama, that people conquered Malacca, and in the same year penetrated to Bantam and the Moluccas. They made repeated attempts upon the maritime states in Sumatra; but, these being then vigorously ruled, the invaders were unable to make any permanent impression. Their chief object was to obtain full possession of the Spice Islands, on account of their rich products; but they were encountered by the Spaniards, who had established themselves in the Philippines. After some sharp contests, however, the latter people agreed to waive their claims, in consideration of a payment of 350,000 ducats. The oppressions of the Portuguese roused a general confederacy against them, which was, however, baffled by the heroism of Galvan; and that virtuous governor introduced a conciliatory system, though it was ill supported by his successors.

4781. *The Dutch*, a new power, who in the course of the sixteenth century sprung up from beneath Spanish oppression, were, after the union of Spain and Portugal, placed in an attitude of regular hostility with both these countries. It was only, however, by timid and cautious steps that attempts were made to dispute Spanish supremacy in the Indian seas. But the maritime power of Holland continually increased, while that of her antagonists diminished, so that she at length first contended on equal terms, and then gained the superiority. Her ambition was peculiarly attracted by the Indian islands, and she successively drove her antagonists from all the positions which they had occupied. Soon she herself had to contend with a new rival, the English; who, under Lancaster, Middleton, and other bold navigators, made peculiar efforts to obtain settlements in these islands, and a share in the spice trade. A most violent series of rivalry, plunder, and piracy was for many years carried on between these two great maritime states, in the course of which the Dutch were impelled to that bloody transaction, the massacre of Amboyna. A treaty was at length concluded, on the principle of mutual equality and compensation; but since that time, the attention of the English company has been almost wholly engrossed by their vast acquisitions on the continent of India, while the Dutch, continuing to devote themselves to their insular possessions, have acquired there a decided preponderance. This was, indeed, suspended during the last war; when England by her superior navy obtained possession of all the principal islands; but, at the peace, which rescued her ancient ally from the thralldom of Napoleon, she, with a generosity which has been considered excessive, restored all the captured settlements. By a convention, in 1825, she even exchanged her possessions in Sumatra for Malacca, which was valuable to her from its connecting together Singapore and Prince of Wales's Island.

SECT. IV. *Political Geography.*

4782. *The political constitution of these states* is mostly simple, and even rude. There are some wandering tribes, in the infancy of society, who present scarcely any vestige of law or subordination. In general, however, the system of village republics, the affairs of which are conducted by elective and sometimes hereditary officers, prevails here, as throughout the continent of India. These little associations, however, are oppressively domineered over, sometimes by a feudal aristocracy, sometimes by princes almost completely despotic. The

aristocratic system prevails chiefly among the states less advanced in civilisation ; Celebes, Sooloo, and part of Sumatra. Here the chiefs, having reduced the body of the people to a state of almost complete vassalage, unite in a species of confederacy, electing a king or head, rather as a servant than a master, to carry on their general concerns. They have also elective councils, consisting in Boni of seven, in Wajo of forty officers, who have not only the command of the public treasure, but the decision of the questions of peace or war. Among the Goa Macassars, there is a very extraordinary officer, who has the power of removing the king, and calling upon the council to elect another. In Java, on the contrary, and others of the more advanced districts, the sway of the sovereign is entire and undisputed ; and the subjects vie with each other in indications of the most abject submission. They approach him creeping on all-fours, and retire in the same humiliating attitude : to stand upright before him is considered an insult. The "royal feet," or "the royal slave," are the appellations by which they designate themselves when addressing him. He is loaded with the most extravagant flattery : his eyes are two gems ; his face is the sun. Yet, even under these regular despotisms, the body of the people are less oppressed than where the feudal aristocracy prevails. Personal slavery is unknown in them, and even the village governments enjoy a greater share of independence. In all these states, however, there are two orders of nobles, out of which the higher and the lower classes of public officers are respectively chosen. Slavery is often produced by war, and Mr. Crawford mentions 10,000 Bugis at one time held in bondage by the Macassar nation, and employed in public works, without distinction of rank. Debt is another source either of temporary or perpetual slavery ; and the atrocious practice of kidnapping is by no means unfrequent.

4783. *The Dutch claim, in a certain sense, the sovereignty of all these islands except the Philippines.* In fact, they hold the leading positions in a state of military occupation, and generally triumph in contests with the natives. Their sway is neither mild nor popular. Oppressive exactions, commercial monopolies, and sometimes bloody severities, have rendered their yoke odious, and given rise to violent insurrections. They appear also never to have made any effective efforts to improve and civilise the people ; and have not followed up the attempts made by Britain for this purpose during her temporary sway. Under the late administration of Van Capellen, however, some improvements took place.

4784. *The Spaniards, whose colonial system has been generally considered the worst of any, have administered the Philippines in a manner decidedly better, and more salutary.* They have established a mild control over the natives, who, when the power of their European masters was in danger, have even taken up arms in their defence. This improvement has been in a great measure effected through the missionaries, who, without any violent means, have converted and gained the attachment of the people. Still, little has been done to develop the vast natural capacities of these fine islands.

SECT. V. *Productive Industry.*

4785. *As to soil and climate, the Indian islands rank with the most favoured regions on the globe.* Situated almost immediately beneath the equator, and beat by the sun's intensest rays, they must, had moisture been deficient, have been converted into arid and sandy deserts. But the vicinity of the sea, their varied surface, and the lofty mountains that traverse their interior, afford a copious supply of waters, which, combined with the heat, produce the utmost luxuriance of vegetation. They yield in abundance not only all the ordinary products of a tropical region, but also peculiar and exquisite spices and fruits, which cannot be transplanted with advantage into any other soil. The Archipelago, according to Mr. Crawford, may, *as to climate and productions*, be divided into five parts, of different character, yet these appear to us all reducible to two, modified by, and passing into, each other. These are, the eastern and western, bordering, one on the Pacific, and the other on the Indian Ocean, and exposed to the respective monsoons which blow from these vast seas. The western quarter is more fruitful in the staple and useful productions of the soil ; rice is raised in abundance, and forms the food of the great body of the people ; noble forests of teak and other valuable timber cover the plains ; but the finer spices are not raised in any perfection, and even its pepper is inferior to that of Malabar. The eastern islands, on the contrary, are less fitted for the production of rice or of any grain ; the subsistence of the inhabitants is derived from the pith of the sago tree, a mode of support unknown to any other great nation ; but they contain the native country of the clove and the nutmeg, the finest of aromatics. The Philippines, however, notwithstanding their easterly position, agree rather with the opposite quarter, being fruitful, not in spices, but in rice, sugar, and tobacco.

4786. *Agricultural operations, even in the most improved of these islands, are extremely simple.* A team is estimated by Mr. Crawford to cost 2*l.* 18*s.* 6*d.* ; of which the plough is 2*s.* and the harrow 1*s.*, the chief expense being the pair of buffaloes, which are worth 2*l.* 10*s.* Irrigation is the most costly process ; it is not effected by those extensive tanks which diffuse fertility over Hindostan, but by damming up the streams as they descend from the mountains, and distributing them over the fields ; and for this purpose the slopes of the hills are often formed into terraces. As the raising of rice by artificial irrigation does not depend upon the seasons, it is often seen, within the compass of a few acres, in every state of progress. "In one little field, or rather compartment, the husbandman is ploughing or harrowing ; in a second, he is sowing ; in a third, transplanting ; in a fourth, the grain is beginning to flower ; in a fifth, it is yellow ; and in a sixth, the women, children, and old men are busy reaping." When ripe, the head is cut off with a species of sickle, with only a few inches of the straw ; it is then dried, and carried to market in the ear. Maize, like oats and barley in Europe, is raised for the use of the lower ranks. The yam, though indigenous, is not much valued, the sweet potato being preferred. The grains of Europe and the common potato are produced only in small quantities. The cocoa nut, the ground pistachio, the palma Christi, and sesamum are largely cultivated for the production of oil, a favourite food among the islanders.

4787. *The sago palm* is a production peculiar to part of this region, growing chiefly under the most boisterous influence of the eastern monsoon. It is only thirty feet high, but so thick that a man with outstretched arms can with difficulty embrace it. It is reared only in marshes, so that a plantation forms a bog knee-deep. The sago is considered ripe in fifteen years, and is then cut into segments, and the pith extracted, which soon dries into a farinaceous powder, eaten either in the form of cakes, or of a species of pap. The produce is prodigious, 500 or 600 pounds being often drawn from a single tree, and one acre may, it is supposed, yield 8000 lbs. annually.

4788. *Spices*, however, form the production of those islands most peculiar and most valued by foreigners. These, with the coffee tree recently introduced, occupy in agriculture the same place which the vine does in Europe, being generally cultivated in the hilly districts of each country. Pepper grows plentifully in its western districts; but Mr. Crawford considers it as introduced from the hills of Malabar, whose produce continues still superior. It is best raised, also, not on the rich plains of Java, but on the hilly districts of Sumatra and Borneo. The *clove* has, perhaps, the most limited geographical distribution of any plant, being confined originally to the five small Molucca islands, whence it has been transplanted to Amboyna, to which the Dutch have sought to confine it. The tree is of beautiful form, about the size of the cherry, bears fruit at a period between seven and ten years, and has an average duration of 75 years, though sometimes it has lasted for 100, or even 130. The fruit is first green, then a pale yellow, and lastly blood red, when it is ripe; and, being gathered, is dried upon hurdles, and then acquires the black colour which we see it bear. Some trees have been known remarkably productive, and one is even asserted to have borne 1100 lbs. in one year; but Mr. Crawford does not consider the annual average to exceed 5 lbs., and the produce of an acre 328 lbs. The nutmeg is much more widely distributed, being found of good flavour in all the Spice Islands, and even on the coast of New Guinea; but the Dutch have sought with tolerable success to extirpate it every where, unless in three of the Banda islands. The tree grows to the height of forty or fifty feet, somewhat resembles the clove, and has nearly the same duration. The fruit, also, is prepared in a manner somewhat similar, though requiring greater care, and with the additional operation of stripping off the mace, which merely requires to be dried in the sun. One tree produces, in mace and nutmegs together, nearly ten or twelve pounds; but, from the distance at which they must be planted, the average of an acre does not exceed 266 lbs.

4789. *Among other products* of these islands may be mentioned the sugar cane, which is indigenous, but is eaten by the natives merely as an esculent vegetable; the Chinese express the juice in the form of clayed sugar. Indigo is indigenous, of excellent quality, but ill prepared for use. Coffee has been introduced from Arabia, and cultivated to a considerable extent in Java. Cardamoms and gum benzoin, the Eastern frankincense, are articles of some importance.

4790. *Forests*, in extraordinary luxuriance, cover a great extent of the Indian islands. The teak, so remarkable for its strength and durability, flourishes only in the rich soils of Java, and there not to the same extent as in Malabar and the Birman empire. There are also a considerable number of ornamental woods, and of others, from which precious gums distil. Bamboos and rattans overspread the whole country wherever not rooted out by cultivation; they serve for building, for cordage, and other important purposes. The mangosteen and the durian are generally considered the most delicate fruits produced in any quarter of the world; though, in the latter, the stranger must overcome the aversion inspired by its unpleasant scent.

4791. *The mineral wealth* of the Archipelago is brilliant and valuable. The lead is taken by gold and diamonds, the most splendid productions of this kingdom of nature. Of the former, these islands, next to South America and Central Africa, contain the most extensive deposit on the globe. It is found chiefly in the south-western islands, whose rocks are mostly composed of primitive strata; and its central position is in Borneo and the adjacent parts of Sumatra. In the fertile volcanic range reaching from Java to Timor inclusive, the quantity is too small to be of any commercial importance. It is found in veins and mineral beds, in the sand of rivers and streamlets, and deposited in alluvial lands. From the first it is drawn only by the Malays and others of the more civilised tribes in the interior of Sumatra. They employ, however, very rude tools, and effect only slight excavations, clearing the mine of water by buckets and manual labour. Yet there are said by Mr. Marsden to be no less than 1200 of these petty mines in the single district of Menangkabao. The sand of the rivers is searched only by the more savage tribes; but the drawing of gold from alluvial deposits, carried on almost entirely by Chinese settlers in the island of Borneo, is by much the most copious source from which the metal is supplied. The mines are situated chiefly at about two days of inland navigation from the western coast, towards the foot of the mountains. The Chinese colony, according to Mr. Crawford, consists of 36,000, of whom only 6000 are employed directly in the working of the mines, the rest in branches of industry subservient to it. There are said to be, in the principal district, thirteen large and fifty-seven small mines; of which, the former employ from 100 to 200, the latter from ten to fifty men. The excavations are longitudinal, and the golden earth drawn from them is put into a trough, and a stream of water passed over it, while it is agitated by a hoe, until the metallic grains separate. Mr. Crawford reckons the annual value of the gold of the Archipelago at 658,000*l.*, which is more than a fourth of that of the mines of America in their most prosperous state, and four times that of all the European mines. Of this amount, 375,500*l.* is from Borneo, 131,600*l.* from Sumatra; the rest is the estimated produce of all the other parts of the Archipelago.

4792. *The diamond* is found only in Borneo; being confined to that island, to Hin-

dostan, and to Brazil. The Indian islanders prize highly this stone, and cut it with skill chiefly into the table form; but it is not valued by the Chinese, whose industry might otherwise have improved the rude processes employed in extracting it by the Dayaks, or aboriginal savages. Almost the largest diamond in the world is in possession of one of the princes of Matan in Borneo. It weighs, in its present rough state, 367 carats; which, by the process of cutting, would be reduced to one half; consequently, it is not quite so large as that purchased by the Empress Catherine, which, when cut, weighed 193 carats; but it considerably exceeds the Pitt diamond, which was only 137 carats. Its value, according to the principles established by diamond-dealers, is 269,000*l.*, though it might be very difficult at such a price to find a purchaser.

4793. *Of other metals, tin* is a rare one of considerable use, and, though discovered in these islands only about the beginning of last century, has become an important and characteristic production. It exists in various parts of the Malay peninsula and of the islands between it and Java; but in none of these is it worked to any extent unless in the small island of Banca, near the eastern coast of Sumatra, which, in Mr. Crawford's conception, is almost entirely filled with this metal, in the form either of veins or of alluvial deposits. The latter, on account of the facility of working, is almost exclusively resorted to. The process is, first to cut down a portion of that vast primeval forest with which nearly the whole island is covered; then to remove the alluvial strata in order to reach the ore, which is then washed in a manner similar to gold, and smelted by machinery, simple though not unskilful. About the middle of last century, the mines yielded 3870 tons, being nearly as much as those of Cornwall. Anarchy, mismanagement, and other causes, had reduced them, previous to the British conquest in 1813, to less than a sixth of the above amount; but in 1817 they rose to 2083 tons, about half the produce of Cornwall. Nothing can more strongly prove the effects of skill and machinery, since "Cornish tin is obtained with vast labour, by mining through obdurate granite, often to the prodigious depth of many hundred fathoms; Banca tin, by digging through a few soft strata of sand and clay, and seldom to more than three or four fathoms." The produce has since continued nearly the same, being two thirds of that of all the mines in the Malay peninsula. Like gold, tin is worked chiefly by the industry of Chinese settlers. Copper is found and worked in several of the islands, particularly Sumatra, though not to any very important extent. Iron is scarce, and occurs in considerable quantity only in the small and rocky island of Billiton. No silver mines of any value have yet been discovered. Sulphur is found abundant and pure on the volcanic mountains of Java; but the transportation to the coast is difficult. Salt, in favourable situations, is easily produced through the evaporation of sea water by the heat of the sun.

4794. *Fishery* is pursued by the islanders with considerable activity; and its produce, used generally in a dried state, forms a considerable article of food and internal commerce. Important objects of exportation are afforded by certain gelatinous marine productions, of a singular character, which bear a high price in the markets of China. Such are sharks' fins, and above all the tripang, sea slug, or *biche de mer*, an ugly shapeless substance, of a dirty brown colour, with scarcely any appearance of life or motion. It is found chiefly on coral shores to the eastward of Celebes, including those of New Guinea and Australia. The chief market is at Macassar, whence upwards of 8000 cwt. are annually sent to China, where it brings from six to ninety Spanish dollars per cwt. The Chinese, who imagine it possessed of some peculiar nutritive and stimulating qualities, divide it into no less than thirty different species, the various qualities of which are understood only by themselves. Here, too, for the want of a more appropriate place, we may notice that kind of edible birds' nests which forms a similar fantastic luxury. These nests are the produce of a peculiar species of swallow (*Hirundo esculenta*), which, by some process not fully understood, constructs its nest, not of the usual materials of hair, straw, and feathers, but of a substance resembling a fibrous ill-concocted isinglass. They are found in the deep damp caves of solitary rocks, at a distance from any human habitation, and chiefly, though not always, on the sea-shore. The adventurer often, by ladders of bamboo or rattan, descends the face of perpendicular cliffs, till he reaches the mouth of the cavern, and must frequently enter it by torchlight over slippery fragments of rock, where a false step would be instantly fatal. According to the nice distinctions made by the Chinese, the value of these nests varies from 2*l.* to nearly 7*l.* per lb.; at which last price they are equal to about double their weight in silver.

4795. *Commerce*, among the nations of this archipelago, has always been carried on with considerable activity. Their country yielded valuable materials, and the insular positions and great variety of seas and coasts afforded ample opportunities. At the time of the first discovery by Europeans, the three most civilised tribes, the Javanese, the Malays, and Bugis, carried on a very active traffic. That of the first two has been in a great measure crushed by European dominion and rivalry. The Bugis, however, who have remained in a great degree independent, are still active traders throughout all these seas. The Chinese, again, under the protection, as Mr. Crawford conceives, of the regular order established by the European governments, have formed extensive colonies, and carry on a constant intercourse by means of their huge junks, some of 600 tons' burden, but so unwieldy that they can only make one annual voyage to Batavia. They furnish to the islanders tea, cotton stuffs, and porcelain, all somewhat coarse; receiving in return tripang, birds' nests, sharks' fins, tortoise-shell, spices, and various minor articles. The tonnage employed by the Chinese and native states is together estimated at 30,000. The trade with Europe is carried on chiefly through the Dutch capital of Batavia, and the British settlement of Singapore. The exports to Europe consist mostly of spices, pepper, cloves, nutmeg, mace, with camphor, rattans, tortoise-shell, &c. The imports are cotton manufactures, particularly chintzes of moderate fineness, and of red, green, and other bright colours, with running-flowered patterns; also white cottons, cambrics, imitation bandana handkerchiefs, and velvets. Notwithstanding the tropical situation of these islands, the mountains which diversify them, and the influence of the sea-breezes, cause a considerable demand for woollens, which should be the light cheap cloths of Yorkshire, with gaudy patterns. Glass-ware, mirrors, lustres, and common earthenware, at low prices, find a good market.

4796. *Interior commerce* is carried on with considerable activity along the rivers and creeks, which, though not generally of long course, are extremely numerous, descending from the inland mountain barriers. The roads are mere footpaths, unfit for a waggon of any description, and the commodities are conveyed on the backs sometimes of animals, but more frequently of men. On one much frequented road, in Java, no less than 5000 porters are said to be constantly employed.

SECT. VI. *Civil and Social State.*

4797. The population of none of these islands has been ascertained by any species of *census*, except Java and the Philippines. Java has been found to contain about 6,000,000, and the Philippines about 2,500,000 people. In the rest of the Archipelago, a judgment can only be formed by considering their extent, in combination with the apparent density with which they are occupied. An estimate has been communicated to us by Mr. Crawfurd, the historian of the Archipelago; and though it differs somewhat from those usually formed, yet the extensive opportunities of observation enjoyed, and ably employed, by that gentleman, lead us to believe that it will make a nearer approach to the truth than any hitherto published. He supposes Sumatra to contain 2,500,000; Borneo, 500,000; Celebes and its appendages, 1,000,000; Bally, Lombok, Sooloo, &c., 500,000; the Spice Islands, Timor, &c., nearly 500,000. The entire amount will thus be 13,500,000.

4798. The people of the Indian archipelago are divided into *two races*, distinct in origin, language, aspect, and character, and irreconcilably hostile to each other; the *brown* and the *black* races. They bear the same analogy that the white and the negro bear in the western regions; the former, superior in intelligence and power, driving the other before him, oppressing and reducing him to bondage. Thus, in all the great islands the brown race has now established a decided and undisputed superiority.

4799. The *black race*, called often the Papuas or Oriental Negroes, appear to be a dwarf variety of the negro of Africa. They are of low stature and feeble frame. Mr. Crawfurd never saw one who exceeded five feet. The colour is sooty rather than black, the woolly hair grows in small tufts, with a spiral twist. The forehead is higher, the nose more projecting, the upper lip longer and more prominent. The under lip is protruded, and forms indeed the lower part of the face, which has scarcely the vestige of a chin. This degraded class of human beings is generally diffused through New Guinea, New Holland, and other large islands of the Pacific. Their habits have been very little observed, Europeans having only had occasional individuals presented to them as objects of curiosity. Little is recorded except the ferocity with which they wage their ceaseless war with the brown races, who have driven them from all the finer parts of this region; but, if we may believe Mr. Hunt, the wrongs by which this hostility has been provoked are of the most aggravated description.

4800. The *brown tribes* differ essentially in their appearance from any others in southern Asia. They are short, squat, and robust, being reckoned on an average four inches lower than the European standard. There are considerable varieties of colour, which Mr. Crawfurd thinks cannot be accounted for by the climate; though, perhaps, he does not sufficiently allow for the change produced by elevated sites. The tint of virgin gold is considered the standard of beauty, which the poets ascribe to the damsels whose praises they celebrate. These islanders are rather an ugly race; their frame is deficient in symmetry, their lower limbs large and heavy. The face is round; the mouth wide, but with fine teeth; the cheek-bones high, the nose short and small; the eyes are small, and always black. The hair is long, lank, harsh, always black, and, except on the head, extremely deficient; so that the Mahometan priests vainly attempt to attain any portion of that venerable aspect which an ample beard is supposed to confer.

4801. This part of the population, by far the most numerous and important, appears *the most uncivilised of all the great nations* who inhabit the south of Asia. Some seem justly charged with cannibalism, the most dreadful atrocity of which human nature is capable. Yet this original rudeness is mingled with features characteristic of the most highly civilised people in Asia, the Arabs, Hindoos, and Chinese, who entered for purposes either of commerce or colonisation. The Javanese and Malays, the principal of these tribes, are destitute of the polished and courteous address which distinguishes the Hindoo and the commercial Arab. When they wish, as they often do, to be obsequious courtiers, they act their part with a bad grace. In return, they are comparatively frank and honest; and much greater reliance can be placed on their word. They show also sympathy in the distresses of their fellow-creatures, and will exert themselves to relieve them, on occasions when the Hindoo manifests a callous indifference. Strong attachment is often displayed to their family, their kindred, and their chief. Though generally subject to a power more or less despotic, they retain strong and even lofty feelings of personal independence. Each man goes armed with a *kris* or dagger, which he regards as the instrument both of defending himself and avenging his wrongs. The right of private revenge is claimed by every individual for injuries received either by himself, his family, or tribe. When circumstances deprive him of any hope of avenging himself with ease or safety, he has recourse to that dreadful outrage peculiar to these islanders termed running *amok*, or a *muck*. The individual under this impulse draws his dagger, and runs through the house, or into the street, stabbing without distinction every one he meets, till he himself is killed or taken. This movement is always perfectly sudden, indicated by no previous looks or gestures, and from motives which it is often difficult to discover. The police officers, in contemplation of these violences, are provided with certain forked instruments, with which they arrest and secure the offender. A predatory disposition, exercised especially upon strangers, is shared by these islanders with all the uncivilised tribes of Asia; but while the Arabs and Tartars carry on their depredations by land, the Malays, inhabiting the shores of straits and narrow seas, through which rich fleets are perpetually passing, have become notorious for piratical exploits, which are practised with peculiar activity on the coast of Borneo, and in the islands of the Sooloo Archipelago.

4802. The *religious belief and observances* of the East Indian islanders, at least of the most civilised portion, have been almost exclusively derived from the great nations in the south of Asia. The first great and effective colony appears to have come from Telingana in southern India; and the creed which they introduced, though now nearly obliterated, is still attested

by the remains of splendid temples and by numberless images scattered throughout the island of Java. From them we discover that here, as in all the countries around India, the pre-

735

REPRESENTATION OF BOODH.

ailing worship has been that of Boodh. His images, of which the principal one in the temple of Boro Budor is shown in the annexed cut (fig. 735.), are much the most numerous. Those of Siva and the deities connected with him are by no means unfrequent; but few or no representations have been found of Brahma or Vishnu. This system, once so widely diffused, scarcely survives, unless upon the small island of Bali, which adjoins to Java, but is rendered almost inaccessible by its entire want of harbour. Here the Hindoo institutions flourish in full vigour, and the worship of Siva is much more prevalent than that of Boodh; the distribution into four castes is fully established; and the same merit is attached to abstinence from animal food, though it is scarcely practised, unless by the priests. The sacrifice of widows takes place on a great scale, chiefly at the death of any of the great men; and the extent of the practice of polygamy renders its effects there very tragical. Mr. Crawford plausibly suspects it to be not wholly imported from Hindostan, but to be a remnant of the

custom general in savage communities, where the chiefs enjoy extraordinary influence.

4803. *The Mahometan creed*, introduced from Arabia nearly four centuries ago, completely supplanted the Hindoo system among the Javanese and Malays. By this channel it came in the form deemed orthodox, and there has never been any mixture of sects. The practice here, however, is exceedingly lax; and it is allowed very little to interfere with the ordinary occupations and enjoyments of its votaries. They hold the festivals with considerable zeal, practise some measure of prayer and fasting, and set high value on performing the pilgrimage to Mecca. But they pay little regard to the prohibition of wine and other intoxicating liquors, and by no means immure their females with that jealous rigour which is usual among Mahometan nations. Seclusion takes place only among the great; and even they, instead of being offended by enquiries after their wives, consider it as a compliment, and usually introduce them personally to gentlemen with whom they have become intimately acquainted.

4804. After the arrival of the Portuguese, *the Christian nations* soon became the ruling powers in the Indian archipelago. The only extensive conversion, however, has been that effected by the Spaniards in the Philippine islands; of which Luconia, the principal one, has, through the efforts of the missionaries, become almost entirely Christian; and though their instruction has not been conveyed in the most enlightened form, it is generally allowed to have effected a very important improvement upon the rude natives. The Dutch colonists, inspired by a spirit almost entirely commercial, have not made the same exertions, and their monopolising and tyrannical spirit was little calculated to recommend their belief.

4805. *The intellectual character* of the Javanese ranks lower than that of almost any other people who have made equal progress in the external accommodations of life; and their literature, like their religion, is almost entirely imported from Southern Asia. "In the Javanese schools," says Mr. Crawford, "a smattering of Arabic, with a religious view, is the only branch of instruction. Javanese literature itself is nowhere taught as a branch of education, but left to be picked up as occasion offers. Its acquisition seems not to be considered as a thing of utility or necessity, but rather as an accomplishment which it may be agreeable to possess, but which it is no discredit to be ignorant of. I have seen many a chief of rank who could neither read nor write; and out of the whole population of an extensive village, you cannot always be sure that you can find an individual that can do so. As far as concerns the women, literary education may be said to be altogether unknown. When one is seen that can read and write, she is looked upon as a wonder. I do not think that, during my extensive intercourse with the Javanese, I saw half a dozen that could do so. The palace of the sultan of Java afforded but a single example." Both the Malay and Javanese languages are uncommonly copious; but it is in a superfluous profusion of terms to express individual objects, while there is a total absence of those relating to general and abstract ideas. The dialects, especially the Malay, are distinguished by the prevalence of the smoothest liquid and vocalic sounds, and the exclusion of all harsh consonants. The Malay, in adopting a large portion of Arabic, has smoothed it down so as to harmonise with the original; and, being written in Arabic characters, which are considered sacred throughout the East, has acquired a general currency among the people of the Archipelago. The language of the Javanese, on the contrary, has an alphabet of its own, the characters of which are peculiarly neat, though seldom carefully written. This people have also a learned and sacred language, called Kawi, which, from the large infusion of Sanscrit, appears evidently to be derived from India, and is employed chiefly in abridgments of the Mahabarat, Ramayana, and other Hindoo compositions. The literature of Java is almost entirely metrical, yet does not display those high efforts of fancy and passion which often distinguish the effusions of a ruder people. According to a late author, they contain neither sublimity, pathos, tenderness, nor humour; but, on the contrary, bombast, puerility, or utter inanity. History was unknown previous to the introduction of the Arabic religion and literature, since which time there has been a tolerably connected narrative of public events; yet the imperfection of this may be estimated when we state, that it is always composed under the eye of the prince whose actions it records, and who employs the writer merely as a servant whose only qualification is that of being able to string events into verse. Malay literature is chiefly in prose; and its largest portion consists in romances, or fragments of real story so disfigured as to be little better. They have the same tame character with the works composed in its brother dialect. The best compositions in both seem to be little songs, the effusions of natural feeling. — Celebes has a language and literature of its own; ruder, though in some respects more energetic, than the Javanese or Malay.

4806. *Dramatic entertainments*, of a very peculiar nature, are cultivated with ardour, particularly in Java. They seem to be only a step beyond the practice of common story-telling, which is so general throughout the East. The *dalang*, or leading personage, sits in front of

the stage, and reads in a chanting tone one of the national romances. The performers behind, covered usually with grotesque masks (*fig. 736.*), accompany his recital with corresponding movements. Their place is frequently supplied by puppets, many of which are of that very peculiar description called *scenic shadows*, — monstrous and grotesque figures, of about twenty inches long, cut out of a stiff untanned buffalo hide, and commonly very highly gilded and painted.

736

JAVANESE MASKS AND SHADOWS.

peculiar species of crickets. Games of hazard are also pursued with passion, even the lower orders squandering their hard-earned wages, and reducing themselves to destitution, by an excessive indulgence in them.

737

MALAY HOUSE.

of very simple materials and construction. The art, by which those magnificent structures were reared, the remains of which adorn the interior of Java, is entirely lost. They appear to have been constructed by the Hindoo settlers, and to have departed with them. The humble and mercantile character of the adventurers who introduced the Moslem faith is the supposed cause why the mosques, instead of the splendour which they display in other parts of the Mahometan world, are here coarsely and inelegantly constructed of temporary materials. The natives have lost even the art of turning an arch. Their very best houses are slight structures of bamboo, rattan, palmetto leaf, and grass. Those of the peasantry (*fig. 737.*), simply constructed of these materials, and surrounded with trees and a little garden, produce a very pleasing effect. Those of the higher classes are called *pandapas* (*fig. 738.*), and consist chiefly of a roof supported by four pillars, both often highly carved and painted. The public halls of the towns, the mosques, and even the monarch's state

738

hall of audience, consist only of such structures on a greater scale. To make one the commodious residence of a chief, it is enclosed by palings, or divided into apartments, by light partitions (*fig. 739.*). The abodes of the great chiefs, and even the palace of the prince, are only distinguished by the greater number and size of these pandapas. The palace, however is enclosed by walls, composed formerly of hewn stone, but at present only of bad brick, yet which form the only structures of masonry now reared in the country.

739

HOUSE OF A CHIEF.

pantaloons, according to the taste of different tribes. In the court dress, on the contrary, all the upper part of the body is naked, smeared with a yellow cosmetic, and loaded with gold ornaments (*fig. 741.*). In the war dress, again, the coat, indeed, is laid aside; but the robe is wrapped close round the whole body; while besides the *kris*, or dagger, which is worn at all times, by every islander, a sword is stuck in the belt, and a long spear is brandished (*fig. 742.*).

4807. Of *runder amusements* the chase is pursued with ardour by the natives of Celebes on their large grassy plains, with small active horses, lightly harnessed, which they ride with great swiftness. This diversion is carried on with much less ardour in Java, and only in its unimproved districts; the natives possessing an inferior breed of horses, which they ride ill. Their most active chase consists in attacking the tiger by a circle of spearmen, while the prince often looks on as a spectator. The islanders in general are not fond of games where much bodily exertion is requisite, and take more pleasure in sitting and contemplating the combats between pugnacious animals. Cock-fighting is a universal passion; the quality and exploits of game-cocks are celebrated in their poems and romances. They delight also to view the conflict between the tiger and buffalo, an arduous and equal struggle, in which, contrary to what might be expected, the buffalo is generally victorious. They take pleasure also in quail-fighting, and even in contests among a

This has suggested a singular expedient to those who employ Javanese to watch during the night over valuable property, and seek to overcome their almost irresistible propensity to forget their charge and fall asleep: a small sum given to them to gamble for completely secures their vigils. Dancing is also a favourite amusement, or rather occupation: it is solemn, stately and slow, performed less with the legs than with the body and arms, and expressing feeling and passion rather than gaiety. The Javanese prince not only trains his concubines to dance, but causes them to exhibit in public. The messenger or ambassador, who approaches the royal presence, enters and retires dancing. In this position is taken the vow of friendship or of enmity, and even he who, in the extremity of despair, terminates life running a muck, performs this frantic deed in measured postures and movements.

4808. The *habitations* of the East Indian islanders are of very simple materials and construction. The art, by which those magnificent structures were reared, the remains of which adorn the interior of Java, is entirely lost. They appear to have been constructed by the Hindoo settlers, and to have departed with them. The humble and mercantile character of the adventurers who introduced the Moslem faith is the supposed cause why the mosques, instead of the splendour which they display in other parts of the Mahometan world, are here coarsely and inelegantly constructed of temporary materials. The natives have lost even the art of turning an arch. Their very best houses are slight structures of bamboo, rattan, palmetto leaf, and grass. Those of the peasantry (*fig. 737.*), simply constructed of these materials, and surrounded with trees and a little garden, produce a very pleasing effect. Those of the higher classes are called *pandapas* (*fig. 738.*), and consist chiefly of a roof supported by four pillars, both often highly carved and painted. The public halls of the towns, the mosques, and even the monarch's state

4809. The *dress* of these islanders presents a medium, not very commodious or elegant, between the light close garments of the European, and the long flowing robes of the Asiatic. The principal part is the *sarung*, or long robe, not fastened to the body, but loosely wrapped round the lower part, and fastened by a zone or sash. The coat, the other principal part of the dress, is only a loose frock. The Mahometans wear a cap resembling a turban; but the other inhabitants have the head naked (*fig. 740.*). The rest of the body is either uncovered, or enveloped in vest, bodice, or

4810. *The diet* of the islanders is simple, consisting chiefly of rice and fish, with little mixture of other animal food. It is eaten greedily, with little ceremony, and lifted to the mouth by the hands, according to

740

the general practice of the East. The people display a remarkable propensity to the use of narcotic stimulants. Wine and still more the spirits of their own manufacture are liberally used, in defiance of Mahometan injunction; yet it is not in these that the chief excess is committed. It is in bang, a substance extracted from hemp; in tobacco, and of late above all in opium. The islanders, reversing the general practice of Asia, chew tobacco, and smoke opium.

SECT. VII. *Local Geography.*

4811. *The local details* of this extensive range of islands, especially as respects their interior districts, are in many respects imperfectly known, and many of them not very interesting; so that they will not detain us so long as the general description. We shall begin with the western islands, and proceed eastward.

4812. *Sumatra*, the most westerly of the great islands, extends from north-west to south-east, above 1000 miles in length, and 160 of average breadth. It is situated immediately beneath the equator, which divides it into two nearly equal parts; yet it is protected from the evils incident to this position by chains of mountains, which extend along the whole of the interior, sometimes in several successive ranges, enclosing between them fine valleys and lakes. Of these Goonong-Pasama, which Europeans, upon a very crude theory, have called Mount Ophir, exceeds 13,000 feet: while Goonong-Kasumbra is upwards of 1000 feet higher. These high chains so copiously water the plains and coasts beneath, that, instead of being in any degree parched and arid, they are overspread with too luxuriant a vegetation. The ground is almost choked with dense forests, and with canes, rattans, and other species of tropical underwood; and a great part of the southern shore consists of a forest of mangroves growing out of a morass. Culture has but partially and rudely cleared these encumbrances, and directed the fruitfulness of the soil to useful objects. Sumatra does not produce so many objects for exportation as smaller and even less fertile islands. The most important is pepper, produced in considerable abundance, yet not equal to that of Malabar. This island, however, excels all other countries in the abundance and excellence of its camphor. This substance consists of the concrete juice in the heart of a species of tree, which, however, is becoming daily scarcer, being cut down by the natives for its valuable wood. In Europe, camphor has only a limited use as a medicine and cosmetic; but the Chinese value it highly, and pay a much larger price for that of Sumatra than of Japan.

4813. *The kingdom of Acheen* occupies the most northerly part of this island, extending opposite to the coast of Malacca. At the first arrival of Europeans, it held dominion over divers states both of the island and continent, and was dignified with the title of empire. Though now greatly reduced, and restricted within its original limits, it has always, amid violent internal dissensions, remained independent of any European power. The Acheenese are a seafaring race, bold, stirring, and often piratical, but inspired by no inconsiderable share of commercial spirit. The capital city of Acheen presents a complete specimen of the sea-ports of these countries. It consists of about 8000 bamboo habitations, raised on posts above the marshy shore, and so completely enveloped in wood, that from the sea it appears like an extensive forest.

4814. To the south of Acheen, but to the east of the great range of mountains, extends *Menangkabao*, which also, at an early period, held many states under its dominion, and was dignified with the title of empire. It was the original country of the Malays, whence they spread to other parts of Sumatra, to Malacca, and Borneo, till they became the ruling people in the Indian seas. This country is watered by a large lake, said to be thirty miles in length, though the precise situation is not ascertained; it abounds in gold, and is under very tolerable cultivation. The inhabitants appear to have made greater progress in the arts than any of the other islanders. The gold and silver filigree work, the only fine manufacture in the Archipelago, is executed by them almost exclusively. They supply all the rest of Sumatra with arms; and, since the introduction of those of Europe, manufacture very good muskets and gunpowder. They were very early converted to the Mahometan religion; and their country and capital possess still a sacred character even among their neighbours the pagan Batta. The country was entirely independent of Europeans till recently, when the Dutch, taking advantage of intestine dissensions, penetrated into it, and established their supremacy.

4815. *The Battas* occupy the country and coast on the opposite or western side of the mountains. This extraordinary race display in some respects a degree of civilisation not to be found among the surrounding states. Their country is fertile, and cultivation generally diffused. They have an alphabet of their own, distinguished by the singularity of being written from the bottom upwards; and the characters are rudely stamped with the point of a dagger on the surface of a bamboo or branch; sometimes even upon a growing tree. In this rough manner, however, the majority of the people can both read and write. But with these attainments they combine habits which have been considered as belonging to the most extreme barbarism. Anthropophagy is not only practised in the heat of victory, to gratify deadly vengeance, but prescribed as a regular part of their laws and institutions. For all who are guilty of robbery, adultery, unlawful marriages, or other high crimes, the penalty is, to be publicly eaten by their countrymen. The officers of justice and the injured parties assemble at the place of punishment, with a provision of salt, pepper, and citron; the individual most wronged selects the first morsel, cuts it off, and eats it; the rest follow according to their rank, till the leader of the assembly severs the head, and carries it off as a trophy. Authors of good repute have asserted that they ate their aged and infirm relatives, after various ceremonies, among which was that of dancing round a tree, calling out, "When the fruit is ripe it must fall;" but, if this most unnatural practice ever prevailed, it is now entirely discontinued. The number of little tribes into which this people is divided, and who wage almost ceaseless war against each other with deadly enmity, appears to be the circumstance which chiefly keeps alive among them this spirit of ferocity. They are assimilated to savage life also in the treatment of their women, who are regarded as little better than slaves, and on whom the labour of cultivating the ground and other hard tasks are devolved. The Battas are pagans, and their religion little known. From their ports of Barous and Tappanoula they export a large quantity of camphor, with gum benzoin and a few other commodities.

4816. *The kingdom of Siak* occupies the eastern coast of the territory, of which the inland and western parts belong to the two states now described. A broad river, rising in the mountains of Menangkabao, traverses the territory, and is navigable sixty-five miles up to Siak the capital; but the chief trade is carried on at the seaport of Campar. The navy and commerce of Siak were once great, and are still considerable. The Dutch, besides the ordinary commodities of Sumatra, draw from it a considerable quantity of timber; but they have not formed any settlement upon its coast.

4817. *The southern quarter of Sumatra* is on the whole the least improved, a great extent being marshy, uncultivated, and overgrown with dense forests. On its hills, however, is the most abundant growth of pepper, the commodity which Europeans principally seek in this island; and here their chief settlements have been formed. Palembang, on the eastern side, and Bencoolen, on the western, have long been the capitals: the first of the Dutch, the second of the English settlements in Sumatra. The sultans of Palembang generally encouraged commerce; and their country has been the chief mart both for pepper and for the tin of the neighbouring island of Banca. The pepper is brought from a considerable distance in the interior. The Dutch long contented themselves with maintaining a fort at the capital, a town of 25,000 inhabitants, with a mosque and a palace handsomely built of stone; but in 1821, being involved in a quarrel with the sultan, they deposed him, and erected the territory into a province or *residence*. Great efforts were made by the English East India Company to raise Bencoolen into a place of importance: in 1714 they founded Fort Marlborough; and in 1810, their property there was estimated at \$14,000. The settlement, however, never paid its expenses; and the trade, instead of increasing, dwindled away; so that in 1824 it was considered advantageous to exchange it with Holland for Malacca, and some small possessions on the coast of India, which, though of no great importance in themselves, served to connect and consolidate other settlements. The Dutch then annexed Bencoolen to the province of Padang, fixing at the town of that name the seat of their administration, and their principal trade. To complete the picture of this part of Sumatra, we may mention the *Lampongs* and the *Redjangs*; interior tribes, under a rude feudal system, less improved on the whole than the Battas, yet having, like them, a language and alphabet, and not being guilty of the same savage enormities.

4818. *Sumatra is begirt by ranges of isles* which, though comparatively small, present peculiarities that deserve some notice. On the western side, beginning from the southward, we may number Eugano, the Pogy or Nassau group, Seeberrow, Nyas, Bali (or Hog). These islands have a rugged and mountainous aspect, and Seeberrow is even the seat of an active volcano. The face of the country and the inhabitants have no affinity with those on the great island, but bear more analogy to the eastern part of the Archipelago, and even to the islands of the South Sea. Sago, instead of rice, is the staple food; the inhabitants, called by the Malays Mantaway, tattoo their skins, and speak a language quite different from that of Sumatra. The Pogy Islands are the chief seat of the rudest of these races, who are unacquainted with the use of metal, have no weapons but bows and arrows, and in many of their customs resemble the people of Otaheite. The natives of Nyas are much more frugal and industrious, rearing with success the hog and the sweet potato. Yet they are fierce and sanguinary, the country being partitioned among about fifty little chieftains, who wage deadly wars with each other. Nearly a thousand prisoners of war are annually sold as slaves, in which capacity the Dutch find them useful, though dangerous, as their fierce pride often impels them to the violent deeds familiar to those islanders.

4819. *The groups of the Nicobar and the Andaman islands* may, for want of a more appropriate place, be here introduced. They extend northwards in almost a continued group from about 100 miles N. W. of Sumatra, where the Nicobar islands begin, to about 400 miles farther, where the Andamans terminate. The Nicobar islands are twelve, of which the principal are Sambelong, Carnicobar, and Nancowry. They are generally hilly and woody, abounding in cocoa-nuts. The inhabitants are of the brown or Malay race, and are peaceable and well-disposed. The Danes, who called these Frederick's Islands, formed first a commercial settlement in 1756, and then a missionary establishment in 1768; but both were abandoned on account of the sickness of the climate. They have recently renewed the attempt, but, it is said, with no promise of better success. The Andamans consist of two long islands, the principal of which is about 140 miles from north to south. They are mountainous, woody, and in some parts very picturesque. The inhabitants, who are a variety of the Oriental negro, appear to be among the most degraded beings in existence. They go quite naked, live in hovels composed of twigs, never cultivate the ground, but subsist on fish; which, however, they shoot and spear with great dexterity. They have been accused of cannibalism, but perhaps without sufficient grounds. The English, with a view to the refreshment and shelter of their ships, attempted settlements first at Port Chatham in the large island in 1791, and then at Port Cornwallis on the smaller one in 1793; but both these stations were abandoned on account of the unhealthy climate.

4820. *Pulo Pinang*, a small island of seven or eight leagues long, separated by a narrow strait from the coast of Malacca, was only one uninterrupted forest till 1786, when the English East India Company purchased it from the King of Queda, and formed a settlement there, with a view to the refreshment of their China ships. In 1805 it was made a regular government, subordinate only to that of Calcutta. The expectations of its becoming a grand ship-building arsenal have not been fulfilled; but it soon acquired commercial importance by becoming the depôt for the produce of all the neighbouring districts, as well as a place where all the vessels touched that passed between India and China; though in this respect it has been lately in a good measure supplanted by Singapore. George-town, the capital, consists of airy and spacious streets, and its markets are well supplied with provisions; but its ill-constructed fort is incapable of defence.

4821. *Off the eastern coast*, Pandjoor and Rupa, almost immediately contiguous to Malacca, form dependencies on the kingdom of Siak. Lingen and Bintang, farther out at sea, are the centre of a numerous group of islets of the most varied form and aspect; some mere naked rocks, others covered with trees and verdure. They have been long, to the Malays, a great seat both of commerce and piracy. They are ruled by a sultan resident in Lingen, who acknowledges the supremacy of the Dutch, and has lately ceded to them in full sovereignty the islet of Rhio, separated from Bintang by a narrow channel. Rhio, being made a free port, has acquired great importance both as an entrepôt and a place of refreshment; and its population amounts now to about 6000.

4822. *The island of Banca* derives its sole importance from the mines of tin, already described. It was a dependency of Palembang till the Dutch lately erected it, with Billiton, into a separate residence or province. The latter is distinguished by its mines of iron, the most valuable in the Archipelago, and nails made from which are exported to the neighbouring islands.

4823. *Java*, the great island which next follows, is separated from Sumatra only by the Straits of Sunda, one of the main entrances into the interior seas of the Archipelago. It extends from east to west about 600 miles, with an average breadth of about 100. From its eastern extremity there extends a succession of smaller isles, Bali, Lombok, Sumbawa, and Flores, separated from it and each other only by narrow channels, and forming, as it were, a prolongation of Java. This island, then, with its attendant group, shuts in on the south all the islands and seas of the Archipelago, and can hold with most of them a direct and ready communication. The English and Dutch, while they contended with each other for supremacy in these seas, placed the centre of their commerce and dominion on the northern coast of Java. This island also surpasses all the others in fertility, population, and general improvement. It does not indeed excel in the finer spices, and even in pepper is inferior to Sumatra. But it is fruitful in the staples of tropical produce, rice, sugar, coffee; and has extensive forests of teak. According to Mr. M'Culloch, the island yields 3,000,000*l.* of revenue to the Dutch government, who maintain there 15,000 troops, of which not less than 8000 are European.

-4. *Batavia* (fig. 743.), the capital of Java, and of the Dutch possessions in the East

BATAVIA.

Indies, is situated on the northern coast, and not far from the western extremity of the island. Several islets surrounding the bay on which it is situated, afford secure anchorage to vessels of 500 tons. A small river runs through the town, the facilities afforded by which are increased by navigable canals. These, multiplied to a superfluous extent, aided in producing that extreme insalubrity for which Batavia was long notorious. Vessels which entered the port either for trade or refreshment, left it often with the loss of more than half their crews. By ac-

counts accurately kept for twenty-two years from 1730 to 1752, the number of deaths in a population of 70,000 amounted to 1,100,000; and in the year 1751 alone there died 58,600. Yet the obstinacy of Dutch avarice still adhered to this fatal spot; but, within the last thirty years, Batavia has been much changed. General Daendels conceived the design of transferring the seat of government to Sourabaya; and, though unable to effect this object, he demolished a great part of the fortifications, and transferred the barracks and official residence to the heights of Weltevreden. The English, during their occupation, were prompted by a national taste to desert entirely the town, and cover with their rural seats the neighbouring districts, particularly that of Buitenzorg. When the place, however, was restored to the Dutch, the governor Van der Capellen applied himself to restore the town; and, by filling up useless canals, opening and widening the streets, he effected such an improvement, that it is now as healthful as any place in Java. The population, by a census in 1824, amounted, exclusive of troops, to 53,800. Of these 23,100 were Javanese or Malays, 14,700 Chinese, 12,400 slaves, 3000 Europeans, and 600 Arabs.

4825. *The commerce of Batavia* is not only that of the island, but of nearly the whole Archipelago, with the exception of the Philippines. In 1828, the exports consisted of coffee to the value of 8,024,000 florins; mace, 96,000; cloves, 229,000; nutmegs, 221,000; rice, 1,194,000; tin, 866,000; sugar, 456,000; birds'-nests, 521,000; piece goods, 499,000; Java tobacco, 401,000; pepper, 151,000; rattans, 141,000; salt, 119,000; various other articles, 3,372,000; treasure, 1,209,000: in all, 17,499,000 florins. The imports consisted of cotton manufactures, 4,778,000 florins; woollens, 263,000; provisions from England, 522,000; brandy and Geneva, 322,000; wines, 1,154,000; opium, 1,032,000; lead, 76,000; copper, chiefly from Japan, 1,034,000; steel, 41,000; iron, 206,000; India piece goods, 787,000; Chinese silk and cotton goods, 367,000; terra japonica, 478,000; rattans, 224,000; tripang, 381,000; marine stores, 264,000; various other articles, 3,431,000; treasure, 2,616,000: in all, 17,976,000. For further interesting particulars on this subject, our limits oblige us to refer to Mr. M'Culloch's valuable *Dictionary of Commerce*, art. *Batavia*.

4826. *The interior details of Java* cannot, consistently with our limits, be described at great length. It is divided by the Dutch into twenty provinces, which they call residences. Of these, Batavia, Bantam, Buitenzorg, Preangers, Krawang, and Cheribon, compose the western part; while Tagal, Pekkalongang, Kadou, Samarang, Japara, Rembang, Grissé, Sourabaya, Passarouang, Besukie, Bangouwangu, Saurocarta, Djocarta, Madura, and Samanap, form the eastern. The two parts are divided from each other by the vast mountain forest of Dayou Loukhour, on the frontier of Cheribon, composed of impenetrable woods intersected by foaming torrents and deep ravines. The western side of the island is in general more level and capable of very general cultivation. It is almost entirely subjected to European influence, and new modes and objects of culture have, under European auspices, been introduced. The eastern part bears a different character; it is mountainous, wooded, and romantic, yet diversified with rich and beautiful valleys, carefully cultivated upon

the native system. This part of the island has always been occupied by the most powerful native princes, ancient and modern, the latter of whom still maintain a large measure of independence, and pay only homage and tribute to the Dutch. Here, too, in consequence, are all the monuments of ancient greatness, and of the faith which formerly prevailed in Java.

4827. *In the western quarter, Bantam*, next to Batavia, is the most celebrated district, having been long the capital of the English settlements, not only in the islands, but in all the Indian seas. The sultan has lately been dethroned by the Dutch, who have taken the administration entirely into their own hands, and have, it is said, introduced considerable improvements. The town of Bantam is now almost deserted in consequence of its unhealthy situation, and the transference of the trade to Batavia. Ceram is now the principal place, and the residence of the governor. The rest of this division is almost entirely partitioned among little princes, held in strict subjection to the Dutch. Tjanjor, one of the chief interior towns, has been described as composed of broad alleys bordered with hedges of bamboo, the houses surrounded by fruit trees and odoriferous flowers, and communicating with each other by shaded footpaths.

4828. *The eastern part of Java*, of which the general character has already been described, contains the kingdoms of Souracarta and Djojocarta, fragments of the dominion which, under the title of the empire of Mataram, held sway formerly over the greater part of Java. The former is estimated by Sir S. Raffles to contain 972,000, the latter 685,000 inhabitants. The loftiest mountains and the finest valleys are found in this region. The two capitals, bearing the same name with the kingdoms, are estimated to contain each about 100,000 inhabitants; but are merely collections of large straggling villages. The residences of the sovereigns are only clusters of various edifices surrounded by brick walls. The Dutch maintain well-constructed forts and strong garrisons to overawe the natives.

4829. *The ancient structures*, already alluded to as distinguishing this part of the island, deserve some more particular mention. Mojapahit, the capital of the greatest princes who formerly ruled over Java, may still be traced in the district of Sourabaya by extensive ruins of walls and temples, built only of brick, yet

744

TEMPLE OF BORO BUDOR.

displaying often considerable beauty. But the most complete example of a temple is that of Boro Budor (*fig. 744.*), situated in the mountainous and romantic, yet fertile, territory of Kadou, immediately to the east of Cheribon. It is a square structure of hewn stone, each side 520 English feet long, and the height 116 feet. It is built on the summit of a small hill, and consists of a series of six enclosing walls, crowned by a dome. The outer and inner side of each wall is covered with a profusion of sculpture, including between 300 and 400 images of Boodh, from whom the temple, perhaps, received its name. But the most extensive display of ancient architecture

is at Brambanan, in the district still called Mataram, between Souracarta and Djojocarta. The temples, though built of hewn stone, are small, but clustered in extensive groupes, of which the largest is that called the Thousand Temples. It occupies a space nearly square, 600 feet in length by 550 in breadth,

745

GIGANTIC STATUE, BRAMBANAN.

within which are four rows of small edifices, surrounding a large central one. The whole group has four entrances, each facing a cardinal point, and guarded by two gigantic statues, of the form here represented (*fig. 745.*), and which are nine feet high though kneeling, and eleven feet in circuit. Singhasari, also, in the district of Malang, once the seat of a powerful monarchy, presents a wonderful multitude of temples and images. In general these structures are profusely covered with minute and often elegant ornaments and sculptures; but they are broken into too many similar parts, and consist only of sculptured walls, without columns, arcades, or any thing which can make them combine unity with relief and variety.

4830. *The sea-ports of Samarang and Sourabaya*, on the northern coast of the eastern division, though quite subordinate to Batavia, are still considerable. The former is the seat of government for the principal eastern provinces, including the two great Javanese kingdoms. It has a flourishing commerce, and a population of nearly 40,000. Sourabaya, still farther east, in a very fine country, the seat of the ancient empire of Mojapahit, is still more flourishing, both as a mart for the products of the surrounding country, and as a place of refreshment for vessels bound to China and the Philippines. Its road is spacious and safe, and its fine naval arsenal derives ample materials from the forests of teak by which it is surrounded. The population is estimated at about 50,000.

4831. *The island of Madura* has been erected by the Dutch into one of their twenty residences; and they exercise almost entire control over the three native princes. The people still profess, to a great extent, the Hindoo religion, practise the burning of widows, and are accused of using poisoned arrows. Samanap, the capital, is only a large village, partly inhabited by Chinese. Bali is almost entirely independent, under eight native princes, and is chiefly distinguished, as already observed, by the complete prevalence of the Hindoo creed and institutions.

4832. *Of the range of smaller islands extending eastward from Java*, Lombok, with high wooded mountains in its centre, is fertile and well cultivated by an industrious race, who irrigate the lands by means of tanks, carry on a considerable trade, and afford refreshments to European vessels passing eastward. Sumbawa is of greater extent, being 180 miles long, and containing in its eastern quarter the powerful kingdom of Bima, tributary to the Dutch. This island affords a large supply of sapan wood for the Chinese market. It contains a very active volcano, which in 1815 committed dreadful ravages.

4833. *The large islands of Flores and Timor*, extending in the same direction, may be considered as the link between the Oriental and South Sea islands, to which last, both in customs and language, the natives bear a close analogy. Flores is very little frequented by Europeans, and has ceased to afford, as formerly, a supply of sapan wood. On Timor, however, the Dutch have formed the settlement of Coupang, with the view of procuring provisions from the Moluccas, and, by making it a free port, have raised it to some importance. It has become a great mart for the tripang, which is collected both on the neighbouring shores and on those of New Holland. The Dutch, with difficulty, hold in vassalage the native states, of which the principal are

those of Veali, Luka, and Samoro; and their influence is shared with the Portuguese, who, in their settlement of Dieli, retain still some remnant of that power which formerly extended so wide over this region. The smaller islands between Floris and Timor; Simao, Rotti, Dao, Savou, Sumba, governed by rajahs, partly vassals of the Dutch, partly independent, call for little particular notice.

4834. *Celebes*, to the north of Flores, is one of the most remarkable portions of the Archipelago. Its position, between 2° N. and 5° S. lat., 118° and 125° E. long., would indicate very large dimensions; but it is so indented by the deep bays of Boni in the south, Tominie and Tolo on the east, as to form only a cluster of long peninsulas, while the distance from sea to sea nowhere amounts to 100 miles. The people are less advanced in civilisation than those of Java, though they possess more of a bold energy of character. The native government is monarchy, combined with a very turbulent aristocracy. The troubles by which it was agitated are attested by the very names of the princes, taken from the manner in which they died; as "the throat-cutter;" "he whose head was cut off;" "he who ran a muck;" "he who was beaten to death on his own staircase," and even the epithet "he who died reigning" strongly intimates the rarity of the occurrence. The Hindoo faith and institutions found little place in this island. It was not till the beginning of the seventeenth century that the Mahometan religion was introduced by the mingled power of force and persuasion. The Macassars of Goa were then the most powerful tribe, and held wide sway over this and even the neighbouring islands; they at one time fitted out against the Dutch a fleet of 700 vessels and 20,000 men. About the middle of the seventeenth century, however, the state of Boni, supported by the Dutch, acquired a complete ascendancy, and that of Goa sunk into a reduced and vassal condition.

4835. *The Macassars and the Bugis* are the two tribes who hold the leading place in this great island. The former, as already observed, are now completely fallen from their ancient supremacy, and closely confined within their original limits. The Dutch have extorted the cession of the city of Macassar, and its surrounding district, and have changed its name to Ulaardingen, erecting for its defence Fort Rotterdam. The sovereign continues to reside at Goa. The Bugis are divided into those of Boni and Waju. The former are much the most powerful, being able to muster 40,000 fighting men, and forming thus, at present, completely the ruling native state. But the Bugis of Waju are decidedly the most civilised and improved, and are, indeed, the most active commercial people in the Archipelago. Their vessels with cargoes which, according to Sir S. Raffles, are often worth 50,000 dollars, are seen in all the seas from New Holland to Siam. The entire population of the island is estimated, by Mr. Hunt, at about 1,000,000. The Dutch maintain their influence rather as the head of a numerous confederacy than as sovereign rulers. Besides the states already named, we may mention Sopeng, Mandhar, Souhon, and Panete.

4836. *Borneo*, if we exclude *New Holland*, as a continent, will rank as the largest island in the world, being between 800 and 900 miles from north to south, by 700 from east to west. It is also well gifted by nature. Though placed directly beneath the equator, the mountains of the interior, some 8000 feet high, with the large and numerous streams, entirely secure it from aridity; and though the soil, formed from primitive rocks, is by no means uniformly fruitful, yet rice and the usual tropical grains are raised with facility: pepper, cinnamon, cotton, coffee, grow wild. This island, according to Mr. Hunt, enjoys a singular felicity in the absence of any ferocious animal, though the dense woods would afford shelter, and they actually harbour the singular species of the oran-outang. The mines of gold, the most copious in the East, and those of diamonds, in which it is second only to Golconda, have been already described. Notwithstanding these advantages, Borneo is the rudest and least improved territory in this quarter of the world. The want of any deep bays and inlets, to facilitate communication and the access of foreigners into its interior, is probably the chief cause of its backward position. The inland tracts are now the chief haunt of the savage race of the Oriental negro, called here in different districts Dayak, Idaan, Maroot, &c. The Malays and other tribes, who have occupied generally the coasts and navigable rivers, describe these their inland neighbours in the darkest colours. They are represented as considering a man unfit for matrimony or any important function of life, till he has imbrued his hands in the blood of at least one fellow-creature; as so devoted to human sacrifice, that a number even of the poorer class will club together to purchase the cheapest man they can find, and offer him as a victim; that they devour the flesh of their enemies, drink their blood, use their bones and skulls as ornaments, and even as money. Through hollow wooden tubes they blow poisoned arrows, the wound of which is said to be mortal. Yet it is certain, that many of them cultivate the ground, rear domestic animals, and carry on some trade; and a tribe called Blajoes are active navigators, roaming from shore to shore, amid the perpetual summer of the tropic. Mr. Hunt accuses the Malays of exaggerating the offences of these poor savages, whose enmity they have justly incurred by driving them into the interior, and seizing every opportunity of catching and selling them as slaves.

4837. *The local features of this island*, with the exception of the gold and diamond mines already described, do not require very detailed notice. Borneo, or Bournu, capital of a kingdom which, during its greatness, gave name to the whole island, is built upon piles on the swampy banks of a large river; canals run through its streets, and the communication from house to house is partly by boats. It has much declined, and is said to contain less than 3000 houses, and only 10,000 or 12,000 inhabitants. Succadana, a great commercial place in the middle of the western coast, was, in the end of last century, subverted by an Arab named Abdul Rachman, assisted by the Dutch, who, in conjunction with him, founded Pontiana. This place, according to Mr. Hunt, is now the most flourishing in the island, and its population, therefore, is probably under-rated by M. Balbi at 3000. In the southern quarter, the trade centres chiefly in Banjermassin, a port of 6000 or 7000 inhabitants, capital of a kingdom almost entirely under the control of the Dutch. In the interior, the chief states are Matan, the most central district, which once assumed the title of empire, and held Succadana and a great part of the western coast; but the sovereign is now confined to his inland possessions, Sambas and Mumpawa; celebrated, especially the last, for gold mines worked by Chinese, who form the chief inhabitants of Montrado, its capital.

4838. *The Sooloo*, called by some the Suluk Islands, off the eastern coast of Borneo, and closely connected with it, may be properly introduced here. They are twenty-seven in number, the great Sooloo being thirty miles long and twelve broad, and the population of the whole is estimated at about 300,000. The people are almost entirely devoted to piracy, for which their situation, on one of the most frequented routes of the Eastern Sea, affords ample facilities. Mr. Hunt, in the *Friend of India*, has drawn a striking picture of this "Algiers of the East." From 300 to 400 vessels, whose crews amount to 10,000, are continually issuing forth on this fierce and perilous occupation. It is carried on under the

sanction of the sovereign, who draws twenty-five per cent. of the proceeds. Yet the same people are animated by an active spirit of commerce, which in one direction they seek to destroy, but in another cherish and protect it. The vessel which, encountered in the open sea, would have been instantly seized, plundered, and the crew sold as slaves, from the instant it has anchored in the road of Sooloo, enjoys perfect security. We presume, though our authority does not expressly say so, that proof of being bound to or from this destination will place the vessel in safety. The banks of pearls already noticed, and the supplying of China with tripang and birds' nests, afford scope to a considerable traffic.

4839. *Singapore* (fig. 746.), become the centre of the commerce of all the islands now de-

746

SINGAPORE.

scribed, may now be treated of in connection with them. It is situated on an island at the southern extremity of the peninsula of Malacca, at the eastern opening of the straits bearing that name. It was founded only in 1819 by Sir Stamford Raffles, in a position so happy that all the commercial tribes of those seas immediately made it their emporium. In 1824, its population amounted to 10,683; in 1827, it had increased to 13,732; and on 1st January, 1830, to 16,634. Of the census of 1827, there were 10,307 males, 3425 females; and the division as to nations was into 6088 Chinese, 4700 Malays, 1242 Bugis, 1021 natives of India, &c. There were only 87 Europeans, who, however, were at the head of the chief mercantile houses. About 5000 Chinese arrive annually by the junks; of whom 1000 remain, the others disperse among the neighbouring settlements. The Bugis with their proas arrive not only from their own but the neighbouring islands. The number in 1829 was reckoned at 190; of which 90 came from the west coast of Borneo, 50 from the east coast and Celebes; 40 from Bali, Lombok, and Sumbawa. The imports in 1827 and 1828 amounted to 1,458,000*l.*, and the exports to 1,387,000*l.* The amount is said to have since nearly doubled. The articles dealt in are all those of China, the Oriental islands, and the Indo-Chinese countries, with British cottons and other manufactures.

4840. *The Moluccas, or Spice Islands*, derive their great celebrity from producing the precious commodities of cloves, nutmegs, and mace, which have been already described. In other respects they present few objects of much interest. Gilolo, the largest, broken, like Celebes, into a cluster of peninsulas, presents the usual spectacle of a rude people governed by a number of turbulent chieftains. Ceram is nearly similar, except that the greater part is under the power of a single sultan, dependent on the Dutch, who take vigorous measures to check the disposition to piracy among the natives. Small islands, contiguous to these great ones, occupy, in this group, the most conspicuous place. Ternate and Tidore, off the western coast of Gilolo, the one twenty-five, and the other twenty-one miles in circuit, have always held a sort of political supremacy. The early European navigators found them contending for the sovereignty which they still hold over the greater part of Gilolo, though in subordination to the Dutch. Amboyna, an island near Ceram, thirty-two miles long and twelve broad, is distinguished as the chief settlement of the Dutch, and the only place where, till lately, they permitted the clove to be reared. They have divided it into cantons, where this precious spice is cultivated, under the superintendence of native chiefs, who are responsible for delivering the whole to the government. The town of Amboyna is neatly built in the Dutch style, and contains a population of about 7000. Fort Victoria, built by the Portuguese, still defends it. The ten small Banda islands, of which the principal are Neira, Pulo Ay, and Lantour, are distinguished by the growth of nutmeg, raised under the same exclusive system. Nassau, the residence of the Dutch governor, is a small town, with 1000 inhabitants, on the island of Neira.

4841. *The Philippines* form an extensive group of two large and nine smaller islands, situated at the north-eastern extremity of the Archipelago. Few countries are more favoured as to soil and climate. Though placed immediately beneath the equator, the height of the mountains, and the ocean breezes, preserve them from suffering under any severe or scorching heat. The moisture derived from their exposure to the vapours of the Pacific is somewhat excessive; yet, combined with the heat, it produces a most luxuriant

vegetation. Still these islands are rather rich in the staple tropical productions, rice, sugar, &c., than in those aromatics for which some of the other islands are celebrated.

4842. Among *the natives* there are a considerable number of the negro race; yet, long before the arrival of the Europeans, these had been driven into the mountains by the Bisayans, a branch of the brown oriental race. These cultivated the ground with considerable diligence, and had raised themselves above the completely savage state; yet they had not, like the other islanders, received colonies, or imported any high civilisation from the great Asiatic kingdoms. The most improved tribe were the Tagalas, inhabiting the sea-coast of Luçon, who constructed and navigated vessels of some magnitude with considerable skill, and had a language which was considered classical throughout the islands.

4843. *The Spaniards early took possession of the Philippines*, and, if we except the English expedition of 1762, possessed them without interruption from any of the other European powers. This people, who labour under severe reproach as to the management of their other colonies, seem to have deserved less blame here. They imposed, indeed, on the natives a heavy poll tax, but did not cramp their industry; and the missionaries assiduously communicated to them, along with the true religion, a tincture of European arts and knowledge. Hence Mr. Crawford conceives that, while in all the others the character of the natives has been deteriorated, in the Philippines it has been decidedly improved by European intercourse. They took arms, accordingly, in defence of these masters, when attacked by another power. The foreign trade, however, was subjected to those jealous restrictions imposed by the prevailing policy of Spain. It was limited to a single galleon, despatched annually from Manilla to Acapulco. Notwithstanding the circumstance of there being only one, yet the mystery and the splendid ideas attached to the very word galleon diffused an impression that Manilla was a place of immense wealth; and the British expedition which captured it in 1762 imposed a contribution of 1,000,000*l.* sterling, which the city was wholly unable to pay. When exact information was obtained of its commercial transactions, they proved to be very limited. They have materially increased since the Spanish revolution, which, loosening the ties with the mother country, threw open the trade to other nations, and the monopoly has never since been re-established. In 1827, the exports in indigo, sugar, tripang, birds' nests, sharks' skins, sapan wood, ebony, rice, dried flesh, pepper, mats, cloths, &c. amounted to 938,000 dollars, with 110,000 in treasure; the imports to 937,000 dollars, with 156,000 in treasure. The trade appears, by Mr. McCulloch's statements, to have since increased nearly one half, though it is still very inferior to the vast capacities of the country.

4844. In regard to *local features*, the island of Luçon is covered to a great extent with high mountains, among which are several active volcanoes, with hot springs in their vicinity; and violent shocks of earthquake have been felt at Manilla and in other quarters. The city is built at the mouth of a fine river, on a noble bay, and three leagues to the southward is a good and safe harbour at Cavita. On opposite sides of the river, connected by a noble bridge, are the war town and the trade town; the latter much the larger, but the former better built, the seat of government, containing some handsome edifices, and churches richly decorated. The population has been very variously estimated, chiefly because some do and others do not include its extensive suburbs. M. Balbi thinks that with these it may contain 140,000 people, which would make it the greatest city in the Archipelago. Mindanao, a large island, 300 miles long, is little occupied by the Spaniards; whose chief settlement, Zamboangan, is used only as a place of banishment. On the eastern side is the large kingdom of Mindanao; the rest is occupied by various tribes, among whom 20,000 are Mahometans, and 61,000 almost savage. Similar observations will apply to Mindoro, a fine island, but little known, and respecting which we need not refute the report of the early navigators, that its inhabitants had tails. We may mention, also, Samar, where the missionaries have made pretty extensive conversions; Zebu, which derives a dark celebrity from the death of Magellan; Panay, Marinduque, Negros, Mesbata, Bohol, and Leyte.

BOOK III.

AFRICA.

CHAP. I.

GENERAL SURVEY OF AFRICA.

4845. *Africa, a spacious continent*, comprising nearly a third of the world known to the ancients, composes a peninsula about 4320 miles in length from north to south, and 4140 in breadth from east to west. Its shape is an irregular pyramid, at the southern extremity diminishing almost to a point; so that it has, properly speaking, only three sides. Its western coast, by far the most extensive, faces the Atlantic, which on the other side is bounded, at several thousand miles' distance, by the parallel coast of America. To the east, Africa looks upon the southern Pacific, but chiefly that mighty portion of it called the Indian Ocean, which has for its remote opposite boundaries Hindostan, the Eastern Archipelago, and New Holland. From Europe, Africa is separated by the Mediterranean, and from Asia by the Red Sea. Both these gulfs communicate with the ocean by narrow straits, at which Africa comes almost in contact with the opposite continents; but it is at their interior extremities that they are separated by that celebrated isthmus, only sixty miles in breadth, which connects this vast continent with that of Asia.

SECT. I. *General Outline and Aspect.*

4846. *Africa*, in all respects except its vast extent, is the least favoured portion of the globe. Its prevailing aspect is rude, gloomy, and sterile. The character of desert, which elsewhere is only partial and occasional, belongs to a very great proportion of its widely extended surface. Boundless plains, exposed to the vertical rays of a tropical sun, are deprived of all the moisture necessary to cover them with vegetation. Moving sands, tossed by the winds, and whirling in eddies through the air, surround and continually threaten to bury the traveller, in his lengthened route through these trackless wilds. The watered and cultivated districts consist of little more than belts, with which this huge expanse of desert is begirt. The best known, and perhaps the finest, is that which borders the northern coast along the Mediterranean, and stretches for 50 or 100 miles inland. The famous range of mountains called Atlas, which ancient fable represented as supporting the heavens, with numerous chains branching from it across the continent, diffuses moisture and fertility over sands which would otherwise have been totally unproductive. Then follows the immense ocean of desert, nearly 3000 miles in length, and 1000 in breadth, reaching across the whole continent from east to west, and from north to south, between lat. 15° and 30°. The sterility of the scene is only interrupted by a narrow line, of not above half a mile, formed by the course of the Nile through Nubia, and by a few islands, or, as they are termed, oases, scattered at wide intervals over this immeasurable waste. These spots, affording springs, verdure, and a few dates, support a scanty population; but are chiefly valuable as affording places of rest and refreshment for the caravans. The traveller who has crossed this dreary interval is cheered by the view of a long line of territory exhibiting a different and much more smiling aspect. Lofty ranges, celebrated under the name of the Mountains of the Moon, cross the central part of the continent, and form perhaps an almost unbroken girdle round it. Thence descend many rivers of the first magnitude; the Nile of Egypt, the Senegal, the Gambia, and the famed mysterious stream so long sought under the name of the Niger. These set bounds to the empire of sand, which would else overspread nearly all Africa; they inundate their banks, and fertilise extensive regions, which are covered with rich harvests, and peopled with nations that have made considerable advances in civilisation. A great part of this tract has been recently explored, though much still remains for discovery; but farther south, the greater part of the interior, as far as the Cape of Good Hope, a space of 40° of lat., has never been trodden by any European. The districts on the east coast, however, are very well known, and still more those on the west. They present a totally different aspect from that of northern Africa; profusely watered by great rivers, in many places luxuriant with tropical products; in others inundated and swampy, overgrown with huge forests and underwood. Some late observers, however, in travelling inland from the Cape, have caught a glimpse of vast expanses of desert, reported almost to rival those at the opposite extremity of the continent. Lastly, the southern angle

presents to the stormy seas of the Pacific broad table rocks and high rude plains, covered, however, in many places, with good herbage and vegetation.

SECT. II. *Natural Geography.*

SUBSECT. 1. and 2. *Geology and Botany.*

4847. The *Geology and Botany* of a continent so extensive and varied as Africa can only be treated with advantage under its respective regions.

SUBSECT. 3. *Zoology.*

4848. *The Zoology of this vast peninsula* assimilates in many respects to that of Asia; while its northern provinces, as we have already seen, present us with many of the European animals. As we recede, however, from such regions as border upon these two continents, the peculiarities of African Zoology become apparent, and show us the necessity of treating it as one of the principal provinces of Physical Geography. That Nature has been far less prolific, both in the number and in the variety of her forms, in this continent, than in any other of equal extent, may be readily inferred from its peculiar formation. Vast deserts, equal in extent to the whole dominions of the most powerful European sovereigns, intersect this continent in various directions, affording neither "green herb or limpid stream," nor even the bare sustenance necessary to life for either man or beast. These deserts are indeed depopulated; they are only passed by the wandering savages, or occasionally visited by migratory troops of quadrupeds. The fecundity of animal and vegetable life is generally equal: hence, on the western and southern coasts, bordering the line of the great virgin forests, numerous animals of the largest dimensions become abundant, the air resounds with the notes of birds, and innumerable insects are sporting on the flowers.

4849. *In giving the following rapid sketch of African zoology*, it appears natural to arrange our observations under three heads: considering, first, Northern Africa, which includes that portion of the continent to the north of the Great Desert, and washed at its confines by the Mediterranean and the Red Sea; secondly, Tropical Africa; and thirdly, Southern Africa.

4850. *The Zoological features of Northern Africa*, so far as regards its ornithology, have been already dwelt upon; and in this department a much greater approach is made towards the European Fauna than in any other. The quadrupeds, however, are eminently distinct. The Lion is occasionally seen. Hyenas are not uncommon; but the Jackalls stated to inhabit these parts are unknown in Egypt, Nubia, and the adjacent countries. A few species of Antelope range over the arid tracts of Barbary, and are probably peculiar to this side of the great sandy ocean; while several quadrupeds of Western Asia appear to propagate and extend their range in the countries bordering on Arabia and Egypt. The northern Giraffe (*Camelopardalis antiquorum Sw.*), which, from very recent researches, we now consider as unquestionably a distinct species from that of Southern Africa, whose food seems to render him nearly independent of herbage, has recently been found towards Nubia by that enterprising and able naturalist, M. Rüppell. The few genera of birds which occur in the Barbary states are neither remarkable for their beauty nor their singularity; nor does the Fauna of Northern Africa, in general, possess so much interest as might be imagined.

4851. *The Great Desert* forms a natural and marked separation between the northern and the tropical Fauna, although we may include in the latter Senegal, and the whole range of that thickly wooded coast extending towards Guinea. The pestilential nature of the climate to the European constitution opposes an insurmountable barrier to the investigation of these countries, no less than to the establishment of maritime colonies: hence, a few gleanings that have been made near Sierra Leone, and the more industrious attention of the French to the productions of Senegal, comprise the scanty materials upon which our knowledge at present rests. Of all those ardent but ill-fated travellers, who have sunk beneath the poisonous atmosphere of this accursed country, the name of Bowdich will long be remembered with peculiar regret by the naturalist; as being the only one whose previous studies and acquirements had peculiarly fitted him for reaping that harvest of unknown forms with which

nature has filled the vast and interminable forests which belt the coasts of Western Africa. In these impenetrable recesses live the Chimpanzees, the largest of apes, representing the Orang Otang of India; troops of large baboons and monkeys, of unknown species, together with numbers of those ferocious and ruminating animals so peculiarly characteristic of the African continent. Nor are the birds less remarkable. That singular bird, unique in its genus, the *Prionops plumatus*, or Ground Shrike (*fig. 749.*), whose forehead is tufted with a loose thick

749

HEAD OF THE GROUND SHRIKE.

mass of bristly feathers, appears peculiar to Senegal, where it is by no means uncommon. From the same region we receive numerous little sun-birds (*Cinnyris* Cuv.) of the most superb plumage, many species of Drongo Shrikes, with Orioles, Rollers, Fantailed Grakles (*Lamprotorni*); and other richly coloured birds. Towards Sierra Leone the ornithological features of Central Africa become more prominent. The rare and lovely Plantain-eaters (*Musophagidæ*) seem restricted to these unhealthy regions, from whence also we derive the Guinea fowl; while those curious birds the bristled-necked Thrushes, forming the genus *Trichophorus*

750

BRISTLED-NECKED THRUSHES.

(fig. 750.), are almost peculiar to the forests of Guinea and Sierra Leone. Serpents of gigantic size are mentioned by travellers; and tremendous crocodiles swarm in the rivers. The Insects are no less numerous; and, by the arduous labours of Smeathman, who immortalised his name by discovering the wonderful economy of the White Ant, we know more of this department of West African zoology than of any other. Among hundreds of species discovered by this traveller near Sierra

Leone, not one has yet been found in the same parallel of latitude either of Asia or America. The conchology of Senegal was most ably explored by Adanson during 1749-53; his work being the last, or rather the only one of any authority, on this branch of African zoology. It appears that the Marine *Testacea* are in much variety and in great profusion; strikingly contrasting in this respect with the opposite coasts of America: the genera, however, do not differ from those of the Indian Ocean, although most of the species are perfectly distinct. The fish, and the rest of the invertebrated marine animals, are as little known as if they were not in existence. Such is a summary statement of the insignificant knowledge we yet possess of the Zoology of Central and Western Africa; yet, trivial as it is, we see enough to convince us how distinct are its characteristics, when compared with either that of the northern or the southern division. Beyond Sierra Leone, the whole of that region which intervenes between Guinea and the boundaries of the Cape of Good Hope is nearly as perfect a terra incognita to the naturalist as it is to the geographer.

4852. *The Zoology of Southern Africa* forms the third division of our subject. Its northern extent may be traced to the farthest point, in that direction, yet reached by European travellers. At the head of these we must place Mr. Burchell; not only as being the one whose researches have been pushed far beyond all others, but whose general scientific knowledge gave him advantages which none other of our countrymen have laid any pretensions to. The general salubrity of this part of Africa, and the facilities which its long subjection to European powers has thus given to travellers, renders our knowledge of its animals and plants much more perfect than would otherwise have been the case; and the names of Sparrmann, Le Vaillant, and Lichtenstein are familiar to the naturalist, as the chief of those foreigners who have elucidated this portion of African natural history. The most striking peculiarity, indeed, of the whole continent is eminently displayed in the southern division, where the variety of quadrupeds is truly surprising, while the vast herds into which they

SECT. III. *Historical View of Africa.*

4855. *Africa, bold, rude, and perilous to the traveller, has always been held in the other quarters of the globe as a region of wonders, which only the most daring enterprise durst attempt to explore.* The Greeks were well acquainted with the tracts on the Mediterranean, containing the once flourishing regions and states of Egypt, Carthage, and Cyrene; but whenever they reached their southern limit, they saw nothing but boundless sands scorched by the intensest rays of the sun. Hence it appears that the ancients drew the early hypothesis of a torrid zone, within whose limits it was impossible for men and animals to exist. Historians mention several attempts to penetrate it, which had the most disastrous issue. The first were prompted by views of conquest. Cambyses, after subduing Egypt, endeavoured to cross the Nubian desert into Ethiopia. He soon, however, experienced a failure of means for the support of his army. Elated with victory, and obstinate in his purpose, he refused to retreat; and the troops, after killing all their cattle, and then feeding on such scanty herbage as the ground afforded, came at last to the region of pure sand, on which was seen neither shrub nor blade of grass. In this dreadful extremity they began to devour each other; and at length Cambyses, struck with horror, renounced his enterprise. Another expedition, sent against the oasis of Ammon, never returned nor was heard of, and was believed to have been buried entire in that vast ocean of sand. These examples struck the world with terror, and prevented all further attempts, till the wild and enthusiastic daring of Alexander impelled him to seek a divine character at the shrine of Jupiter Ammon. The march was accomplished, but not without dreadful sufferings and extreme peril on the part of the army, and the danger of perishing before they reached the verdant groves and flowing rivulet which enclosed that celebrated temple.

4856. *If the mightiest monarchs were thus baffled in their attempts to overcome the barrier of these awful solitudes, it was not likely that private adventurers should be more fortunate.* Yet the natural desire of man to penetrate into what is unknown and mysterious seems early to have had a powerful influence even upon individuals. Herodotus gives the narrative of an expedition undertaken by some young Nasamonians of distinction, inhabitants of a territory occupying part of the modern Tripoli. They described themselves as passing successively through cultivated tracks, then through a region inhabited by wild beasts, and lastly arriving at the great desert of sand. Having reached one of its verdant oases, and begun to pluck the fruit which was growing on the trees, they were surprised by a party of little black men, who took them prisoners, and conveyed them to a city far in the interior, traversed by a river flowing from west to east. These particulars, notwithstanding the sceptical comments of M. Gosselin, seem strongly to point at central Africa and the course of the Niger.

4857. *The Romans, when they had accomplished the final overthrow of Carthage, and established their empire over Northern Africa, would doubtless be impelled both by ambition and curiosity to make some enquiry as to what lay beyond.* Their expeditions, however, having gained for them no extension of power, have escaped the notice of history. There occurs only in Ptolemy an incidental notice that a detachment under Septimus Flaccus, and another under Julius Maternus, had reached the country of the Ethiopians, after successive marches of three and of four months; and the latter called the region Agysimba: but what they saw and what they found there is nowhere reported.

4858. *The efforts made to explore the coast of the African continent formed the grandest object of ancient maritime enterprise.* The voyages, therefore, undertaken with that view, have been a leading feature in the first part of this work, which details the progress of geographical discovery (p. 10—21.). To the same part we must refer for the subsequent settlements formed by the Arabs, and for the expeditions undertaken in modern times to explore the interior of this continent, and the course of its great rivers (p. 51.). The chequered series of success and disaster by which this career has been marked, composes the most interesting chapter in the history of modern discovery (p. 68—9.). The successive efforts made by the African Association, by Park, Hornemann, Denham, Clapperton, and Lander, have at length lifted up, from a great portion of this continent, the mysterious veil by which it had so long been covered.

SECT. IV. *Social and Political State of Africa.*

4859. *The political constitutions of Africa are rude, and in general despotic.* The unlimited power of the sovereign is in general checked only by the turbulence of aristocratic chiefs, not

by any well-regulated freedom on the part of the people. Africa, however, is divided into an almost infinite variety of states, whose political system can only be understood by considering each in detail.

SECT. V. *Industry and Commerce in Africa.*

4860. *The processes of agriculture and manufactures*, in Africa, are performed generally in a rude and imperfect manner. The soil, however, is cultivated almost throughout, to a greater or less extent; and some fine fabrics, particularly those of cotton, cloth, mats, and gold ornaments, are very widely diffused.

4861. *Africa has scarcely any trade*, except that which is carried on overland and across its oceans of desert, by caravans, consisting chiefly of camels. It is truly astonishing with what facility these companies now make their way to the remotest interior of the continent, in defiance of obstacles which might have been deemed insuperable. By these immense journeys they procure considerable quantities of gold and ivory; but the importance of these articles is merged in a cruel and iniquitous traffic, of which Africa has always been the main theatre. Other parts of the globe have for ages depended upon its oppressed and unfortunate inhabitants, for supplying their demand for slaves. Whoever, throughout Africa, has the evil power of selling any of his fellow creatures, is sure to find purchasers who will give in exchange the best products of Europe and the East. Some are condemned to slavery under a criminal code, framed by legislators who make it a study to multiply the number of such offences as may be made punishable in this lucrative manner; others are captives taken in war; but a large proportion are procured by mere slave-hunting expeditions, undertaken even by the most civilised states against neighbours whom, with little reason, they account more barbarous than themselves. The number thus conveyed across the desert, to fill the harems of Turkey and Persia, has been rated at 20,000. These, however, serve merely as domestic slaves; and, though subjected to many humiliations, they are, on the whole, mildly treated. A much severer lot awaits those who, from the western shores of Africa, are carried off by the *polished* people of modern Europe. After suffering through the passage under a confinement and pestilential air which prove fatal to a large proportion, they are sold to taskmasters whose sole object is, under a burning sun, to extract from them the utmost possible amount of labour. It is calculated that, during the flourishing period of the slave trade, 80,000 were annually transported across the Atlantic. At length, however, the wrongs of Africa were heard; Britain, roused by the voice of some generous philanthropists, took the lead in the cause of humanity. The resistance was powerful, and it occasioned many years of debate, signalised by the long labours of Wilberforce, Clarkson, and other friends of Africa, till, in 1806, Mr. Fox moved and carried the bill for the final abolition of the trade of importing slaves into the British colonies. It has since been declared felony for a British subject to engage in this trade. America and France afterwards followed the example; and thus the export of slaves from the northern part of Guinea has been in a great measure prevented; though the numbers still procured from the southern quarters of Benin and Congo, by the Spaniards and Portuguese, are but little diminished.

4862. *This vast continent* is almost universally in a state of *barbarism*: yet in ancient times its northern states rivalled Europe in civilisation. Egypt and Carthage, when in their glory, ranked among the most civilised and opulent states then existing. Even after the first ravages of the Saracens, learning and science distinguished the splendid courts established in the west of Barbary. The continued influence, however, of a gloomy superstition, and the separation caused by it from all the refined modern nations, have induced among these states a general relapse into barbarism. The population of the continent may now, in a large view, be divided into Moors and Negroes. The Moors, including the descendants of the original Arab invaders, and those whom conquest and religion have assimilated with them, fill all northern Africa and the Great Desert. They reach the banks of the Senegal and the Niger, which may be considered as the boundary of the two races, though they mingle and alternate on the opposite sides, where sometimes one, sometimes another, hold the chief sway. The Moors are a rough roving race, keeping numerous herds, chiefly of camels, with which they perform immense journeys through the most desolate tracts, and across the greatest breadth of the continent. Africa is indebted to them for all the literature she possesses; at least, few of the Negroes can read or write who have not learned from them. The Moors, however, at least all that scour the desert, are a race peculiarly unamiable. A furious bigotry, joined to the most embittered hatred of the Christian name, renders them mortal foes to every European traveller who falls into their power. The Negroes, on the contrary, though inferior in arts and attainments, are generally courteous, gay, and hospitable. Like all barbarous nations, they are fond of war, and cruel to their enemies; but their domestic intercourse is friendly, and they receive with kindness the unprotected stranger. They are led away with fantastic superstitions, charms, witchcraft, ordeal, &c.; but these errors never impel them to hate or persecute those who entertain the most opposite belief. Their external aspect is well known, being marked by a deep black colour, flat nose, thick

lips, and coarse hair like wool. The Moors are deeply embrowned by the influence of the sun, but have not the least of the Negro colour or aspect.

SECT. VI. *The African Languages.*

4863. A general view of the African languages may here be most advantageously introduced. For this and the two remaining divisions, a summary notice may suffice, as most of the idioms included in them are as yet too imperfectly known to admit an ethnographical classification equally definite with those of Asia and Europe. This is the less to be regretted, since few if any of the nations properly belonging to those divisions can be said to possess a literature. Indeed, what native people south of the equator can be said to have a cultivated language?

4864. The *African languages* hitherto known may be classed in five branches: — 1. The languages of the region of the Nile. 2. Those of the region of Atlas. 3. The languages of maritime Nigritia. 4. Those of South Africa. 5. Those of the Soudan, or Interior Nigritia.

1. *The languages of the region of the Nile* may be classed in the following manner, of course excluding those spoken by nations belonging to the Shemitic family, as the Abyssinians, who speak the Gheez, the Amhara, and other idioms of the Abyssinian branch; and the Turks, the ruling nation of Egypt, who are of Tartar origin: — The *Egyptian* family, including the ancient Egyptian, and the modern Egyptian, or Coptic. The *Nubian* family. The *Troglodytic* family. The *Shiho-Dankali*. The *Chillouk*. The *Dizzela*. The *Tacazze-Shangalla*. The *Cheret-Agow*. The *Agow-Damo*. The *Gafate*. The *Gurague*.

2. *The languages of the region of Atlas*, including the *Amazigh*, *Ertana*, *Tibbo*, *Chellouk*, and *Guanche*.

3. *The languages of Maritime Nigritia*. Under this term are comprehended all the languages spoken in the country called by the French *Senegambia*, and in Guinea. The following are the principal in this group: — 1. The *Foulah*. 2. The *Mandingo* family. 3. The *Wolof*, or *Iolof*, with various others. 4. The *Ashantee* family. 5. The *Dagwumba*. 6. The *Ardrah* family. 7. The *Kaylee* family.

4. *The languages of South Africa*, amidst the uncertainty and obscurity that still envelope them, may be classed in the following families: — 1. The *Congo* family. 2. The *Caffre* family. 3. The *Hottentot* family. 4. The *Monomotapa*. 5. *Gallas*; besides some independent languages, as the *Somauli*, and the *Mohenemougi*.

5. The principal languages of Interior Nigritia, or the *Soudan*, are, the *Tombuctoo*, the *Haoussa*, the *Mandara*, the *Darfur*, the *Wassanah*, the *Mahee*, and the *Eyeos*, or *Eyo*.

CHAP. II.

EGYPT.

4865. *The whole north-eastern part of Africa* consists of a mighty expanse of desert sand, extending for upwards of a thousand miles in each direction. The chains of arid and rocky mountains by which it is traversed give only a more rugged and dreary character to this immense waste. One vast feature alone breaks its terrible monotony. From the high chains of Abyssinia, and from the still loftier Mountains of the Moon that traverse central

Africa, descend numerous and ample streams, which, long before entering Egypt, unite in forming the Nile, a river of the first magnitude. Although the Nile, in its whole progress through this desert, does not receive the accession of a single rivulet, it brings so vast an original store as enables it to reach and pour a mighty stream into the Mediterranean. For many hundred miles in the upper part of its course, confined between high and rocky banks, it is merely bordered by a brilliant belt of fertility, the sandy waste stretching indefinitely on both sides: this is Nubia. After traversing the barrier of the cataracts, it passes through a broader valley between mountains of some height, and on its banks are many shaded or inundated tracts, which yield products of considerable value: this is Upper Egypt. Emerging from these mountains, the Nile enters a flat and extensive plain, where it separates, and by two great and divided streams, with various intersecting branches, enters the Mediterranean: this is Lower Egypt. In this last part of its course, the Nile is nearly on a level with the district which it intersects, and, when swelled by the autumnal rains of central Africa, overflows it entirely. The waters begin to rise about the 18th or 19th of June, attain their greatest height in September, and subside as gradually as they rise, and within about an equal space of time. The land thus covered with the fertilising alluvial deposit, collected during so lengthened a course, becomes the most productive perhaps on the face of the globe; and, notwithstanding its limited extent, and the mighty wastes on which it borders, has always maintained a numerous population.

4866. *Thus Egypt exists solely by the Nile*, and within the sphere of its action. The encircling desolation is only broken, to the west of Upper Egypt, by one large valley called Fayoum, into which the mountains open; and by several oases, or cultivated spots, which at wide distances break the uniform waste of sand.

SECT. I. *General Outline and Aspect.*

4867. *Egypt, consisting entirely of the Nile, its branches, and its banks*, must be measured in length by the course of that great river. The coast which, nearly in a straight line, unites the mouths of the two great branches, may be fixed about the parallel of $31^{\circ} 30'$; while Syene, beyond whose cataracts Nubia begins, is in $24^{\circ} 5'$. This gives an extent of $7^{\circ} 25'$, or about 520 miles directly north and south, and the distance is somewhat augmented by the bending of the river; Syene being about two degrees east of Rosetta, and one east of Damietta. The breadth is much more vague. The sea coast which forms the base of the Delta from Alexandria to the extremity of Lake Menzaleh, will measure upwards of 150 miles; but in ascending to Cairo, not more than ninety miles from the sea, the cultivated tract tapers almost to a point; and through the whole of Upper Egypt seldom exceeds the breadth of four or five miles. Beyond this space, the country passes, by insensible yet rapid gradations, into wild wastes, the domain of wandering Arabs. Egypt has always claimed as her own those rocky and sandy tracts, about 100 miles in breadth, which stretch from the Nile to the Red Sea. Although, however, she anciently formed a caravan route across them to the great sea-port of Berenice, it does not appear that any attempt was ever made to bring it into a civilised and cultivated form. On the west the transition has been still more abrupt, into the pathless tracts of central Africa; for even the oases, strong in the surrounding desolation, have seldom owned any permanent subjection to the power which ruled over Egypt. The boundaries of that country, like its dimensions, are very undecided. The position of this country is, in a remarkable degree, both central and insulated. It is placed amidst others which have been eminently distinguished in history, yet is separated from each of them by broad expanses of sea and desert. On the north the Mediterranean divides it from Greece, allowing its vessels, by an easy navigation, to reach the coast of Syria, of Asia Minor, and even of Italy. To the east the Red Sea separates it from Arabia, except at the desert isthmus of Suez, beyond which are Syria and Palestine, the countries with which Egypt has always maintained the most important political relations. To the south is Nubia, with all those wide tracts comprehended by the ancients under the vague name of Ethiopia. Notwithstanding its proximity and close intercourse, the thinness of its population, and the difficulty of access have prevented that region from ever being fully conquered or incorporated with Egypt. On the west, Egypt is separated from Barbary by immense wastes of trackless deserts, which prevent every approach to national union. Caravans, indeed, by indefatigable activity, have formed a route across it; but an army has never entered it without encountering the most overwhelming disasters.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

4868. *In Upper Egypt*, three geological regions can be distinguished:—

1. The most southern, the *granite region*; which extends from Philæ through the cataract district to Syene. It affords, besides granite, also *syenite* and some other crystalline primitive rocks. The finest granites and syenites are red and highly crystallised; and re-

markable for their durability and the fine polish which they are capable of receiving. Colossal statues, pillars, obelisks, and even whole temples, are constructed of these beautiful rocks. It is said that the third pyramid of Djizeh, and also that of Mycerinus, were originally cased with slabs of granite.

2. The most northern, the *limestone region*, extends some days' journey south of Thebes. This limestone was formerly much used as a building material. The catacombs of Thebes are situated in this limestone.

3. The third, or *sandstone region*, lies between the two former, and extends from Syene northwards to Esné. This sandstone is by some authors referred to the grès, or sandstone of Fontainebleau, the paving-stone of Paris; by others to the molasse of Switzerland: but all are agreed in considering it as a comparatively recent deposit. Its colours are white, grey, and yellow; it is very soft and easily worked, and the buildings constructed of it would probably not have long resisted the weather, had they not been covered with a *coloured varnish*. The great temples, and many pillars and obelisks, are of this sandstone, but it does not appear ever to have been used in building private houses.

4. The whole of Egypt to the north of the limestone, that is, the *Delta region*, is principally composed of alluvium deposited from the waters of the Nile.

SUBJECT. 2. *Botany of Egypt, Nubia, and Barbary.*

4869. *We shall, with Mirbel, consider Egypt, Nubia, and Barbary, as the Southern Transition Zone, already spoken of: the Mediterranean dividing it from the Northern Zone.*

4870. *From the Red Sea to the Atlantic Ocean, and from the Tropic of Cancer to the Mediterranean, the greater part of the soil of Africa presents nothing but deserts, interspersed with oases.*

4871. *Many of the springs afford only brackish water, and the rivers and torrents rarely reach the sea; being absorbed by the sands or dried up by the heat. The Nile is the only navigable river; and the alluvial soil which its periodical overflowing deposits on the shores and over the plains of Lower Egypt, with the hills on the coast of Cyrenaica, some provinces of Fezzan, and the western part of Barbary, which is intersected by the range of Mount Atlas and its ramifications, are almost the only productive parts, and their fertility is truly astonishing.*

4872. *The winter temperature of the coasts falls as low as $+7.5^{\circ}$ at Alexandria, Rosetta, and Damietta; but, in general, it oscillates between $+13^{\circ}$ and 18° . At some distance from the sea, the climate of the plains is scorching at all seasons. Still it sometimes happens in winter, that the violent northerly winds do sink the temperature for a very short period to $+6^{\circ}$, $+5^{\circ}$, and even $+2^{\circ}$, and zero, in latitudes adjoining the tropics.*

4873. *At Cairo (lat. $30^{\circ} 2'$) the mean annual temperature is $+22.4^{\circ}$; that of winter, $+14.7^{\circ}$; in spring, $+23.1^{\circ}$; in summer, $+29.5^{\circ}$; in autumn, $+21.9^{\circ}$: in the hottest month, $+29.9^{\circ}$; in the coldest, $+13.4^{\circ}$.*

4874. *At Algiers (lat. $36^{\circ} 48'$) the annual mean is $+21.1^{\circ}$; in winter, $+16.4^{\circ}$; in spring, $+18.7^{\circ}$; in summer, $+26.8^{\circ}$; in autumn, $+22.5^{\circ}$: in the hottest month, $+28.2^{\circ}$; in the coldest, $+13.4^{\circ}$.*

4875. *Westward of the Red Sea lies Egypt, a spacious valley, bounded by mountains and deserts. At the period of the greatest heats, the traveller who for the first time visits this country, which is so celebrated for its fertility, feels great surprise: his disappointed glances only rest on a vast plain, enclosed by whitish and naked mountains, and sprinkled with a few trees and withered herbs. At the summer solstice, the swelling of the Nile commences, and about the autumnal equinox the country is so inundated as to resemble a great lake, above the waters of which appear, here and there, Date trees, Figs, Acacias, Willows, Tamarisks, &c. At the approach of the winter solstice, the waters gradually retire, and vegetation occupies, in succession, the spots that become dry. Upon this damp and muddy soil, splendid harvests rise, which have cost nothing more than casting the seed on the ground. All kinds of grain are ripe before the month of May, when returning heat destroys the verdure. By the close of December, or the beginning of January, the trees are stripped of their foliage; scarcely all the old leaves being detached, when the new ones are expanded. The exhalations that rise from the Mediterranean fall again in rain on the shore; while in the interior, the showers are few and light. The clouds which are driven by the north wind towards the high mountains of Africa, and are dissolved in the flaming atmosphere of Upper Egypt, pass away unperceived: nothing dims the clearness of the sky. "What will you say," so writes Hasselquist to Linnæus, "when I tell you that there are trees which have existed here for 600 years, on which not six ounces of water have ever fallen." The country would be uninhabitable during summer, if the sea-breeze, accompanied by abundant dews, did not moderate the heat of the atmosphere. The traveller may wander for many days in the deserts of Egypt, Nubia, Libya, and Fezzan, and the northern part of Bornou, without finding a drop of water, or the smallest trace of vegetation. The soil*

is sometimes formed of pebbles and gravel; but oftener of a calcareous shifting sand, coated with saline efflorescence. On its surface are shells, marine sponges, and petrified trunks of trees; all attesting the ancient revolutions of our globe. At intervals, ridges of calcareous mountains, quite destitute of vegetable soil, cut up the arid plains in different directions. Some of the districts which are during winter bedewed with rain, produce at that season, a vegetation which suffices for the nourishment of numerous flocks; but so soon as the great heats return, every appearance of verdure is lost. How, indeed, can vegetation resist an atmosphere, of which the temperature sometimes rises to $+ 50^{\circ}$? The low spots, and the beds of the torrents where humidity lingers longest, produce some shrubs and under-shrubs, as the Tamarisks (*Tamarix gallica*, *africana*, and *orientalis*), the Caper plant, some Casias, Acacias, Mimosas, &c. The saline soils again present the harder and thorny species, Salsolas, Traganum, Calligonum; and succulent plants with thick and fleshy leaves, as

754

MESEMBRYANTHEMUM CRYSTALLINUM.

Salicornias, the Mesembryanthemum copticum, crystallinum (fig. 754.), and biflorum; the organisation of the latter permitting them to retain in their substance an abundant portion of moisture, even during the period of the greatest drought. These plants are cropped by the camel, that pattern of humble and patient endurance. Lastly, the oases, which are moistened by springs of living water, like fertile islands in an ocean of sand, produce the Date, the Doum (*Cucifera thebaica*), which grows as far as the coasts of the

Bight of Benin, the Acacia vera, and other species of the same genus, also affording gum; with a tree of the family of Coniferæ, which many travellers have taken for the yew, but which is probably a species of Juniper or Thuja. The Orange, Citron, Banana, Olive, Pomegranate, Peach, and other fruit trees, with Rice, Wheat, and Barley, &c., are cultivated in these spots.

4876. Egypt also produces the Christ's Thorn (*Zizyphus Spina Christi*), the Chaste tree (*Vitex Agnus castus*), *Salvadora persica*, the Oleander (*Nerium Oleander*), and other woody Asclepiadeæ, the Sycamore Fig (*Ficus Sycamorus*); *Acacia gummifera*, *nilotica*, *farnesiana*, *Lebbeck*, *albida*, *Sejal*, *heterocarpa*, *senegalensis*; *Mimosa Habbas*, or *M. polyacantha*; the Prickly Fig (*Cactus Opuntia*), &c. In some of the gardens at Cairo grow the Weeping Willow (*Salix babylonica*), *S. egyptiaca* and *subserata*, the White and Black Poplars, the Cypress, the Cassia Fistula, *Anona squamosa*, the Tamarind, &c., with our common Elm, which only attains the height of a shrub. Formerly the Sacred Bean of India (*Nelumbium speciosum* Willd., *Cyamus Nelumbo* Smith) displayed its broad foliage and splendid flowers on the waters of the Nile: it has now disappeared. Representations of it still exist on the ruins of ancient monuments. Can this lovely plant, which is indigenous to the East Indies, have been an exotic in Egypt, and only preserved there by cultivation? This is very probable.

4877. The mountains of small elevation in Cyrenaica produce abundantly the Carob tree, the Olive, Myrtle, Lentisk, Arbutus or Strawberry tree, and *Juniperus phœnicea*: their summits are clothed with thick forests of a Thuja, which is doubtless *Fresnella Fontanesii* (*Thuja articulata* Desf.). Oaks, which are so abundant upon Mount Atlas, the Date and Prickly Fig, are wanting here.

4878. The Atlas mountains, whose highest summits do not exceed 7000 feet according to Mirbel, 11,400 feet according to recent travellers, consist of two parallel chains, running east and west, between lat. 28° and 33° . They divide Barbary from the great desert of Sahara. The range nearest the coast, refreshed by the sea breezes and frequent showers, is covered with forests. The other, lying towards the desert, is dry and nearly barren. Some large intermediate valleys, which are watered by a great number of rivers and streams, are surprisingly fertile. In summer, the air is so hot and oppressive, in the southern districts, that the inhabitants quit their dwellings to live under the shadow of the Palm trees.

4879. Though the plains of the northern parts be generally sandy, they display great richness of vegetation wherever they are not quite destitute of humidity. Winter is to them the season of verdure; a gentle degree of warmth, accompanied by rain, hastens the growth of a multitude of plants, and flowers spring up in the open country, as they do in our climate at the return of spring. But when the sun draws near the tropic, rain ceases, the rivers dry up, the atmosphere becomes scorching, the leaves of the trees lose their verdure, and every plant is burnt up under foot.

4880. The forests of Barbary occupy the higher ranges of Mount Atlas. They are chiefly formed of the Cork tree and *Ilex*, *Quercus obtecta*, *pseudo-suber*, *coccifera*, *pseudo-coccifera*, &c.; the *Q. Ballota*, of which the agreeably tasted acorns are eaten by the natives, the Aleppo Pine (*Pinus halepensis*), *Fresnella Fontanesii*, *Juniperus phœnicea* and *lycia*, and the Cypress. M. Desfontaines, to whom science is indebted for an excellent work on the vegetation of the states of Algiers and Tunis, has rarely seen the Common Oak

(*Quercus Robur*), the Alder or the Poplar, and Ash. The valleys and low hills are fringed with Wild Olives, Pistachio trees (*Pistachia Terebinthus*, *P. vera* and *atlantica*), with the Arbutus, the Shrubby Jasmine, the Bay tree, the Myrtle, *Rhus pentaphyllum*, *Coriaria*, and other species, with *Zizyphus Lotos*, and *Spina Christi*, with the Chaste tree, the *Viburnum Tinus*, *Osyris alba*, *Celtis australis*, &c. The streams are bordered with Tamarisks; *T. gallica*, *germanica*, and *africana*; *Salix tridentata*, *pedicellata*, and *monandra*; with the Oleander, &c. The Palmetto (*Chamærops humilis*) abounds on all the uncultivated eminences; *Pinus Pinea* and *Pinaster* grow on some parts of the coast; while forests of the Aleppo Pine (*P. halepensis*) skirt the boundaries of the kingdom of Algiers.

4881. *The vegetation of Northern Africa*, of which 2100 to 2200 species are now known, differs little from that of the northern and eastern shore of the Mediterranean. Of 344 woody plants, that is, about 284 shrubs and 60 trees, which Northern Africa possesses, about 100 are peculiar to the country; 16 to 18 are part of the equatorial Flora; the others, that is, more than two thirds of the whole, have been remarked in Southern Europe or in the Levant, before or after M. Desfontaines's expedition into Barbary; and among these are reckoned thirty-nine trees of lofty or middling stature. Many of the herbaceous plants are also common to Europe or the Levant. They are certainly mingled with a great many African species; but the latter have almost all their generic types in the Flora of Europe.

4882. *In fine*, there are no less than half the species, whether woody or herbaceous, of Egypt, Libya, or Western Barbary, but also grow in the other Mediterranean countries belonging to the Transition Zone.

4883. *The Coniferæ and Amentaceæ* contribute twenty-four trees to Northern Africa; the Leguminosæ, eleven; the Terebinthaceæ, five or six; the Rosaceæ, four or five, &c. The *Ricinus* (*fig. 755.*), or Castor-oil plant, which only appears a tall herb in the South of Europe, grows to a tree on the southern shores of the Mediterranean.

CASTOR-OIL PLANT.

4884. *The proportion of trees and shrubs to the annual, biennial, and perennial plants is about one to six.*

4885. *That of perennial to annual and biennial plants is seven to nine.* Here the proportion is increasing, while in the other parts of the zone it is decreasing. This anomaly is, perhaps, more in appearance than in reality, and would probably disappear if we knew all the herbaceous plants of Mount Atlas; for it cannot be doubted that, on mountains, the number of perennial greatly exceeds that of annual plants.

4886. *The plants collected by the late Dr. Oudney, from Tripoli to Mourzouk, are, with the exception of a few species, identical with those of Barbary.*

4887. *Of all the coast provinces of Africa, Lower Egypt possesses the largest number of equatorial plants; which must be attributed, not only to the vicinity of Arabia, but to the presence of the Nile, whose waters, descending from a country very near the equator, necessarily waft, along with the valuable mud that they deposit, a great number of seeds, many of which grow and propagate themselves under the burning sky of Egypt.*

4888. *Of Egypt, Forskål, a celebrated writer on the botany of that region, says, that it has little in common with other countries. "All that is seen in it excites admiration, whether the works of men or of nature. Lofty mountains are unknown there, and alpine productions are consequently banished. The absence of woods excludes a vast number of flowers; nor do those plants flourish which properly belong to rivers and lakes. The cold of the northern regions forbids the growth of tender exotics. Egypt, on the contrary, consumes them with unwonted heat. The same advantages of climate and soil, which favour native plants, banish foreign ones. Every kind of vegetable cannot subsist without rain, without the vapour of springs, rivers, or marshes, without the cool shades of mountains and woods. They are not all qualified to endure the diurnal heat by the periodical refreshment of the nocturnal dew. In the dry soil of some parts of Egypt, seeds of other climes quickly perish; again, plants coming from a dry soil ill endure the inundation and marshy state of other parts. The plants of Egypt are fitted to exist by a peculiar vegetative economy. Their texture is loose, and, as it were, plethoric; so that their proper aliment is prepared in continually distended veins. The widely opened mouths of the vessels receive the copious dews; and the leaves perform the functions of so many roots. Hence, great transpiration is excited; and the moist roots enable them to endure the summer sun, and to pass from the extreme drought of summer to the humidity of a three-months' flood. Besides, the inverted order of things that prevails here, covers the Egyptian fields in winter with verdure and blossom, while the plants of Europe are undergoing a state of repose. Sandy deserts, destitute of moisture, insulate the vegetation of Central Africa, and prevent its extending to Europe. Seeds, too, which drop accidentally on the earth, and are subsequently covered by the sediment of the river, are never likely to be developed. This is the reason, too, why the entomology of Egypt is so poor. The eggs and chrysalides of insects are smothered by the stagnant waters; some few families retire to the trees and loftier shrubs; but there are not enough of these sheltering spots to protect them from the scorching atmosphere. In like manner, the birds, which inhabit mountains and groves, avoid these exposed and thirsty fields.*

4889. *The northern plants, therefore, most of which belong to mountains or lakes, are*

entirely absent. A few only, scattered, and changed in appearance, show themselves as strangers. Egypt arms with thorns the *Colutea* and the *Carduus*; while Sweden points the leaves of the *Juniper* and *Fir*. The one abounds with Dates and Sycamore trees; the other with Willow-grounds. The Nile is clothed with luxuriant reeds; Sweden maintains an endless race of *Carices*. The entire absence of *Fungi*, in the moist soil of Egypt, is remarkable; Mosses and Lichens are extremely rare, and chiefly exotic.

4890. *The plants of Egypt* may, therefore, be distributed into two classes; of which the principal feature is the presence or absence of water.

4891. *The irriguous or cultivated plants*, all of which are exotic, owe their introduction and propagation to human industry. The number of fruit trees by no means answers to the culture and fertility of the soil. The most flourishing of these are, the Date and Sycamore; which, perhaps, have the greatest power of sending their roots deep into the ground, in quest of latent moisture. The spontaneous plants belonging to this division are seen either near the Mediterranean or the banks and islands of the Nile; or they occupy the edges of fields and gardens which are artificially irrigated.

4892. Every region, almost every province, has its peculiar *Botanic Garden*, in which plants spontaneously thrive, being particularly favoured by the soil. The peninsula Ras-et-tin is distinguished from the shore of Alexandria by eminences, fields, fig plantations, fosses, salines, and a variety of shady open places. Thus, plants of very different kinds are collected in a small space, each having appropriated to itself its own fit habitation. What is still better, in this place the botanist may pursue his researches with security; the situation defending him from the attacks of robbers. The portion of the peninsula which joins it to the land is occupied by dwellings; the rest is bounded by the sea, and the Arabs are afraid either to cross the water or to go through the city.

4893. *Of noxious and useless plants*, there are either none, or they are very few, and occupy remote spots; the reason for which is obvious; the unceasing cultivation of the more valuable plants entirely excluding the weeds. To the conveniently situated lands no rest is allowed; as crop after crop is carried away, the ground is turned up with the plough, till every weed is extirpated, and the thick growth of the cultivated plants choke the last straggling native of the soil. Should any remain, in a field not immediately sowed, they fail not to be destroyed by the heat.

4894. *The desert plants*, again, form a strong contrast to the former class; being distinguished by their poor and parched growth, which almost seems to bespeak one's compassion. Even the dreariest spots are not wholly destitute of vegetation, about fifty species having fixed their abode there, and affording a maintenance, though of the slenderest and coarsest kind, to the flocks of the wandering Bedouins. These plants seem to partake of the nature of the soil which supports them, being arid and crustaceous; their hollow leaves, however, often retain the moisture of the nightly dews and winter clouds, which periodically call them into life. They are growing till the end of March, and disseminate their seeds during April and May; but before the summer solstice arrives, they are almost all withered.

4895. *The Date* is the principal object of cultivation; the trees are planted at intervals of eighteen feet, and after six years they bear fruit. When they are young and tender, it is customary to cover them with mats, so as to cause the leaves to form themselves into a trunk; every year two rows of boughs are cut off round the tree, so that their age is easily computed.

4896. *But of the plants of Egypt*, a few, for which that country is rendered remarkable, must be here noticed: and among them none is more worthy than the *Papyrus* (*fig. 756.*), commonly called the *Papyrus* of the Nile, or of Egypt; because, though

apparently of rare occurrence in that country, it was there first employed in making paper. It is the *πᾶπυρος* of Theophrastus and of Dioscorides; *Papyrus* of Pliny, and *Bera* of the Egyptians; in Syria, *Babier* (whence come the words *Papyrus* and *Paper*); *Cyperus Papyrus* of Linnæus, and *P. antiquorum* of Link. It is not an unfrequent inmate of the stoves of our country; where, if the roots be kept constantly moist, it flourishes, and is highly ornamental. The main stem, surrounded at the base by a few short leaves, is bluntly triangular, and attains a height of ten or twelve feet, bearing a large compound umbel of slender, feathery, gracefully recurved, and very numerous flower-stalks, with inconspicuous blossoms. It is from the delicate and white pith which fills the interior of the stems of this fine plant, that the ancients prepared their paper. To accomplish this, after having removed the epidermis, they cut the spongy part into thin slices, which they steeped in the water of the Nile, or into water slightly imbued with gum; after which, two layers were placed one above another, taking care to arrange them in contrary direc-

tions, that is, alternately breadthwise and lengthwise, many layers being often required to make one sheet of paper. Then the article was dried, and subjected to a strong pressure, and finally smoothed with a tooth, or a piece of polished ivory. On this kind of paper, most of the ancient manuscripts were inscribed; especially those which have been brought to light by the excavations at Herculaneum and Pompeii.

4897. Other accounts, indeed, of the ancient mode of preparing paper from the *Papyrus* are a good deal at variance with what is above given, and with what we know of the structure of the plant in question; which is by no means composed of layers, but is an uniform mass of very cellular pith, covered by the epidermis. Thus, according to Theophrastus, "For making paper, the stoutest stems of the *Papyrus* were selected; the thin layers were divided, the central ones being the finest, whitest, and most esteemed. After these were spread out, and the irregularities reduced, the muddy water of the Nile, which somewhat partakes of the nature of paste, was sprinkled over them; many leaves being requisite to form one sheet of paper. It was common, after pressing them, to beat them with a mallet, to dry and polish them; all these preparations being essential, before the paper would bear writing; and for such as was destined to keep a long time, the precaution of rubbing it with cedar oil, which imparted to it the incorruptible nature of that tree, was also adopted." This account is, in all probability, applicable to the paper of the ancients made from trees inhabiting marshy situations, such as the Willow, Poplar, &c.

4898. The sacred Lotus of Egypt is a plant that has elicited much controversy, and it does appear that, in different and even in the same countries, the inhabitants called very dissimilar plants by the name of Lotus. According to Shaw, in the plate that represents the mosaic pavement at Præneste, relating to some of the animals and plants of Egypt and Ethiopia (and of which a full history is given in *Montfaucon's Antiquities*, v. 14.), the Lotus of those countries is unquestionably a Water Lily, of which three kinds are mentioned by M. Desfontaines, and represented on many Egyptian monuments. "Two of them," he says, "have been well described in the works of Herodotus and Theophrastus; one has white flowers and fruit like that of a poppy, full of a great number of small seeds: this is the *Nymphaea Lotus* (fig. 757.) of Linnæus. The other, called by Herodotus the Lily Rose of the Nile, and by Theophrastus the Egyptian Bean, or Lotus of Antinoüs, has a flower of a lovely red, and a fruit shaped like the rose of a watering-pot, pitted with deep hollows, each containing an oblong seed, as large as a small filbert: this is the *Nymphaea Nelumbo* of Linnæus, the *Cyamus Nelumbo* of Sir J. E. Smith, and, according to him, the *κνυμος* of the ancients, which has been confounded by other able writers with the true Lotus of Egypt, *Nymphaea Lotus*, and has probably become important in the Egyptian Mythology only as a substitute for the former (the real "Lotus of India"). This fruit, compared by Theophrastus to a wasp's nest, is represented on various Egyptian monuments.

NYMPHÆA LOTUS.

4899. The red-flowered Lotus is common in India, but has disappeared in Egypt; its former existence there being incontestably proved by the testimony of Herodotus and Theophrastus.

EGYPTIAN ARUM.

4900. Lastly, the third species has blue flowers, and a fruit like the first: it is likewise delineated on the monuments of antiquity, and has been noticed by Athenæus. This author says that at Alexandria the crowns worn at the festivals of Antinoüs were composed of the red or the blue Lotus. MM. Delille and Savigny observed the blue Water-lily Lotus, in Egypt, and have described it under the name of *Nymphaea cærulea*.

4901. The Egyptian Arum (*A. Colocasia* Linn.) (fig. 758.) abounds in Egypt, Syria, and the adjacent countries, and is extensively cultivated for the sake of its large esculent roots, which are no less esteemed than those of the allied Arum esculentum Linn. in the West Indies. The gourd and cucumber tribe are every where planted; no kind, however, being held in such favour as the *Cucumis Chata*, which, says Hasselquist, grows about Grand Cairo, and nowhere else, and which the grandees and Europeans in the capital eat as the most pleasant fruit they can obtain, and that from which their health is least liable to suffer.

4902. The *Carthamus tinctorius* (fig. 759.), or Safflower, is raised in large quantities throughout the country, and is a source of much profit to the natives. Besides its valuable properties as a dye, at Cairo the young leaves are considered an excellent salad.

CARTHAMUS TINCTORIUS.

4903. The Onion (*Allium Cepa*) is a plant, the use of which may be traced, in Africa, and especially in Egypt, to a period of very high antiquity, so far back as 2000 years before Christ. It still forms a favourite addition to the food of the Egyptians. Hasselquist, in a panegyric on the exquisite flavour of the Egyptian onion, remarks, that it is no wonder the Israelites, after quitting the land of bondage, should have regretted the loss of this delicacy as they did, with the reproachful exclamation, "we remember the fish that we did eat in Egypt, the cucumbers, and the melons, the leeks, and the onions, and the garlic." These roots are mild and pleasant in Egypt, though strong and nauseous in other countries. There they are soft and yielding; but in more northern regions they are hard, and their coats so compact, as to render them difficult of digestion. The Egyp-

tians and Turks eat them roasted and cut into four pieces, with some bits of cooked meat: a preparation which they call *kebab*, and consider so delicious, that they devoutly wish it may form one of the viands of Paradise. A soup made of Egyptian onions was pronounced by the learned traveller to be certainly one of the best dishes of which he ever partook. The predilection for this savoury bulb extends in Africa beyond the country of the Nile. Major Denham, in his route south from Bornou, observed numerous gardens, in which the only vegetable cultivated was the onion. The ancient Egyptians worshipped the onion, and "shed tears at the scent of a deified leek." By the Greeks, again, this root was held in abhorrence; while the Roman soldiery and labourers almost lived upon it. In the south of Europe, the love of onions was formerly not confined to the lower classes, but extended even to the court; and it is related of Alfonso, king of Castile, who had the greatest aversion to that savoury vegetable, that, in the year 1368, he instituted an order of knighthood, by the laws of which it was enacted that those knights who had eaten garlic or onion should not appear at court, nor have any communication with their brethren, for the space of one month. So great a quantity of onions was cultivated at Albi, in France, that the tithe of them produced to the archbishop an annual revenue of 1000 crowns.

4904. The *Acacia* of the Nile (*A. nilotica*) is supposed to be the species that yields gum-arabic.

4905. From time immemorial the Cerealia have abounded in Egypt; and in the tombs of the Egyptian kings, which were observed by the naturalists of the famous French expedition, vessels were found, filled with wheat, perfect in form and colour, though buried for many thousand years; so that it is not improbable that Egypt may have been the native country of this grain; and for many years so great was the fertility of Egypt, that it was styled the granary of Europe.

4906. Many are of opinion that we are indebted to Egypt for the Bean (*Vicia Faba*); certain it is that the Greeks received it from that country.

4907. The coast of Barbary is described by Desfontaines, in his *Flora Atlantica*, as a warm but salubrious and agreeable region. Its mild winters resemble an early spring, when the Peaches, Plums, Nectarines, and Almonds are in blossom, the herbage is green, and the fields are adorned with innumerable flowers. There are *Triticum durum*, distinguished by its horny, scarcely farinaceous kernel, bearded spike, and solid culm; Barley, used only as food for horses; Indian Corn, Sorghum, *Holcus saccharatus*, Rice in the inundated grounds; Tobacco (*Nicotiana rustica* and *Tabacum*), a great variety of Olives, beautiful Oranges, Figs, Pomegranates, Almonds, Grapes, Plums, Peaches, Pistachio nuts, *Zizyphus Lotus*, delicious Melons and Gourds, *Crocus vernus*, the White Mulberry for feeding silkworms, Cotton, Sugar Cane (in gardens), *Hibiscus esculentus*, and many European kitchen vegetables. Opposite to Tripoli, in the Lesser Syrtis, is an island, now called Gerba, or Jerba, once inhabited by the Lotophagi, a people so termed because their chief food was a fruit called Lotos. "After the Palm," says the learned Shaw, in his account of the vegetable products of Algiers and Tunis, "we are to describe the Lotus, whose fruit is frequently mentioned in history; the Lotophagi also, a considerable people of these and the adjacent districts, received their name from the eating of it. Herodotus informs us that the fruit was sweet like a date; Pliny, that it was of the bigness of a bean, and of a saffron colour; and Theophrastus, that it grew thick, like the fruit of the myrtle tree. This shrub, which is common in many parts of Barbary, has the leaves, prickles, flower, and fruit of the *Zizyphus*, or Jujeb; only with this difference, that the fruit here is round, smaller, and more luscious; at the same time, the branches, like those of the *Paliurus*, are neither so much jointed nor crooked. This fruit is still in great repute,

tastes something like gingerbread, and is sold in the markets all over the southern districts of these kingdoms." It appears very certain, according to M. Desfontaines, that this shrub is the true Lotos, whence the Lotophagi derived their name; and this is rendered more evident by a passage from Polybius, who affirms that he saw the Lotos himself. The lotos

ZIZYPHUS LOTOS.

760

of the Lotophagi, says the historian, "is a stiff and thorny shrub; its leaves are small, green, and like those of a Rhamnus. The immature fruits resemble myrtleberries; when ripe, they are of a reddish colour, and equal to round olives in size, containing a stony nut." This description entirely coincides with that of *Zizyphus Lotos* (fig. 760.), and cannot be applied to any other tree of the country. Polybius has further informed us of the mode of preparing the Lotos. When ripe, the fruits are gathered, crushed, and kept in close vessels; the common sort being destined for the slaves, and the best quality for the free men. In this state the fruit is eaten, the flavour resembling figs or dates. A kind of wine is prepared from them by adding water, which is very good, but does not keep above ten days.

4908. *Theophrastus relates* that the Lotos was formerly so common on the island now called Zerbi, and the adjoining continent, that the army of Orphellus, when their provisions failed, on the way to Carthage, lived for several days upon it. Now, the inhabitants of Syrtis, and the vicinity of the desert, still gather the fruit of this shrub; they sell it in the market for the food of man and beast, and drink the water in which it has been infused. The tradition of its having been formerly the chief food of man is still preserved among them. Homer alludes to this very plant in his *Odyssey*, when he says that the Lotos had so delicious a flavour, that the strangers who ate it lost all recollection of their own country. Thus were the companions of Ulysses obliged to be removed by force from the place where it grew. Doubtless the lotos fruit was a convenient resource for people who dwelt among uncultivated lands; but nothing but the glowing imagination of a poet could have conferred such exquisite flavour on a fruit which is far inferior to the dates of the same neighbourhood, as to aver that those who had once tasted it were unwilling ever to leave the favoured land that produced it. Some have considered this Lotos to be the *Diospyros Lotos*; but without sufficient reason.

4909. *It is much to be regretted* that the *Atlas* mountains have not been explored; and yet it would appear, from the geographical notice of the empire of Morocco, recently published in the *Journal of the Royal Geographical Society of London*, by Lieutenant Washington, R. N., vol. i. p. 123., that so desirable an object would not be of difficult accomplishment. This gentleman accompanied a mission that was sent by the

OLEANDER.

761

British Consulate at Tangier, to Morocco, which is situated in a plain that extends east and west, between a low range of schistose hills to the north, and the lofty Atlas to the south, about twenty-five miles wide, and apparently a dead flat to the foot of the mountains, which rise abruptly to the height of 11,000 feet, their peaks covered with snow. This plain, which has no limit as far as the eye can reach east and west, lying about 1500 feet above the level of the sea, the soil a light sandy loam, with numerous rolled stones of crystallised quartz, agates, flints, porphyry, a green stone, carnelians, &c. &c., is, generally speaking, covered with low brushwood of the thorny plant called *Sidra nebach*, or *Buckthorn*; the bank of the streams fringed with *Oleanders* (fig. 761.) in great beauty, while to the north of the city is a forest of Palms and Olives. The river Tensift, springing at about forty miles east of the city, flows at about four miles north of Morocco, and, joined by streamlets from Atlas, reaches the Atlantic near Saffy, about 100 miles distant; the river is shallow, but rapid; the channel about 300 yards wide, but fordable almost every where. "The quarter of the city allotted to the British mission was one of the Sultan's gardens, called *Sebt el Mahmōnia*, covering an extent of fifteen acres, planted in the wilderness style, with every variety of fruit tree, Olive, Orange, Pomegranate, Citron, Mulberry, Walnut, Peach, Apple, Pear, Vine, &c.; with Cedar, Poplar, Acacia, Rose,

Myrtle, and Jasmine, forming a dense and luxuriant mass of foliage, only broken by the solemn Cypress and more stately Palm; and through which nothing was to be seen but the snowy peaks of Atlas, rising almost immediately above our heads, and the tall tower of the principal mosque, distant about a quarter of a mile. Nought but the playfulness of gazelles, and the abundant trickling of water in every direction, to break the stillness of this delightful spot, combining every thing to be desired in a burning clime, — silence, shade, verdure, and fragrance. But, as a contrast to the limited view of our garden, the terraced roof of our house commanded a prospect over the city, the extensive plain, boundless to the east and west, and the whole *dahir*, or belt, of the Atlas, girdling, as it were, the country from the south-west to the north-east, with a band of snow; and few days passed, during our stay at Morocco, that we did not spend the hours of sunrise and sunset, gazing on this beautiful and striking object, noting its masses and peaks of snow, and deploring that this mighty range, combining within one day's journey every variety of climate, from the torrid to the frigid zone, and offering such a field to the naturalist, the geologist, and the botanist, should still remain unexplored, and present an impassable barrier to civilisation. Viewed from Morocco, the frozen range of Atlas bounds the horizon from east to south-west. In January, the transition from the wooded to the snowy zone is immediate; the formation inclines more towards sharp ridges and points than to alpine peaks. The highest of these points visible from the city bears S.S.E., distant twenty-seven miles; two other remarkable masses, forming sugar-loaves, S.E. by E. and S.E., called by the Moors *Glaoni*. It is singular that neither Moors nor Arabs have any distinguishing name for the Atlas. It is usually called *Djibbel Telj*, or *Snowy Mountains*; but the word *Atlas* is unknown: whence is it derived? May it not be a Greek corruption of the Libyan *Adraer*, or *Athraer*, signifying mountain? Many of these heights were measured trigonometrically, and the highest, named by the Moors *Mittsin*, lat. 31° 12' N., twenty-seven miles S., twenty miles E. of Morocco, was found to be 11,400 feet above the level of the sea. This is below the limit assigned to perpe-

tual snow by Humboldt; yet but once in twenty years had these summits been seen free from snow." From the enchanting Jebel el Mahmônia, the travellers visited the Atlas mountains, and spent three days among them. At daylight of the 8th of January (a season of the year when the mountains of more northern latitudes are unapproachable) they bade adieu to their earthly paradise, the garden of El Mahmônia, and journeyed S.E. towards Atlas. The soil of the plain which they traversed was a light sandy loam, covered with rolled stones and shrubs of the Buckthorn, traversed by brooks, fringed with Oleanders, and large Olive groves and ruined aqueducts; at sixteen miles they entered one of the valleys of the Atlas, and, winding up a mountain torrent, encamped for the night at about 2400 feet above the plain, commanding a splendid view of the city and plain of Morocco, with the winding river, losing itself in the western horizon. Next morning, they struck their tents, and set forward by a sharp ascent; a brawling torrent was in the valley beneath them, its banks well wooded with Olive, Carooba, or Al Kharob (*Ceratonia Siliqua*), Walnut, Acacia, Cedar (the finest timber that the country affords, though not very large), and a profusion of Oleanders, and stunted Palms and Rose Trees: they were also cheered and enlivened on the march by the shouts of the Shelluh huntsmen, who, at every angle of the road, endeavoured to rouse game, every turn disclosing fresh beauties in the valley, and a more boundless view of the plain and city of Morocco, its various mosques glittering in the morning sun; the basis of the road, limestone; the soil, a stiff clay and stony, with boulders of limestone, sandstone, agate, flint, porphyry, gneiss, greenstone, and carnelian; on the brow of the hill a range of limestone, full of vertical fissures, resembling a pile of artificially placed and gigantic tombstones; and several villages near the road, perched in the most romantic situations, and inhabited by the free Shelluhs, the aborigines of these mountains. Till two o'clock in the afternoon they continued ascending, the herbage becoming more scanty, and the cedars more stunted, till they reached the limit of snow, and proceeded some way above it; when, their guides declaring they would proceed no farther, and the thawing snow giving way under their feet, our travellers reluctantly halted, gazing on the highest peaks, far beyond their reach, and the intermediate interval presenting one mass of untrodden snow. The barometer indicated an elevation of 6400 feet. Such a country as that round Morocco would indeed afford a glorious harvest to the botanist.

SUBSECT. 3. Zoology.

4910. *The Zoology of Egypt* presents that scantiness in the number and variety of its objects which might be expected from the nakedness of the country. The French government, always more attentive than ours to scientific research, even in the midst of war, commissioned some of the most able zoologists to accompany their army into Egypt; but the paucity of its animal productions prevented the results from being so important as had been expected. The more recent researches of M. Rüppell have made us acquainted with many new animals.

4911. *The following quadrupeds appear to be the most peculiar:—*

Romolpus tridens. Trident Bat.
Nycteris Geoffroyi. Geoffroy's Bat.
Nyctinomus ægyptiacus. Egyptian Bat.
Pteropus ægyptiacus. Egyptian Vampire.
Taphozous perforatus. Perforated Bat.
Canis niloticus. Egyptian Fox.

Mangusta Ichneumon. Ichneumon.
Arvicola niloticus. Egyptian Arvicola.
Psammomys obesus Rüpp. Alexandrian Sand Rat.
Psammomys cahirinus. Egyptian Rat.

Gerbillus ægyptiacus. Egyptian Gerbel.
Lepus ægyptiacus. Egyptian Hare.
Felis maniculata Rüpp. The True Cat.
Felis Chaus Gold. The Booted Lynx.
Canis niloticus Rüpp. Nilotic Fox.

4912. *Of these animals*, the three latter have been recently discovered by M. Rüppell. This naturalist is of opinion that the *Felis maniculata* is the original stock from which the domestic or house Cat of Europe, in all probability, has sprung; the intermediate gradation being marked by the tame cats of the modern Egyptians. The wild breed is still to be met with in Nubia, and extends, in all probability, to the confines of Egypt. The *Felis Chaus* somewhat resembles the Booted Lynx of Abyssinia; but is distinct. The Egyptian Fox, *C. niloticus*, both in habits and appearance much resembles the European Fox; but has a much more slender body, and longer legs: the body also is yellowish, and the throat and belly grey.

4913. *The Egyptian Ichneumon* (fig. 762.), as celebrated, and even deified by remote antiquity, deserves a more detailed notice.

762

EGYPTIAN ICHNEUMON.

The important services which this animal renders to mankind certainly gave it higher claims than any other to the homage of the ancient Egyptians. It presents a lively image of a benevolent power perpetually engaged in the service of man, by destroying those noisome and dangerous reptiles which are the pests of hot and humid climates.

Of a small size, and without any great physical strength, the Ichneumon carries on a secret and destructive warfare against crocodiles, serpents, and lizards of every description, not, indeed, by attacking these reptiles, frequently so much larger than itself, but by seeking with the greatest perseverance and cunning after their eggs. Urged by this instinct of destruction, it may be seen at the close of day gliding through the ridges and inequalities of the soil, fixing its attention on every thing that strikes its senses, with the view of evading danger or discovering prey; its thirst for destruction, in fact, is so great, that, even after its appetite has been satisfied, it destroys every living thing within its reach too feeble to make resistance. It particularly seeks after eggs, of which it is extremely fond, and it thus proves so destructive to the race of crocodiles. It is easy of domestication, and in this state evinces great attachment both to the house and the person of its master. It never wanders from the first, and knows the person of the latter, recognises his voice, and is pleased by his caresses. Its sense of smell, as may be supposed, is particularly acute; and the ears are remarkable for their breadth and the extension of the orifice.

4914. *The domesticated animals*

EGYPTIAN GOAT.

763

Sicily by the British army, on its return from Egypt; and, from personal observation, we think those countries well adapted to promote its increase.

4915. *The Birds* do not materially differ from those of Europe. Vultures and Storks

SACRED IBIS.

764

are of much the same breeds as those distributed in the Barbary States. The vicinity of Arabia supplies the Egyptians with the fleetest and most beautiful horses; while the ass is much stronger and more serviceable than ours: this breed attains to the size of ponies, and has long been introduced into Malta, where they command a price equal to fifteen or twenty pounds. The sheep are of the broad-tailed race, spreading, with various modifications, over Barbary and the Levant, from whence it has passed into India, China, and Southern Russia. The Goats (*fig. 763.*) are particularly elegant: the hair is sleek, the forehead arched, and the ears very long and pendulous: this breed was introduced into Malta and

are held in deserved esteem, from their usefulness in devouring offal and all dead animals: hence they may be seen on the terraces of houses, building and living in perfect security even in the midst of noisy and populous cities. The Vulture *percnopterus*, or Slender-billed Vulture, rare in Europe, is here one of the most common birds: it also frequents the deserts, and preys upon those men and animals who have unfortunately perished in those immense wastes. Several Bustards, together with Partridges and Quails, inhabit all the sandy tracts.

4916. *The sacred Ibis of the ancient Egyptians* (*fig. 764.*) was long confounded by naturalists with other birds not even natives of the country. M. Cuvier, however, has now clearly ascertained the species which excited so much veneration from antiquity. Its colour is white, with long disconnected plumes on the wings, of a glossy blackness.

4917. *The Scarabæus sacer*, or Sacred Beetle of the Egyptians, so often seen represented on their sculptured monuments, is rather larger than our common dung beetle, and is entirely black. Of the fish and other inferior animals we have nothing of much interest to communicate.

SECT. III. *Historical Geography.*

4918. *There is no kingdom more distinguished in history than Egypt*, or the name of which excites more awful and solemn ideas. The dim records of her ancient story are coeval with the origin of social union, and of all the arts which improve and embellish human life. Yet her early dynasties are involved in deep obscurity, and the descriptions of this pomp and grandeur might even have been treated by modern scepticism as fabulous, had not such astonishing monuments remained almost entire to attest their truth. The reign most celebrated by tradition is that of Sesostris, who is represented as having subjugated Asia, even to its central regions; and in fact the sculptured monuments of Thebes are representative of triumphs, not only over the Ethiopians, Jews, and Syrians, but over the natives of Assyria, Persia, and even of Bactriana. Greece has always owned herself indebted to Egypt for her civilisation, which began much later, though it proceeded with more rapid steps, and rose to a much loftier height. At length, in 525 A. C., Psammenitus, the last native king, yielded to the arms of Cambyses, who endeavoured, but with little success, to push his own conquests into Ethiopia and the Oases. Egypt, however, proved a turbulent member of the Persian empire, the authority of which was disputed by Nechtanebis and other usurpers. This antipathy to the Persian yoke caused Alexander to be welcomed as a deliverer. That great monarch appears to have highly estimated the importance of Egypt, especially in a commercial view, which his comprehensive mind could fully appreciate. Alexandria, the most celebrated of all the cities founded by him, proved by its subsequent greatness the judgment with which its site had been chosen. The benefits projected by that conqueror were, even after the partition of his empire, in a great measure secured by the dynasty of the Ptolemies, which was established in 430 A. C. Its intelligent princes rendered Egypt the main seat of Grecian learning; and, by promoting every species of public improvement, made her probably more flourishing and enlightened than she had been amid the tyrannic pomp of the Pharaohs. The subjection to Rome, therefore, which was completed in 29 A. C., was a misfortune to Egypt; though industry and civilisation were still protected, and Alexandria continued a great seat of learning, and the second city in the empire. A harder fate awaited her in the seventh century, when she was over-run by the Saracen hordes. The ferocious bigotry of Omar impelled him to exult in the destruction of that library which had been the pride of the Ptolemies, and unrivalled in the ancient

world; and it led him to inflict upon Egypt evils still more deeply felt. By degrees, however, the conquerors imbibed the arts and humanity of their new subjects; the Saracens became a polished people; and, under Saladin, the soldans of Egypt held the first place, as to power and splendour, among Mahometan princes. An unfortunate reverse, however, awaited this dynasty. The Mamelukes, a race of slaves whom they had imported from Georgia and Circassia, revolted against their masters, and set up a lawless and turbulent sway, which long crushed in Egypt all the seeds of order and improvement. They were destined, indeed, to bend beneath the dominion of the Turks, after the capture of Constantinople had rendered them masters of the Eastern Empire. In 1516, Selim subdued and put to death the Mameluke soldan, and appointed a pacha in his room. The Mamelukes, however, retained many privileges, particularly that of bearing arms; and, as they formed the bravest cavalry in the empire, they were always the rivals of the Turks, and often their masters. From that time Egypt continued to vacillate between this tumultuary aristocracy and the gloomy despotism of the Porte. The extraordinary and unjustifiable invasion of the French in 1798 had no permanent effects; and gave only an opportunity for British valour to display itself in their expulsion. The new order of things, however, afforded to the Turks an opportunity of establishing their power more firmly than before. The Pacha, Mohammed Ali, succeeded, certainly by very violent means, in cutting off the principal leaders of the Mamelukes, and expelling the rest from Egypt. That chief has since rendered himself independent of the Porte, and has governed the country with such vigour, and in such a spirit of improvement, as promises in some degree to restore to Egypt the prosperity of her best days. He has even sought to extend his dominion over other parts of the Turkish empire, and is at present (1833) master of both Palestine and Syria; which the Porte by a recent treaty has been obliged to cede to him.

SECT. IV. *Political Geography.*

4919. *Egypt, since the earliest ages, has been governed despotically.* As soon as the Turks obtained possession of it, they claimed the right of ruling it by a pacha, invested with all the prerogatives of the Sultan, and responsible to him. It has, however, as we have already observed, been always a loose and turbulent appendage of the Ottoman empire. This insecurity was occasioned, not only by its distance, and the difficulty of communication, but by the share in the administration still left to its former rulers, the Mamelukes. This share was, in theory, vague and slight, but in practice extensive; since they composed the best cavalry in the empire, and were ever ready to enforce with the sabre their own claims, just or unjust. The undefined limits between their power and that of the Pacha necessarily caused a constant collision. Sometimes the Pacha was expelled by the Mamelukes; and the Porte, when pressed by other concerns, was obliged to connive at the revolt. If the people were ever able to mingle in these contests, it was in a tumultuous manner, which produced no benefit to themselves, and only augmented that reign of disorder, which was so fatal to all improvement and regular industry.

4920. *The Mamelukes now belong to history.* They appear to have made their final exit from the political scene; and, notwithstanding some brilliant qualities which they possessed, their fate can be no object of regret. Their expulsion left Egypt almost wholly subject to the sway of Mohammed Ali, who had received from the Porte the appointment of pacha, but who, profiting by the distractions of the Ottoman empire, has established a power wholly independent. His administration has hitherto been a blessing to Egypt. He has established a better system of law and order than that unfortunate country had for centuries experienced; he encourages every species of industry, and is studying to introduce the arts and improvements of Europe. Actuated by the usual ambition of monarchs, he attempted conquest, and extended his dominion southward along the Nile as far as Sennaar, and even to Darfour; but tracts so distant and difficult of access can never be held without much difficulty, and are said to have already eluded his sway. In Arabia he has completely crushed the power of the Wahabees, and added to his domain the sacred territory of Mecca and Medina. For some time Mohammed Ali ceased not to own the supremacy of the Porte, and sent to Constantinople a tribute in money and grain. Now, however, he has established his complete independence, and has even threatened the overthrow of the Ottoman power, which was only saved by the interference of Russia.

4921. *Besides these supreme authorities, there is a sort of interior political system, existing particularly among the Arabs, who form the chief population of the villages, especially in Upper Egypt.* These, with their surrounding territory, are governed each by its sheik, whose office is hereditary. The accession of a new sheik, indeed, must be confirmed by the Pacha, who requires on this occasion to be propitiated by a large sum of money. When, however, these sheiks pay their tribute, and perform the military services demanded, they are little molested in their internal administration. Like the rest of the Arabs, they are divided among each other by deadly feuds, and sometimes carry on private war.

4922. *The revenues of Egypt arise from three sources, the lands, the miri or poll tax, and the customs.* All the lands are judged to belong to the Grand Signior, and this claim has been

made good by Mohammed Ali, who has in a great measure abolished the prescriptive rights which many individuals claimed to them. The poll tax is levied only upon Christians and Jews, and is not nearly so considerable. It is paid by all males arrived at the age of sixteen, and varies, according to their property or favour, from $2\frac{1}{2}$ to 11 dollars. The next branch consists of the customs on all goods imported at Alexandria, Damietta, and Suez, and also at Cairo, on their transit to Upper Egypt. Pococke reckoned the land tax at 480,000*l.*, the *miri* at 64,000*l.*, the customs at 118,000*l.* : in all, 662,000*l.* ; of which he understood that only 16,000*l.* along with a tribute in grain and other commodities, was remitted to Constantinople. General Reynier, during the occupation of the French, supposed that the amount might approach 1,000,000*l.* It is understood that the present ruler, by a rigorous levy of the duties, by the improvement of the country, and by the tribute exacted from the conquered territories, has considerably enlarged the sums, which by the most recent writer is estimated at 2,250,000*l.* while the ordinary expenses are not supposed to exceed 1,760,000*l.*

4923. *The army*, which formerly consisted only of an undisciplined and turbulent though brave militia, has been placed by Mohammed Ali on the most efficient footing. By the aid of French officers, he has disciplined a large body of troops in the European manner, and rendered them decidedly superior to any force which the East can oppose to them. In 1826, the troops thus trained were reckoned at 48,000, and since that time it is probable they have been considerably augmented. The Pacha has founded at Cairo a military college, in which 1400 boys are educated by numerous European teachers, and in which he expends monthly about 6000 dollars : he has also established there a cannon foundery, and a manufactory of arms and gunpowder.

SECT. V. *Productive Industry.*

4924. *Egypt* was distinguished at an early period for the cultivation of the useful as well as of the fine arts. Agriculture, the primary art, for which her situation and soil peculiarly fitted her, appears to have been carried to great perfection, at a time when the finest of the bordering countries were under common and pasturage. Those earliest authentic records of the human race, contained in the sacred writings, represent Egypt as greatly resorted to, in times of scarcity, for a supply of grain. When high cultivation has once been established in a country, it is scarcely eradicated, even by long periods of anarchy and misgovernment. After all the calamitous revolutions through which Egypt has passed, and notwithstanding her deep political degradation, her fertile lands continue to be cultivated with skill and care, and to yield copious harvests.

4925. *In all hot countries*, but more especially in Egypt, irrigation is the first resource of agriculture. The periodical inundation of the Nile, when swelled by the rains of Abyssinia and central Africa, is the primary cause on which her fertility depends. This is so fully admitted, that, in the years when the Nile does not rise beyond a certain height, the *miri*, or tribute, is not exacted. The whole of the Delta, during the autumnal season, is laid entirely under water. To effect this object, a number of intersecting canals were formed by the provident care of the ancient government ; and the utility of these is so urgent, and the consequences of their interruption so immediately fatal, that they have not been wholly neglected, even by the supineness of modern administration. The number of canals in Egypt has been stated at 6000 ; but this, at all events a loose estimate, cannot be true, unless we include those minor channels conducted by private industry through every tract, and almost every field. The great canals, which are maintained by the public, do not exceed eighty or ninety. In a great part of Upper Egypt and of Fayoum, machinery is employed to convey the water to grounds which, from their elevation above the river,

765

WATERING MACHINE.

cannot, without artificial means, be inundated. Buckets raised by pulleys are sometimes sufficient ; but at other times recourse is had to more operose and ingenious machines moved by oxen (*fig. 765.*). This successive rise and retiring of the waters produces a singular variation in the aspect and surface of Egypt. According to the description of Amrou, in his report to the Caliph Omar, it presents

in succession an appearance of a field of dust, that of a freshwater sea, and that of a flower-garden.

4926. *Few countries unite in a greater degree than Egypt the products of various and opposite climates.* On the borders of the tropical and temperate zones, it yields, in almost equal abundance, the vegetable productions proper to each ; while the variation from overflowing moisture to extreme dryness greatly extends the range of cultivation. Rice, which was introduced by the Saracens, has been found peculiarly adapted to those lower lands which at one season are thoroughly submerged by the Nile. On these it is sown in June, grows amid the water, and yields a harvest in October. Wheat and barley grow better in the higher grounds, and particularly on the well-watered districts of Upper Egypt. Those tracts which obtain but scanty irrigation by artificial means are only fit for the coarser product of the *Holcus dhourra*, the grain generally consumed in Nubia, which combines the qualities of a shrub with that of bread corn. Its stalk contains a juice

which the natives suck, and which, when dried, serves the purpose of fuel; above grow leaves, which afford food for the cattle. Oats are not an Egyptian product; but beans are raised for the use of the camels. Maize, flax, and sugar are also objects of some culture; and, in a smaller degree, indigo. Cotton, which, till lately, was scarcely ranked as a product, has, through the exertions of Mohammed Ali, become an article of the greatest importance, supplying the home manufactures, and affording the materials of a large export. Since 1822, a continually increasing quantity has been imported into Britain; in 1828, this amounted to 6,454,000 lbs. It bears a higher price than any other except that very finest American species called "Sea Islands." The soil requires little labour, besides that of irrigation. Being softened to a species of thick mud, it receives the grain without farther preparation; and even where dry, its quality is so loose and sandy that it may be worked with very little trouble.

4927. *Egypt, in its fertile tracts*, exhibits a blooming and verdant aspect; yet it is not, on the whole, a wooded country. The foliage which embellishes it, is derived chiefly from fruit and garden trees. The palm, the sycamore, the tamarisk, and some species of acacia, are the most prevalent. For timber and firewood it is almost entirely dependent upon Syria. Some Egyptian wines were celebrated in antiquity, though the country seems by no means well adapted for this product; at present the vine is cultivated chiefly for its grapes. Fruit is generally abundant, but apt to be watery. The apricot, the citron, the lemon, are reckoned the best.

4928. *Domestic animals* are not numerous in Egypt. Cultivation is performed by the aid of cows and oxen of a large breed, and also a species of tame buffalo, which is sometimes excited to fury by the strange vesture of Europeans. A small number of cattle suffice for the easily cultivated soil; and, as Egypt is nearly destitute of natural grass, they are fed upon clover. The great have very fine horses, imported chiefly from Barbary; though, since the expulsion of the Mamelukes, who took especial pride in these animals, their numbers must have diminished. Their paces are only suited for military manœuvres: they can do nothing but walk or gallop. In Egypt, as in Syria, the animal used for travel is the ass, of which there is a breed very superior to any seen in our climates. As the Orientals ride much, asses are very numerous; there are said to be in Cairo 40,000. Camels are seen in great numbers; but they are rather for journeying over the vast surrounding deserts, than for the interior of the country. Large swarms of bees are bred in Upper Egypt; while Lower Egypt is remarkable for a process of hatching fowls by artificial heat, of which, however, it is difficult to perceive the advantage, and which does not produce such sound or healthy chickens as the natural process. The bordering deserts contain the lion, the hyena, the antelope, and other wild animals generally found throughout Africa; and in Upper Egypt a considerable number of crocodiles and hippopotami are found in the Nile.

4929. *Egypt is not, and never was, a great manufacturing country.* With the produce of her soil she purchases the fabrics of neighbouring nations, particularly at Constantinople; and, generally speaking, every thing which is imported thence is better and more valued than what is made in the country. There are, however, extensive manufactures of linen, though not of that fine linen for which Egypt was anciently famous. Muslin and cotton dresses are now preferred, as more suited to the climate. The linen at present manufactured consists chiefly of the coarser kind, for sheets, curtains, towels, and sackcloth. The large towns of Lower Egypt, particularly Damietta and Mehallet, are the main seats of this manufacture, which is also carried on at Cairo, Fayoum, and Siout in Upper Egypt. These are produced, not merely for internal consumption, but large quantities are exported to different parts of Turkey and the Mediterranean. The Pacha has introduced the cotton manufacture, which he successfully carries on by European machinery, and even the steam engine. There are also manufactures of carpets for sofas at Benisuef, and of embroidered silk handkerchiefs at Cairo; but none of the articles there produced equal those brought from India or Asia Minor. The potteries of Egypt are extensive, the mud or slime deposited by the Nile being well fitted for this purpose. From it the Egyptians fabricate a species of porous jars, which are highly prized for the property ascribed to them of cooling and clarifying the water; every thing which tends to improve that simple beverage being held in these climates especially valuable. These jars appear to have been used from the earliest ages, representations of them being found on the most ancient monuments.

4930. *Egypt is more favourably situated for foreign commerce* than most other countries, as it may be said to form the connecting link between Africa, Europe, and Asia. It is only, however, at particular periods that its government has afforded the necessary encouragement and protection. The Pharaohs, like the other Oriental despots, were averse to navigation and foreign intercourse of every description. The Persian policy was similar. The sovereigns of the Greek dynasty were the first who turned their attention to the means of improving the vast natural capacities of Egypt. Alexander, in founding the city to which he gave his name, had evidently formed the design of making it a grand commercial emporium, which it soon became. Under the Roman empire the supply of the capital of the world, and its rich dependencies, with the commodities of central and eastern Africa, and still more of India, occasioned an immense traffic; but on this the conquest of the Saracens inflicted a blow from which the country never recovered. The Venetians and Genoese, indeed, who first revived commercial enterprise in Europe, formed factories in Egypt, which they made the entrepôt for Indian goods. But the natives had no share in these transactions; and, after the discovery of the passage by the Cape of Good Hope, the land carriage, the difficult navigation of the Red Sea, the exactions and persecutions to which Europeans were exposed, rendered it no longer possible to compete with those who conducted the traffic even by that circuitous route. Egypt, however, possesses natural advantages, which, under an improving and protecting administration, might again enable it to engross a large share of the communication between Europe and India. Some efforts, though yet in their infancy, are understood to be actually making by the Pacha to renew this intercourse. As yet its maritime trade is nearly confined to the Mediterranean. From Damietta it exports, to Syria, Asia Minor, and Turkey in Europe, large quantities of grain, in which shape the tribute was sent to Constantinople; also coarse linens in considerable quantity. The commerce with what are called the Frank nations is carried on entirely from Alexandria, and by European merchants resident there; but in the course of the last two centuries it greatly declined, though it has been much augmented by its present ruler. He commits, however, the great error of interfering in every branch, and even becoming himself a partner, demanding often unreasonable advantages. The internal trade is entirely carried on by the Nile and its branches, natural and artificial, which penetrate to all the great cities and cultivated tracts of Egypt. The communication of Alexandria with the interior was, in earlier times, usually maintained by a canal reaching direct from that city to Foua. After the negligence of its modern rulers had allowed that communication to be choked up, the European goods landed at Alexandria were conveyed in boats to Rosetta, and up that western branch of the Nile. The present Pacha, however, has restored this canal, forming a channel forty-eight miles long, ninety feet wide, and about eighteen feet deep. This important work was executed in 1819, in the course of little more than six weeks, by the labours of 250,000 men, who were violently impressed for that purpose.

4931. *The most active branch of Egyptian commerce*, and that which has remained unaffected by political vicissitudes, is carried on by caravans with the interior of Africa. The journeys on every side must be made through immense tracts of desert, where they could penetrate only by the aid of the camel. The caravans which go westward from Cairo do not penetrate beyond Fezzan, at which emporium they obtain, imported by the merchants of that country itself, the varied produce of Soudan. This caravan goes annually, unless prevented by peculiar circumstances, and performs its journey in fifty days. Those which proceed southwards depart chiefly from Siout; and their destination is Darfour and Sennaar. The caravans to the former country are the most numerous and frequent, though still inferior to the Fezzan caravan. Their departures are very irregular: sometimes there are two in the year; at other times, two or three years pass without one. A caravan is reckoned large if it numbers 2000 camels; some amount to no more than 500, or even 200. The imports from all these quarters are much the same. Gold, ivory, senna, ostrich feathers, gum, are secondary objects; but the main staple is always slaves. Egypt supplies with this unlawful commodity not only its own harems, but those of Turkey, Persia, and all the East. These slaves, being employed chiefly in a domestic

capacity, are not doomed to the same severe and oppressive labour as those transported to the West Indies and America; and though the services in which they are employed are often of a nature peculiarly degrading, yet, being brought near the persons of the great, they are often raised to favour, and even to power.

4932. *The pilgrimages to Mecca and Medina*, from the Mahometan states of the West, form another branch, or at least an auxiliary, of commerce. Those from the interior, indeed, go by Nubia, and cross the Red Sea at Suakim; but from Barbary, and particularly Morocco, the most populous and zealous Mahometan countries, the direct route is by Cairo and the isthmus of Suez. In all the countries where pilgrimages are customary, it seems the system that they shall be so far turned to profit, as to pay their own expenses. Traffic becomes, thus, a joint object with religion, and is carried on probably for more moderate gains than if its dangers and hardships were undertaken solely for the benefits accruing from itself. The hostile occupation of the holy cities of Mecca and Medina, by the Wahabees, interrupted for some time this intercourse, which has been reopened, however, since the occupation of that territory by the viceroy of Egypt.

SECT. VI. *Civil and Social State.*

4933. *The estimates of the population of Egypt* have been extremely various; nor are we aware that it has ever been the subject of any accurate census; but the most careful recent estimates seem to fix it at about 2,500,000. The most detailed one, which seems to have been made with diligence, makes, of Copts, 160,000; Arab Fellahs, 2,250,000; Bedouin Arabs, 150,000; Arabian Greeks, 25,000; Jews, 20,000; Syrians, 20,000; Armenians, 10,000; Turks and Albanians, 20,000; Franks, or European Christians, 4000; Mamelukes, 500; Ethiopians, 7500.

4934. *Egypt* has long been occupied by races of various origin, who have retained their distinguishing characteristics with the constancy peculiar to Oriental nations. The Mameluke, making his boast of being a purchased slave, lived for centuries by the side of the Arab, proud of his freedom and ancient family. The Mamelukes, however, are now expelled; and the leading races consist of the Copts, the Arabs, and the Turks.

4935. *The Copts*, though not supposed to exceed 160,000 individuals, and of no political importance, are by much the most ancient, and, strictly speaking, the only native race. The sculptures on the most ancient monuments represent under the same form and features the original Egyptians, when that country was ruled by its native kings. The word Copt seems even a corruption of the middle syllable of the word Egyptian. Some authors, and Volney among the rest, have represented their features to be substantially the same with those of the negro; but this seems refuted by the observation of Brown, and the minute anatomical examination of Baron Larrey. The latter considers them as exhibiting, with a few variations, the characteristic features of the Nubian and Abyssinian — their skin of a dusky yellow; their countenance, full without being puffed; their eyes fine, limpid, opening in the form of an almond, and with a languishing look; the nose almost straight, rounded at the tip; the nostrils dilated; the mouth middle-sized; the lips thick, but less so than those of the negroes, and not, like theirs, thrown back; the beard and hair black and bushy, but not woolly. (*Description Historique, Etat Moderne*, ii. 3.) In their character, they too much resemble those who, being treated with scorn by others, can with difficulty learn to respect themselves. As usual with degraded races in barbarous countries, they are employed in those branches of trade and accounts which are repugnant to the turbulent pride of the ruling people. For want of others who possess the requisite capacity or application, their oppressors are under the necessity of employing them as stewards, superintendents, collectors of the revenue, keepers of registers, &c.: and various branches of trade are in their hands. They cannot, however, be expected to exercise these functions in the same honourable and respectable manner as if the employments, and those who practised them, were the objects of public esteem. The Copts are represented as crafty, covetous, cringing, and addicted to mean sensual indulgences. They are, however, a peaceable race, and are said to be remarkable for the warmth of their domestic attachments. Though they are found in every part of the country, their chief seat is in Upper Egypt, where whole towns are peopled by them.

4936. *The most numerous part of the population*, being that almost exclusively employed in agriculture, consists of Arabs, whom the fertile soil of Egypt has attracted from all the surrounding regions of desert. Lower Egypt has been peopled chiefly from Arabia and the shores of the Red Sea; Upper Egypt from the tracts of Africa which lie to the west and south. These cultivating Arabs, called Fellahs, retain much both of the features and character of their original tribes; an oval countenance, dark skin, large forehead, and small sparkling eyes. Neither have they, by any means, lost that pride, attachment to kindred and ancestry, and vindictive spirit, which distinguish the independent sheiks of the desert. On the whole, however, their conduct is much more settled and peaceable; indeed, in the large towns of the Delta, they have contracted dissolute and irregular habits, which seem to have prevailed from antiquity in that part of Egypt.

4937. *The Mamelukes* can claim little notice here, since the vigorous though cruel policy of Mohammed Ali has finally rooted them out of Egypt, and scarcely allowed them to find refuge in the remotest depths of the African continent. This extraordinary race, without kindred, without progeny, consisting of slaves imported from a remote country, and raised by the ill-earned favour of their masters to the most distinguished posts, formed the most prominent part of the Egyptian population. Their bravery, their splendour, their incessant

conflicts with each other and with the Turks, gave to Egypt a stirring and picturesque aspect, which no other part of the Ottoman empire exhibited. This sort of interest, however, very poorly compensated for the licence and disorder with which they continually afflicted the country, and for the interruption which they occasioned to all regular industry. Their extinction, therefore, may well be considered as a fortunate circumstance, and an omen of better times.

4938. *The Turks*, though the least numerous part of the population, are highly important, as having been always nominally, and as being now really, the masters of the country. In their general features they do not differ from those who inherit the rest of the empire. This small portion, however, the instruments of a despotic government, and who all either possess or aim at political power, do not afford a favourable specimen of the Turkish character. Among no description of men, perhaps, exists a more entire disregard of principle, than among the officers of a despotic government, who, in seeking to rise, are accustomed to resort to every means of violence or fraud. Spending most of their time in a gloomy retirement, they brood in silence over their dark machinations, and are continually revolving schemes for circumventing and destroying each other. The present Pacha has not much to boast in regard to the means by which he attained his actual supremacy; though he has certainly used it in a great degree for the benefit of those placed under his government. The troops by which Egypt is held in subjection have consisted chiefly of the turbulent race of Arnauts, or Albanians; but the Pacha has recently recruited his armies from all classes, particularly the Arabs, and even the negroes brought from the interior.

4939. *There are Jews, Greeks, and Armenians in Egypt*, but scarcely in sufficient number to be considered otherwise than as strangers settled in the country. The Jews are, in a great measure, supplanted by the Copts, a similarly oppressed race, in all those branches of traffic which usually devolve upon them in Mahometan countries.

4940. *The religion of Egypt* is the Mahometan, exercised with all its accustomed bigotry and intolerance. The Copts, who profess Christianity, are subjected to a special tribute or poll tax, and are excluded from all public employments, except those in which their exclusive qualifications render it absolutely necessary to employ them. They belong to the Eutychian sect, or that of the Jacobites, who differ in several respects from those professing the Greek religion, whom they regard with peculiar antipathy. The patriarch of Alexandria is considered as the head of this sect, the religion of which is also that of Abyssinia. The Copts have a considerable number of convents, particularly in Upper Egypt and the desert of the lakes of natron. Celibacy, however, is not absolutely required of the inmates. Pococke seems to have rated very low their practical religion, alleging that it consists merely in reciting their long services, without the least appearance of understanding or devotion, and in the strict observance of their frequent fasts. The Jewish rite of circumcision is retained.

4941. *The only language peculiar to Egypt* is the Coptic. Unlike the Oriental tongues, which appear little more than dialects of one original language, the Coptic has only faint analogies with any other. Its basis appears to be that of the ancient Egyptians, who in every respect were much insulated from the surrounding nations. It ceased to be spoken in the middle of the seventeenth century, and was supplanted by the Arabic, but it is still used in the liturgy and sacred books of the Coptic church. The Coptic differs from the ancient Egyptian only by the great admixture of Greek and Arabic, with some Latin, introduced during the successive domination of the Greeks, the Romans, and the Arabs.

4942. *Science and literature* throughout Egypt were lately at the lowest ebb. In their loftiest flights the Egyptians made no higher attainments than those of reading, writing, and casting accounts. Even these humble elements were disdained by the ruling powers, and only taught to a few of their domestic slaves, in order to fit them for transacting certain branches of business. Some improvisatory reciters of tales and verse, and some practitioners in astrology, formed the only members of the society who employed themselves in any thing that partook of intellectual exertion. Of late the Pacha has made great efforts to introduce European knowledge, particularly in the mechanical arts; printing-presses have been established under his direction, and even a newspaper has begun to be published.

4943. *Oriental manners*, by the gloomy seclusion which is inherent in them, greatly circumscribe what are called public amusements. The coffee-houses are much resorted to by the middling classes, who there spend their time in listless indolence, beguile it by occasional conversation, or by listening to the story-tellers, with which Arabia supplies all the countries on which it borders. The baths (*fig. 766.*) are places of habitual resort, both for health and pleasure, and the ablution, being accompanied with skilful and gentle friction, has been described as producing the most voluptuous sensations. The women here chiefly mingle in society with each other, and sometimes, as is alleged, find opportunities for intrigue. In the large towns, particularly of Lower Egypt, the *almés*, or dancing-girls, attract

numerous audiences by their exhibitions ; the grace and skill of which are variously reported,

766

EGYPTIAN BATH.

it is made of silk, and they cover the greater part of the face with a gauze veil. The usual head-dress is the turban, confined, however, to the higher ranks, and not allowed to be worn by the inferior classes, who merely cover their heads with the red woollen caps common all over Barbary.

4945. *The Egyptians of every class are temperate* in respect to food, and even the richest take no pride, nor perhaps much delight, in the luxury of the table. Their dishes consist of pillau, soups, stews, made particularly of onions, cucumbers, and other cold vegetables, mixed with meat cut in small pieces. The Barbary cuscusoo, which is a dish of this description, is not unfrequent. On great occasions, however, a whole sheep is placed in the middle of the festive board. The poorer classes content themselves with dipping their bread in oil or sour milk. The fasts in general are rigidly observed, and, during several of the hottest months, even the rich restrict themselves almost entirely to vegetable food. The use of opium, so general in Turkey, is superseded in a great measure by that of wine, in which the people in this country, even the Turks, indulge with much less scruple than those of other parts of the empire. The lower ranks make a preparation from the buds of hemp, which produces effects nearly similar to those of opium. They prepare also from barley a species of beer called *bouza*, to which, as an ancient Egyptian liquor, an allusion of Herodotus seems to apply.

SECT. VII. *Local Geography.*

4946. *The only division of Egypt* which can be considered as permanent or important is that made by nature into three great portions: — 1. Bahireh, or Lower Egypt, composed of the Delta, or territory on the coast, and including the great sea-ports of Alexandria, Rosetta, and Damietta. 2. Vostani, or Middle Egypt; where the Nile, though no longer spreading into branches, flows through a broad and fertile valley. In this quarter are situated Cairo the capital, the Pyramids, and Fayoum. 3. The Said, called partly also the Thebaid, or Upper Egypt, where the Nile, bordered by hills, flows through a narrow valley, containing not any great cities, but the most remarkable of the ancient edifices and monuments.

SUBSECT. 1. *The Delta, or Lower Egypt.*

4947. We shall begin our survey with *Alexandria* (fig. 767.), once the splendid capital of

767

ALEXANDRIA.

came the emporium of the most splendid and important of the then existing branches, that with India. The merchandise being brought up the Red Sea to Berenice, thence transported across the desert, was carried down the Nile to Alexandria, and thence distributed throughout the West. Alexandria, when it became the splendid and polished capital of the Ptolemies, almost superseded Athens as a literary metropolis. Even when subjected to the yoke of Rome, it was still the second city in the empire, and a grand centre of religious and political faction. It received a mortal blow from the invasion of the Saracens, who not only crushed the general civilisation of Egypt, but showed an early preference for Cairo, which connected them with Syria, Arabia, and their other Eastern kingdoms. Alexandria, however, still continued to flourish, so long as it was the channel of the Indian trade; but when this took the direction of the Cape of Good Hope, it sunk altogether, and exists now only as the medium of that limited intercourse, carried on between

but they are universally said to manifest a total disregard of decorum. The great seldom appear in public, unless on occasions of public procession; and their leisure is spent chiefly in the indolent seclusion of the haram.

4944. *The Egyptians are not much encumbered with dress.* The most common and seemingly the most ancient article of apparel, consists of a linen or cotton shirt with wide sleeves, over which is a brown woollen cloak or coat. The rich throw over all a fine white vestment, of the form of a surplice, which, being worn on solemn occasions, is supposed to have served as a pattern for the upper vestment of the Christian priesthood. Among the ancient Egyptians, linen was the only material used for stately and sacred apparel; but cotton now, to a great extent, supplies its place. Some of the poorer classes wear nothing but a blanket or wrapper of wool or cotton cloth. The dress of the women is nearly similar; but much of

Egypt, and one of the most celebrated cities of the ancient world. Even now it forms the link by which Egypt is united with the states of Europe. Its founder, the celebrated conqueror whose name it bears, chose this site as the most favourable for commerce; and it be-

Egypt and the Frank or Christian states. Its population, once estimated at 300,000, is dwindled so low, that some do not suppose the amount of inhabitants to exceed 5000. This, however, was doubtless too low, even before the late improvements of the Pacha, who has re-opened its water communication with the Nile, and established an arsenal, in which 1600 carpenters, and other artisans, are said to be employed. The present number is supposed not to fall short of 17,000. Notwithstanding this limited population, it presents a sort of epitome of the East. Its traffic draws to it, as to a common centre, the different classes, not only in Egypt, but in Syria, and all the Levant; who all retain their own costume and habits of life, without the least mixture or accommodation either to each other, or to the Europeans with whom they here meet.

4948. *The approach to Alexandria from the west is attended with some danger, on account of the flat and uniform character of the coast, which affords no objects to guide the mariner. The first landmark is formed by two turreted eminences called Abousir, or the tower of the Arabs. On a nearer approach, Pompey's pillar affords a more precise mark. There are no longer any traces of the celebrated Pharos, and even its site is doubtful. Two harbours are found, the old and the new; the former is commodious, though of somewhat difficult entrance; but it is exclusively reserved for the followers of the prophet; and Europeans must content themselves with the new harbour, which has a rocky bottom, and affords very imperfect shelter. The new Alexandria is built entirely outside the walls of the old city, to which it forms only a suburb. The traveller finds here nothing correspondent to those magnificent ideas which history had led him to form. Its aspect is mean, gloomy, and dirty; and it presents no striking or ornamental edifice. A number of granite pillars have, indeed, been brought thither from the ancient Alexandria; but they are only employed to adorn the interior courts of the principal houses. Immediately on quitting these modern precincts, however, all the grandeur of ancient Alexandria bursts upon the view. A vast plain is seen covered with its ruins; broken walls, fronts crumbled down, roofs fallen, battlements decayed, ancient columns, and modern tombs. These objects are intermingled with palm trees and nopals; while owls, bats, and jackals are the only living creatures to be met with. The remains may still be traced of those immense reservoirs which supplied the city with water, both for drinking and for gardens. The whole ground on which Alexandria stood was excavated to form them, and the waters of the Nile were at a particular season solemnly admitted into them. Only twelve now remain, which are sufficient for modern supply. From the extremity of the old city extends for upwards of a mile along the coast a range of tombs cut in the rock, each of which appears to have contained three bodies. These monuments, however, to which has been applied the name of Necropolis, or City of the Dead, have been almost entirely stripped of their contents, probably by the Arabs, inspired with the hope of finding treasure.*

4949. *Amid the general ruin which ancient Alexandria presents, three objects, remaining still entire, arrest*

CLEOPATRA'S NEEDLE.

POMPEY'S PILLAR.

the attention. The most celebrated is Pompey's pillar (fig. 768.). It seems clear that this title is modern, and that it was probably erected under one of the emperors; perhaps Diocletian. The general impression of its loftiness seems in a great measure owing to its insulated position on a level plain. Pococke does not reckon the height at more than 117 feet; and more modern estimates reduce it to 94 or 95. The pedestal, the shaft, and the capital consist each of a mass of the finest granite. Some travellers have described it as the finest column in the world as to workmanship; but Denon rates it much lower in this respect; conceiving that the only beauty is in the shaft, and that neither the pedestal nor the capital have any peculiar merit. The other objects worthy of particular notice are the two obelisks, fancifully called Cleopatra's Needles, of which one only (fig. 768.) is standing. They consist each of a single block of granite, about fifty-eight feet high, and are entirely covered with hieroglyphics, whence it has been inferred that they could not originally belong to a Greek city, but were brought down from some of the ancient capitals of Upper Egypt.

4950. *Alexandria is situated upon a long narrow ridge of land, separating the large lake Marcotis from the Mediterranean. This lake, of a very irregular figure, is upwards of fifty miles in length, and about twenty in its extreme breadth; but its western part, running parallel to the sea, is not above three or four miles broad. It was nearly dry when the English, in the campaign of 1801, admitted the sea into it, with the view of cutting off the French army from Cairo. It is still very shallow, and is passed in many places by fords, or upon causeways constructed by the Arabs. This lake, on the west and south, is surrounded by extensive deserts, abandoned to the Arabs, which insulate Alexandria from the inhabited part of Egypt. It was otherwise in ancient times. This tract formed then the Marcotic nome, within the precincts of which a considerable number of towns are enumerated by Ptolemy. Under the Roman empire, it was peculiarly crowded with convents, the inmates of which sought this as a retired situation, and as affording refuge from the persecutions of the Arians and other sectaries. The Emperor Valens, when he compelled the monks of Egypt to military service, is said to have levied in this district no less than 5000 recruits. Gratien le Père, in making a survey round the lake, found the territory every where covered with verdure and shrubs, and capable of culture. (Description de l'Egypte Moderne, ii. 10—20.) He found also the remains of cities, bearing indications of former importance. Among these were two, at a little distance from each other, on the neck of land between the lake and the sea. They appear to be those to which the ancients gave the common name of Taposiris, and are situated near that well-built column, called Koum Abousir, or Tower of the Arabs, which serves still as a beacon. They found also a large ornamented building, about 260 feet square, the destination of which seemed uncertain. In the valleys at the western extremity of the lake appeared the remains of four towns, distant a very few miles from each other. On the southern shore of the lake, near a spot called Abou-el-Kheyr, a double wall, large and well-built moles, and an extensive surface covered with fragments and rubbish, mark the site of an important commercial city, which was doubtless the ancient Marea. Nothing but culture, and the restoration of some of the old canals, seems wanting to restore fertility and population to this district. The great obstacle would arise from the Arabs, large bodies of whom are now in full possession of it, and whose habits of restless and desultory warfare would render it very difficult either to drive them back, or to fix them as cultivators.*

4951. *The province of Bahirch, the most western of the Delta, is traversed by the canal of Alexandria, which separates from the Nile, near Rahmanieh, a town of some magnitude, surrounded by a wall, and which the French, in 1801, converted into a fortified post, but were obliged to surrender it to the British army under*

General Hutchinson. This district is less watered than other parts of the Delta; and its chief product is cotton; the market for which gives some importance to Damanhour, situated in the heart of the province. In ascending the Nile, the canals derived from it cease, and cultivation is nearly confined to its immediate banks. Terane, affording the nearest point of water communication to the lakes of natron, exports from 3500 to 4000 tons of that article, chiefly to Marseilles. Woordaun is the most southerly port, whence vessels may reach Cairo in twenty-four hours.

4952. From Alexandria, the ridge of land between Mareotis and the sea extends eastward, and is prolonged by the lake Maadie till it reaches the castle of Aboukir, on the other side of which is the bay of that name. This line of coast, and this bay, are rendered illustrious by glorious events in British history; the victories of Nelson and Abercromby. Near the termination of Lake Maadie commences that of Edko, about fifteen miles long, communicating with the sea at its western point, but afterwards separated from it by a long line of barren coast composed of shifting sands. The path through them is pointed out to the traveller by columns at regular distances of half a mile, within each of which is placed, for his refreshment, a vase of water. After accomplishing this dreary journey, he arrives at Rosetta.

4953. Rosetta is situated at the mouth of the most westerly of the two branches of the Nile, which enclose the province of Garbieh, the only portion of Egypt which is now strictly Deltaic. While the canal of Alexandria ceased to be navigable, Rosetta became the only medium of communication for that city with Cairo and Upper Egypt; the goods landed at Alexandria being conveyed thither in boats. The town itself, being situated on the western bank, is surrounded by barren sand hills, which here form the boundary of the sea; but it enjoys on the other side the view of the blooming groves and rich gardens of the Delta. Rosetta is better built than Alexandria; the materials are of brick; and though the streets are, as usual in Egypt, narrow and gloomy, it has, on the whole, when compared with other Oriental towns, a neat and pleasing appearance. A considerable manufacture of striped and coarse linens is carried on; but its wealth and population (supposed about 15,000) are rather on the decline. Even the recent improvements, including the restoration of the canal of Alexandria, have rather tended to remove the commerce which formerly centred in it.

4954. In ascending the Rosetta branch, we come first to Metoubis, a large town, noted for the dissolute character of its inhabitants. Farther up is Foua, once distinguished as the entrepôt between Alexandria and Cairo. In consequence of the neglected state of the canals, it has been supplanted by Rosetta in this trade; and having greatly declined in consequence, only a small part of its wide circuit is now inhabited. The canal of Hashabi, derived from the head of the Damietta branch, and ending at the lake Bourlos, runs nearly parallel to that branch at the distance of five or six miles, and communicates with it by several channels. On this branch, at a village, still called Sa el Hadjar, are the ruins of the ancient Sais, once the residence of the Pharaohs, and the original seat of the colony by which Athens was founded. An enclosure of more than half a mile square, covered with rubbish and fragments of every description, still attests its ancient grandeur.

4955. Farther to the south, about ten miles east from this branch of the Nile, is Tanta, considered the most populous town of the Delta, though it does not contain above 10,000 inhabitants. It is chiefly supported by the pilgrims frequenting the tomb of Seid Ahmed el Bedaouy, who died in the thirteenth century, in such an odour of sanctity as rendered his shrine one of the most sacred in the estimation of Oriental devotees. There, at a particular season, an assemblage takes place, from Egypt, Barbary, Abyssinia, and even from Darfour, of not less than 150,000 persons. According to Eastern custom, trade is combined with superstition; and, when the acts of devotion terminate, a most extensive fair succeeds. A tumultuous and often disorderly festival closes the scene. The mosque, built by the Sultan Melik el Nasser, in honour of the saint, is one of the most splendid edifices of modern Egypt. This city is observed to be nearly at an equal distance from Cairo, Damietta, and Rosetta.

4956. The upper extremity of the Delta, consisting of the angular space formed by the junction of the two branches, is called Menoufieh, and forms one of the most agreeable and fertile portions of Egypt. It is traversed by a broad canal from one branch to the other; and though at each inundation it is completely overflowed, the waters do not remain so long, or prove so injurious to health, as in the lower districts. Menouf, the capital, is a town of some importance.

4957. In descending the branch of Damietta, we find it, like that of Rosetta, accompanied by a parallel canal, called, in its early course, that of Karinein, and afterwards that of Melyg. At this last village, it throws a branch across the Delta, and finally loses itself in the lake Bourlos. It appears to be the ancient Sebennytic branch, and, in fact, presents no appearance of having been formed by art. The shores of the Nile are still more fertile and beautiful here than on the opposite branch; and at the distance of every two or three miles occurs a large town or village, embosomed in palm trees. Among these may be noticed Benalhassar, to the north of which appear traces of a large ancient city, enclosed between two circular mounds, defending it against the inundation of the Nile; the site, as Pococke supposes, of the ancient Bubastis. The next place of importance is Abousir, a well-built town, where considerable remains give some support to the opinion of D'Anville, who pronounces it to be the site of Busiris, celebrated anciently for a magnificent festival held in honour of Isis. About five miles below is Semenhoud, a very flourishing town, carrying on an extensive trade, for which its situation upon the Nile, and connection by several channels with the canal of Karinein, and with Mahallet, is very favourable. It appears to contain 4000 or 5000 inhabitants. It is usually considered as the ancient Sebennytus; on which, indeed, Pococke observes, that the latter might be on the Sebennytic branch, but Boys-Aymé remarks, that the adjacent ruins actually extend westward as far as the canal of Karinein. On that canal, about four miles to the west of Semenhoud, is Mehallet, considered the capital of the Delta, and the most industrious and manufacturing town in all Egypt. The chief fabrics are those of silk, and particularly a sort of linen handkerchiefs with silk borders, used in the baths, with which this city supplies the whole country. The manners, however, appear to be very licentious; disorderly females are particularly numerous, and are allowed a degree of liberty which is denied them in other Egyptian cities. Farther to the north, on the same canal, are the ruins of Bahbeys, the most splendid in the Delta. In the centre of an enclosure of brick, about 1200 feet by 800, are the remains of a grand edifice, 160 feet by 100. It consists of a confused mass of granite, among which are distinguished trunks of columns, and the remains of capitals with the head of Isis, all covered with sculptures in bas-relief most carefully executed. These fragments consist of the finest red granite brought from the quarries of Syene. Farther down on the Nile is the large town of Mansoura, celebrated in the history of the crusades for two great battles, in one of which St. Louis was defeated and taken prisoner. Lastly, four or five miles above the mouth of the river is the city of Damietta, which, though on the eastern bank, belongs properly to the interior Delta, as forming the chief market for its productions. Rice of excellent quality, and in great abundance, is grown in its vicinity, and, with coffee brought up the Red Sea, forms the staple article of export to Syria and the Levant. Tobacco and soap are imported from Syria; and luxuries of all kinds from Constantinople. The town is large, but ill built and without ornament. It is chiefly inhabited by fishermen and janissaries, and devoted to trade, of which a great part is contraband. The people are said to be the very worst in all Turkey, and to have a particular hostility to Christians, which seems to have descended from their ancestors in the time of the Crusades. It is such that a European cannot appear in the streets, without danger of being insulted. Damietta has no harbour; vessels anchor in a road by no means remarkably safe, at the mouth of the river, and the goods are brought up in boats.

4958. The base of the Delta, or the coast between Rosetta and Damietta, remains to be described. It consists, for eight or ten miles inland, of desert and marshy sand, and more than half its breadth is filled by the lake Bourlos, about twenty miles in length, and six in breadth. Like Mareotis and Edko, it is shallow, and separated from the sea by a narrow ridge, penetrated only in one point by a channel, which seems to be that of the ancient Sebennytic branch. This wild tract, the ancient Etearchis, is described in history as having repeatedly afforded refuge to the kings of Egypt, when driven from the throne by foreign invasion or by insurrection. It is still inhabited by a race of bold and rude fishermen, who hold themselves nearly independent of the national authorities.

4959. *The last division of Lower Egypt*, and one of comparatively little modern importance, is the province of Charkieh, situated to the east of the Damietta branch, and consequently beyond any channel which can now be considered as the Nile. In ancient times, however, it was traversed by two great branches, the Tanitic and Pelusiatic, flowing into the lake Menzaleh. Their channel may still be traced. M. Malus traversed the whole Tanitic branch, now known under the name of the canal of Moez, from the village about thirty miles north of Cairo, at which it strikes off from the canal of Damietta. In the lower part it changes to San, probably a corruption of the ancient Tanis. It is navigable along its whole length for small barks, and, when the Nile is high, even for vessels of some size. It would be easy for an active government to restore it to all its former importance. Even now it affords large means of irrigation, and consequently supports a considerable culture and population. The upper banks are exceedingly fertile, and even the lower contain many fine villages, though they are kept in perpetual alarm by the frequent incursions of the Arabs. Not only is every village fortified, but from place to place along the Nile are erected towers, without entrance or windows; and into these strong-holds, on the approach of a band, the inhabitants with their most precious effects are hoisted up by ropes, and kept till the danger be past. Eighteen miles below the commencement of the canal, Malus found immense ruins, which, contrary to the opinion of Pococke, he supposes to be those of Bubastis. Enormous masses of granite, more or less mutilated, and covered with hieroglyphics, were heaped together in an astonishing manner.

4960. *The course of the most easterly or Pelusiatic branch* may also be still traced, though much more imperfectly; the cultivation is there much inferior, and the exposure to the Arabs greater. The most important points on this line are Belbeis and Salahieh, maintained as military posts on the Syrian frontier. The southern district between the course of these canals and Cairo, called the province of Kelyoubieh, is tolerably watered, and abounds in cattle. From this circumstance, as well as its vicinity to the head of the Red Sea, we should presume it to be the Goshen of the Israelites. All the towns in this part of Egypt being built upon huge masses of unburnt brick, with the view of defending them against the inundation, we may thence account for the severe and oppressive labours to which that people were so cruelly doomed.

4961. *The lower part of the province of Charkieh* is marshy and sandy, like all the rest of the Egyptian coast. It is traversed by the Menzaleh, a broad shallow lake, separated from the sea by a narrow ridge, similar to those of Mareotis and Bourlos, but much more extensive. It is sixty miles in length, and twenty-five in breadth, divided by a projecting peninsula. It abounds with fish; and the fishermen who inhabit its coasts, and the islands of Matharieh, near the above peninsula, are of the same savage, rugged, and independent character as those dwelling in the vicinity of the lake of Bourlos. It has two openings into the sea, one of which corresponds with the canal of San, the current of which is seen distinctly running across. On this peninsula is the town of Menzaleh, and six miles up the canal are seen the ruins of Tanis, the Zoan of Scripture, once a magnificent residence of the Pharaohs. There are still several Corinthian obelisks and capitals of columns, fallen to the ground, and particularly some very fine antique earthen vessels, of which the glazing remains.

SUBSECT. 2. *Vostani, or Middle Egypt.*

4962. After passing the angle formed by the two divergent branches of the Nile which form the Delta, we ascend to what is called *Vostani, or Middle Egypt*. Here, about a league to the east of the river, appears the village of Matarieh, to the north of whose site are the ruins of the celebrated Heliopolis, the On of Scripture, and the great seat of Egyptian learning. Though almost in complete ruin, it has still some interesting antiquities; an obelisk sixty-seven feet high, several sphynxes, and large stones covered with hieroglyphics.

4963. *Cairo the Great* (fig. 769.), or, as it is popularly called, *Grand Cairo*, attracts the

CAIRO.

attention of the traveller sailing upwards, and he gazes with wonder on the numerous minarets which distinguish the capital of Egypt and of Africa. Throughout that continent and Arabia, Cairo is considered as the queen of cities, as the city without a rival; its splendour forms one of the great themes of Eastern romance. Old Cairo appears to be of very great

antiquity, being built on the site of the fortress of Babylon, which derived that name from being assigned as a residence to some Babylonish captives, brought, probably, by Sesostrius. The new city, however, which has alone risen to the rank of a capital, was founded in 973, by the first of the Fatimite Caliphs. Saladin surrounded it with strong walls and magnificent gates; and it soon eclipsed the splendour of the now neglected Alexandria. Europeans, however, in the aspect of Cairo, find little corresponding to the ideas raised in them by Eastern description. The streets are narrow and winding; the principal one, which traverses the whole area of the city, would be considered in Europe as a mere lane. As they are not paved, a most disagreeable dust is raised by the crowds of men, dogs, camels, and asses, which press through them. The houses are two or three stories high, which is not usual in the East; but almost all their light is derived from interior courts, and they present to the street only a mass of dead wall, which makes them appear like prisons. There are, however, several extensive open squares, round which are built the houses of the principal persons. Into these, when the Nile rises, the water is conveyed by a canal called the Kalisch, and converts them into lakes, which, being traversed by pleasure boats, present at this period a gay scene. On the retiring of the waters, these lakes

become so many plains of mud, which is soon completely dried, and covered with excellent vegetation. The chief ornament of

770

MOSQUE OF SULTAN HASSAN.

Cairo consists in its gates, several of which are built in a style of simple magnificence, and in its mosques, of which that of Sultan Hassan displays all the splendour of Saracenic architecture (*fig. 770.*). Many of the baths have their interior very richly ornamented. The tombs of the Mamelukes, also, built of white marble, and with painted or gilded domes, are very beautiful. The Pacha resides in the citadel, where he has magnificent apartments.

4964. *Cairo, according to Pococke, is seven miles and a half in circuit, and covers as much ground as Paris; but as a great part is occupied with gardens and empty spaces, it cannot, according to Volney, contain more than 250,000 inhabitants. Browne, however, reckons them at 300,000, Jomard at 260,000, Balbi at 380,000. The police is maintained with great strictness, each street being shut in at night with gates, and guarded by several janissaries. Notwithstanding the gloomy exterior presented by the houses even of the great, the interior of these mansions possesses great magnificence. Space and coolness are especially studied. They present wide halls, high domes, verandas, rich sofas and carpets, walls adorned with sentences of the Koran, and with foliage and flowers. The habits of life are recluse; the only great festivals are those of marriage and circumcision, when families bring all their wealth into full display.*

4965. *Cairo is perhaps the greatest thoroughfare of any city in the world. All the merchandise which passes between the Mediterranean on one side, Upper Egypt and Arabia on the other, must be conveyed through it. Its land communications are perhaps still more extensive, as in this respect it forms the grand link between the Asiatic and African continents. With the interior of Africa, in particular, a vast trade is carried on; and slaves are imported in very great numbers, to be exposed in the markets of Cairo. The sale takes place in the open street, where they are subjected to the most minute examination of the purchaser. According to Sonnini, the price did not exceed from eight to twelve pounds a piece. The amusements of Cairo are generally of a very humble nature; tumbling, rope-dancing, and juggling are publicly performed in the few open spaces which the city affords. For the amusement of the rich, there are improvisatory poets, both male and female, who are said to display occasional talent, though their medicant muse is too apt to employ itself chiefly in fulsome praises of its patrons.*

4966. *Old Cairo, originally of much smaller extent than the new city, is now uninhabited through a great part of its site. It is chiefly occupied by Copts, for whom it forms a sort of capital. They have twelve churches in it, some of them large and sumptuous; and their patriarch has removed his residence from Alexandria to this place. It contains also the ancient granaries, bearing the name of Joseph, which are still used for their original purpose. The place is distinguished also by an immense and skilfully contrived machine, by which the water is raised into an aqueduct for the supply of the castle of New Cairo.*

4967. *The last appendage of this great city is Boulak, its port on the Nile, distinguished by the bustle of trade, and boats without number ascending and descending. It is of considerable extent, but does not present any remarkable object, except very fine baths. There is an institute for 100 pupils, maintained at the expense of the Pacha.*

4968. *The pyramids next claim our attention. Scarcely has the traveller ascended above Cairo, when he comes in sight of those far-famed structures, to which the world presents nothing comparable, and which cannot be contemplated without the most awful emotion. These mighty monuments seem to look with disdain on every other work of human art, and to contend with nature herself. They form an uninterrupted range for about twenty leagues, on a declivity sloping down towards the river (*fig. 771.*); but the first two, the pyramids of Cheops and Cephrenes,*

771

THE PYRAMIDS.

from the union of magnitude and skill in their construction, have almost exclusively attracted the attention of the world. The first or great pyramid (*fig. 772.*) is 693 feet square, covering upwards of eleven acres, and rising to the amazing height of 599 feet. In an age when machinery was imperfect, and every thing was done by manual labour, it

is said to have employed 100,000 men for twenty years. The destination of this and all similar colossal structures appears evidently to have been sepulchral. The original entrance,

as well as that into each successive gallery and chamber, is

GREAT PYRAMID.

studiously concealed, by being made exactly similar to the surrounding wall; and it is carefully barred by huge blocks of granite, which cannot be cut through without great labour, but which, to the experienced eye, afford a sure test of the sought-for entrance. The opening of the first pyramid has been long ago effected; it is ascribed to the Caliph Mohammed, in the ninth century.

772

ENTRANCE TO THE SECOND PYRAMID.

Several long galleries have been traced, leading to two chambers, the largest of which is 32 feet by 16; and contains a sarcophagus now empty. The second pyramid, or that of Cephrenes, is about 400 feet high. It had defied all attempts to enter it, till the enterprise was recently achieved by Belzoni. His attempts were long unsuccessful; but at length, by the position of the block of granite placed to bar the entrance, he was enabled to trace its real direction (*fig. 773.*). At the end of a long passage, he found a chamber 46 feet by 16, in which was a sarcophagus containing a small quantity of bones. These bones were supposed by him to be human; but on being brought to London, and examined by the Royal College of Surgeons, they were pronounced to be those of the bull, that base object of Egyptian worship. Indeed, it seems every way

improbable that structures so stupendous should any where, and most of all in Egypt, have been undertaken without a religious impulse and motive.

4969. About three hundred paces from the second pyramid is the gigantic statue of the *Sphinx* (*fig. 774.*), that singular object, in the delineation of which Egyptian art so much

773

SPHYNX.

delighted. It has been overthrown, and, till of late, only the head, the neck, and some part of the back, were visible above the sand. The length, from the fore part to the tail, was found to be 125 feet. Mr. Belzoni, having succeeded in clearing away the sand, discovered most singular appendages, consisting of two temples, one of which it holds between its legs, and the other in one of its paws.

4970. This part of Egypt, reaching even above Benisuef, though it does not present the same wide-spread fertility as the Delta, is by no means destitute of the benefits of irrigation. The inundation extends for a considerable space along its western bank; but, from the peculiar slope of the ground, it cannot be diffused without some difficulty. Immediately on the Nile, the ground is considerably higher than the river, whose

waters must be raised with wheels moved by oxen, and with other complicated and laborious machinery. Farther on, the level descends, till it falls even below that of the Nile; but the river must be considerably swelled before its waters can reach across the high separating ridge. In seasons of low inundation, therefore, it is almost entirely deprived of water; and, even in average years, does not obtain nearly the quantity which might be advantageously employed. This evil might be entirely remedied by an active government; but in the present neglected state of the canals, the country suffers severely from it. In one part, indeed, the tract along the foot of the mountains is watered by a natural derivation from the Nile, called the canal of Joseph, the principal branch of which passes into Fayoum, while another reaches even into Lower Egypt. — (*P. D. Martin, in Descript. Egypte, Etat Moderne, ii. 197—202.*)

4971. Except the pyramids, this tract contains few remarkable objects. Along the Nile is a succession of tolerably large, but ill-built villages. Benisuef, somewhat handsomer than the rest, is a brick town, containing a considerable manufactory of coarse carpets. Near Metrahenny appear extensive though faint traces of the ancient Memphis, the capital of Egypt at the era of the construction of the pyramids.

4972. To the west of Benisuef appears the province of Fayoum, truly remarkable by its physical character, even in Egypt. An opening in the elsewhere continuous Libyan chain, aided by a vast artificial cut, has let in the river upon this tract, and converted it from a desert into the most fertile portion of this most fertile land. After traversing the territory in numberless canals, this branch forms the lake of Fayoum, which antiquaries no longer hesitate in identifying with the ancient Moeris. Being only, indeed, about thirty miles in length, and four or five in its general breadth, its extent is much inferior to that ascribed to it by the ancients, who represented it as resembling a sea. Both Martin and Jomard, however, who carefully examined its environs, were convinced that the present lake may be considered as occupying little more than the bottom of its former bed. The surrounding tract bears every appearance of having been abandoned by the waters.

It is incapable of culture, covered with sand, lagoons, saline crusts, and some shrubs of a weak vegetation. On the northern side, Martin saw a number of detached hillocks, bearing every mark of having once been islands, and is convinced that the lake formerly extended to the foot of the mountains which bound the prospect in that direction. It has been deemed impossible, considering the vast extent of the hydrographic features of this province, that they should, as antiquity records, have been the work of art. To have turned the waters of the Nile into this lake would, it is urged, have required the removal of 3,200,000 cubic yards of earth or rock. Reflecting, however, on the stupendous magnitude of the works executed by the ancient sovereigns of Egypt, we are reminded that, among all their wonders, this has been celebrated as the most wonderful. To Jomard, both the passage through the mountain, and the channel of the Bahr Belama, by which the lake was fed, appeared to display evident marks of artificial excavation. The Mœris formed the grand sluice of Egypt, which drew off the waters when they were superabundant, and afforded a supply when they were deficient. Some of the dikes which were employed in alternately retaining and letting out the water, and which still remain, present indications of an extent of labour truly stupendous.

4973. *Fayoum* appears to enjoy a pre-eminence, as to soil and products, over every other tract of Egypt. According to Jomard, the eye is never weary of contemplating its smiling fields, watered by a thousand canals, which maintain a perpetual freshness, and whose aspect forms the most striking contrast with the bordering deserts of Libya. Besides yielding rice and grain in equal abundance with the other provinces, it abounds in dates and flax, and produces almost exclusively fine fruits. Here the olive and the vine come to perfection, and the plantations of roses afford materials for a perfume highly valued throughout the East. The objects, however, for which this country has been chiefly visited by travellers, are its antiquities; for, besides the lake of Mœris, tradition assigns to it the famous Labyrinth of Egypt, which held so high a place among ancient wonders. Great difficulties, however, have occurred in tracing its site. Attention has been mainly attracted by an edifice situated about a league from the western extremity of the lake, in a tract now uninhabited, but where the ruins of a number of large villages have been lately discovered. The temple is stated by Pococke at 165 feet long, and 80 broad; but these dimensions appear to be those of the whole enclosure; for the edifice itself is described by Jomard as only 90 feet long, by 50 broad. There are some large apartments, adorned in the Egyptian style, though without any particular magnificence; but the most remarkable feature is a long narrow passage, or rather hole, ending in a cell 6 feet by 4. Jomard penetrated into it, and, finding it extremely sonorous, and skilfully adapted for the conveyance of the voice along the passage, infers that it was destined for the emission of a pagan oracle. Upon the whole, his observations and those of Belzoni (*Researches*, p. 384, 385.) seem clearly to show that neither in its magnitude, the disposition of its apartments, nor in any other feature, does this structure bear the least resemblance to the famous temple of the Labyrinth, for which, as the most entire and conspicuous remaining in Fayoum, it has long been implicitly taken. Jomard is generally supposed to have been more successful in another quarter. About six miles south of Medinet el Fayoum is a lofty brick pyramid, near which is an extent of ruins about 900 feet in length, and 400 in breadth. This whole space is covered with heaps of hewn stones, and various materials confusedly piled upon each other; though, on penetrating through this rubbish, some vestiges of walls are discovered. The enclosing wall on the side of the pyramid, and some little towers with which it was flanked, are the parts best preserved. Upon the whole, he observes that there is little in these remains to justify the pompous descriptions of the ancients, and cannot but express his astonishment that an edifice which, in the time of Pliny, thirty-six centuries from its foundation, remained perfectly entire, should since his time have been so completely destroyed. He supposes that the mass of the building must have been buried in the sand, and that the visible ruins are only those of its terraced roofs. There are some minor discrepancies; but, upon the whole, the vicinity of the pyramid, the position, the extent, and, above all, the absence of any other ruins within the region, which can at all correspond with the magnitude which the ancient descriptions assign, seem to leave us no alternative but to accept this as all the trace that will ever be found of the famous labyrinth of Egypt.

4974. *Amid the peculiar interest of the antiquities of Fayoum*, we had almost forgotten its modern dwellings. Medinet, the capital, however, is a fine town, built near the ancient Arsinoë, and of materials taken from its ruins. All that remains of the latter city is a mere heap of stones and rubbish; but whatever was fine in its columns and fragments is found irregularly inserted into the modern town. Medinet is situated upon the canal of Joseph, immediately before its separation into nine branches. The place is flourishing, contains some fine mosques, and is surrounded by beautiful gardens. The population is reckoned at 5000; a considerable part of whom are Christian.

4975. *Returning to the Nile*, and ascending above Benisuef, we pass through a tract, still very fertile, more varied and beautiful than the Delta; and where towns and villages occur every where at short intervals. Minyet, or Minget, capital of an extensive district, is a very pretty town, whose mosques are adorned with magnificent columns of granite and porphyry, of Greek architecture. To the west of the city, there are also vestiges of antiquity, entirely, however, converted into rubbish. The markets of Minyet are crowded, its population considerable, and it contains a manufactory of those earthen vessels for cooling water, which are so much valued in Egypt. To the west of Minyet is a large lake, or rather swamp, called the Bathen. It extends southward as far as Achmounein, and is of large and vague breadth, but seldom more than a foot or two deep. It seems to be on very slender ground that Sicard and D'Anville identify this inundated surface with the lake of Mœris.

4976. Above Minyet, the Arabic chain on the east of the Nile is pierced by numerous and most extensive ancient quarries, which have converted it from a sloping face to one of perpendicular rock, and have caused it in one place to present the appearance of an immense fortified castle. The rocks are also excavated into a number of those tombs, to which the ancient Egyptians devoted their labour and their art. These are particularly remarked at a place called Zayonet el Mayetain, or the Village of the Dead, and farther up, near Benihassan. The interior, as in those on a greater scale at Thebes, is adorned with numerous hieroglyphics, and with paintings, which exhibit the most brilliant colours, and represent various particulars of the manners and domestic life of the ancient Egyptians.

4977. *We now approach antiquities of a more classic character.* As yet, Egypt has pre-

775

RUINS OF ANTINOË.

4 F

sented to us only monuments which astonish by their immensity, and by the incredible labour bestowed on them; but in those to which we allude, that vastness is combined with a high and peculiar architectural skill. About ten miles above Minyet, we pass between two of these grand masses of ruins. On the eastern bank are those of Antinoë (*fig. 775.*), bearing a very different character from any others which Egypt now presents. They are remains of a Greek city, founded by Adrian, with the design of uniting the elegance of classic architecture with the colossal

grandeur of the Egyptian. In order to produce the same impression of grandeur, he made streets extending the whole length of the city, and forming one continued and immense colonnade. Here are no colossal statues, obelisks, palaces, temples and tombs of gigantic dimension; but amphitheatres, triumphal arches, thermæ, and hippodromes. The ruins of Antinoë extend about a mile in every direction, amid a wood of date trees, above which its columns are seen towering; they form a grand picture, to which the lofty and naked Arabian rocks form a noble background. The theatre with its portico, the hippodrome, the principal street, a triumphal column raised to Alexander Severus, a triumphal arch, and a great gate, may still be traced. The piles of fragments and rubbish are of very uncommon magnitude. Shekh Abade, close to Antinoë, is a pretty large village, inhabited by Arabs, and surrounded with considerable plantations of sugar cane.

4978. *The other side of the river* presents the site of *Hermopolis Magna*, where Greek, Roman, and Egyptian ruins are mingled on a most extensive scale. Their length is about 7000 feet, their breadth 5000, and their circuit nearly three miles. The greater part of this space is covered with rubbish, detached stones, and fragments of columns. The only part which remains entire is the portico of the great temple, a most magnificent monument, rivalling the greatest of which Egypt can boast. It consists of twelve columns, but there are indications that twenty was the original number. The whole length is 120 feet; the architrave and frieze consist of five stones which are 20 feet long; and the single stone which remains of the cornice is 34 feet long. The shafts are 80 feet 10 inches in diameter, and 60 feet high.

4979. *At one extremity of these ruins* is situated *Achmounein*, a large and populous village, containing 5000 souls. Its territory, of about ten miles in breadth, between the river and the mountain, is under peculiarly high cultivation, being watered by numerous channels from the Nile and the canal of Joseph. Six miles above is *Mellawi*, also a neat and considerable town, having some manufactures, and exporting a good deal of grain to Mecca. Considerably higher is *Moufalout*, still more important from its extent and beauty, and which combines considerable manufactures of cloth with a trade in grain.

SUBSECT. 3. *Said, Thebaid, or Upper Egypt.*

4980. After *Moufalout*, Middle Egypt, the *Vuestani* or *Vostani* of the moderns, the *Heptanomis* of the ancients, terminates, and *Upper Egypt*, the *Thebaid* of the ancients, the *Said* of the moderns, commences. Egypt, which in the Delta was a wide inundated plain, which in the *Vostani* became a broad well-watered valley, is here little more than a mountain glen. Still, however, though less fertile and populous, it presents objects which, in interest and grandeur, surpass all the most remarkable in the lower and more level tracts of this extraordinary country.

4981. *Siout* is the first large town of Upper Egypt, which has not here assumed the narrow and contracted aspect peculiar to other parts of the Thebaid. On the contrary, this part of the valley of the Nile is upwards of twelve miles broad, though the river itself has not a breadth of more than 750 feet. *Siout* has a large district attached to it, which is very fertile in wheat, barley, dhourra, flax, and contains very fine gardens. The population is reckoned at 200,000, and the taxes at 40,000*l*. The city is large and populous, and carries on a considerable trade in linen cloth, earthenware, natron, and opium. This also is the point from which the caravans of Nubia and Darfour usually depart, and to which they return. Behind the city are a number of country houses erected by the Mamelukes, partially fortified. There are no remains of ancient edifices, though trunks of columns adorn the houses of several of the principal inhabitants. The face of the mountain, however, which is about two miles to the west, is excavated into grottoes throughout its whole extent. The greater part of these are ancient Egyptian tombs, lavishly adorned with hieroglyphics and paintings. Others are the retreats of Christian hermits, who, in the first centuries, were induced by a mistaken devotion to bury themselves in the savage recesses of the Thebaid. Small niches, stucco facings, a few rude paintings representing crosses, and some Coptic inscriptions, are all the traces they have left of their abode in these cells. It seems ascertained that *Siout* stands on the ground formerly occupied by the city which, in the time of Ptolemy, was called *Lycopolis*.

4982. *The first great monuments of the Thebaid* which strike the eye of the traveller are those of *Anteopolis* (fig. 776.), situated at the village of *Kau*, or *Gau*, on the western bank of the Nile. Traces are here

RUINS OF ANTEOPOLIS.

found of a temple 230 feet long, and 150 broad; but the only part at all entire is the first portico, about 50 feet high. The columns produce a peculiar effect, their capitals being composed of the leaves of the date palm tree, and being surrounded with groups of those trees, of which they present a faithful copy, and with which they are confounded. The village of *Kau* is poor, and the surrounding territory indifferently cultivated. Close to it is a mountain remarkable for the immense excavations made in it for the purpose of building; one of these quarries is stated by Jomard as 600 feet by 400.

4983. After passing the two small towns of *Tornieh* and *Tahta*, we come to *Akhmym*, or *Echmim*, a neat town, with wide streets, though built only of unburnt brick, and containing several handsome mosques with lofty minarets. The population is estimated at 10,000; the full half of whom are Christians, and even the Sheiks have been suspected of Christianity by the government of Cairo. Commerce and agriculture, which always flourished here, continue prosperous; but its fine manufactures of linen are changed into those of cotton, and its elaborate works in stone into earthenware, which is transported, however, throughout all Egypt. Near it are the remains of two great temples, evidently part of the city called *Chemnis* by the Egyptians, and *Panopolis* by the Greeks.

4984. About eighteen miles south-east of *Akhmym* is *Girge*, or *Girshe*, the capital of Upper Egypt. Notwithstanding this proud distinction, it is not so large as *Siout*, being about the size of *Moufalout*, *Minyet*, and other secondary towns. Neither is it particularly handsome; but it is situated in a very fertile country, and all provisions are extremely cheap and abundant. During Denon's residence, 3000 Frenchmen were

quartered there for three weeks, without causing the least appearance of scarcity. The name is derived from an ancient monastery dedicated to St. George, pronounced here Girge.

4985. Near this city, five miles west from the Nile, on the canal of Joseph, and on the borders of the desert, the French discovered the remains of *Abydos*. This city was accounted by the ancients the second in the Thebaid; it contained a palace of Memnon, and the tomb of Osiris: works by the same hands which constructed those of Thebes. It had the misfortune, however, of being situated at the end of a long valley crossing the mountains, and through which the sands of the boundless western deserts were blown in upon it. Plantations, canals, and all the expedients which were employed during the prosperous times of Egypt to preserve Abydos from the encroachments of these sands, could not avert its destiny. Not only is it in ruins, but these ruins are almost buried. They may be entered, however, by the roof, where spacious interior apartments are found entire, and adorned with hieroglyphics and paintings, of which the colours are as fresh and brilliant as in the first day they were painted. Jomard particularly admired the lower part of a kneeling statue, of human size, in black granite. This fragment appeared to him perhaps the most beautiful that had ever come from the Egyptian chisel. Only two miserable villages now exist on the site of these great ruins.

4986. In ascending above Girge, the traveller passes by *Farshout*, a poor-looking town, containing, however, a considerable manufactory of sugar; and *Hen*, a long village, on the site of the ancient Diospolis, but presenting no remains of it. He then arrives at *Kene*, a town of some consequence, and remarkable for its fabric of earthen vessels. Pococke met large floats coming down the river, containing jars placed on a framework of twined palm branches, and thus raised stage above stage. Four long poles, like oars, were employed to direct the boat. The curious observer, however, hastens across the river to *Dendera*, two miles to the west of which are the ruins of *Tentyra*, justly ranking with the most remarkable of which Egypt can boast.

4987. The ruins of *Tentyra* cover a space of about a mile in length, and half a mile in breadth. The greater part of this ground is overspread with mere fragments and rubbish; but one part presents a temple (*fig. 777.*), which, though it cannot cope in grandeur with the

777

PORTICO AT DENDERA.

monuments of Thebes, surpasses in art and skill every thing else in Egypt. The spectator feels, as it were, transported into a fairy scene of enchantment; he sees monuments which have no affinity with the products of Grecian architecture, or with those created by the taste of modern Europe, yet which present exquisite beauty, and a magnificence the most imposing. The length of

the temple is 265 feet, and 140 broad. The portico, above all, inspires astonishment by the grandeur and singularity of its aspect. It consists of six columns, the capitals of which are formed of colossal heads of Isis, the deity in whose honour this temple appears to have been reared, and to whom almost every thing in it has reference. The height of the portico is sixty feet; but that of the general wall of the temple not more than seventeen. The whole is entirely covered over with those mystic, varied, and often fantastic sculptures (*fig. 778.*), which characterise Egyptian architecture; hieroglyphics, groups, figures of deities, and sacred animals; the whole of the manners and mythology of ancient

778

PART OF A SCULPTURED WALL AT DENDERA.

779

INTERIOR OF TEMPLE AT DENDERA.

Egypt embodied. The workmanship is of the most elaborate execution, and highly finished. The interior (*fig. 779.*) of the portico is equally beautiful and striking. It composes a rectangle 120 feet by 67, and is supported by 24 columns, ranged in six rows of four deep. The ornaments are equally profuse and varied; but the roof formerly presented a feature which strongly fixed the attention. Divided into twelve compartments, it exhibited, by a variety of mythological figures, many of which coincide with those employed by the Greeks, a representation of the twelve signs of the zodiac. This remarkable monument has recently, upon principles which we shall not now discuss, been detached from the roof, and conveyed to Paris.

4988. *From the contemplation of these monuments* has arisen a question, certainly of deep interest in the history of art. It was never doubted that they had been erected by the early and native kings of Egypt, until Visconti, in his notes to Larcher's edition of Herodotus, endeavoured to prove them to be of much more recent date. The structure of the zodiac appears to indicate, that the commencement of the Egyptian year answered then to the sign of Leo, which would take place between the years 12 and 132 of the Christian era. This opinion is strengthened by a Greek inscription on the front of the cornice, first observed by Denon, and since copied by Mr. Hamilton, in which the pronaos is dedicated to Aphrodite, and the reign of Tiberius assigned for the date of the dedication. These reasons appear irresistible to Dr. Young, in his very learned dissertation on the antiquities of Egypt, in the *Supplement to the Encyclopædia Britannica*. On the other hand, Jollois and Devilliers urge, with a good deal of plausibility, that the erection of edifices thus entirely in the style of a conquered people, was quite foreign to the custom of the Romans, and that no similar instance can be adduced; while it seems impossible that a structure of such extraordinary magnitude and splendour could have been erected at such a period, and yet no record of it have been preserved in history. The dedication of the *pronaos* to Aphrodite, who is essentially the same with Isis, might have been prompted in that ambitious people by the desire of taking possession as it were of so magnificent a monument, and marking its front with the name of one of their emperors. They conceive that the edifice was erected under the later kings of Egypt, at a period when Egyptian art had risen, through successive stages, to its highest pitch of perfection.

4989. About ten miles above Kene and Dendera is *Keft*, the ancient Koptos; and higher still, *Kous*, the ancient Apollinopolis Parva. These, under the Ptolemies, and even under the Saracen princes, were places of great wealth and importance; for opposite to each is an opening in the mountains, through which is the caravan route to the ancient Berenice and the modern Cosseir. Through the loss of the trade to India, and the transference of that of Arabia and Suez to Cairo, this communication is now become of very little importance. Even the few modern caravans which proceed in this direction take their departure from Kene. Both Keft and Kous, therefore, are now poor towns, containing many uninhabited houses, and ruins that belong to all the ages of Egyptian history. Kous, in particular, presents the portico of an ancient Egyptian temple, of which the entablature only appears above the rubbish, but with a beauty almost rivalling that of Dendera. These towns are inhabited chiefly by Christians, and are surrounded by gardens, which appear beautiful to those who have newly passed the desert.

4990. Above Kous, for some miles, is a sandy plain, after which the rocks approach close to the river. Beyond a projecting point, however, the view opens upon a scene to which the world presents nothing parallel; an extensive plain, covered almost throughout its whole extent with the most amazing ruins. This is *Thebes*; the city of the hundred gates, that mighty capital, the foundation of which is unknown to history, and belongs only to the dim ages of traditionary poetry, whose report would have been denounced as fabulous, had not such mighty monuments proved that it fell short of the reality. This work of the first age of the world almost eclipses, as to grandeur, all that art and power have since produced. At first, the observer sees only a confusion of portals, obelisks, and columns, all of gigantic size, towering above the palm trees. Gradually, he is able to distinguish, on the eastern or Arabian side, the palaces of Karnac and Luxor; on the western or Libyan side, Medinet Abu, the Memnonium, and the tombs cut in the mountain behind.

4991. *Karnac* (*fig. 780.*) surpasses in grandeur every other structure in Thebes and in

780

RUINS OF KARNAC.

the world. The French engineers on horseback were an hour and a half in performing its circuit, which, they therefore conceive, cannot be less than three miles. On the north-east entrance the Egyptians appear to have lavished all their magnificence. The approach is by a long avenue of sphynxes, the largest of any in Egypt, leading to a succession of portals with colossal statues in front. These structures

are distinguished, not only by the grandeur of their dimensions, but by the variety of the materials. A calcareous stone, compact like marble, a variegated siliceous limestone, beautiful rose-coloured and black marbles of Syene, have been severally used. "Most points of view present only the image of a general overthrow, rendering it difficult to distinguish Karnac as a series of regular edifices. Across these vast ruins appear only fragments of architecture, trunks of broken columns, mutilated colossal statues, obelisks, some fallen, others majestically erect; immense halls, whose roofs are supported by a forest of columns, portals and propylæa, surpassing in magnitude all similar structures. From the west, this chaos assumes an orderly appearance; and the almost endless series of portals, gates, and halls appear ranged in regular succession, and harmonising with each other. When the plan is thoroughly understood, its regularity appears wonderful; and the highest admiration is excited by the arrangement and symmetry of all the parts of this vast edifice."

4992. *Not only the general extent, but all the particular features, of this extraordinary structure* are distinguished by a magnitude elsewhere unparalleled. There are two obelisks of 69, and one of 91, feet high: this, the loftiest of any in Egypt, is adorned with sculptures of perfect execution. The principal hall (*fig. 781.*) is 318 feet long, and 159 broad, having the roof still supported by 134 columns. These are about 70 feet high,

and 11 feet in diameter; and a long avenue of others have all, except one, fallen down

HALL AT KARNAC.

entire, and lie on the ground, still ranged in their primitive order. All the sculptures are adorned with colours, which, though they ought, it should seem, to have most experienced the ravages of time, shine still with the brightest lustre. Of the large sphynxes, fifty are still remaining, and there are traces which show that the whole avenue once contained 600. The palace itself is entered with great difficulty, and its interior, being dark and filled with rubbish, presents few objects to attract the attention; but on reaching the roof, the spectator enjoys a distinct and most magnificent view of the whole range of surrounding ruins. All who have visited this scene describe the impression made by it as

almost superior to that caused by any other earthly object. According to Denon, the whole French army, on coming in sight, stood still, struck as it were with an electric shock. The scene, according to Jollois and Devilliers, appears to be rather the produce of an imagination surrounding itself with images of fantastic grandeur, than any thing belonging to real existence. Belzoni, in particular, declares that the most sublime ideas which can be formed from the most magnificent specimens of our present architecture, would give a very inadequate picture of these ruins. It appeared to him that he was entering a city of departed giants. He seemed alone in the midst of all that was most sacred in the world. The forest of enormous columns, adorned all round with beautiful figures and various ornaments; the high portals seen at a distance from the openings to this vast labyrinth of edifices; the various groups of ruins in the other temples; these, altogether, had such an effect upon his mind, as to separate him in imagination from the rest of mortals. For some time he seemed unconscious whether he was on terrestrial ground, or on some other planet.

4993. If Karnac is unrivalled in the grandeur and extent of its remains, *the temple of Luxor*, as a single and beautiful object, seems superior to any thing else in Egypt. The view from the river is peculiarly beautiful, when, across the verdant islands with which it is studded, appears a wide plain covered with palm trees, over which these colossal masses throw their shadows; while, behind, the Arabian mountain chain forms the boundary of the landscape. The approach is through the village of Luxor, whose crowded and miserable huts form a strange contrast with these monuments of ancient splendour. At length the portico appears, by the sides of which are seen the two most beautiful obelisks in the world (*fig. 782.*), each rising to the height of eighty feet, yet composed of a single block of the

RUINS OF THE TEMPLE OF LUXOR.

finest granite, from the quarries of Syene. By what means such colossal masses were conveyed to so great a distance, and placed in their present position, surpasses the conception of modern art. Behind them are two colossal statues, now studiously defaced, and deep sunk in the sand, but which must have been forty feet high, and composed of a single block of the same granite. The pylon is 200 feet in height, rising fifty-seven feet above the present level of the soil. The interior is equally grand. It presents to the view upwards of 200 columns of different dimensions, many of them ten feet in diameter, and most in an entire state. But nothing is more remarkable in this edifice, than the profusion of sculptures with which

the obelisks, the walls, and all the apartments are covered. These, indeed, are favourite ornaments on all the Egyptian edifices, and remarkably frequent in the palace of Karnac; but they occur here in unexampled profusion, and executed with as much care and delicacy as if they had been the work of the most skilful seal-engraver. They appear to represent the history and triumphs of an ancient Egyptian sovereign, probably the founder of the edifice. One compartment, in particular, exhibits a great battle, in which the

Egyptians, armed with bows and arrows, gain a complete victory over their Asiatic enemies, armed with the spear and javelin. The forms of pursuit and retreat, the attitudes of the victors, the wounded, and the dying, are so varied and striking, that Mr. Hamilton imagines it probable, this and a similar representation at Karnac may have furnished Homer with materials for many of the varied descriptions with which his narrative is filled. In another compartment, the conqueror is represented as seated on his throne, while the captive monarch is fastened to a car, and the chiefs are treated with all that studied and ruthless cruelty which the ancient laws of war were supposed to authorise.

4994. *The western or Libyan side of the Nile* presents monuments of the grandeur of Thebes, which, though not of the same stupendous magnitude, are, perhaps, equally interesting. The *Memnonium*, or, as the French writers seem rather to show, the tomb of Osymandyas, and the temple of Medinet Abu present, though on a smaller scale, architecture and painted sculpture of the same character; equally excellent, and in many cases still better preserved. This is particularly observable in regard to the brilliancy of the gold, ultramarine, and other colours. The *Memnonium* is distinguished by three colossal statues, one of which is within the edifice, and the two others (fig. 783.) are in the plain adjoining.

783

MEMNONIAN STATUES.

The former is entirely broken into fragments, which, being dispersed through the court, cover a space of sixty feet square, giving it the resemblance of a quarry. The form of the head, however, may still be traced, though the face is entirely mutilated; a foot and a hand have been found among the fragments. The ear is three feet long; the distance from shoulder to shoulder is twenty-two feet; and the entire height of the statue appears to have been about

fifty feet. It was composed of a single block, which must have weighed 2,000,000 lbs. The French writers, in the *Description Historique*, adduce strong reasons for judging it to be the statue of Osymandyas. The two statues placed on the plain, and called by the country people Iama and Chama, are still standing, but mutilated to such a degree that it is impossible to judge of the merits of the sculpture. One of them, from the numerous inscriptions, appears evidently to have been the vocal statue of Memnon, celebrated by the ancients as emitting a musical sound at sunrise or when struck at particular times of the day. No modern visiter, however, has been able to elicit more than the usual sound made by percussion upon granite; and there seems no doubt that the musical tones were produced by some contrivance of the Egyptian priests. Amid these huge mutilated colossi, attention has been strongly attracted by another of smaller dimensions; but of which the head, detached from the body, has been found in a state of perfect preservation. All travellers have admired its elegant simplicity and pleasing expression, and have considered it the most perfect specimen of Egyptian sculpture which is to be found entire. The authors of the *Description* would have been tempted to believe it a production of the Greeks during the most brilliant period of the art, had it not borne evidence of that Egyptian style, which the Greeks never imitated, and which cannot be mistaken. This head, through the very great exertions of Belzoni, was embarked on the Nile, conveyed to London, and is deposited in the British Museum.

4995. *The tombs of Thebes* remain to be noticed. The rocks behind conceal in their excavated bosom these monuments, less vast, indeed, than those now described; but of a still more striking and peculiar character. In all the Oriental countries peculiar honours are paid to the dead; but no nation appears to have equalled the Egyptians in monumental works. Wherever the remains of a city have been investigated, the mountains behind have been found excavated into sculptured tombs; and those of Thebes, as might be expected, surpass all the others in number, extent, and splendour. The Libyan chain, which presents for about six miles a perpendicular height of 300 or 400 feet of limestone rock, has appeared peculiarly suited for such elaborate sepulchres. These subterranean works of the Egyptians almost rival the monuments which they raised on the surface of the earth. Entrance galleries lead into large apartments, in which are placed the sarcophagi, and which are profusely decorated with that species of coloured sculpture with which they lavishly ornamented their walls. The deceased lies surrounded with representations of all the objects which formed his pride and occupation while living. A complete picture is thus exhibited of the domestic life of the ancient Egyptians; and many of the customs there indicated have been transmitted unaltered, and are still characteristic of the nation. Festivals, agricultural operations, commercial transactions, hunts, bull-fights, fishing and fowling scenes, vineyards, ornamented grounds, form the varied subjects of these representations. The chambers and passages adjoining contain numerous mummies, in that wonderful state of

preservation which the Egyptians had the art of securing to the mortal remains of their ancestors. They are found wrapped up in successive folds of linen or cotton cloth, impregnated with bitumen, and so skilfully applied, as to preserve almost unaltered the form of the features and of the minutest parts of the body. Many of them contain, wrapped in their folds, *papyri* covered with hieroglyphical writing, an object of eager research to the European antiquary. Belzoni gives a very lively description of the difficulties attending this search. "A vast quantity of dust rises, so fine that it enters the throat and nostrils, and chokes the nose and mouth to such a degree that it requires great power of lungs to resist it and the strong effluvia of the mummies. You must creep through narrow passages, sometimes not more than a foot wide, after which you come to a more commodious place, perhaps high enough to sit. But what a place of rest! surrounded by bodies, by heaps of mummies in all directions. After the exertion of entering into such a place, through a passage of 50, 100, 300, or perhaps 600 yards, I sought a resting-place, found one, and contrived to sit; but when my weight bore on the body of an Egyptian, it crushed it like a band-box. I naturally had recourse to my hands to sustain my weight, but they found no better support; so that I sunk altogether among the broken mummies, with a crash of bones, rags, and wooden cases, which raised such a dust as kept me motionless for a quarter of an hour, waiting till it subsided again."

4996. *The ancient Egyptians* took the most jealous care to prevent any one from penetrating into these repositories of their dead. The entrances were closed with the greatest care by large stones, so united with the neighbouring rock as to prevent, if possible, any suspicion that they existed. It has required the most eager research of the moderns to penetrate into these subterraneous abodes. The cupidity of the Arabs, however, stimulated by the chimerical expectation of finding hidden treasures, has, in many instances, overcome every obstacle. The district immediately contiguous to Thebes is inhabited by a peculiar race, who maintain a fierce independence, and have scarcely, unless when compelled by the sword, owned the sovereignty of any government established in Egypt. They have taken up their abodes in many of the tombs, and eagerly employ themselves in searching their recesses for *papyri* and other antiquities, which they dispose of at high prices to European antiquarian travellers. This speculative traffic, however, has been on the whole injurious to them, by rendering their habits still more disorderly, and diverting their attention from regular industry and cultivation.

4997. These monuments of private individuals, however, are far surpassed by the *tombs of the kings*. At a small but highly finished temple, called El Ebek, a narrow gorge or ravine leads by a winding track into the heart of the Libyan mountains. At the end of two miles, a narrow chasm between rocks opens into "the valley of the tombs," a gloomy solitude, presenting the arid and desolate aspect of the most frightful desert. High mountains with rocky summits bound the horizon on all sides, and allow only part of the sky to appear. The heat reflected by them is so violent, that, in 1799, it killed two of Dessaix's escort; and there would be no possibility of enduring it, but for the shelter which the tombs afford. In this awful solitude, the ancient Egyptians sought to seclude from every human eye the magnificent monuments of the kings of Thebes. Avarice and curiosity, however, have triumphed over every precaution. All had been done to secure the entrance. The huge mass of stone which bars it, opens, when penetrated, into a narrow and intricate passage, closed by successive gate after gate. At length, entrance is found into a spacious chamber,

784

PRESENTATION TO OSIRIS.

in the middle of which is the sarcophagus, commonly empty, while the walls are adorned with painted sculpture, in the highest style of Egyptian magnificence. The subjects are of a different character from those found on the walls of the temples. They frequently consist of funeral processions, religious mysteries, sacred animals; a globe, the emblem of eternity; and Osiris judging the dead (*fig. 784.*). The eye, however, is often shocked by the representation of a number of victims newly beheaded, and streaming with blood, while others are led to share the same fate. This seems too strongly to suggest the savage mode of honouring the royal funeral by sacrificing over it a number of captives. The high preservation of these paintings is the more remarkable, as they are in general executed, not on the solid rock, which is here too hard to be susceptible of such ornaments, but on a soft plaster or stucco, which, however, has preserved them unaltered during several thousand years.

4998. *At the time when Belzoni began his operations*, ten of these tombs had been opened, and were accessible. That enterprising traveller succeeded in opening several; but there was one, of which the entrance had been so carefully concealed, that it long defied his efforts. At length, he found a stone similar to that which had formed the opening into the second pyramid, and was able to penetrate. After making his way through accumulated obstacles, he arrived at a sepulchral chamber, similarly adorned with the others, but far surpassing all the rest in magnificence. In the centre was a sarcophagus nine feet five inches long, and three feet five inches wide, composed apparently of alabaster, though it has since been found to be aragonite. Both the inside and outside are covered with sculptures, most minutely and carefully executed, and representing several hundred figures, each about two inches in height. The subject appears to be the obsequies of the deceased, in which are introduced a number of foreign captives, among whom the Jews are distinguished by their physiognomy and complexion, the Ethiopians by their colour and ornaments, and the Persians by their dress. This entirely agrees with the inference which the learned observation of Dr. Young has drawn from the hieroglyphical inscriptions, that this is the tomb of Necho and Psammeticus, the former of whom is mentioned in Scripture as having made successful war against Judea and Assyria; and the latter is known by an expedition against the Ethiopians. This remarkable sarcophagus was, by the exertions of Belzoni, transported to England, and is now placed in the Museum at Cambridge.

4999. *A full idea of ancient Egyptian painting and sculpture* may be formed from the numerous specimens preserved in these tombs, as well as upon the walls of the Theban edifices. These arts are practised in a very peculiar style. The figures are first cut out in a certain degree of relief, and the colours then laid over them. All that belongs to drawing is performed by the chisel. It has merely, however, distinguished the figures by cutting away the stone round them, so that only the profile is exhibited, and the whole appears as a flat surface. The drawing of the figure, too, is far from being always correct. At the same time, a great deal of spirit and invention is displayed in the groups, and the expression of the heads is often very forcible. The painting process is still more simple. It consists merely in laying on the simple colours of red, blue, green, yellow, and black. No attempt is thus made to imitate that variety of tints with which nature adorns her works. The colours are remarkably bright, and have proved wonderfully durable; but these merits seem rather to belong to the chemist than to the artist. The only merit which the latter can claim is that of the harmonious distribution of them.

5000. *The village of Erment*, about six miles above the southern limit of Thebes, on the site of Hermonthis, contains still a temple of second-rate magnitude, dedicated to Typhon. It gives, in some respects, a better idea of ancient Egyptian architecture than any other, no part being either sunk in the ground or covered with rubbish. It has also remained uninjured by time, and might have been still entire, had not great part of it been studiously demolished by human hands.

5001. About twenty miles above Erment is *Esné*, capital of the most southern district of Egypt, and the last great town which occurs in ascending the river. It is situated in a plain of considerable extent, formerly watered and rendered fertile by canals derived from the Nile; but, these being now neglected, cultivation is confined to the immediate vicinity of the river. Esné, prior to the administration of Mohammed Ali, was almost politically separated from Egypt, having become, amid the frequent civil wars with which that country has been distracted, the usual refuge of the vanquished party. The military chiefs, however, who preserved here a remnant of power, generally used it for the purposes of oppression and extortion, which were exercised particularly upon the agricultural classes. The town itself displays a luxury and industry not usual in Upper Egypt. It has manufactories of fine blue cotton, shawls, and pottery, and carries on a considerable trade with Sennaar. A great part of this industry is in the hands of about 300 Coptic families. The portico of the temple of Esné (*fig. 785.*), belonging to the ancient Latopolis, is remarkable for its beauty,

785

PORTICO OF THE TEMPLE AT ESNE.

which surprises even those who have seen the grandest of the monuments of Egypt. Its chief merit consists in an antique purity of style, peculiar to itself; and it was viewed by Denon as one of the most perfect ancient monuments. It is not peculiarly distinguished by its magnitude; the columns, twenty-four in number, are about 35 feet high, and 17 feet in circumference. The zodiac, with which its cupola is adorned, forms one of the most remarkable monuments of ancient science, and has given rise to much controversy.

5002. *At Edfû*, thirty miles higher, towards the extremity of habitable Egypt, is found still another monument, which, according to Jomard, may be compared, for the happy conception of the plan, the majesty of the composition, the execution and richness of the ornaments, to whatever is most magnificent in architecture. Denon conceives that, if that at Tentyra is more learned in its details, this at Edfû (*fig. 786.*) has more grandeur as a whole. It is 484 feet in length,

786

TEMPLE AT EDFU.

212 in breadth; and there is no Egyptian edifice of the same dimensions in equal preservation. In the interior court (*fig. 787.*), the eye sees almost entire the height of the grand gate of entrance, the two huge pyramidal masses, and the peristyle of thirty-two columns, which form a most magnificent perspective.

5003. *Above Edfû*, the plain of Egypt narrows extremely; the rocks on both sides in many places overhang the river. In these rocks, to which has been given the name of Gebel Silsili, are seen the immense quarries, out of which the Egyp-

tians constructed that astonishing range of monuments which we have now surveyed. M. Rosière observes, that travellers, consulting rather their imagination than their eyes, have seen in the temples of the Thebaid some precious material; marble, the granite of Syene, or the porphyry of Arabia. He states, that, in fact, all the edifices from Syene to Dendera are constructed of the sandstone found in these quarries. They are mingled with quartz, united by a calcareous gluten; the general colour is white or grey, though marked by variously tinted spots or veins. It is very easily operated upon by the chisel; he supposes it would have cost five times the same labour to have executed on marble the numerous sculptures which cover the walls of Egyptian edifices. Some of the subterraneous quarries form grottoes, which have been adorned in a manner nearly similar to the temples. The whole of this part of Egypt presents the most dreary aspect, consisting of naked rocks, whose fragments are mingled with the sand at their feet. The Nile, which elsewhere diffuses such luxuriant fertility, has no power over these spots, doomed to eternal sterility. The narrow band of verdure, which sometimes bounds one of the banks,

mingled with a few earthen huts and stunted palms, seems only to make more sensible the surrounding barrenness.

INTERIOR OF TEMPLE AT EDFU.

reflected entire. The moderns have searched in vain for this well; and the position assigned is not strictly correct, Syene being in $24^{\circ} 5' 22''$ S. latitude; but, considering the imperfection of ancient instruments, this does not imply a very great error. The ancient Syene contains a temple, by no means, however, correspondent to so great a name; and, with the other original monuments, it is in a great measure buried under the remains, first of a Roman, and then of an Arab town, erected on the same site. The modern town is closely adjoining, and, though populous, is very poor, being supported chiefly by a trade in dates. The inhabitants are observed to go almost naked, a custom which is partly excused on account of the extreme heat.

5006. *Syene* is surrounded on all sides by dark and rugged mountains, extending for many miles up the river. They are formed of that rose-coloured granite which, from the spot, is called *syenite*; but though, on fracture, it exhibits that and other brilliant colours, the surface is covered by the action of the air and elements with a dark brown tint. For about three miles round Syene are the famous quarries, whence the Egyptians drew their granite chiefly for the edifices of Lower Egypt. The marks of the instruments employed may still be traced; the soil is every where strewn with pieces of various forms and dimensions, and it is still possible to discover the purpose for which many were destined. The most remarkable is an obelisk, which is 54 feet high, without reckoning its point, buried in the sand. The rocks all round Syene are covered with sculptures and hieroglyphic inscriptions.

5007. *The Nile immediately opposite Assouan* encloses *Elephantine*, an island, the beauty of which strikes all travellers with an admiration, which they express by terming it the "Island of Flowers" and "the Garden of the Tropic." It presents, indeed, within the space of a mile in length and a quarter of a mile in breadth, a verdure and fertility equal to the finest spots of Egypt. This, in so savage a region, which elsewhere offers nothing but naked peaks and glittering sands, makes an extraordinary impression. The island contains also two temples of small comparative dimensions, but distinguished by their simplicity and elegance. These are considered by Jomard as only slender remains of the ancient power of Elephantine; but though that island appears once to have formed a separate kingdom, it could never, we think, have been powerful, situated, as it is, in a tract which for twenty miles in every direction is doomed by nature to perpetual barrenness.

5008. *The cataracts of the Nile* (fig. 788.), so celebrated in antiquity, commence about three miles above

CATARACTS OF THE NILE.

Elephantine. The picture drawn of them, however, as forming a prodigious fall, whose sound deafened the neighbouring inhabitants, and obliged them to remove their dwellings to a distance from the roar, has not been verified by modern observation. It does not appear that there is at present any considerable fall: and though some change might be possible, one so entire cannot be imagined. A most picturesque and extraordinary scene is, however, produced by the Nile dashing through a wild confusion of granite rocks, with

which its bed, for several miles, is thickly studded. The two opposite chains, presenting peaks of every form and aspect, meet and cross in the middle of its course. The river, which above flows in silent majesty, upwards of a mile in breadth, is here narrowed to half that space; and its stream, forcing its way through these steep and innumerable islets situated above, amidst, and below the cataract, boiling, foaming, and breaking among a thousand rocks, presents a scene of the grandest effect. The water in the different channels is tossed about in every direction, forming numberless little cascades. The noise, resembling that of a tempestuous ocean on a rocky shore, is in winter and spring very formidable, and heard at the distance of three miles.

5009. *The island of Philœ* (fig. 789.), above the cataracts, and at the very gate of Ethiopia, constitutes still

PHILOE AT SUNRISE.

another striking feature. Within a space of a quarter of a mile in length, and half that breadth, it exhibits a confusion of grand and beautiful monuments, rivalling those left by the greatest cities of Egypt; and their elegant forms and white colour strikingly contrast with the embrowned tints and the wild and rugged peaks of the surrounding mountains. Denon distinguished eight different temples, built apparently at different periods, and quite separate, though some pains had been taken to combine together those which were contiguous. Philœ is far from presenting the smiling aspect of Elephantine; but a few dates and cultivated fields on the island itself and the opposite shores, placed as they are upon this burning soil, and amid this immensity of arid rocks, produce an agreeable impression, and soften somewhat the extreme severity of the site.

5009. *The island of Philœ* (fig. 789.), above the cataracts, and at the very gate of Ethiopia, constitutes still another striking feature. Within a space of a quarter of a mile in length, and half that breadth, it exhibits a confusion of grand and beautiful monuments, rivalling those left by the greatest cities of Egypt; and their elegant forms and white colour strikingly contrast with the embrowned tints and the wild and rugged peaks of the surrounding mountains. Denon distinguished eight different temples, built apparently at different periods, and quite separate, though some pains had been taken to combine together those which were contiguous. Philœ is far from presenting the smiling aspect of Elephantine; but a few dates

5010. *Having thus traced the Nile in its entire course through Egypt*, we have gone over the main body of that country; but *some wild appendages remain*, which she claims as belonging to her. Among these is that peculiarly desolate tract, which extends from the Nile to the Red Sea, through the whole extent of Middle and Upper Egypt. No district of it appears to produce any thing which can afford food for man. The soil is sand, intermingled with rocks, through which, however, are interspersed trees and shrubs, affording pasture to the camels and sheep of the Ababde, a rude and independent race, who hold undisturbed possession of these wilds. At all times, however, a caravan route has been pursued across them to the Red Sea, for the purpose of carrying on that intercourse with Arabia and India, of which Berenice was anciently the great emporium, but whose much diminished amount is now chiefly carried on by Suez and Cairo. There is still a caravan from Kene to Cosseir, for the supply of Upper Egypt. The journey is performed with camels in forty-two hours, and without any inconvenience but what arises from the necessity of carrying provisions, and from the scarcity of water; several of the few springs which occur being rendered useless by the saline and mineral impregnations. Cosseir is an assemblage of Arab huts composed of wood and mats, situated in a frightfully poor and barren country, and without any good water but what is brought from Asia. The sea, however, abounds with fish, and it displays some commercial activity, though containing no accommodations for trade, and having only one harbour capable of holding a limited number of inferior merchant vessels.

5011. *Belzoni, by great exertions, found his way to the ancient Berenice.* He could trace the main streets, and even the materials of the houses, consisting of corals, madrepores, and petrifications, the copious products of those seas. Opposite to it is a very fine natural harbour, which has not, however, depth enough for large vessels, and whose entrance is at present obstructed by a bar of sand, easily removable. There is a small Egyptian temple, built of sandstone. The extent of the ruins is 2000 feet by 1600, which might, it is supposed, have contained a population of 10,000. At present it is entirely deserted.

5012. About twenty miles inland from Berenice is the mountain of Zubara, famous for the *emerald mines* found in it by the ancients. When Belzoni passed, fifty men had been employed for six months by a speculator from Egypt, to open again this long lost source of wealth. They had found, however, only a few specimens, mostly of inferior quality. Towards the western quarter are said to be still two large monasteries, those of St. Anthony and St. Paul, whose gardens and plantations somewhat enliven the aspect of this desert.

5013. *At the head of the Red Sea is Suez*, by which Egypt carries on nearly all that remains of its once immense trade in that sea. This trade is now insufficient to give any degree of wealth and importance to Suez. It is a poor, ill-built town, which derives all its provisions from Cairo, and has to send several miles for water, and even that is bad. Almost its only intercourse is with Jidda, from which it receives coffee, and supplies it with grain for Mecca. A few vessels also come from Yemen. Those of any considerable burden are obliged to lie in the road, as only small boats can enter the harbour of Suez itself.

5014. *The canal which anciently united the Red Sea and the Mediterranean* was traced by the French engineers, who, after considerable search, conceived that they had ascertained its whole line. It extended across part of the isthmus of Suez, and by Belbeis, into the Pelusiac branch of the Nile. Although the work appears to have been continued successively by the native princes, the Greeks, and the Romans, there is no record that the canal was ever actually used, unless in the seventh and eighth centuries, under the Saracenic princes; and then probably only on a small scale. It is conceived quite possible to renew the work; though the necessary dependence on the rise of the Nile, and on the variable winds of the Arabian Gulf, renders it difficult to secure a regular navigation.

5015. *The region to the west of Egypt* consists of an equally dreary and still more unvaried plain, or rather ocean of sand. Interspersed in it, however, are oases, or cultivated islands, of considerable extent. The principal is the one called El Wah, or the great Oasis. It must be of tolerable magnitude, since Browne was eight hours in travelling from Aine Dize, the first spring, to Charje, the capital. Poncet describes it as a delightful spot; but it may have derived additional charms from contrast with the dreary wilderness around. The governors of Upper Egypt keep a garrison here, and consider it of importance, as affording to the caravans that proceed to the south, an opportunity of renewing their supply of provisions and water. Charje, the capital, contains about 2000 inhabitants, who subsist on rice and dates. The continual blowing of the sand is provided against by the singular precaution of a flooring formed above the streets, which renders them almost like a dark chamber. Near this place is a truly magnificent temple, 191 feet in length, and containing, in high perfection, all the ornaments peculiar to those of the Thebaid. On the outer gate is a very long Greek inscription. In the vicinity of other villages are considerable temples, where, though the character of the architecture be Egyptian, arched roofs and Greek inscriptions mark that additions, at least, have been made by a different people.

5016. About one hundred miles to the west of El Charje, Sir Archibald Edmonstone and M. Drouetti lately discovered *another Oasis*, consisting of twelve villages, of which the principal, called El Cazar, is beautifully situated at the foot of a line of rocky hills, and surrounded by fine gardens of palm, acacia, and fruit trees. Near it are vestiges of a very large town; and ruins of similar character with those of El Charje, though on a smaller scale, are scattered throughout the Oasis.

5017. *The little Oasis*, called likewise that of El Cazar, not being in the route of any caravan, remained almost unknown, till Belzoni lately made his way thither. It consists of a plain, fourteen miles long and eight broad, formerly cultivated throughout, but now only in parts. The people are a rude, independent race, who once had sheiks of their own: they hold little intercourse with any other tribe. Belzoni found here the remains of a large temple, with a number of tombs cut in the rock, in the Egyptian style. From these, and from a spring, varying somewhat in temperature, but not actually in the manner described by Herodotus, he conceives that on this oasis may have been situated the celebrated temple of Jupiter Ammon, at least that it may enter into competition with Siwah for that distinction.

CHAP. III.

NUBIA,

SECT. I. *General Outline and Aspect.*

5018. *In the beginning of the chapter upon Egypt*, a general idea has already been given of Nubia. Like that country, it owes its exemption from the character of complete desert entirely to the Nile, which holds through it a course of nearly 1000 miles in direct distance, without including its long bend round Dongola. That great river, however, diffuses its waters to Nubia in much more scanty portions. Being every where hemmed in by high banks and rocks, it cannot, even without some artificial aid, be made to inundate

in general more than a mile in breadth upon one side. The country forms, therefore, a narrow belt of immense length, through the endless desert, stretching eastward to the Nile, and to the westward lost in the wide and unknown wastes of interior Africa.

5019. *As Nubia*, in consequence of this structure, is divided, both physically and politically, into a number of small states almost entirely detached from each other, our general view will be short, and the most interesting details will be reserved for the local survey.

SECT. II. *Natural Geography.*

SUBJECT. 1. *Geology.*

5020. *Travellers* mention granite, syenite, porphyry, marble, sandstone and limestone among the mineral formations of Nubia; but no account has hitherto been published of its geognosy. Its mines of gold were formerly celebrated.

SUBJECT. 2. *Botany.*

5021. The *Botany* of Nubia has already been considered along with that of Egypt. (p. 1147.)

SUBJECT. 3. *Zoology.*

5022. *Our acquaintance with the Zoology of Nubia* is almost exclusively derived from the very recent discoveries of M. Rüppell: whose work, indeed, on the animals of Northern Africa, has scarcely yet, we believe, been brought to a conclusion.

5023. *The following quadrupeds*, besides those equally found in the northern regions of Africa, seem more particularly appropriated to Nubia:—

Lepus sabellinus Rüpp. Fawn-coloured Mouse.
Mus dimidiatus Rüpp. Nubian Mouse.
Canis variegatus Rüpp. Variegated Fox-dog.
Canis Anthus Rüpp. Nubian Wolf.
Canis famelicus Rüpp. Kordofan Fox.

Canis pallidus Rüpp. Pale Fox.
Felis maniculata Rüpp. Nubian or True Cat.
Hyaena venatica Burchell. Painted Hyæna.
Oryx Tao Sm. Nubian Oryx Antelope.
Oryx Addax. Addax Antelope.

Antelope Saltiana Rüpp. Salt's Antelope.
Antelope montana Rüpp. Mountain Antelope.
Gasella Dama Pall. Swift Antelope.
Phasochæres æliana. Masked Boar.
Gasella Cora. Cora Gazelle.

5024. *Several of these deserve a slight notice.* Wild Dogs and Foxes appear to be numerous; as M. Rüppell has discovered no less than four new species. The Variegated Fox-dog is ochre-coloured, the fur thick, and variegated with blackish: it was discovered both in Nubia and Upper Egypt, where it lives in the deserts, but does not burrow.

5025. *The Nubian Dog*, or more properly Wolf, is light grey, marked with a few black spots on the back, while the tail is entirely black. It may be regarded as the wolf of Egypt as well as of Nubia, where it nevertheless appears to be rare. A third species, the Kordofan Fox, principally occurs in the deserts bearing that name, and in those of Nubia: it is nearly related to the Fennic, which it resembles in its burrowing habits, and is probably the fox-like animal represented on the monuments of ancient Egypt; for the true jackal (*Canis aureus* L.) does not appear to exist, either there, or in the immediately adjoining countries. Lastly, the Pale Fox (*C. pallidus*) is entirely of a light yellowish grey, with a bushy tail, tipped with black; it is only found in the provinces of Kordofan and Darfour.

FENNIC.

5026. *That grotesque and rare animal, the Fennic* (*Canis Zerba*) (fig. 791.), first described by Bruce as inhabiting Abyssinia, was also discovered by M. Rüppell in the neighbourhood of Ambukol, and in the desert of Korti, where they live in holes, dug by themselves, and not on trees, as has been asserted by Bruce.

5027. *Respecting the Unicorn*, M. Rüppell's researches have furnished us with some very singular information; while his observations on the structure of the horns of the Giraffe prove at least that the existence of a quadruped like the supposed Unicorn, furnished only with a frontal horn, is at least neither impossible nor contrary to nature. Our traveller obtained some information on this much debated subject in Kordofan, where the Unicorn was said to be known, and to bear the name of Nillekma. Persons of various conditions agreed in the statement that the Nillekma was of a reddish colour, equal in size to a small horse, slender as the gazelle in its shape, and furnished with a long, slender, straight horn in the male, which was wanting in the female. Some added, that its hoofs were divided, while others declared they were entire. According to these statements, this animal inhabits the deserts to the south of Kordofan, is uncommonly fleet, and only occasionally visits the Kaldagi Slave Mountain, on the borders of this province. Three several Arabs asserted to M. Rüppell that they had themselves seen the animal in question: and one of his slaves from Kaldagi, on seeing the antelopes brought from the desert of Korti, gave, of his own free motion, a description of the Nillekma, exactly coinciding with the notices afterwards obtained by the traveller: it appears he had eaten of it in his own country, and described it as a very beautiful animal. Of the veracity of this slave M. Rüppell had frequent proofs, especially in the descriptions of animals, all of which were found to accord with the respective species which were subsequently procured. (*Zool. Journ.*, vol. xv. p. 390.)

5028. *The most beautiful Antelopes of Nubia* are those named the Mountain, the Addax or White, and the Dama or Swift Antelope. The first inhabits the neighbourhood of Fazogl on the White Nile. The elegant White Antelope (*A. Addax*) is very rare, being found only in certain parts of the desert to the south of Ambukol, where it lives in small herds: it is so exceedingly fleet, that even the best Arabian horses have much difficulty in keeping pace with it. The Dama, from the great length of its legs, would seem to possess the same celerity of motion.

5029. The northern Giraffe, or Camelopardalis of the ancients (*C. antiquorum* Sw.) (fig. 792.), has been seen by M. Rüppell in small herds in all the desert steppes south of Simrie, is plentiful at Darfour, and is even found to the east of the Bahr el Azrek. There can be no doubt that this is a distinct species from the Giraffe of Southern Africa (*C. australis* Sw.)

NORTHERN GIRAFFE.

5030. Several interesting birds appear to be peculiar to this kingdom, or, at least, not hitherto known as inhabitants of Northern Africa.

5031. Among those most deserving notice should be mentioned the Occipital Vulture (fig. 793.), first discovered by Mr. Burchell in the southern regions of Africa. It is a large and imposing bird, having the upper plumage brown, the head and under parts white, and one half of the bill red: it inhabits the borders both of Nubia and Abyssinia, and is found either solitary or in pairs. The Red-throated Shrike (*Malakonotus erythrogaster* Sw.) is a new species, not very unlike the Barbary Shrike. M. Rüppell describes, under the erroneous generic name of *Ixos*, several curious birds belonging to the family of Great-legged Thrushes (*Crateropodinae* Sw.). The Otis Nuba, or Nubian Bustard (fig. 794.), is likewise a new acquisition; and seems peculiar to the deserts of tropical Africa. By the discovery of a new Parrot (*P. Meyeri* Rüpp.) in Kordofan, M. Rüppell has ascertained the most northern range of this family in the Old World. We could dwell much longer on the important discoveries of this enterprising traveller and able naturalist, did our limits permit. We must, therefore, merely add, that his researches have been extended to every department of the animal kingdom, and have made a very important addition to our knowledge of geographic zoology.

5032. The feathered game is not deficient in these arid wastes. Besides the Nubian

OCCIPITAL VULTURE.

Bustard already noticed, another of the same genus, the Otis Arabs of Linnæus, is found in Kordofan: it is of considerable size, and distinguished by a pointed black crest. Partridges and quails are mentioned by former travellers: among the first is a new species discovered by Messrs. Denham and Clapperton, and justly named to commemorate the latter.

NUBIAN BUSTARD.

SECT. III. Historical Geography.

5033. Ethiopia is one of the most venerable names of antiquity. In a vague and indeterminate sense, it comprehended the whole of interior Africa south of Egypt and Mauritania; but it was applied in a peculiar sense to *Ethiopia sub Ægypto*, — the region of the Upper Nile. This Ethiopia appears to have been a much more powerful and civilised kingdom in the early ages of history, than at any subsequent period. Egypt was repeatedly conquered from this quarter; and, according to some, she derived from Ethiopia the original of those arts and institutions which have rendered her name so celebrated. There certainly was an interchange between the two countries; but we should rather suppose Egypt, more fertile, and possessing much greater natural advantages, to have been the parent. Ethiopia, however, attests its ancient grandeur by monuments, excavated from lofty rocks which overhang the Nile, and which, though they do not display such exquisite skill, are nearly as magnificent as those of Egypt, and in some respects more striking.

5034. Ethiopia did not, like Egypt, sink under the ascendancy of the great empires. The disastrous repulse of Cambyses forms a memorable event in ancient history. It does not appear that, beyond some occasional inroads, the Romans did more than maintain a frontier legion at Elephantine, which checked incursions, and exacted some imperfect homage and tribute from the chiefs immediately above. The Saracens and Turks never did more. Even for some centuries after the former enjoyed possession of Egypt, Nubia continued Christian; though it has since, by some unknown agency, become Mahometan. This rough independence, however, has been perhaps a misfortune to Nubia, since it has prevented her from receiving any of the improvements introduced by the great conquering nations. Split into a number of insignificant states, she has lost all her early civilisation,

and her population was abandoned, either to lawless independence, or to the brutal tyranny of arbitrary chiefs. The late conquest by the army of Mohammed Ali was too violent, and attended with too much of outrage and rapine, to be attended with beneficial effects; and it appears to have been in a great measure ephemeral.

SECT. IV. *Political Geography.*

5035. *Nubia exhibits no semblance of a well-organised government.* Every town or large village, with its adjoining territory, has its *mek*, or *melek*, who exercises to the utmost whatever power he may possess, which, according to circumstances or character, is sometimes almost absolute, at other times is held in contempt. Each individual is armed with a crooked knife, which he is ever ready to employ in deeds of violence. From the various character and detached position of these states, their details will be best treated under the local survey.

SECT. V. *Productive Industry.*

5036. *The range of cultivation* in Nubia is extremely limited. That irrigation derived from the Nile, on which it entirely depends, is obtained almost solely by *sakies*, or wheels for raising the water to the level of the high banks. Of these, within the space of 150 miles, which intervenes between the first and second cataract, there are from 600 to 700. The *dhourra*, noticed as the produce of the more arid Egyptian soils, is almost the only grain of Nubia; though sometimes the people raise an after-crop of barley or lentils. Tobacco also, a luxury in universal demand, is cultivated with success. Sheep are fed on the tracts unfit for grain, but are by no means very numerous. Camels are numerous in the trading towns; but horses are only maintained by the chiefs, and for military purposes. The Nubians have scarcely any manufacture which can be termed national. The women make coarse woollen and cotton cloths, mats of date canes, and the necessary implements for cooking.

5037. *The commercial intercourse of Nubia* is less limited. Being the only practicable line through the desert, it forms the medium of communication for Arabia and Egypt with the vast regions of central Africa. Cotton goods, toys, arms, and a variety of trifling articles, are carried to be exchanged for gold and ivory, but chiefly for slaves. These are purchased from Darfour or Kordofan, where they are obtained by war, or by mere slave-hunting, from the still more savage countries in their vicinity. This is almost entirely a transit trade; for though a considerable number are kept by the great in Dongola, Merawe, Sennaar, &c. by much the larger proportion is sent across the deserts to Egypt, or by Suakim to Arabia. The chief seats of this traffic are Mahass, Dongola, and particularly Shendi, in which last Burckhardt supposes that 5000 slaves are annually exposed for sale. The slaves from eleven to fourteen or fifteen years of age are the most valued, and bring fifteen or sixteen dollars. Above that age, they are considered intractable, and rarely sell for more than eight or ten. The good treatment of the slaves is limited to that which mere self-interest imperiously dictates. The necessary supply of food, and whatever is absolutely essential to health, is regularly furnished. In the early part of the journey, while these unfortunate victims are yet near their native country, they are treated with kindness and indulgence, though narrowly watched; but when they are once beyond the Nile, more severe measures are resorted to without hesitation. It is a common saying, with regard to a refractory slave, "Let him pass the Berber, and the whip shall teach him obedience." The more violent are secured by long poles fastened behind with cords; and at night they are put in irons. The final destiny, however, of these unhappy persons is by no means so severe as that of those employed to till the ground in the European settlements.

SECT. VI. *Civil and Social State.*

5038. *The inhabitants of this extensive line of territory* consist of two leading races. The first is the proper Nubian, called Berbers or Barabras; a class strictly native, and of the same race with those who inhabit the mountainous districts of Barbary. The banks beyond Dongola, and the still more southerly kingdom of Sennaar, are inhabited by negroes; though between them is interposed the tract of Berber, held by a mixture of Nubians and Arabs.

5039. *The Nubians are in a very rude state*, and are scarcely acquainted with any of the arts and improvements of civilised society. Many of them, even a little above Egypt, were found by Belzoni absolutely ignorant of the use of money. Like savages, they prized looking-glasses and shining toys more highly than articles of real value. Their food consists of *dhourra*, ground between two stones, and baked into cakes without leaven, over which they pour onion sauce, broth, or milk. They make from it *bouza*, a species of beer, in which they indulge to excess. Their houses are roughly built either of mud or loose stones: in the former case, they are roofed with leaves of the date tree. A cap of cloth or linen, and a woollen mantle or cotton shirt, form all the attire which is considered necessary; and, in many cases, even this is thought superfluous.

5040. *The Nubians are generally a handsome race*, well made, strong, and muscular. The countenances as well as the demeanour of the females are sweet and pleasing, and they are said to be strictly observant of their matrimonial engagements. In the small and secluded villages, the inhabitants of which are employed in agriculture, a primitive simplicity of manners appears to prevail, and a number who go to act as porters in the cities of Egypt are considered remarkably honest. In the large trading towns, which are chiefly inhabited by slave merchants, the utmost profligacy of manners prevails.

SECT. VII. *Local Geography.*

5041. *There are no data for exhibiting the divisions of Nubia* in any precise or definite form. Beginning, however, with the frontier of Egypt, and proceeding up the Nile, we shall obtain a rapid view of its varied objects.

5042. *In that close valley to which we now ascend*, the natural features, though striking, are uniform and monotonous. The Nile flows between rocks, which either overhang its stream, or leave room only for little patches of cultivation; and the modern inhabitants are poor and rude. The banks, however, as in Egypt, are diversified at short intervals with ancient monuments of a grand and striking character. Instead of being composed of masonry, they are in many and the most remarkable instances, cut out of the solid rock. After passing a small temple at Debod, and a number of singular ruined enclosures at El Umbarakat and Sardab, we arrive at Kalabshe, the first Nubian temple on a great scale. The pylon is 120 feet long, and

50 feet high ; but the portico is entirely wanting, and its destruction seems to have been effected by violence, as the remaining parts are in good preservation, particularly the colours. A golden lamp, evidently Grecian, was lately found among the ruins. At the distance of a quarter of a mile is a small temple, with the ruins of a considerable town, about a mile in length, supposed by Burckhardt to be the ancient Talmis.

5043. After passing Garba Dendour, we come to *Gyrshé*, or *Guerfeh Hassan*, which presents the first specimen of the excavated temples of Ethiopia. The greater part of it has been hewn out of a perpendicular rock. The entrance is adorned not only with large columns, but with three colossal statues, eighteen feet high, the workmanship of which appeared to Belzoni to display the mere infancy of the art. The figures were such as barely to indicate that men were meant to be represented, and their faces were a caricature of that of the negro. About nine miles above is Dakki, a much more elegant structure, situated in a plain, which appears once to have been cultivated, but which is now covered with sand. There are smaller edifices at Offelina and Leboua, but nothing of much importance occurs till we reach *Dehr*, or *Derri*, reckoned the capital of Lower Nubia, about 130 miles above Syene. It possesses little either of extent or elegance. The houses, which, with the exception of a few belonging to the chiefs, rarely exceed eight or ten feet in height, are built of mud and stones intermingled. There is an excavated temple, but not of much importance. A few miles above is Ibrim, strikingly situated on an almost perpendicular rock which overhangs the Nile, and considered a strong military post against the Arabs. The Mamelukes occupied Ibrim on their retreat from Egypt, but on being obliged to leave it, they entirely destroyed the place, which has remained ever since uninhabited. The date plantations round it are considerable.

5044. The country above presents little of interest ; rude villages, date plantations on the

ROCK TEMPLE AT IBSAMBUL.

eastern bank, total barrenness on the western. About fifty miles above Dehr appears the grandest monument of Nubia, *Ibsambul*, whose excavated chambers rival the proudest boasts of Thebes and Tentyra. This temple (*fig. 795.*) is cut out of a solid rock, rising perpendicularly about 600 feet from the Nile. The entrance, however, when first visited by Burckhardt, was choked up with such immense masses of sand, that all idea of penetrating seemed out of the question. Belzoni, by

almost unexampled exertion and perseverance, succeeded in clearing away the obstacles, and found the interior (*fig. 796.*) truly magnificent. The pronaos, 57 feet long and 52

796

INTERIOR OF TEMPLE AT IBSAMBUL.

feet wide, is supported by two rows of square pillars, each pillar being adorned with a figure elegantly executed. Hieroglyphics, painted sculptures, colossal statues, and all the ornaments which characterise Egyptian temples, are profusely employed. Battles, storming of castles, triumphs, particularly over the Ethiopians, with captive groups of that race, are the subjects chiefly represented. The exterior of the temple is 117 feet wide, and 86 feet high ; but the most remarkable feature consists of four colossi, which, with the exception of the Sphinx, are the largest sculptured figures in Egypt or Nubia. Burckhardt, who saw only the shoulder of one of them above the sand, conjectured, from its

dimensions, that the whole would be 65 or 70 feet. Belzoni, after removing the sand, found it 51 feet, not including the cap, which was 14 feet. Of these colossi, one is still buried, and another thrown down.

5045. With Ibsambul terminate the ancient monuments belonging to that part of Nubia which borders on Egypt. Above, at the distance of a day's sail and a half, is *Eshke*, the residence of a cacheff, and situated on a larger extent of wooded and cultivated land than intervenes between it and Syene. Another day's sail leads to *Wady Halfa*, the second cataract. Here, too, Europeans have been disappointed of finding a mighty waterfall. This cataract, like the first, is formed by several thousand rocky islands, through which the Nile dashes amid clouds of foam, and is whirled and tossed in perpetual eddies. The rocks consist, not of granite, but of a species of black marble ; and the islets, being covered with patches of verdure, and several even

inhabited, produce a picturesque effect, and relieve that aspect of extreme desolation, which characterises the scenery of the first cataract.

5046. The territory of Mahass may be described in a manner nearly similar ; and the rude and violent character of its chief obliged Burckhardt here to terminate his career of Nubian discovery. Majestic ruins, however, continue to be scattered along the bank, among which, pre-eminent beauty is displayed by the temple of Soleb (*fig. 797.*). The remains consist only of a range of solitary columns,

TEMPLE OF SOLEB.

but these are of such peculiar lightness and elegance, that they may come into competition with any of those which adorn the banks of the Nile.

5047. *Wady el Hadjar and Sukkot are rude and sterile territories*, in which the range of culture scarcely extends beyond the immediate banks of the Nile, and the poor villages, when not under the dominion of Egypt, are ruled over and oppressed by a succession of turbulent little chieftains. They contain, however, the temples of Semneh and Amarah, the remains of which possess considerable beauty.

5048. From Dar Mahass the traveller enters the territory of *Dongola*. The vicinity of the river continues to present the aspect of a narrow belt of cultivated land, rescued from the surrounding desolation; but this belt, hitherto on the eastern, is now on the western bank. Dongola, besides, presents tracts of more brilliant fertility and beauty than any part of Lower Nubia. High granite rocks enclose the green and cultivated valley of Jarjar, which flourishes in freshness and fertility in the bosom of the wildest waste. Immediately beyond is a pass called the Water's Mouth, which is represented as exhibiting a scene of grandeur and wildness, superior to those at the first and second cataract. It is formed by a succession of huge and detached masses of naked rock, and of large fragments scattered on the plain. Below is the large island of Argo, a spot of peculiar and striking fertility, forming, in the bosom of the desert, the most luxuriant natural garden. The air is full of fragrance, and the palm trees are rendered melodious by the song of numberless birds, among whose notes that of the dove is predominant. A narrow mound separates this fairy land from the regions of barrenness and death, and this display of nature's bounties singularly contrasts with the wide surrounding expanse of sandy desert. In one part of it are found two colossal statues, lying on the ground, 23 feet in length, and the sculpture of which displays considerable skill, especially when it is considered that the materials are peculiarly hard.

5049. About ten miles above Argo is *Maragga*, or *New Dongola*. This last name was given to it by the Mamelukes, who, during their temporary occupation of this country, made it their capital. They converted it, though built only of mud, into a very neat town, with several large courts or squares. The surrounding country, naturally the richest in the whole territory, was greatly improved by them. Old Dongola, which appears at no time to have answered to its ancient reputation, is now a miserable mass of ruin. The sand, which, when Poncet was there, had already made large encroachments, has now buried the centre of the town, and divided it into two separate parts.

5050. *The Nile*, in the tract which we now approach, no longer flows in that straight direction from north to south, which marks almost the whole of its known course. Soon after receiving the Tacazze, it makes a great bend, and for about 200 miles flows southward, contrary and parallel to its former course. It then bends again, and renews its usual northerly course, which it maintains through Dongola and Nubia. It thus forms three parallel channels, enclosing two peninsulas, which contain a greater extent of cultivated land, and support a larger population, than any part of Lower Nubia. The middle channel, or that which flows southward, parallel to the Dongola branch, is occupied by the *Sheygga*, a race of negroes, peculiarly roving, fearless, and warlike. They have numerous slaves, whom they employ in tilling the ground, and in performing all laborious offices, while they devote themselves entirely to arms. They make battle a scene of gaiety, rush laughing into the field, and address their enemy with the Eastern salutation, "Peace be with you." Disdaining the improved instruments of modern warfare, they have obstinately adhered to their ancient arms, the lance and the shield. Even with these, they fought a most obstinate battle at Korti with the troops of the Pacha of Egypt. It ended, however, in their entire discomfiture; after which they put to death their necromancers, who had deluded them with predictions of victory, and submitted to the invader. Rumour, however, since states, that they have risen in the rear of the Pacha's troops; and it does not, indeed, seem very probable that a race thus fierce and restless, inhabiting so distant and inaccessible a tract, should remain in quiet subjection to Egypt.

5051. *Merawe*, perhaps the ancient Meroë, capital of the Sheygga, is situated on the Nile. The modern town is large, being supposed to contain about 10,000 souls; but the houses are built of mud, and the streets are long and gloomy. In its vicinity, however, is situated a range of the grandest monuments which Ethiopia can boast. A lofty eminence, called Djebel el Berkel, or the Holy Mountain, presents, partly cut out of its rocks, partly built along its sides, seven or eight temples, the largest of which may rival the most magnificent monuments of Egypt. It is 450 feet long, by 159 wide, and the principal interior chamber is 147 feet by 111. Sculptures and hieroglyphics, of a religious import, cover the walls in equal profusion as in Egypt. The symbols of Jupiter Ammon, that primary object of Ethiopian worship, hold of course the foremost place. These works appear to great disadvantage, since they consist, not of the solid and durable materials which compose the Egyptian monuments, but of a friable sandstone, the surface of which has, in a great measure, wasted away. Considerable skill seems to be displayed in some of the workmanship; though other parts of it are inferior. Near these temples are seventeen pyramids,

798

PYRAMID AT EL BELLAL.

of no remarkable dimensions; but at El Bellal, on the opposite side of the river, at the distance of seven miles, there is a very magnificent range, though still decidedly inferior to the Egyptian structures. The largest (*fig. 798.*) stands on a base 152 feet square; and, though diminished in height by the fall of a great part, still rises to 103 feet. One very curious feature is presented by the existence, within its interior, of another pyramid, of a different age and style of architecture, but much more entire than that in which it is enclosed.

5052. *Beyond the head of the branch*, the Nile is joined by its great tributary the Tacazze, which has flowed through Abyssinia. A Berber population again appears; and the name of Berber is even given to a succession of four large villages situated along the river. The inhabitants are a very fine race, as to bodily quali-

ties; they are somewhat taller, and much stronger, than the Egyptians. Though their colour is nearly as black as that of the negro, they have very different features; indeed, they are handsome, both in face and person. Their moral character, however, as drawn by Burckhardt, appears under the most unfavourable colours. Consisting of slave-traders, or having continual intercourse with that class of men, they contract all the irregular habits which their mode of life tends to generate. Among their bad qualities, treachery and avarice predominate; and in the pursuit of gain, they trample upon every ordinance, human and divine. The mek's authority is little regarded among the wealthier inhabitants, who carry on perpetual private quarrels, and terminate every dispute by the law of the strongest. They are also addicted to intoxication and every species of debauchery. Farther up the Nile is Shendi, or Chendi, a town still subject to the Arabs, which Mr. Bruce found in a state of decay, and not containing above 250 mud houses: but, when Burckhardt visited it, a protecting government had again rendered it the emporium of the trade with central Africa; particularly that in slaves, of whom about 5000 are supposed to be sold in the markets of Shendi. Near this place is a range of monuments, the existence of which was reported to Bruce, and which were lately visited and examined by M. Cailliaud. They consist of forty pyramids, and a temple, of which few traces remain, but which seems to have been about 280 feet in length. The largest pyramid is 87 feet high. They appeared to M. Cailliaud more ancient than the monuments of Egypt, and of the same character. Jomard, as well as M. Cailliaud himself, has supposed them to be the remains of the ancient Meroe; but it appears to us that the name of Merawe, and the ruins on a much greater scale at that place, give it a decided claim to preference in this respect.

5053. Soon after leaving Shendi, the territory of Sennaar begins; but the banks of the Nile are still sandy and barren, diversified only by occasional woods and cultivation. About fifty miles above is Gerri, a large village, and near it is a ferry across the Nile, joining the road which leads through the desert to Dongola. Soon after, another grand feature occurs; the junction of the Bahr el Abiad or White River, coming from the west and from central Africa, and of the Azreek, or Blue River, coming from Abyssinia; which two great streams uniting form the Nile. The controversy which is the Nile, seems now universally decided in favour of the *Bahr el Abiad*, which is described by Bruce himself as the largest of the two. Halfaia, a large, handsome, and pleasant town, is situated near the junction. The tropical rains here begin to be felt, and relieve the territory from that general barrenness, and dependence upon inundation, which characterise Egypt and Nubia.

5054. In ascending the Blue River we pass Herbagi and Gidid, two considerable villages; then, about a hundred miles above the junction, we come to Sennaar. This is the most important and populous kingdom throughout all that tract which bears the name of Nubia. Its fertility, however, is not maintained by inundation, but by the tropical rains, which are here considerable, though not so violent as in regions more immediately under the equator. Through their influence, the country in August and September assumes a verdant and delightful aspect, and a number of lakes are formed. On the cessation of the rains, the dhourra ripens, and the country acquires a yellow appearance. Soon afterwards, the lakes dry up, the country becomes parched, "all the beauty disappears, and bare scorched Nubia returns, with all its terrors of poisonous winds and moving sands, glowing and ventilated with sultry blasts." The horses of Sennaar are fine, and the horned cattle are represented by Mr. Bruce as the largest and finest in the world: but there is something, either in the air, or in the rank vegetation, which renders it impossible for animals to be bred, or even to live in it the whole year round; and they require to be removed frequently to the dry grounds, three or four miles from the river. The present native government of Sennaar was formed in 1504, by the conquest of the Shilluks, a race of negroes inhabiting the banks of the Bahr el Abiad. It has been in theory, entirely despotic; the inhabitants assuming, even as a boast, the title of slaves; but, even in Bruce's time, the military officers had usurped the whole actual power, and left to the king little more than the name. The troops amounted to 14,000, consisting chiefly of a race of negroes, called Nuba, occupying the country between Sennaar and Abyssinia. The infantry were bad; but the cavalry, amounting to 1800, were equal to any in the world. This country was lately occupied by the army of the Pacha of Egypt, who entered Sennaar with little or no opposition; but the general insurrection since raised in their rear has probably restored the native power to complete independence. The city of Sennaar has been supposed to contain 100,000 inhabitants; but, according to Cailliaud, they do not exceed 9000. The houses are built of clay with flat roofs, and, except those of the great officers, are small, and do not consist of more than one story. The palace is four stories high, built of burnt brick, but in a ruinous state. Although Sennaar produces abundantly dhourra, millet, rice, and even wheat, it yields few commodities fitted for trade. The only intercourse consists in the transit trade from interior Africa to Egypt and Arabia. The gold dust, brought in quills from Kordofan and Fazuclo, has the reputation of being the finest and best in Africa. The returns consist chiefly in blue cotton cloth from Surat, which, made into a species of long robe or shirt, forms the universal dress of the country. Spices, hardware, toys, particularly a species of Venetian black beads, are also in demand.

5055. To the south of Sennaar is Fazuclo, a hilly territory, forming a province of the former country, though still governed by its own prince. Beyond it extends a vast range of mountainous districts, called Dyre, and Tegala, or Taggala. It is nearly independent; but the wild inhabitants are hunted and carried off as slaves to Sennaar, where, however, they are well treated, and employed even as troops, to keep in subjection the Arab inhabitants. The gold mines are found chiefly in a district called Quamaml; but, when the Egyptian expedition had reached it, by great efforts and sacrifices, they found them very poor, the ore being extracted in small quantities, and with great labour, from sand and earth. To the west, along the Bahr el Abiad, dwell the Shilluk negroes, who, as already mentioned, conquered Sennaar in 1504, and now assume the title of Funje, or lords. El Aicè, or Alais, their capital, seems merely to consist of a tract of country, formed into islands by branches of the Bahr el Abiad, and densely peopled. They employ themselves much in fishing, and have many boats, in which they sailed upon Sennaar, and effected their conquest. The country between the two rivers which form the Nile, and which for some space run nearly parallel to each other, is in general an extensive plain, covered with large woods, but diversified by one or two ranges of mountains.

5056. The deserts to the east and west of Nubia next claim our notice. The Nile, particularly between Berber and Dongola, has a winding course, the following of which would render the commercial route to Egypt very circuitous. The caravans, therefore, with that enterprising courage which characterises the inland trade of Africa, have struck a route across tracts where, for many hundred miles, no human habitation is to be seen, and only a few bands of predatory Arabs procure for their flocks a scanty herbage. The eastern route from Berber to Syene, forming a line of about 500 miles, has been travelled by Bruce and by Burckhardt, and by both without meeting a human being. It does not present, however, unvaried plains of sand, like those which constitute the western deserts of Africa. It contains mountains, some 1000 feet high, and interspersed with wadys, or valleys, affording a supply of water, and supporting some trees, shrubs, and grass. Many days' journey elapse without travellers having an opportunity of filling their bags with water. Its aspect is extremely rugged; but Burckhardt, after having passed through those of Suez and Sinai, did not think it quite so dreary.

5057. The western desert appears much more desolate. Travellers, indeed, after their departure from Siout, are refreshed at Charje, or the Great Oasis; but, having quitted its limits, find nothing but an unvaried waste of sand. Even the wells, which occur only at a wide distance, and of which the principal are at Sheb, Selimé, and Leghea, though they produce a verdure which relieves somewhat the nakedness of the desert, offer nothing which can be food for man or beast. Poncet strongly describes the painful impression made by a scene, "where we meet neither with beast, grass, nor even so much as a gnat; and see nothing but mountains of sand, carcasses and bones of camels." The caravan to Darfour has about 800 miles of this tract to pass through, ere it reaches Cubcubea. That to Sennaar, again, touches the Nile at Moscho, and proceeds through Dongola to Korti. It then strikes across the desert of Bahiouda, which, containing a few trees and herbs, does not present so frightful an aspect as the western solitudes.

5058. *Another line of commercial intercourse* reaches across from the district of Berber to the Red Sea. It is far from presenting the same desert aspect as those just described. On the contrary, the district of Taka, through which it passes, is famous over all these countries for its extreme fertility. Though the capacities of the soil are by no means duly improved by cultivation, yet its dhourra sells in the markets of Jidda 20 per cent. higher than that of Egypt; and its breeds of camels and oxen are said to be equally excellent. The Arabs of Taka are a warlike race, engaged in almost continual contests with the Bishareen, a fierce tribe, who wander over the neighbouring deserts. They are robust, hardy, hospitable among themselves, but accused of treachery and inhospitality to strangers.

5059. After three days' journey through this tract, the caravans arrive at *Suakin*, or *Souakin*, the only seaport of Nubia. The island on which it is situated was seized in the sixteenth century by the Turks, who made it their maritime capital on the Red Sea. De Castro, at that time, found it one of the richest and most flourishing cities of the East, and had seen nothing equal to it except Lisbon. All this splendour has vanished with the loss of the Indian trade, and only a few wretched *dows* are seen unloading their cargoes by the side of some miserable houses. The Turks still retain Suakin, though with so small a force that they dare not set foot on the main land opposite. The harbour retains all its excellence, being capable of holding 200 large, besides a prodigious number of smaller vessels. The conveyance of pilgrims and slave-traders to Jidda is the only support of what remains to Souakin. Two minarets, however, attest its past splendour, and the general custom of whitewashing the houses gives it still a handsome appearance when seen at a distance.

CHAP. IV.

ABYSSINIA.

5060. *After tracing upwards the course of the Nile*, we come to *Abyssinia*, the region from which that river derives much of its immense store of waters. The *Bahr el Abiad*, indeed, flows from the yet unknown interior of the continent; but a large portion of the stream which penetrates Nubia, and inundates Egypt, is poured down from the country to the eastward, where the mountains, rising to a stupendous height, yield copious supplies of water. That prime element of tropical cultivation renders Abyssinia the most fertile country in this part of Africa, and, with a very few exceptions, in the whole continent.

SECT. I. General Outline and Aspect.

5061. *Abyssinia*, in a manner insulated amid rocks, deserts, and boundless plains, though it has imbibed some elements of civilisation, has scarcely any intercourse with the civilised world. On the east, it is judged to be bounded by the Red Sea, with which, however, the proper domain of Abyssinia comes in contact only at one point. On the north it communicates with the deserts of Nubia, traversed by wandering Arabs. On the west it has Sennaar; and, on the south, the Mahometan kingdom of Adel, or Adaiel: but the greater part of these two last frontier lands consists of wild regions occupied by the Galla, who always ravaged, and have recently conquered, a large portion of the Abyssinian monarchy. It is difficult even to guess the dimensions of a region of which there are no fixed limits, measurements, or surveys; but somewhere between 700 and 800 miles from east to west, 500 and 600 from north to south, may form a tolerable approximation.

5062. *Abyssinia has been described as entirely a country of mountains*. Chain succeeds chain; and the level tracts which cover a great extent of the kingdom bear almost all the character of mere mountain valleys. The ridge of Lamalmon is the best known to Europeans, who have to cross it in entering Abyssinia from the Red Sea to Gondar. The mountains of Samen (*fig. 799.*) to the south, however, are still more lofty, and the same

799

MOUNTAINS OF SAMEN.

may be said of those of Gojam, which give rise to the Abyssinian Nile. Of Shoa, Efat, Damot, and the other southern provinces, our information is less precise; but it appears that they consist equally of an alternation of high mountains and deep valleys. All these mountains present forms peculiarly rugged and precipitous. The representations given by Mr. Salt fully exhibit the chaos of rocky masses into which these mountains are thrown; though he disputes the accuracy of Mr. Bruce, who represents them,

in many cases, as pyramids pitched on their tops. In many of these mountains, the summit forms a plain of some extent, encircled by walls of rock, which being accessible only by ladders and cordage, may be called a natural castle. Such, in Amhara, was the mountain of Amba Geshen, in which the princes of the blood royal were confined, as a security against those machinations which are so dangerous in an unsettled government.

5063. *Abyssinia is not less a country of rivers than of mountains.* The eastern tract, above the province of Gojam, gives rise to the *Bahr el Azrek*, or Blue River, so much celebrated, in modern times, as presenting the long sought-for head and source of the Nile. It is, indeed, so considered in Abyssinia; and all the Portuguese travellers and missionaries, from whom alone our early information is derived, were impressed with the same idea. It is not, therefore, wonderful that Bruce went on his travels with this impression, and that, after having placed his glory in the discovery, he should have been slow in admitting the observation of D'Anville, that the *Bahr el Abiad*, admitted to be the greater stream, had in all respects the best title to be considered as the Nile of the ancients. Numerous waters rising in the same chain of mountains flow first eastward, and form the great lake of Dembea, one of the most conspicuous features of Abyssinian geography. From the eastern shore of this lake the Blue River then issues, and, making a vast semicircular sweep round the province of Damot, passes westward not far from its original source. It finally turns northward, receives from the south the copious accession of the Maleg, and, becoming the river of Sennaar, falls into the *Bahr el Abiad*, as we have seen, considerably beyond the Abyssinian frontier. The Tacazze, with its auxiliary streams, the Mareb and the Coror, drains all the high chains of Western Abyssinia, then makes its way through the Nubian desert, and pours its large tribute into the Nile. The mountains in the south give rise to two rivers, the Hanazo and the Hawash, which direct their course eastward, but meet extensive plains of sand, through which they are either naturally or artificially dispersed, and thus lost, before they arrive at the Red Sea.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5064. *We do not find any precise information regarding the geology of this vast alpine land in the writings of travellers.*

SUBSECT. 2. *Botany.*

5065. *Abyssinia*, doubtless, in its vegetation, as in its geographical position, borders on Egypt; and here want of space and want of information compel us to be very brief; for, though two eminent modern travellers have visited that country, Bruce and Salt, and though one of these, in particular, has given a chapter to the most remarkable plants, yet, for want of scientific names and descriptions, they cannot always be satisfactorily determined. Mr. Salt's collection, according to Mr. Brown, amounted to about 260 species, and in its character is somewhat extra-tropical, bearing but little affinity to the vegetation of the opposite and western coasts of Africa, in the same latitudes. In the *Protea abyssinica*, observed by Bruce, and *Pelargonium abyssinicum* and *Geissorhiza abyssinica*, found by Salt, it more resembles that of Southern Africa. The first plant Mr. Bruce notices is the *Papyrus*, of which he has given a full history. In Abyssinia, its roots are chewed in the manner of liquorice, and a considerable quantity of sweet juice is thus obtained. One of the angles of the stem is observed to stand opposite the stream, like the cutwater of a boat, or the sharp angle of a buttress of a bridge, by which the pressure of the stream upon the stalk would be greatly diminished.

5066. The Balessan Balm, or Balsam, is the *Amyris Opobalsamum* (Linn.) *Balsamodendron Opobalsamum* (De Cand.), of which a full account has been given by Bruce. The Sassa Myrrh, or Opocalpasum, is the Jaga (?) Sassa of Willdenow and De Candolle. This plant yields a very light gum, which Mr. Bruce believed to be the Opocalpasum of Galen. In water, this substance swells, turns white, and loses its tenacity. In quality it much resembles Gum Tragacanth, and may be eaten with impunity. The native merchants use it to set a gloss on the blue cloths of Surat, when they come in an injured state from Mocha. The tree that produces the Sassa is as high as our largest elms; the gum covers almost all the trunk and the principal branches, issuing in large globules, which often weigh 2 lbs. each, though the substance is of a light nature. The bark is thin and bluish-white, the wood white and very hard; the flowers of a crimson red; the filaments of a violet red, and purple at their extremities. The fruit has never been observed.

5067. Ergett y' Dimmo is *Desmanthus divergens* of Willdenow and De Candolle; Ergett el Krone, *Mimosa polyacantha* (Willd.), is probably not different from *M. asperata*. The Ensete is *Musa Ensete* (Gmel.), a species of Banana, which grows in the Abyssinian marshes, where there are large plantations of it; and it is almost the sole food of the inhabitants. They eat the green leafless stem, which is many feet high, and an excellent vegetable; scraping off the green skin, and cooking it like turnips, which it somewhat resembles in flavour; and is light, wholesome, and of easy digestion. The Kol-Qual is the *Euphorbia antiquorum*; and though Bruce says that he was prepared to see wonders, yet that this tree much surprised him. The ripe fruit, of a crimson colour, and borne on the top of the branches, gave the trees, that stood thick together, a veil of the most vivid

red. The tree, which sends out most vigorous shoots, is succulent, and leafless below, and bears many golden-coloured flowers, succeeded by red fruit. From the green leaves an almost incredible quantity of milk issues; and, on severing two of the finest branches, no less than four gallons flowed out, of so caustic a nature that, though the sabre used for the purpose was immediately washed, the stain long remained. When the tree grows old, the branches wither, and, in place of milk, the inside appears to be full of powder, which is so pungent, that the small dust that flies, on a touch, from the branch, excites dreadful sneezing, while the milky juice excoriates the fingers. Still the woodpeckers pierce these rotten boughs, apparently with perfect impunity. The only use the Abyssinians make of this fluid is for tanning hides, at least for taking off the first hair. The Rack appears evidently, from the description and figure, to be a species of *Avicennia*; it grows near the sea-shore, and the Arabs build boats of the wood, which is hardened by the sea, and so bitter that no worm will touch it. Toothpicks, made of it, are sold in small bundles at Mecca, and are reputed to be favourable to the teeth, gums, and breath. The Gir-Gir, or Geshe el Aube, a grass, the favourite food of the goats about Ras el Feel, is the *Andropogon afer* (*Gmelin*). Kantuffa, a thorny tree, which, says Bruce, "like many men we meet daily in society, has wrought itself into a degree of reputation and respect, from its noxious qualities, and the power it has of doing ill, together with the constant exercise of these powers, is an universal nuisance in the country where it grows; seizing the raiment of the men, whether coarse or fine, and giving them the alternative of dropping their garments and appearing naked, or of extricating them, torn to rags; and laying hold of the long hair of the women. So dangerous is it for the natives of Abyssinia to leave this thorn standing, that every year, when the king marches, among the needful proclamations this is thought needful, 'Cut down the Kantuffa in the four quarters of the world, for I know not where I am going.' The wild animals well know the shelter that this shrub affords them; and they would be perfectly secure but for a hard-haired kind of terrier, of the smallest size, who, being defended from the thorns by his rough coat, goes into the bush, and brings the game, one by one, to his master." This plant is the *Pterolobium lacerans* of Brown's MS. in Salt's *Abyssinia*, and the *Mimosa* (?) Kantuffa of De Candolle. Gaguedi is the *Protea abyssinica*. Wanzey (*Cordia abyssinica* of Brown in Salt's work) is a common tree throughout Abyssinia; and so universally planted in the towns, that they have the appearance of a wood. "Gondar, in particular, at the season when the white flowers of this tree, which come out in a single night's time, appear, looks as if covered with white linen or new-fallen snow. To this tree, and the coffee tree, divine honours are paid by the Abyssinians. Under its shadow the king is chosen, and holds his first council; and his sceptre is a bludgeon made of its wood, carried in state before him. Farek (*Bauhinia acuminata* of Bruce, not Linn.), the *Bauhinia* Farek of Desvaux, was found on the banks of a brook, which, falling from the west side of the mountain of Geesh, down the south face of the precipice where the village is situated, runs into the lake Gooderoo. It is the water we employed for common uses, not daring to touch that of the Nile, unless in drinking and dressing our food. It grew in the side of a cliff, not 400 yards from the fountain of the Nile itself. Its name of Farek itself is derived from the division of the leaf. Kuara (the *Erythrina abyssinica* Lamarck and De Candolle) (*fig. 800.*), is a beautiful tree, and bears a red bean with a black spot in the middle, which has been, from the earliest ages, used as a weight of gold among the Shangalla, and where that metal is found, all over Africa; and repeated experiments have proved that the seeds vary so little in weight, that a better choice could not have been made between the collectors and buyers of gold. From its name of carat, the weight of gold is derived, and, passing from the gold country of Africa to India, it came to be used for weighing precious stones, especially diamonds; so that to this day both gold and diamonds are said to be so many carats fine. Walkuffe is evidently a plant of the Natural Order *Buttneriaceæ*, and described in the *Encyclopédie Botanique* under the name of *Walkuffia Pentapetes*. But it is probably not different from Cavanilles's genus *Dombeya*, of Bourbon and the Mauritius. It is spoken of as a tree of inimitable beauty. Woognioos, a powerful medicinal plant, grows abundantly in Ras el Feel, where dysenteries reign considerably; "Heaven having put the antidote in the same place with the poison." Both there and through all Sennaar, the inhabitants are well acquainted with the virtues of this plant, and it was successfully employed on Bruce himself, when all other means of cure had failed. Our traveller brought seeds with him to England, and the plant is now not uncommon in our stoves. Sir Joseph Banks named it, in honour of its distinguished discoverer, *Brucea dysenterica*. Cusso is a celebrated vermifuge in Abyssinia. It is the *Hagenia abyssinica* of Lamarck (*Banksia abyssinica* of Bruce). The Abyssinians of both sexes, and at all

ERYTHRINA ABYSSINICA.

antly in Ras el Feel, where dysenteries reign considerably; "Heaven having put the antidote in the same place with the poison." Both there and through all Sennaar, the inhabitants are well acquainted with the virtues of this plant, and it was successfully employed on Bruce himself, when all other means of cure had failed. Our traveller brought seeds with him to England, and the plant is now not uncommon in our stoves. Sir Joseph Banks named it, in honour of its distinguished discoverer, *Brucea dysenterica*. Cusso is a celebrated vermifuge in Abyssinia. It is the *Hagenia abyssinica* of Lamarck (*Banksia abyssinica* of Bruce). The Abyssinians of both sexes, and at all

ages, are troubled with a terrible disease, which custom, however, enables them to bear with some indifference. Every individual, once a month, evacuates a large quantity of worms; and the method of promoting these evacuations is by infusing a handful of dry Cusso flowers in about two English pints of Bouza, the common drink of the country. While taking this remedy, the patient stays in the house, unseen by any one, from morning till night. The want of this drug is thought to shorten the lives of those Abyssinians who travel. It is always planted near churches, for the benefit of the town or village, and grows about 20 feet high. The Teff, or *Poa abyssinica*, is commonly sown all over Abyssinia, and from it is made the bread generally used throughout the country, alike by the king and peasant. The manner of making it is by taking a broad earthen jar, and, having made the pounded grain into a lump with water, they set it at some distance from the fire, where it begins to ferment; they then bake it into circular cakes about two feet in diameter. It is of a spongy soft quality, and a sourish, not disagreeable taste. At the Abyssinian banquets of raw meat, the flesh, being cut in small bits, is wrapped up in pieces of this bread, with salt and Cayenne pepper. The principal people eat the White Teff, which is made of finer grain; and the coarser sort serves the poorer classes. Every man wipes his fingers on the bread which he leaves for his successor, which Bruce truly calls "a most beastly custom." The Teff bread, after being well toasted, is put into a large jar, closely covered, after being broken into small pieces, and warm water poured on it: it is then set by the fire, and frequently stirred; after three or four days it acquires a sourish taste, and is what they call Bouza, or the common beer of the country.

5068. *An appendix to Bruce's Abyssinia* contains the following, more or less interesting, plants; but to which we dare not give other names than those under which they are published: — "Cassia Fistula," which Bruce says, though growing in Syria, Egypt, and Arabia, is a stranger in these places. Abyssinia is its native soil, and the goodness of the drug which it produces in all these countries is in proportion to their vicinity to its native country. The "Lehan, or Tabernæmontana," a tree of which nothing can exceed the beauty and fragrance. "Krihaha" appears to be a species of Bamboo, growing to a height of 55 feet, and to have been worshipped anciently among the Agow nation. "Anguale" is a tree found near the river Tacazze, and believed to be what bears the true Frankincense; and it produces, indeed, a gum very like it. The Gesh is a very common tree in Abyssinia, the leaves of which the people are accustomed to put in their hydromel or mead; they are also reduced to powder, and mixed with the mass from which the Abyssinians make bouza. "Merjoubey" indubitably is a species of *Solanum*, whose fruit, combined with other ingredients, is used as a cathartic. The "Nub" (*Polymnia frondosa*) a syngenesious plant, yet in the description said to be a species of *Sesamum*. It is from this herb they extract most of their vegetable oil. "Umfar, or Amfar," is determined by Mr. Brown to be a *Buddlea* (*B. acuminata*). "Kummel" is stated to be a species of *Mimusops*, of which the fruit is probably esculent, though nothing is said of its properties.

SUBJECT. 3. Zoology.

5069. *The Zoology of Abyssinia* is still but imperfectly known, although the general accounts given by Bruce, and by subsequent travellers, are, perhaps, sufficient for the general reader: the first of these writers, however, is frequently inaccurate. The Elephants, Rhinoceros, Lion, and some kind of Panther, are not uncommon; while the northern Giraffe, *Camelopardalus antiquorum*, Sw., now known to inhabit Nubia, is in all probability found in the less frequented parts of Abyssinia.

5070. *Among the more local quadrupeds* we may enumerate the following: —

Megalotis Brucei. Bruce's Fennic.
Viverra Civetta. Civet.
Lynx Chaus. Booted Lynx.

Hyrax syriacus. Syrian Hyrax.
Antelope Soemmeringii Rsp. Black-fronted Antelope.

Sciurus rutilans Rsp. Abyssinian Squirrel.
Capra Jaeta. Abyssinian Ibex.

CIVET.

801

5071. *The Civet* (fig. 801.) is the only quadruped we shall particularly notice, as having long been celebrated for the odoriferous substance which it yields. This animal measures about two feet and a half in length; the tail is not more than one foot, and the height one foot and a quarter: the body is marked by narrow, black, transverse bands upon a grey ground, narrow, and parallel with each other on the shoulders, larger on the body and the thighs, and which sometimes form eyelike spots, like those on the panther: the tail has four or five black rings, and is broadly tipped by the same colour. The odoriferous substance is contained in a bag, opening by a narrow cleft near the vent: this scent was formerly in much more request than it is now. The Civet of India is the same as that of Africa: and Father Poncet has asserted that Emfras, a town of Abyssinia, is celebrated for the Civet trade, an immense number of these animals being there brought up in a state of domestication for this sole purpose. He further affirms, that with some of these merchants he has seen upwards of 300. The Civet is a particularly drowsy

animal, and is roused from sleep with much difficulty. When irritated, the odour of musk becomes stronger, and from time to time it falls from the pouch in small pieces about the size of a nut.

5072. *The Abyssinian Ixer* (*Capra Jaeta* Ham. Smith) is but imperfectly known, and merits the attention of future travellers. It is supposed to be the animal mentioned in the book of Job, under the name of Jaal. This interesting species, differing in many respects from the European Ixer, is said to be numerous in the mountains of Abyssinia and of Upper Egypt.

5073. *The Domestic Oxen* are of a large white breed, with long horns; but the greater number are variously coloured. The Abyssinian breed of hunched cattle is somewhat peculiar, they are marked with black and white in clouds; low on the legs, with the horns hanging loose, forming small horny hooks nearly of equal thickness to the point; turning freely either way, and hanging against the checks. This breed, by being transferred to Caffraria, and crossed with the straight-backed, has lost its hump: it is esteemed very valuable. (H. Smith.)

5074. *The Ornithology* is no doubt interesting; but the materials for forming an opinion on its general nature are much scattered, and not very precise. The Golden Eagle has been mentioned by Bruce; but the accounts of travellers, not themselves conversant with natural history, are now very justly viewed, on all occasions, with great suspicion. We shall, therefore, restrict our notices to the most remarkable authenticated species.

ABYSSINIAN HORNBILL.

5075. *The Abyssinian Hornbill* (*Buceros abyssinicus* Lath.) (fig. 802.) is of very large dimensions, little inferior to a turkey in size; and, like that bird, is said to have a wattle under the throat, changing at times to a full red: there is a large horny nob on the forehead; the quill feathers are pure white; but the rest of the plumage is dark. The nest is made in large trees, and of such unusual dimensions, as to be four times as large as that of an eagle; it is covered like the magpie's, the entrance being on the east side: it is the largest bird of the genus, sometimes measuring three feet and a half long. Mr. Salt mentions another species, the Yellow-billed Hornbill, not larger than a magpie. One of the lovely Turaccos, or Crown Birds, in all probability a distinct species from that of Guinea, is known in Abyssinia; the plumage is grass-green, of a soft silky texture, and the head is adorned with an elevated semicircular crest of delicately webbed feathers.

PLANT-CUTTER.

5076. *The Hyrcus, or Abyssinian Plant-cutter* (fig. 803.), is a bird of great rarity, no museum in Europe being known to possess a specimen; it is not much bigger than a common grosbeak, or sparrow; but it has only three toes, and the margins of the bill are finely toothed in the manner of a saw; the plumage is black, with the head, throat, and breast red: according to Bruce, it is a solitary species, frequenting woods, and feeding upon the kernels of hard nuts; but this may reasonably be doubted, since the saw-like margins of the bill appear destined to cut off plants close to the ground, in a similar way as is done by the Chilian Plant-cutter.

5077. *Several Water Birds* inhabit the lakes and mountain streams. Of these, we shall only mention the African Jacama (*Siv. Zool. Illust. 2.*); a most graceful bird, of the size and habits of our water-hen, but with toes and claws of extraordinary length.

SECT. III. *Historical Geography.*

5078. *Abyssinia was little known to the ancients.* None of the conquerors of Egypt were able to penetrate, across Nubia and Meroe, into this ulterior region. The tradition which makes the Queen of Sheba an Abyssinian princess, and the monarchs of that country the descendants of Solomon, seems to rest on a very chimerical foundation. The Ptolemies, in extending their commerce, became intimately acquainted with all the ports of the Red Sea. Their observations thus reached the kingdom of the Axumitæ, whose port, Adulis, was celebrated for the great quantity of ivory which was shipped from it, and whose capital, Axum, exhibits splendid monuments, bearing somewhat of an Egyptian character. The same territory, though now forming a loose appendage to Abyssinia, continues to be the sole channel of its trade. The Abyssinian annals represent the country as converted to Judaism several centuries before the Christian era; and it certainly retains many observances bearing the stamp of that faith. In the fourth century, the nation was converted to Christianity, by the efforts of Frumentius, an Egyptian, who raised himself to high favour at court. Abyssinia remained impenetrable to the arms or the creed of the followers of Mahomet, and, affording shelter to the refugees from Egypt and Arabia, it became more decidedly Christian. To the Portuguese, when they began their grand career of maritime discovery, this country was an object of eager enquiry, as being the supposed seat of the chimerical prince whom they named Prester John. Its situation, too, at the bottom of the Red Sea, appeared, before it was thoroughly known, likely to be favourable to a trade with India. Early in the sixteenth century, Covilham reached it by way of Egypt, and was followed by successive embassies and missions. The Abyssinians adhered to the Eutychean sect, held the Monophysite doctrine, and owned the supremacy of the Patriarch of Alexandria; the Portuguese, therefore, although this system was rather less superstitious than their own, considered it little better than pagan, and made incredible efforts to convert the Abyssinians

to the Catholic faith, and obtain their allegiance to the see of Rome: in fact, Paez, a missionary of great address, persuaded the king, Susneos, in 1620, to proclaim the Catholic religion to be that of the state. This step, however, occasioned violent civil wars, which ended in the total expulsion of the Portuguese. Since that era Abyssinia has maintained scarcely any intercourse with the powers of Europe. It had been almost forgotten among us, until the popular and animated narrative of Bruce made it again familiar; and, notwithstanding some vague and vaunting statements, the general accuracy of his information has been confirmed by subsequent enquiry. Mr. Salt has also favoured us with recent and accurate, though somewhat less extended, observations on the same subject.

5079. *Abyssinia has been always governed by native princes*; though disputed succession, and the rebellion of the military chiefs, frequently involved it in the calamity of civil war. These evils, rising to a peculiar height, exposed the country to the inroad of the Galla, a race of warlike and powerful savages from the south. By successive conquests, they have become themselves masters of all the central provinces, which their chiefs govern under the name of an Abyssinian prince. The position thus held by them separates Abyssinia into two parts, of which the northern division of Tigré was administered, in Mr. Salt's time, by Ras Welleta Selasse, who has since been succeeded by Subegadis, an able chief, who is aiming at the recovery of Gondar. The southern provinces of Shoa and Efat, again, are held by a prince descended of the royal family.

SECT. IV. *Political Geography.*

5080. *The constitution of the Abyssinian monarchy* has been, in theory, a complete despotism, no limit being assigned or prescribed to the absolute power of the sovereign. The country, in fact, appears to have been in a better state, when this system of government really prevailed. For some time past it has exhibited the calamitous picture of a broken-up despotism. The continual conflicts with the Galla and other barbarous neighbours have thrown extraordinary power into the hands of the governors of provinces and the military chiefs; and every thing has finally become almost wholly subject to the law of the sword. The nation, however, still holds the race of its kings in such reverence, as to make it unsafe for those armed usurpers openly to place the crown on their own head. They choose, therefore, some branch of the royal family, to whom they leave the form and shadow of sovereignty, and in whose name they administer public affairs. Even the Galla chiefs, who, as already observed, are become masters of half the kingdom, and of its capital, Gondar, have found it expedient to adopt this policy.

SECT. V. *Productive Industry.*

5081. *Abyssinia is a very fertile region.* Its valleys, supplied with copious moisture from the numerous mountain ranges, are completely exempted from the arid character of tropical plains. They maintain a rough plenty, with little aid from human art. The only disadvantage of the soil is, that the combined influence of heat and moisture produce often a rank fertility, which unfits it for the production of the finer kinds of grain. Wheat can be raised only on the higher grounds, and for the consumption of the rich. Barley is also cultivated, but chiefly for the feeding of horses. That which constitutes the food of the people, and can be raised almost on every soil, is *teff*, a weak herbaceous plant, with a stalk not much thicker than that of a carnation, and the seeds of which, though scarcely the size of a pin's head, by their great number make up a bulky crop. The lowest grounds produce some still coarser kinds of grain, which are mixed with *teff* and barley in making bread. The Abyssinian plough is extremely rude, often without iron. The operations of weeding and reaping are entirely performed by women. The low state of this important art may be inferred from the circumstance, that scarcely such a thing is known as corn brought to sale, and that each family raises what is necessary for its own use. The upland districts abound with horses and cattle, which, with cheese and butter, form objects of exchange. Bees are bred in great numbers, and the honey is of good quality. It is not only used for food, but, being mixed with maize, is formed into a fermented liquor, which is the favourite drink of Abyssinia. Cotton is raised in considerable quantities, though not sufficient for supplying the fabrics of the country.

5082. *The mineral wealth of Abyssinia is small.* No metallic substances are worked, or are known to exist; although, from the mountainous character of the country, there is little doubt that a search for them would be rewarded with success. A little fine gold is found in the sands of its eastern rivers; but the greater part, even of that article, is brought from regions farther in the interior. The most important fossil production is *salt*, drawn from a great plain in the western frontier, and even beyond its limits. The salt on the surface is hard and crystallised, like ice on which snow has fallen; but at the depth of two feet it is coarse and softer. It is cut with an adze into pieces, which, like the cotton cloth, are used as money. The employment of cutting it is dangerous, since both the workmen who dig the salt, and the caravans which convey it, are exposed to the attack of the Galla. A military force is therefore employed, under the command of an officer called *balgudda*, who receives payment for his services in salt.

5083. *The manufactures of Abyssinia* are of a rude character, and merely adapted for its home consumption. The staple is cotton stuffs, with which the people are universally clothed. Fine cloths are manufactured at Gondar, the capital, and coarse at Adowa; the latter, from their universal demand, serve in this rude state of commerce the purpose of money. The Abyssinians cannot dye their cloth dark blue, but are obliged, when they wish to introduce a mixture of that colour, to unravel the threads of the blue cloth of Surat. Coarse carpets are also manufactured at Gondar and in Samen, though for fine carpets the Abyssinians depend upon Persia. The demand for arms being regular and extensive, considerable industry is employed in manufacturing them. Adowa is distinguished for the fabric of knives, and Antalo for that of spears; and similar articles are imported from Sennaar and the district of Berbera.

5084. *The foreign commerce of Abyssinia* is far from extensive. Goods can be imported only at the single point of Massua, and thence conveyed through the empire by the laborious route of the caravans. Almost all the articles of refined luxury must be procured from abroad; but the demand for these is very limited. From Surat are imported both raw cotton and fine manufactured cloths; carpets from Persia; raw silks from China; velvets, French broadcloths, coloured skins from Egypt; glass beads and decanters from Venice. For these articles Abyssinia can give in return only ivory, gold, and slaves, the staples of interior Africa, between which and the eastern frontier of this empire there must exist a considerable communi-

cation, though yet undescribed by European travellers. This country, however, as a channel for the above trade, by no means equals Nubia. The slaves, indeed, are in some demand, being considered particularly handsome. On the whole, it appears, that, until Abyssinia shall attain a much higher degree of improvement, its commerce cannot be a material object to any European power.

SECT. VI. *Civil and Social State.*

5085. *The manners of the Abyssinians*, under a slight semblance of civilisation derived from Arabia and Egypt, present indications of the deepest barbarism. Indeed, their domestic life is marked by habits more gross and revolting than any that have been witnessed among the most savage tribes. Some, indeed, are such, that the bare report of them shook the credit of one of our most eminent travellers, who had not, however, been the first to report them, and whose testimony has since been fully confirmed.

5086. *The luxury of the brinde feast* is that which has particularly excited the astonishment of travellers. Slices of warm flesh cut from the ox standing at the door, are brought in, with the blood streaming and the fibres quivering, and are eagerly swallowed as the choicest delicacy. According to Mr. Bruce, the animal is yet alive while the slices are cut from him, and is heard bellowing with the pain; but Mr. Salt asserts that he has been just that instant killed: probably there may be some variation of practice. This strange food is as strangely administered. The chief is seated between two ladies, who wrap up the delicious morsels in teff cake, and thrust into his open mouth the utmost quantity which it is capable of receiving; "just," says an old traveller, "as if they were stuffing a goose for a feast." The ladies are then at liberty to satisfy their own appetite, and when these refined members of the company have supplied themselves, the servants succeed, and clear the table. The grossest indecencies are said by Mr. Bruce to be acted at these feasts; an assertion which Mr. Salt does not fully confirm, though he admits that the conversation is marked by the least possible reserve.

5087. *The shulada*, a similarly savage custom, is practised by the drivers of cattle. When they feel hungry on the road, they stop the animal, cut out a slice from him, close up the wound, and, having satisfied their hunger, drive him on.

5088. *A general ferocity, and promptitude in shedding blood*, seems to characterise the Abyssinian nation, and is, doubtless, stimulated by the frequency of civil and of foreign wars. The principal officers scruple not to execute in person the sentence of death, which the king, or whoever he may be whom they obey, has passed against any individual; and they perform this horrid task with the most perfect coolness and indifference. While Mr. Bruce resided at Gondar, during a period of commotion, he could not stir out without seeing the victims of civil strife left unburied in the streets, to be devoured by the dogs and hyænas.

5089. *The manners of the Abyssinians* are not less distinguished by licentiousness than by cruelty. Intoxication is very prevalent, produced partly by hydromel, but chiefly by bouza, a drink well known also in Egypt and Nubia, and mostly produced here from the fragments of teff cakes brought from table. Marriage is scarcely considered by Mr. Bruce as existing at all; so great is the ease with which the contract may be formed and dissolved. The lover consults only the parents of the bride, and, having obtained their consent, seizes and carries her home on his shoulders. A *brinde* feast concludes the ceremony. Sometimes it is rendered a little more formal; the parties going, two or three weeks after their union, to church, and taking the sacrament together. A lady was met at Gondar, in company with six persons who had been successively her husbands. Ladies of rank assume great sway over their partners, and are at the same time very little observant of the duties which the marriage bond imposes. Polygamy is very common, though a great pre-eminence is allowed to one wife, and the rest are considered merely as concubines.

5090. *The Abyssinians profess the same form of Christianity with the Copts of Egypt*, and even own the supremacy of the Patriarch at Cairo. From him the Abuna, the actual and resident head, receives his investiture. By a regulation supposed to have been adopted with the view of securing a greater measure of learning than could be expected to be found in an Abyssinian, this pontiff must be a foreigner. As such, however, he is usually ignorant of the language; and his influence, and means of holding communication with the people, are much circumscribed. The Abyssinians combine with their Christian profession many Judaical observances, such as circumcision, abstinence from meats, and the observance of Saturday as well as Sunday as a Sabbath. At the same time, they share amply the superstitions which have infected the Catholic church. Their calendar of saints is equally numerous; scarcely a day occurs which is not consecrated to one or other of them, and sometimes to several. They maintain, that no nation, except themselves, holds the Virgin in due reverence; and in this respect even the Catholic missionaries found themselves outdone. Their churches are numerous, and adorned with paintings; but images and sculptured forms of any description are considered unlawful. They have monasteries, the tenants of which, however, are not at all immured with the same strictness as those in Europe. Upon the whole, the above account of their general conduct shows how little

they are under the influence of Christian principles ; which do not, it appears, even extend so far as to produce legal prohibition of divorce and polygamy.

5091. *Of the learning of the Abyssinians* little has been made known by travellers, and indeed it appears to be very limited. Yet they have a written language, the Gheez, which has a great affinity with the Arabic. The Amharic, however, more simple and less harsh, has for some centuries been the language spoken at court. Each province, besides, has its dialect, in which the native Arabic mixes, more or less, with idioms of African origin. There seems to be an expectation that the priests should be able to read ; and a slight examination is made of their qualification in this particular : but no similar pretension exists among the laity. Their literature seems to be confined to legends of saints, chiefly translated from the Coptic, and to the chronicles, which are written by persons employed at court for the purpose, on the model of the Jewish chronicles ; in these the transactions of each month are separately recorded.

5092. *All the houses in Abyssinia* are built in a conical form, and with thatched roofs. Some attempt at magnificence is made in their churches, also roofed with thatch, but surrounded by an arcade formed of pillars of cedar ; and, being placed on the summit of little hills, they give the country a very picturesque appearance. The sovereign and grantees have also large and commodious residences. The Abyssinians are extremely fond of paintings, or rather daubings, made on the walls of the churches and of the houses of the great ; but of these, the glittering colours seem almost the only recommendation.

ABYSSINIAN CHIEF.

5093. *The dress of the Abyssinians* consists chiefly of a large cotton mantle, with close drawers, and a girdle. Round their head they put a white wrapper, which leaves the crown exposed. Many chiefs, as a mark of dignity, wear an ornament in the shape of a horn (*fig. 804.*) projecting from the forehead, which, with their long beard, gives them a very wild and rough appearance. Bruce supposes a similar embellishment to have been worn by the Jews, and to have been alluded to when the exaltation of the horn is mentioned as an emblem of prosperity.

5094. Such are the natives of Abyssinia proper ; but the society of that country could not be exhibited in all its deformity without noticing *those barbarous neighbours* who have harassed it with continual inroad, and have now possessed and covered so large a portion of the country. The origin of the *Galla* is involved in much obscurity. They have evidently come from the depth of that unknown region which composes the southern interior of the continent. They appear to have been long wandering in search of regions more fertile than their own, and were seen about two centuries ago by Lobo, near Melinda ; but the fine plains of Habesh seem to have attracted the whole mass of their population. The *Galla* present an aspect of barbarism, in comparison with which that of the Abyssinian is humane and refined. Their favourite ornament is composed of the entrails of their oxen, which, without any superfluous care in cleansing them, are plaited in the hair and tied as girdles round the waist ; decorations which are not only obnoxious to sight, but soon assail the olfactory nerves. The besmearing of their body with melted grease completes their embellishment. Their career is marked by indiscriminate massacre : they spare neither sex nor age, unless from the anticipation of gain by carrying off and selling prisoners. In Europe, they would be considered as a species of light cavalry ; they perform immense marches, swim rivers, and endure incredible fatigue. Being almost destitute of iron, their arms consist of little more than wooden javelins, with the points hardened in the fire. They make a most furious onset, with shrill and savage cries, which strike terror into all but the steadiest adversaries ; but, if this first shock be withstood, they are ill fitted to sustain a regular battle. They have been said to be without religion, and they certainly have neither priests nor temples ; but they have been observed to hold certain trees as sacred, to worship the moon and some of the stars, and to believe in a future state. In their persons they are small, and neither in hair nor features resemble the negroes. In general, their complexion is only a deep brown ; but this appears to be a consequence of their descent from nations inhabiting mountainous districts ; those who have long dwelt on the plains are quite black. They are divided into several tribes, of whom the principal are the Boren *Galla*, who have occupied the Abyssinian provinces of Dembea, Gojam, and Damot, and even Gondar the capital ; and the Adjow *Galla*, who are established in Amhara, Begemder, and Angot. These *Galla* who have long lived among the Abyssinians have in a great measure exchanged their original customs for the more mitigated barbarism which prevails among their new subjects. Some of the southern tribes have been converted to the Mahometan faith, which for them is an improvement.

5095. *Abyssinia is extensively infested by other tribes*, still more uncivilised and savage. The *Shangalla*, or *Shankala*, a race decidedly negro, of deep black colour, with woolly hair, occupy a most extensive range of territory along the western frontier. Bruce conceives them to be the same race who, under the name of *Funje*, inhabit the banks of the

Bahr el Abiad, and are now masters of Sennaar: but this branch, possessed of much higher advantages, is now in quite a different state, both social and political. The proper Shangalla inhabit the deep banks and ravines which border the Tacazze and the Mareb, in the lower part of their course. The numerous streams poured down from the heights, with the intense heat of these close valleys, produce a rank luxuriance of forest and underwood, which, not being pruned by the hand of industry, chokes the growth of every useful production. The hippopotamus, in these waters, rolls his unwieldy bulk, the elephant stalks along the shore; all wild animals here find subsistence, and, as it were, a home. Mixed with them, and only a degree higher in the scale of being, are the Shangalla. During summer, they live in pavilions formed under the shade of trees, the lower branches of which are bent down, fastened in the ground, and covered with skins. When the rainy season, however, converts the whole surface of the earth into mud, they retire to caves dug in the soft sandstone rocks, and subsist on the dried flesh of the animals caught in the favourable season. These are the tribes whom Ptolemy classes under the general appellation of Troglodytæ, or dwellers in caves, and whom he particularises under the titles of elephant-eaters, rhinoceros-eaters, locust-eaters; for there are some whose situation confines them to this last description of food. In the rainy season, the Shangalla are not left to the undisturbed possession of this wilderness. It is a favourite hunting-ground of the Abyssinian monarchs; and the objects of chase are not only the elephant and hippopotamus, but the Shangalla, who, wherever they are seen, are pursued, attacked, and carried off as slaves. This brave and fierce race, however, though without either horses or fire-arms, make often a desperate resistance; they have even undertaken successful inroads into the neighbouring districts of Tigré.

SECT. VII. Local Geography.

5096. The entrance of Abyssinia for Europeans is by the town of Massuah, situated on an island in the Red Sea, not more than three quarters of a mile in length. The houses are built chiefly of wooden poles and thatch, but a few are of a species of stone with shells embedded in it. The trade of Massuah was once very extensive, when the intercourse with India was carried on by this channel; but it fell into decay immediately after its subjection to the tyrannical sway of the Turks. Its decline has since been rapid; though, as the only channel by which all the limited trade of Abyssinia passes, Massuah must ever retain some importance. Its foreign intercourse is almost entirely with Mocha and Jidda on the opposite coast; and from these ports it brings India cotton wool and piece goods, European iron, copper, and manufactured goods, to the amount of about 400,000 dollars. The returns are in the usual African staples, brought during the month of February by a caravan from the interior. The Turks governed Massuah by a *mayor*, who has now acquired an authority nearly independent. He levies 10 per cent. *ad valorem* on all goods which pass through the place.

5097. Opposite to Massuah is Dahlac, or Dahalac, the largest island in the Red Sea, twenty-five miles long and twelve broad. It bears marks of former populousness and importance, and still carries on a little trade. At the bottom of the bay of Massuah is Arkeeko, a sea-port once celebrated, but which contains at present only a collection of miserable huts, inhabited by a thievish and degenerate race. Mr. Salt saw reason to think that, could he have searched, he might have found in this neighbourhood the ancient Adulis.

5098. The kingdom of the Baharnegash, as it is called by early travellers, is situated in the interior, south-west from Massuah, but it is rather an appendage to Abyssinia, than an integral portion of that country. The mayor of Massuah has now extended his authority over the greater part of this district. The road from Arkeeko leads first over the lofty mountain of Taranta, covered with fine cedar trees, and affording pasture to numerous flocks. On its opposite side is Dixan, a somewhat handsome town, of flat-roofed houses, built on a conical hill, commanding an extensive view over the high mountains of Tigré. It has a considerable trade, including, among other branches, the shameful traffic of selling children. Dobarwa is also an important town, and was the residence of the Baharnegash. The ruder parts of this province are traversed by races of Troglodytic shepherds, called the Hazorta and Shiho, who live in caves, or in small wooden cages covered with hides. They have the reputation of not much respecting the property of those whom they encounter in their wanderings, a charge which applies too generally to the African nomades.

5099. The Mareb forms the boundary between the province of the Baharnegash and that of Tigré proper. This last consists almost entirely of a wild confusion of rocky mountains, affording only occasional spots capable of cultivation. It is enriched, however, by some manufactures, and by its traffic as the channel of all intercourse with the Red Sea. The main theatre of its industry is Adowa, the capital, situated on the side of a hill, and containing about 8000 inhabitants. Cotton cloth, both coarse and fine, is manufactured to a great extent, and passes as money; about 1000 slaves are driven through it annually. Trade is chiefly in the hands of the Mahometan inhabitants, of whom the number is considerable. The inhabitants are rather above the usual standard of civilisation.

5100. Although Adowa is at present superior in importance, Axum is the most interesting town in Tigré, and even in Abyssinia, from its extensive monuments, which attest it to

OBELISK AT AXUM.

have been the ancient capital, and the most conspicuous town in all this part of Africa. In the great square alone there are forty obelisks, one of which is 80 feet high (*fig. 805.*), and considered by Mr. Salt as rivalling whatever is most magnificent in Egypt. From the character of the architecture, it seems to have been erected by the Ptolemies, or in their time; and a Greek inscription, discovered by Mr. Salt, shows this place to have been in the third century the capital of the Axumitæ. It still contains 600 houses, from

which may be inferred 6000 inhabitants; and it carries on manufactures of parchment and of coarse cotton cloth. The inhabitants are rude and inhospitable. Chelicut is also a town of some importance, lately the occasional residence of the sovereign, distinguished for its church, the finest in Tigré, and perhaps in Abyssinia. This edifice is composed of three concentric walls.

5101. *Tigré, as a grand division of Abyssinia*, contains nine other provinces besides Tigré proper and the maritime district. These are, *Agame* to the east, a level and fertile territory, bordering on the great salt plain. *Enderta*, a mountainous province to the south of Agame. It contains Antalo; which, being made the residence of Welleta Selasse, on account of its vicinity to the frontier, became a sort of northern capital. It is situated on the side of a mountain, and contains about 1000 houses, chiefly poor cottages, with thatched conical roofs. *Wojjerat* and *Wofila* are wild, low, and wooded districts, reaching to the great lake Ashangel, which abound in wild beasts, and where the Galla are intermixed with the native Abyssinians. *Lasta*, *Avergale*, and *Samen*, are very rugged and mountainous districts, between the Tacazze and the Coror, the two former of which are chiefly inhabited by Agows. The mountains of Samen are the highest in Abyssinia, and frequently covered with snow. *Sire* and *Zemben*, beautiful provinces, lie immediately to the west of Tigré proper. Sire, in particular, is the most picturesque part of Abyssinia, abounding in valleys, flowery meadows, and shady groves. Tigré, composed of the above eleven districts, now forms a separate and powerful kingdom, since the central provinces have been over-run by the Galla. Though not the most uniformly fertile, it contains the most warlike of the native population. It monopolises all the trade, including the important branches of salt and of muskets.

5102. *The central division of Abyssinia*, called Amhara, is in several respects pre-eminent. It presents the most extensive level plains, and yields the greatest abundance of corn and cattle. While Abyssinia was entire, and till the whole division itself was over-run by the Galla, Amhara was the residence of the sovereign, and it still contains the principal and most ancient families. The inhabitants are reckoned very brave, and it has even been asserted, that, when well armed, they are equal to double their number of the other Abyssinians. In this province was the mountain of Amba Geshen, which formed the place of confinement for the younger branches of the royal family.

5103. To the east of Amhara is *Begemder*, a large and rude province, chiefly employed in pasturage. It possesses the finest breed of horses in the kingdom, and from it were drawn most of the cavalry employed in the Abyssinian armies. The people are under very little subordination, and cannot be called out but by a prince or chief capable of swaying their affections. Its mountains are said to contain iron mines, and it is bordered on the south by a chain of deep ravines, which long formed a barrier against the incursions of the Galla. The province of Lasta, adjoining to Begemder, presents nearly the same aspect.

5104. East of Begemder is *Dembea*, a province pre-eminent in several respects. It contains Gondar, the capital, and the great lake of Tzana or Dembea. Gondar is the only place in Abyssinia entitled, from its magnitude, to the appellation of city. In time of peace it contains 10,000 families; but the habitations are in no degree superior to those met with elsewhere, being merely mud cottages, with conical thatched roofs. There are an hundred churches; but the only very handsome edifice is the palace, built of stone, four stories high, commanding an extensive view. The presence chamber is 120 feet long. For this structure, however, beyond the powers of her native masons, Abyssinia is indebted to the Jesuits, since whose departure it has not been kept in repair, and the two upper stories have become uninhabitable. Emfras is a small but pleasantly situated town, with 300 houses. The province of Dembea is generally flat, and fertile, particularly in wheat. Its produce is assigned for the supply of the royal household.

5105. *The lake Tzana*, or Dembea, occupying the centre of this province, and forming one of the grand features in the physical aspect of Abyssinia, is fifty miles in length, and thirty-five in breadth. It is formed by the early stream of the Bahr el Azreek, or Abyssinian Nile, combined with numberless other streams poured down from the mountainous tracts in the west. It contains numerous islands, some of which have been used as state prisons.

5106. *The Bahr el Azreek*, after passing through the lake Tzana, and coming out on its eastern side, makes a grand semicircular sweep of several hundred miles, until it reaches a point not very distant from its origin. This part of its course encloses *Gojam* and *Damot*, fine and fertile regions, the latter of which has, by a modern traveller, been painted as a terrestrial paradise. They are pastoral districts, containing numerous herds of very fine cattle. The inhabitants differ somewhat in religion and manners from the other Abyssinians, and have often shown a refractory spirit to the government.

5107. *The last division of Abyssinia* consists of the southern provinces of *Shoa* and *Efat*, with some dependencies little known. These now form a kingdom, entirely separated from that of Tigré by the interposition of the Galla, and governed by a branch of the ancient royal family. Shoa is famous as having, about the year 900, afforded a refuge to the royal family, when the kingdom was seized, and a great part of them were massacred by an usurper. The survivors remained in it 400 years, and afterwards resumed possession of the kingdom. Shoa is described as a fine and rich province, containing the bravest and best-equipped troops in all Abyssinia. It has been supposed that there are more remains of learning in these southern provinces than in those visited by Europeans.

5108. *Abyssinia* is bordered by a number of *loose appendages*, subject or tributary to it when powerful and prosperous, but impatient of the yoke, which they throw off whenever opportunity offers. On the east is Angot, which the Portuguese, in the sixteenth century, found one of the finest parts of the empire, and adorned with a number of beautiful churches; but it has since been so entirely occupied by the Bertuma Galla, that it has ceased to be regarded as belonging to Abyssinia. Eastward, as far as the Red Sea, is Dankali, a sandy and saline tract, inhabited by a Mahometan people, called Taltal, who, without being subject to Abyssinia, have been in general submissive allies.

5109. On the western frontier, to the north of Gojam and Damot, is *Agow-midré*, or the country of the Agows. This remarkable people is somewhat widely diffused; another tribe of them occupies a great extent of the province of Lasta. Their subjection to Abyssinia consists merely in the payment of a tribute in butter, honey, cattle, and hides, partly to the king, and partly to the governor of Damot. Their traffic consists in selling these articles at Gondar; for which purpose they resort to that capital, often in parties of 1000 or 1500. Their mountains do not exceed 4000 or 5000 feet; an altitude which, in that climate, admits of verdure and cultivation to the very summit. Salt circulates with them as money. Their dress consists of leather softened by a peculiar process, and worn in the form of a shirt. Each of their habitations has behind it an immense cave dug in the rock, which does not seem to be now occupied in any shape. Whether its original destination was for a Troglodytic abode, or for a place of shelter in case of barbarous inroad, is matter of conjecture. The Agows were originally worshippers of the Nile; but, less than two centuries ago, they were converted to Christianity, and are now strict observers of, at least, its outward forms.

5110. *The district of Sacala*, in the southern part of this territory, contains the celebrated fountains of that river, which has been supposed to form the main branch of the Nile of Egypt. They are three in number, situated in a marshy plain, at the foot of a mountain nearly 5000 feet high. The natives have erected an altar of turf at each of the fountains; a high-priest officiates at them; divine honours are paid to them by the Agows, and an assembly of their national chiefs is held annually on the spot. Bruce's boast of

having been the first to visit these "coy fountains," has been refuted, and is indeed doubly unfortunate; since neither is this river the main branch of the Nile, nor was he the first European who visited even its sources. They were traced three centuries ago by Peter Paez, and perhaps by Lobo. The charge, however, brought against him, with so much bitterness, of having practised an artful deception, is altogether unfounded. The Abyssinian river is considered as the Nile by the people of the country, by all the Portuguese missionaries, and by all modern geographers prior to D'Anville. The main facts which refute Bruce's opinion are to be found in his own book; for he there states that the Bahr el Abiad is greater than the Nile, and he inserts the narrative of Paez. His error was only one of judgment, into which a man may surely fall, without deserving to be termed a liar.

5111. *The Abyssinian Nile*, after making the circuit of Gojam and Damot, passes through a low marshy territory, called Maitsha. The soil, which is too moist for grain, produces an herb called *ensete*, which forms excellent food. Hereabouts are some tribes, the Gafats and the Guragues, of rude habits, and with languages peculiar to themselves. From the turn of the river northward, the interval between it and Abyssinia is filled by Kuara, a wild mountainous country, which receives a governor from Abyssinia when it dares not do otherwise. Its chief importance consists in the gold which passes through its territory from the East.

5112. *To the north are Walcayt and Waldubba*, wild wooded regions along the lower Tacazze, forming the domain of the Shangalla, already described. The southern regions of Narea, Caffa, and Gingiro do not seem in any shape to belong to Abyssinia.

CHAP. V.

BARBARY.

5113. *Barbary* is that long line of territory, from 100 to 200 miles in depth, which extends eastward from Egypt to the shores of the Atlantic. The name, though familiar with Europeans, and derived from the Berbers, a race of native inhabitants, does not appear to be recognised in the country itself; and the region is even occupied by different independent states; yet such is the similarity both as to nature and the condition and aspect of the inhabitants, that they may very advantageously be considered under one head.

SECT. I. General Outline and Aspect.

5114. *The level plain*, which composes the greater part of Barbary, resembles in surface and quality that immense ocean of sand which overspreads nearly the whole northern half of the African continent. Barbary, however, derives a distinctive and superior character from that mountain-chain, or series of chains, which, under the celebrated name of *Atlas*, ranges through nearly its whole extent from west to east. The loftiest pinnacles are in the west, rising above the plain of Morocco, and facing the Atlantic, where it appears even to rise above the limit of perpetual snow; but beyond the frontier of Morocco, and eastward through Algiers and Tunis, the mountains of this chain seldom exceed 3000 or 4000 feet. On the territory of Tripoli, they sink into lower eminences, and gradually subside to that flat sterile surface which characterises Northern Africa. The aspect of the Libyan desert, which separates Tripoli from Egypt, is compared by travellers to that of the bottom of the sea after its waves have receded. The breadth of the plain between the mountains

and the Mediterranean, which constitutes Barbary, nowhere exceeds 100 miles, and in many places is not more than five or six; its average breadth may be estimated at about fifty or sixty miles. On the southern side of the mountains is another plain of vast and vague extent, stretching indefinitely to the south. This tract, which possesses naturally the same dry and desert character as the bordering regions, derives, from the streams poured down by the Atlas, a certain degree of fertility, which continues to the places where these are absorbed in the sands, or expanded into lakes. This region forms a loose appendage to Barbary, being inhabited by tribes in some sense tributary and dependent, though they are generally accustomed to rove with little control over their spacious plains.

5115. The plain of Barbary is watered by numerous *rivers* descending from the great mountain range; but, on account of the short interval which interposes between it and the sea, they cannot have any long course. None of them can be considered as general features of the region; their character is local, and will be described under the local head. The same may be said of the less known streams poured from the southern declivity of Atlas, though these roll a somewhat longer course, till they are absorbed in the sandy waste.

5116. *The limits of this vast region*, especially on the land side, where it passes by an insensible gradation into the trackless deserts, cannot be easily defined. It would be difficult even to fix the extreme points of Tripoli and Morocco. Port Bomba, on the eastern frontier of Tripoli, is in $32^{\circ} 26' E.$, while Mogadore, nearly the most western part of Morocco, is in $9^{\circ} 20' W.$, forming thus a line of forty-one degrees of longitude, or about 2000 miles from east to west. Of its northern boundary along the Mediterranean, the highest point is Cape Blanco in Tunis, in latitude 37° , whence it declines in Morocco to 35° , and in the Gulf of Sidra even to nearly 30° . The southern boundary is altogether of that vague and indefinite nature already described.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5117. *Atlas, or northern region of Africa.* — This interesting division of Africa is characterised by the Atlas range of mountains, some of the summits of which rise to a height of 13,000 feet above the sea. The central and higher chains are composed of granite, gneiss, mica slate, and clay slate; while resting upon and forming the lower ranges are extensive deposits of secondary limestones and sandstones. The limestone abounds with organic remains, as shells, corals, and even fishes, and is said to be referable to the various limestones of the secondary class, extending from the *lias*, or even the *magnesian limestone*, to *chalk* inclusive. Resting upon these limestones are deposits of tertiary rocks. Salt springs and gypsum are mentioned as occurring in different parts of the range. The secondary and tertiary formations are variously charged and upraised by trap rocks of modern date.

SUBSECT. 2. *Botany.*

5118. The *Botany* of this country has been described with that of Egypt, page 1147. *antè.*

SUBSECT. 3. *Zoology.*

5119. *The Zoology of the Barbary States* assimilates with that of northern Egypt, Arabia, and Asia Minor; and requires, therefore, but a slight notice. The quadrupeds, as may be expected, differ materially from those which are now known as inhabitants of Europe, as will be better seen from the following list: —

Cynocephalus Babouin. Little Baboon.
Felis Pardus. Panther.
Lynx Caracol. Sw. Caracol Lynx.
Lynx Chaus Sw. Booted or Marsh Lynx.

Sciurus getulus. Barbary Squirrel.
Camelus Dromedarius. Arabian Camel.
Mus barbarus. Barbary Mouse.
Gasella Dorcas Sm. Barbary Antelope.

Gasella Kevella Sm. Morocco Antelope.
Ovis tragelaphus. Bearded Sheep.
Damalis Bubalis Sm. The Bubalis.

5120. *Some of these we shall slightly notice.* The Dromedary (*fig. 807.*) (*Camelus Dromedarius* L.) is well known to be the most useful and

the most general beast of burden throughout the whole of Northern Africa. It is smaller than the Asiatic or Bactrian camel, and has but one hump, while that has two; but the legs are more slender and elevated. There are several breeds, differing chiefly in size or colour; those of Turkey are the strongest, and best suited for burden; but the Arabian and Barbary breeds are the lightest and the swiftest. The females, when gravid, are usually taken from their work.

5121. *Regarding the Bearded Sheep* (*Ovis tragelaphus*) said to inhabit Northern Africa in a wild state, no very recent accounts have reached us. Dr. Caius, about 1561, describes it as being of an immense size, nearly equal to that of a stag; yet it was gentle, petulant, and lascivious, fond of ascending high

places and roofs of houses, running swiftly, and bounding prodigiously. This animal, continues Major Smith (*Grif. Cuv.* iv. 320.), appears to be the real Fishtall, or Lerwee, of Shaw.

5122. *The Bubal (Damalis Bubalis)* so nearly resembles the European buffalo, that travellers have confounded the two together. Its general appearance is not unlike that of a small cow; the proportions are heavy, the head long and clumsy, and the singular elevation of the shoulders is remarkably striking. It is wholly of a yellowish dun colour; the tuft of the tail being alone black. They seem to live in small troops throughout the deserts and forests of Northern Africa, from the Nile to Morocco, and were met with by Messrs. Denham and Clapperton in the woods of Bornou. The Arabs give them a name signifying cattle of the forest.

5123. *The Domestic animals* deserving notice, besides the Camel, are the superb Horses of Barbary, and the different breeds of cattle and sheep extending over Northern Africa.

5124. *The Barbary horse vies with the Arabian* in beauty of form, although not, perhaps, in the fleetness of its course. The chest is better made, and more rounded; the forehead, instead of being hollowed, is rather prominent, and the shape of the head is finer: the figure altogether is more imposing than that of the Arab, although their stature is nearly equal. The best Barbary horses are found, at the present day, in the kingdoms of Morocco and Fez; but the Moors do not take near so much care of their horses as the Arabians.

5125. *The Morocco breed of Sheep* have long wool, the hair on the neck rather shorter and more curled: like most of the African breeds, they are remarkable for their strong make and long legs: their horns are small, turned spirally outwards, and the scrotum forming two separate sacs; the general colour is white, tinged with liver-colour. There is another breed, called the Barbary, having the tail so broad at its base, as to be wider than the buttocks: the wool is coarse, and of a rufous colour on the neck, legs, tail, ears, and nose: the face is much arched, the ears pendulous, and the horns retain the original curve of the Argalis, on a smaller scale; the tail is longer than in the last. The third race of Northern Africa is found in Barbary, and even in Corsica. It is policerate, with pendulous ears, having the tail not much widened, and the colour white. This breed is remarkable for bearing two different kinds of fleece, the posterior parts being covered with wool, while soft loose hair extends from the head to the shoulders: a crossed breed of this race was some time ago brought to England. It was entirely covered with soft silky hair of a silvery whiteness; that on the neck being of great length.

808

BARBARY SHRIKE.

5126. *Besides several Birds*, found also on the opposite shores of Europe, Barbary is known to possess many other species, inhabiting the arid tracts of the desert, such as Quails, Partridges, and Bustards. The most beautiful bird seems to be the Barbary Shrike (*fig.* 808.) (*Malaconotus barbarus* Swains.), about the size of a thrush; black above, and crimson beneath; the top of the head being yellow.

SECT. III. Historical Geography.

5127. *Barbary* occupied a more conspicuous place in the ancient than in the modern world. It formed part, and in many instances a prominent part, in the great system of civilised nations around the Mediterranean. Cyrenaica, its most westerly portion, corresponding now to Barca and part of Tripoli, was one of the most flourishing Grecian colonies. Africa Proper, including the rest of Tripoli and part of Tunis, contained Carthage, the pride of Africa, the mistress of Spain and Sicily, and the chief medium of commercial intercourse in the ancient world. Illustrious by her rivalry with Rome, and her mighty struggle for universal empire, she was not less distinguished by her glorious fall. The southern part of Tunis, joined to the Algerine province of Constantina, once formed the powerful kingdom of Numidia, which rendered itself famous both as the ally and enemy of Rome. Western Algiers and Fez composed Mauritania, a ruder region, yet distinguished for its swarms of brave irregular cavalry. The southern part of Morocco was Getulia, an imperfectly known tract, inhabited by a race almost proverbial for savage fierceness.

5128. *All these districts*, with the exception of the remote ones last mentioned, were incorporated into the *Roman empire*, and became, in some degree, the granary of Italy. They were exposed, however, earlier than might have been anticipated from their situation, to the inroad of the northern barbarians. Genseric the Vandal fixed here the seat of his kingdom, and established a naval power which made him master of the Mediterranean.

5129. *The invasion of the Saracens* produced a complete and permanent change in Northern Africa. They entered it, not only as conquerors, but in vast migratory bodies, which stamped the Arabian and Mahometan character upon the whole population. Barbary was at first

governed, under the caliphs of Bagdad, by a viceroy, who established his residence at Cairoan, or Kairwan. As the central power lost its energy, the states of Barbary erected themselves into independent kingdoms, among which Cairoan was still the eastern capital; but it was almost eclipsed in power and splendour by Fez, a city which then ranked among the first in the world for learning and civilisation. By degrees, however, the Barbary states, like all others subjected to the recluse and bigoted system of Mahomet, lost their light and intelligence, and, having no intercourse but that of deadly hostility with the improved kingdoms of Christendom, they had no means of recovering those advantages. Thus they became, three centuries ago, and have ever since continued, blind, stupid, and barbarous.

5130. *The piratical war between the Turks and the Christians*, during the fifteenth century, occasioned a further change. The celebrated pirates Barbarossa and Hayraddin seized upon Algiers, Tunis, and Tripoli, and established them as dependencies of the Turkish empire. Retaining still the spirit of these conquerors, they continued, even after the fall of the Turkish naval power, to devote themselves to piracy; and their situation along the Mediterranean enabled them to act with terrible effect on the European states. Morocco, though she remained independent of Turkey, thought this too good an example to be neglected; and her piracies were at one time still more terrible than those of the other states, though they have not been so long continued.

5131. *In the course of the last half-century*, the three states have shaken off the Ottoman yoke. In Tunis and Tripoli, the Turkish population has been reduced to subordination under the Moorish and Negro troops; while in Algiers, the Turkish soldiery continued to hold a barbarous sway, deposing and electing the sovereign at pleasure. Their flagrant piracies, however, at length called forth the armed interposition of the European powers. England first inflicted a signal chastisement; and France has at length made a complete conquest of the city, and is endeavouring to colonise the territory, though with what success appears yet very doubtful.

SECT. IV. *Political Geography.*

5132. *Scarcely any trace of order, liberty, or good government exists* in any of the states composing this extensive region. The only limitation to a blind and barbarous despotism is found in the tumultuary sway of a brutal soldiery. In Morocco, pure despotism reigns; and that country has repeatedly been ruled by monsters who were a disgrace to humanity. The emperor, however, who reigned previous to the existing civil wars, of which we have only a very imperfect account, is described as mild and equitable, compared to his predecessors. The monarchs of Morocco claim the crown in the capacity of *sheriffes*, or descendants of Mahomet, and they attempt to increase the lustre of the regal dignity by assuming the character of doctors, prophets, and saints; which, however, they seem to regard as not inconsistent with the most unbounded indulgence of cruelty and sensuality. The emperor claiming the supremacy in religion, which in Mahometan countries includes law, prevents, probably, the formation of any corporate bodies, either hierarchical or juridical, sufficiently important to influence the public. There does not appear even to be any council of state, or deliberative assembly, like the Turkish divan. Every thing depends upon the momentary will and caprice of the prince. This absence, however, of all regular check, does not prevent the frequent occurrence of rebellion, which is almost without intermission fomented by the different members of a family contending for the throne; the sons against the father, and the brothers against each other.

5133. *The government of Algiers* was formed on the Turkish model, the Dey being originally an officer appointed by the Porte, and, like other despotic viceroys, exercising in the interior government all the powers of the sultan. Here, as at Constantinople, there appears to have been always a divan, which, being composed of the heads of that military body by whom the Turkish sway was alone maintained, possessed very extensive influence. When Algiers became independent of the Porte, nearly the whole power passed into the hands of the tumultuous Janissaries, who set up, deposed, and massacred the chief magistrate at pleasure. A long interval did not often elapse between the period when the Dey was raised to power, and that in which his life was terminated by the bowstring.

5134. *Tunis presents a more agreeable spectacle.* Its ruler, who, under the title of Bey, was originally a mere officer of the Porte, has now succeeded in emancipating himself, not only from this subjection, but even from dependence upon the Turkish soldiery. This revolution was chiefly effected by Hamooda, the Dey reigning in 1816, whose vigour of character had preserved him in power twenty-nine years; a very unusual period in the tumultuary annals of Barbary. Instead of allowing himself to be kept in thralldom by the Turks, he chose his officers in preference from among the European and Georgian slaves and renegadoes. He established a regular administration of justice, and extended equal protection to all classes of the inhabitants, not even excepting Christians and Jews, whom it had been considered the duty and privilege of the Moors to take every opportunity of insulting, of plundering, and even of killing. Although, therefore, the administration still

exhibits many barbarous and oppressive features, yet, upon the whole, Tunis has improved, while Western Barbary has been sinking continually deeper in wretchedness and brutality.

5135. *Tripoli* has made still farther advances. Its progress has been ascribed to Hamet, whom the Tripolitans honour with the surname of Great. At the commencement of the last century he was a mere Pacha under the Turks, and his life was in perpetual peril from their licentious soldiery. He relieved himself from them in a manner truly barbarous. Having invited their chiefs, to the number of 300, to a feast, he caused them all to be seized and strangled. His adherents then commenced a general massacre throughout the city, and the Turkish sway was entirely annihilated. The Porte, which could with difficulty have vindicated its claims, suffered itself to be pacified by presents and tribute, and finally lost all dominion over the state. Hamet was very active in introducing every kind of improvement, inducing Europeans to settle in his territories, and promoting all the manufactures for which Tripoli was adapted. His successor, of a milder character, finding himself in peaceable possession of the sovereignty, exercised it with great equity and moderation; so that Tripoli assumed an orderly and civilised appearance, resembling that of the European states, especially when compared with the turbulent aspect of its African neighbours. Although it has been since exposed to some convulsions, the present government, from its conduct towards the English, appears to retain the same liberal and improving character by which it has so long been distinguished.

5136. *The foreign relations* of the Barbary states have not been extensive. The European powers long regarded them with cold and distant hostility, but without considering the conquest of them as a desirable object. These states were not in a condition to attempt schemes of distant aggrandisement. Their only pretensions to dominion are over the tracts behind the Atlas, and bordering on the great desert, called Taflet, Sigilmessa, and the Bled el Jereed. Even the subjection of these countries is confined to the exaction of a tribute, which a flying detachment of troops, sent round once a year, forcibly collects. Since the reign of Hamet the Great, Tripoli has held Fezzan tributary. Spain possesses the fortresses of Ceuta, Melilla, and Peñon de Velez in Morocco, but without any territory attached to them; and this is now the only memorial of the long and deadly wars between the two countries. The efforts to put down their piratical inroads have brought them more into contact with the powers of Europe; and the issue of these, in the occupation of Algiers by France, promises to form a new era in the destiny of this part of the world. Those predatory ravages by which, down to a very recent period, they rendered themselves terrible to the powers situated upon and navigating the Mediterranean, seem to be now finally suppressed.

SECT. V. *Productive Industry.*

5137. *In every branch of productive industry* the states of Barbary exhibit marks of imperfection and decay.

5138. *Of the agriculture of Barbary our accounts are very imperfect*, this branch having been unaccountably omitted by Dr. Shaw; but enough has transpired to show it to be in a most imperfect state. In the greater part of Morocco, there exists no such thing as fixed property in land. It is cultivated by movable Arab camps, called *douars*, which establish themselves on a spot, continue till they have exhausted it, and then remove to another. In consequence, however, of the fertility of the soil, and of the want of a manufacturing population to consume its produce, there is in every state a large surplus of corn, which forms, when permitted, the staple article of export. Wheat and barley are the kinds generally cultivated; the soft and friable soil is particularly adapted to the latter. Rice is said to be raised on the banks of some of the rivers; but to its culture, upon the whole, this arid soil is peculiarly unfavourable; and the species of holcus, or dhourra, peculiar to the district are extensively cultivated. Coolness and moisture being the requisites wanted, the winter months compose the verdant and flourishing period of the year. The harvest is gathered in April and May; after which, from June to September, the country exhibits an aspect entirely parched and burnt up. The inhabitants possess the art of preserving the grain for several years, by burying it under ground in their dry soil.

5139. *All the fruits of southern Europe come to perfection in Barbary*; and the excellence of the olive is particularly noted. The vine flourishes; though the religious system of the natives deters them from converting the grape into wine, even for exportation. As we advance into the dry plains of the interior, all these fruits disappear; but their place is supplied by that of the date tree, which entirely covers the face of the country, and forms the principal support to the inhabitants of the southern districts.

5140. *Of domestic animals*, the cow, destitute of the rich pastures of Europe, is small in size, and deficient in milk. The sheep are also small; but those fed on the Atlas produce that exquisite mutton peculiar to mountain pastures. There are also some species, which, with little attention on the part of their proprietors, produce very fine wool. Goats are very numerous in the mountain districts; and their skins yield that soft and delicate leather for which Morocco is famous. The horses of Barbary were formerly much valued; and this ancient boast of Numidia has not altogether lost its qualities; but, the persons in power under so oppressive a government being accustomed to seize the best for their own use, the proprietors are discouraged from bestowing any peculiar pains in improving the breed. The once famed Barbary horses now yield to the Arabian, and even to the Egyptian. The ass, and the mule, are the ordinary beasts of burden. Beyond Atlas, the camel alone is suited to the sandy expanse of the wilderness. A small number is maintained of that species called the *heirie*, or desert camel, which seems to be the fleetest of all known animals. Mr. Jackson mentions one, which, in seven days, travelled across the Great Desert, a distance of about 1000 miles; and another which went from Mogadore to Morocco, and returned in one day, though the interval between these cities is not short of 100 miles. The honey, which is copiously collected through Barbary, seems to be chiefly the produce of wild bees.

5141. *Although manufacturing industry* must rank low in the Barbary states, yet there are some branches in which the inhabitants excel. The most noted is that of the leather already mentioned as known under the name of *morocco*, and celebrated for its softness, pliancy, and beauty. It is afforded by the goats which climb the declivities of the Atlas, particularly on the side of Taflet: but its valued qualities are doubtless, in a great measure, due to the mode of tanning and preparing it. Fez is the chief theatre of this manufacture. It carries on also several woollen fabrics, particularly of a species of long robes called *haïks*, which are generally worn in the East; and of carpets, little inferior to those brought from Turkey. It makes also silk stuffs, chiefly sashes and handkerchiefs. Among the states on the Mediterranean, Tunis is by much the most distinguished for industry and manufactures. Its staple is a small species of conical woollen caps, called skull-caps, which are universally worn in Eastern countries. This fabric is said to have afforded at one time employment to 50,000 persons; but Leghorn and Marseilles have

now succeeded in producing an imitation, and the caps manufactured there, though not equal in quality, can be sold so much cheaper, that they have superseded to a great degree those made at Tunis. There are likewise large manufactures of robes and shawls of woollen and gauze, carried on also in Algiers and Tripoli, though not on so large a scale.

5142. *The commerce of this rude territory is also very limited.* Its exports consist chiefly in the raw produce of the soil. In ancient times the African coast formed the granary of the Roman empire; and its corn continued to find a copious market in southern Europe, till its exportation was prohibited by the absurd policy of all the Barbary states, except Tunis. Even there, it is loaded with heavy imposts, twenty-two piastres and a half (14, 10s.) being paid on the coffee (two English quarters) of wheat, and eleven piastres and three quarters on the same quantity of barley. The chief shipping port is Biserta. Tunis exports also olive oil, which does not become rancid so soon as the Italian oils; a large quantity of excellent soap, made from olive oil and barilla, with some sponge and orchilla weed collected on the shore. The commerce of Morocco is carried on almost exclusively from Mogadore. The exports consist of almonds, sweet and bitter, to the amount of about 1,000,000 pounds, cow-hides and calf-skins, 260,000 lbs.; goat-skins, 10,000 dozen. Wool was formerly a large article of export; but it is now absurdly prohibited. Ostrich feathers, olive oil, and some varieties of fruit, complete the list of native exports. Tripoli, Tunis, and, still more, Morocco, send to Europe the produce of Soudan, gold dust, ivory, and gums, particularly gum senegal. Of this last article Mogadore exports not less than 100,000 lbs. The total value of the exports from that city is stated by Mr. Jackson at 127,000*l.* sterling. The commerce of Eastern Barbary has been carried on chiefly from Leghorn and Marseilles, at which last place Louis XIV. established an African company. Britain at the same time had a company, which shared some portion of the trade; and private merchants opened a little direct intercourse, but sent their goods chiefly through the French and Italian ports. Since the continental war, however, and the possession of Malta by the British, a good deal of communication has been maintained from that island. The Barbary states receive, generally speaking, every species of European manufactured goods and colonial produce. The cloths most in demand in the markets are those which, being of a coarse description, can be offered cheap. Those of the kind called scarlet long ells are particularly adapted for the trade of interior Africa. German coarse linen, hardware, toys, tin and lead, alum, vitriol, and cochineal for their manufactures, may be named among the principal articles.

5143. *The most active commerce of the Barbary states is that by the caravans with interior Africa.* Tripoli sends hers by Fezzan to Bornou and Cassina, and thence across as far as Ashantee; Tunis by Gudamis and Tuat to Tombuctoo; Morocco across the broadest of the desert to the same city, and to the countries on the Senegal. A more particular account of the mode in which this trade is carried on will be given when we come to treat of the central countries of Africa. Into these countries the caravans carry salt, which is wanting along the whole line of the Senegal and Niger; together with European manufactures, particularly cloths of different kinds, hardware, and toys. The returns are gold dust, ivory, gum senegal, and, above all, slaves, for whom these unfortunate countries have been so long ransacked to supply the other quarters of the globe. It is impossible to form even a conjecture as to the amount of this inland trade; for Lempriere's estimate, according to which the imports would amount to 10,000,000*l.*, is evidently a monstrous exaggeration.

5144. *The mercantile shipping of the Barbary states may be considered as next to nothing.* *Fishery*, notwithstanding the extent of its coasts, is pursued only for immediate consumption. There is, indeed, a coral fishery, of some value, on the coast of Constantina, in Algiers, near Bona and La Cala. Mr. Blaquiere asserts that it might employ 500 boats and 9000 men; but we question if Europe would afford a market for so extensive a produce. With a view to this fishery, the British government, in 1806, contracted to pay to the Dey of Algiers 50,000 dollars (11,000*l.* sterling) for the possession of Bona, La Cala, and Il Col; but, having omitted to form a military establishment at any of these places, it has derived, as yet, no advantages from the purchase. This branch of industry is carried on chiefly by vessels from Sicily, Leghorn, and other ports of Italy.

SECT. VI. *Civil and Social State.*

5145. *Of the population of Barbary*, which has probably much diminished, only a very loose estimate can be made. Mr. Jackson, indeed, has given statements of the population of the empire of Morocco, founded on documents in the imperial register, according to which, it amounts to 14,886,600: but, if such records really exist, we can scarcely consider them as proceeding from any thing but an empty vaunt, unless they be taken as relating to a more prosperous period. They assign to the city of Morocco, for instance, a population of 270,000; while the most judicious travellers do not suppose that, in its present state of decay, it contains more than 80,000. We cannot, therefore, but prefer the estimate of Chenier, which allows to the whole empire only 6,000,000; and perhaps even this is beyond the truth. Respecting the population of Tunis and its territory, the statements made to Mr. Macgill, according to which it amounted to 5,000,000, appeared to him greatly exaggerated. The most careful estimates of the population of Algiers make it rather under than above 2,000,000. Tripoli is stated by Ali Bey at 2,000,000; but, notwithstanding the extent of territory, its prevailing barrenness would warrant the conclusion that one third of this is a very full estimate. Proceeding on these loose data, which are all we have, we may guess the population of Barbary as follows:—Morocco, 6,000,000; Algiers, 2,000,000; Tunis, 2,000,000; Tripoli, 600,000: in all, 10,600,000.

5146. *The inhabitants of Barbary* are separated into three very distinct classes; the Moors, the Arabs, and the Berbers or Berebbers.

5147. *The Moors* inhabit the cities of Barbary, and the country in their immediate vicinity. The term Moor, derived from the ancient *Mauri*, is applied throughout Africa in a very vague manner. In Central Africa it is made to comprehend all Mahometans who are not Turks. In Barbary, however, the wandering tribes are distinguished by the name of Arabs, and the term Moor is applied chiefly to the inhabitants of cities. Mahometan cities, in general, present a uniform scene. The inhabitants drag a recluse, gloomy, and monotonous existence. They are strangers to social assemblies, to public amusements, to the arts, and to every thing that animates life. Their time is chiefly spent, in a retired manner, in the interior of their houses. The females, according to the invariable Mahometan custom, are strictly excluded from general society, and must see none of the male sex, except their husbands; they are immured like slaves in the apartments of the haram. That

aspect of apathy and gravity, however, which a Moor presents at first view, is, in a great measure, fallacious, and he is easily roused from it to the most outrageous acts of bloodshed and violence. In Barbary, the habits of a seafaring and piratical life have rendered these occasions more frequent, and have produced a character more habitually turbulent and disorderly, than is usual in Turkish states. Indeed, European travellers have usually described the Moors as a race devoid of all good qualities, and combining every sort of depravity; but the relations between the parties have usually been of a very hostile nature, embittered both by religious and political rancour.

5148. *The haram, that favourite and almost sole seat of Oriental luxury*, is, of course, inaccessible, and can only through some peculiar chance be seen by Europeans. Lempriere, however, in his character of a physician, was admitted into that of the Emperor of Morocco. It consisted of a wing of the palace, entirely separated from the rest, and communicating only by a private door, of which the emperor had the key. The edifice was divided into a number of courts, communicating by narrow passages, round which were ranged the apartments of the wives and concubines, who were from sixty to a hundred in number, besides their domestics and slaves. There was a principal sultana, who had a general superintendence over the establishment, but enjoyed not the same influence with the emperor as some of the younger favourites. There were several European captives, who appeared to the traveller the chief ornament of the haram, both as to personal and mental accomplishments. The Moorish ladies were enormously fat, and utterly stupid and ignorant. Their allowance from their imperial master amounted, in the case of the most favoured, only to half a crown a day; so that expense and luxury were to be maintained by presents or bribes received from the numerous suitors for favours from the emperor, who is understood to approve entirely this delicate mode of supply. A more favourable account is given of the Tripolitan haram by a lady who resided in that city for many years, in the family of Mr. Tully, the English ambassador. The inmates, who are generally Georgian and Circassian captives, not only possess superior personal beauty, but are endowed with various ornamental accomplishments acquired at Constantinople. Their time is also busily employed in superintending the numerous slaves, who grind, spin, and perform all the domestic operations. Their toilette is performed in a very elaborate manner, which employs several hours, and demands the service of a number of slaves. Each of the latter has a separate office; one to perfume the hair, another to arrange the eyebrows, a third to paint them, and so on. The blackening of the latter by a preparation of antimony, the forming of them into a particular shape, and the filling of the hair with powdered cloves, perfumes, and scented waters, are the most favourite modes of female adornment. In their domestic character, the ladies are said to display many amiable qualities; though here, as in Morocco, the jealousy of superior favour with their lord and master often excites violent enmities, and even impels to the crime of administering poison to a hated rival.

5149. While the Moors thus inhabit all the great towns and the fixed villages in their immediate vicinity, all the remoter districts are occupied by a race who are called *Arabs*, either because they are really the descendants of the Saracen conquerors, or, from situation and circumstances, have acquired similar habits. They dwell in a species of movable encampments called *douars*, composed of a number of broad and low tents, painted black, and resembling in form the hull of a ship. They are formed of cloth made of camel's hair and the fibres of the palm tree, and are arranged generally in three concentric circles, in the interior of which the cattle are secured during the night. Each douar is governed by a sheik, or chief, who is considered as standing in a paternal relation to the rest; kindred being the tie which chiefly unites them, and no one not related to the common family being allowed to reside in the douar. Their manner of living is quite patriarchal, and their rites of hospitality so primitive, that they remind us of those practised by Abraham to the three angels, as recorded in Scripture. The greatest sheik, when a stranger enters his tent, sets down water, and assists him to wash his feet. He goes to the flock, brings in a calf or a kid, kills it with his own hands, and delivers it to his wife to dress. Like all the races which bear the Arab name, they are equally distinguished for hospitality and robbery; often exercising the latter against those who have just been the objects of the former. When they have exhausted one spot, they prepare to remove to another; for which purpose, however, they must obtain the sanction of the government, which is held as the proprietor of all these wide tracts of unoccupied land; a permission for which a large sum of money must be always paid. The douar then breaks up, and its members depart, with their wives, children, cattle, tents, furniture, agricultural implements, and every thing which they possess. The men walk, driving the cattle; the women are mounted on camels, three on each; the children, lambs, and kids are hung in panniers by the sides of these animals (*fig.* 809.). The internal administration of these camps, or douars, is almost entirely independent of the emperor or prince; the several communities are animated by deadly feuds against each other, which often lead to conflict; and, in every case of weak government or disputed succession, many of the Arabs betake themselves without hesitation to plunder.

5150. While these wandering tribes cover the plains, the mountain districts of Atlas are occupied by the *Brebes*, or *Berbers*, who seem to be the original and most ancient inhabitants

809

REMOVAL OF AN ARAB VILLAGE.

of Barbary, driven to take refuge in these inaccessible retreats. In the little valleys embosomed within the huge declivities of the Atlas, they build their villages, which are beautifully enclosed with gardens and plantations. Some of those, however, occupying the higher and ruder parts of the chain, dwell in caves cut out of the rock. They are hard-featured, athletic, and patient of fatigue. Occupied in pasturage and cultivation, they also employ themselves much in hunting, and derive an extensive profit from the skins of wild beasts. Their favourite exercise is the use of the musket, both in firing at a mark, and twirling it variously in the air; in which they have acquired remarkable dexterity: those who can afford it take a pride even in ornamenting their fire-arms with gold and ivory. Possessing such habits, they are by no means quiet subjects of the Moorish empire and the other states to which their territory belongs. Their only homage consists in a tribute, at once scanty and uncertain. In their revolts, which are not unfrequent, their valour, and the rugged nature of the territory, render it almost impossible to subdue them. On the contrary, they have sometimes descended into the plain, and carried their inroads to the very gates of Morocco. They have none of the migratory habits of the Arabs; but, on the contrary, are unwilling to remove from their original spot. Unlike the Arabs, too, they elect their own sheiks, and have a republican form of government, very unusual in this part of Africa. They speak a language called the *Amazigh*, or *Berber*, entirely different from that of the Moors and Arabs, who often require an interpreter when conversing with them. This language is supposed to be very ancient, and is of the same family with that of the *Tibbo*, the *Tuaricks*, and other indigenous tribes who roam over the plains to the south-east.

5151. The *Shilluks* are a branch of the *Berbers*, somewhat smaller in stature, and less rude in character, inhabiting the mountainous districts in the south of Morocco. The *Errifi*, on the contrary, who border on *Algiers*, are still braver and fiercer; the very glance of their eye is said to strike terror into the inhabitants of the plains.

5152. The religion of all the *Barbary* states is that of zealous *Mahometans*; and the ferocious bigotry which every where characterises the professors of *Islam* is carried, if possible, to a higher pitch in this country than elsewhere. The cruelty exercised against their European captives is exasperated, or at least all pity and remorse are deadened, by religious antipathy. Although they have *talbas*, or spiritual instructors, very little of any real knowledge or improvement seems derived from these personages. There is no connection between the ministers of religion and the government; neither is there any corporate body, like the *ulema* in *Turkey*, to preserve and maintain the doctrine and discipline of the church. The veneration of the people is almost exclusively bestowed on a class of persons who, by individual exertion, raise themselves to the character of *saints*. This character is not attained by any peculiar purity of life, or even rigour of superstitious observance. Grotesque and fantastic pretensions to supernatural power, and to an intercourse with invisible beings, are the means by which they impose on the credulous multitude. Throughout all this region the idea prevails according to which idiots and madmen are reputed holy; and privation of reason is even feigned for the sake of attracting veneration. The higher class of saints are decidedly the second persons in the kingdom, if they do not even rival the monarch. Indeed, the emperors of *Morocco* have been long accustomed, by high pretensions to sanctity, to heighten the respect of their subjects. That most savage of tyrants, *Muley Ismael*, spent a great part of his time in superstitious gestures and observances, calculated to impress the idea of his direct communication with the Deity and with *Mahomet*, and of superhuman

powers thence derived.

810

SERPENT CHARMER.

Barbary, moreover, is over-run by superstitions of all kinds, such as usually prevail among the vulgar in unenlightened countries; among which, the belief in the potency of an evil eye is particularly prevalent. Individuals among the Arabs still make a boast of the power of charming serpents. They exhibit themselves to the admiring multitude, half-naked, in strange attitudes and contortions, and twined round by those creatures, whom they certainly have the art of rendering innoxious (*fig. 810.*). The most amiable of their feelings consists in the reverence paid to deceased relations, which exists to a much greater extent than is customary among Europeans. Every Friday evening forms what is called "the feast of the dead," when the people repair to the tombs of their ancestors, who are supposed to be present on that evening, and to share the almost gay festival which is there celebrated.

5153. *Learning and science in Barbary* may be considered as nearly extinct. Like the other Saracen states, those of Barbary, and of Morocco in particular, were formerly distinguished for the cultivation of mathematics and astronomy. Fez was a celebrated school, to which students from the most distant quarters resorted. At present, by far the greater part of the population can neither write, read, nor perform the most common operations of arithmetic, and there are scarcely any persons who have acquired the mere rudiments of knowledge. Shaw mentions as having been shown to him quadrants and astrolabes constructed in the most admirable manner; but such instruments were exhibited as mere curiosities, without the least idea being entertained of their use. Medicine, in which the Arabs boast of the great names of Avicenna and Averrhoes, cannot be very highly cultivated in a country where the usual fee of a physician is sixpence; and a shilling is only bestowed in the most serious and important cases. Accordingly, unless for mere external wounds and hurts, the interposition of a native practitioner seems rather productive of injury than benefit. European physicians are always eagerly sought, and are considered as possessed of almost supernatural power.

5154. *The amusements of the natives of Barbary* are very little varied. Mixed company, public exhibitions, and theatrical entertainments, which give so gay an aspect to European society, are altogether foreign to their habits. Among those who are not obliged to labour for bread, the day is spent chiefly in a sort of listless indolence; lounging at coffee-houses and barbers' shops, the favourite scenes of talk and scandal. Chess is pursued with great eagerness. Opium, so passionately indulged in by the Turks, is not in use here; but, instead of it, they have a sort of preparation from hemp, which produces nearly the same effect. Wine, too, is taken much more freely, even to excess, and in a convivial manner, especially at Algiers and Tunis, than in other Mahometan countries. But horsemanship, above every thing else, forms the pride and amusement of the Moors; and their feats in this art are often very wonderful (*fig. 811.*). They are particu-

811

AMUSEMENTS OF THE MOORS.

larly fond of galloping, and then suddenly stopping; and some will even lift objects from the ground while riding at full speed. Although, however, the rich Moors are almost constantly on the backs of their horses, they train them to none of those travelling paces which are found so useful in Europe; they have no idea of any thing intermediate between a walk and a gallop.

5155. *In the dress of the Moors and Arabs*, the most conspicuous feature is the *haik*, or *hyke*, a large square piece of woollen cloth, commonly six yards both in length and breadth, which is folded loosely round the body. It seems to be the same with the *garment* of the Jews, and indeed the very same with the Highland plaid. The loose manner in which the *haik* is attached to the body renders it necessary, whenever any work is to be seriously set about, to tighten the girdle, which is formed of woollen, often richly ornamented, and in which also the weapons are stuck. Hence arises the figurative expression so often applied in Scripture to the industrious, to have their loins girt. Under the *haik* is the tunic, or coat, which sits close to the body, and beneath it the shirt, which the Moors wear of linen or cotton, but the Arabs of woollen. A species of cloak, called *burnoose*, is thrown over the *haik*, when necessary, as a defence against rain or cold; and it has a cape which may be raised to cover the head. On the head is also worn a species of conical scarlet cap, covering the crown; below which is wrapped the turban, expressing, by the number and variety of its folds, the rank of the wearer (*fig. 812.*).

5156. *With regard to food*, one dish prevails at the table of all, from the prince to the peasant, which is *cuscusoo*, a sort of almost fluid paste made of crumbled bread, and enriched, according to the means of the preparer, with small pieces of meat, vegetables, and condiments. This dish, placed in a large wooden or

812

DRESS OF THE MOORS.

earthen bowl, is set in the middle of the company, who immediately thrust in their fingers, lift it to their mouths, stirring it, if necessary, with their hands, and selecting the most savoury morsels. The rich, on great occasions, present a variety of dishes; but they are all cooked in the same manner, consisting of what we call in England spoon meat. To make some amends for this mode of eating, the custom of washing the hands both before and after eating is still rigorously observed.

SECT. VII. *Local Geography.*

5157. *Morocco*, the most westerly, is also the most extensive and important, of the Barbary states. It has two coasts; one along the Mediterranean facing the north, the other and larger along the Atlantic, looking to the west. The loftiest part of the chain of Atlas runs parallel to these coasts, changing its direction along with them, and leaving an intermediate plain, finely watered and not surpassed in natural fertility by any part of the globe. But though the modern Moors have advanced greatly beyond the rude and roaming habits of the ancient Mauri, they are far from improving the country to nearly the extent of which it is susceptible. Mr. Washington conceives it might be made one vast corn-field, and that the ground over-run with weeds and brushwood might afford food to millions. Beyond the range of Atlas, however, Morocco includes a more arid region named Tafilet, unfit for grain, but yielding the finest dates in the world, and rearing a breed of goats whose skins afford the material for the fine morocco leather.

5158. *The political and social state of Morocco* is rude and degrading. The emperor

813

EMPEROR OF MOROCCO.

possesses a power more despotic than any other even of the Mahometan potentates. He is not held in check by a mufti, an ulema, or even a council or divan. He is supposed to possess a divine character, and to be superior to all law. One emperor, being reminded of a promise, said, "Takest thou me for an infidel, that I must be the slave of my word?" Yet this monarch must pay respect to long-established usages and institutions; must not invade the domestic privacy of any of his subjects; and must even give public audience four times a week to administer justice to all who may appeal to him from the *cadi*, or local governor. On these occasions he appears on horseback, in an open interior court of the palace, with an umbrella over his head (*fig. 813.*). This absolute power, meantime, is little regarded by the mountaineer tribes, and even by some of those that wander over the plains. Having, too, no one interested in its support, it is continually liable to be shaken by treason, revolt, and disputed succession. Hence these princes have derived a peculiarly jealous

and ferocious character: and Morocco has been ruled by some of the most bloody tyrants recorded in history. Among these was pre-eminent Muley Ismael, who introduced the system of employing negro mercenaries as body-guards. They were raised at one time to upwards of 20,000 (Mr. Washington is probably mistaken in saying 100,000), but are now reduced to 5000. They constitute, however, the only regular troops in the empire; the rest are merely a loose militia, summoned by imperial mandate, and, though expert horsemen and good marksmen, destitute of any sort of discipline. The revenue is collected in kind,

in the proportion of a tenth of grain and a twentieth of cattle, which, aided by fines and the poll tax upon Jews, is estimated by Mr. Washington at about 1,000,000*l.* sterling.

5159. *Industry and commerce* have in Morocco a very limited range. The only important manufacture is that of the leather which bears its name. One tannery in the capital employs, according to Mr. Washington, 1500 persons; and, though the processes are slovenly, a fine colour is produced, which Europeans are unable to imitate. Other articles for exportation are almonds, of very fine quality, from Suse, dates from Tafilet, ivory and gold dust from Soudan; honey, wax, ostrich feathers, &c. In return, it receives the usual articles of European manufacture and colonial produce. This trade is carried on chiefly by the port of Mogadore. The outrageous piracy formerly exercised from Sallee and other ports of Morocco has for a considerable time ceased.

5160. *Morocco, the capital*, is situated on a very extensive and naturally fruitful plain (*fig. 814.*), above which rises abruptly, covered with perpetual snow, one of the loftiest

814

VIEW OF MOROCCO AND THE ATLAS.

ranges of Atlas. The mosques are numerous, and several of them present striking specimens of Arabian architecture, particularly that called El Koutouben, the tower of which is 220 feet high. Of the eleven gates, one is richly sculptured in the Moorish style. The palace forms an oblong of 1500 by 600 yards, divided into enclosures, where, surrounded by gardens, are the pavilions of the sovereign, his principal officers and ladies. The floors are tessellated with variously coloured tiles; but a mat, a small carpet, and cushions, compose the entire furniture. Beautiful gardens surround the city, and spacious aqueducts, conveying water from the Atlas, twenty miles distant, bear testimony to a superior state of the arts in former times.

5161. *Fez*, situated in the more northerly province of the same name, is a place of high celebrity, and ranked long as the splendid and enlightened metropolis of Western Africa. It was founded, in the end of the eighth century, by a prince of the name of Edris, and rose to such magnitude, that Leo, in the twelfth century, describes it, though doubtless with some exaggeration, as containing 700 mosques, of which fifty were magnificent and adorned with marble pillars. Its schools and its baths were also very celebrated. At present it is described by the latest travellers as presenting a singular mixture of splendour and ruin; and, amid the usual defects of Mahometan cities, the splendour being almost confined to the interior of the houses, it is still an agreeable place. The situation is singular, but pleasant; in a hollow valley surrounded by hills covered with groves and orchards, and with a river winding through it. Fez is still not without some of the sciences which formerly rendered it illustrious; but they are nearly confined to the Koran and its commentators, a slight tincture of grammar and logic, and some very imperfect astronomical observations. The population, respecting which authors greatly vary, is probably rather under than above 100,000. Mequinez, to the west of Fez, has risen to importance by having been made the residence of the sovereign. The seraglio, or palace, consists of a most extensive quadrangular enclosure, though the mansions which it contains are only one story high. The citizens are said to be more polished and hospitable, and the females handsomer, than in the other cities of Morocco. The population seems extremely uncertain.

5162. *The sea-ports of Morocco*, though they have lost the greatness formerly derived from commerce and piracy, are still not inconsiderable. Mogadore, the most southerly, and the nearest to the capital, is now the chief emporium of the intercourse with Europe. It was founded only in 1760, by the emperor Sidi Mohammed, who spared no pains in raising it to importance. Being composed of houses of white stone, it makes a fine appearance from the sea; but the interior presents the usual gloom of Moorish cities, and is chiefly enlivened by the residences of the European merchants and consuls. The country round is almost a desert of sand; water is scarce, and provisions must be brought from the distance

of several miles. The population is reckoned at about 10,000. Saffi, or Azaffi, a very ancient town, with a fine harbour, though also in a barren country, was the chief seat of European commerce till the monopolising preference of the emperor transferred it to Mogadore. Saffi is still supposed to retain a population of 12,000. Mazagan, a small well-built place, of 2000 inhabitants, was in the possession of the Portuguese till 1770. Azamore, formerly a great town, and with walls a mile and a half in circuit, is now deserted, and crumbling into ruin: it has 3000 people. Dar al Beed is a very small place. Farther north, on the opposite sides of a small river, are the important towns of Sallee and Rabat. Sallee, once the terror of the seas, whence issued such bands of pirates and rovers, the seat of action, riot, and bustle, is now still and lifeless. It continues, however, to be surrounded by a wall thirty feet high, and in its mosques, arches, and fountains displays traces of beautiful sculpture, and of great antiquity. What remains of its commerce has been mostly transferred across the river to Rabat, or New Sallee. This place, when viewed from without, presents a picturesque grouping of minarets, palm trees, ruined walls, and old mosques, near which are conspicuous its venerable and battlemented Kassubah, or citadel, and the lofty tower of Sma Hassan. The interior retains still some activity, and the markets are well supplied. Population 18,000, of whom 3000 are Jews. Mehedia, now a poor fishing village, has monuments which display its former importance. El Arache, or Larache, was once a flourishing European and Christian town; but the churches are now converted into mosques, and the deserted houses of the consuls line the Marina. It has been made the imperial arsenal, and is very strong towards the sea. Tangier, on the straits, was in 1662 ceded by Portugal to England, which abandoned it in 1684. It derives its chief present importance from the permission granted by the emperor to supply Gibraltar with provisions, and from the residence of European consuls. Tetuan, the only port within the Mediterranean, is allowed to carry on some intercourse with the English, whose vessels often take in victuals there on their way up the Mediterranean.

5163. *Algiers*, the ancient Numidia, and the grand modern seat of piratical warfare, comprises an extensive and beautiful range of coast, lying between 2° E. to about 9° W. longitude, and thus extending 700 English miles in length. The breadth of the inland territory, till it passes, by almost insensible gradations, into the domain of the mountain tribes, or of the wandering Arabs, is much more vague, varying probably from 50 to 150 miles. The southern border is traversed by the Atlas in three successive ranges, separated by fine and fertile valleys. The range which faces the maritime plain is called Jurjura; and its peaks, though they do not reach the stupendous altitude of those which tower above Morocco, are of such height, that the snow on their summits melts only in May. The eastern tracts, traversed by numberless streams of pure water descending from the Atlas, form perhaps the most finely irrigated country in the world. Desfontaines mentions a spot near Tremecen, where, in a circuit of two leagues, about 2000 springs occur. Yet the surface is too varied to allow this moisture to spread into swamps; it is only diffused so as to maintain a general verdure and fertility. None of these numerous streams, however, attain the character of rivers, except those which rise in the second range of Atlas, roll through the intermediate valley, and then force their way into the plain of Barbary. Such are the Seibouse, the Rummell, the Zeitoun, and the Shelliff, which last has an early course of nearly 100 miles through the mountain valley.

5164. The territory of Algiers is thus greatly distinguished by *natural fertility*. With the exception of some arid and rocky plains, it consists of valleys covered with rich pastures, fitted for the best kinds of European grain, blooming with the orange and the myrtle, and producing olives, figs, and grapes of peculiar excellence and size. Noble forests of pistachio, of cypress, and of oak, cover the sides of the mountains. Yet the indolence of the people, the oppression of the government, the want of roads and interior communications, cause three fourths of the country to be left uncultivated. Their oil, wine, and butter are all of inferior quality. They are not so wholly destitute of manufacturing industry. Skins are prepared and coloured in almost as perfect a manner as in Morocco. Their bonnets, shawls, and handkerchiefs are in request throughout the Levant. Baskets of palm-leaves, and mats of junk, are fashioned with singular elegance. Essence of roses is prepared with a skill little to be expected in such rude hands; but there is an extensive demand for the article in the voluptuous palaces of the East. The trade, before the French invasion, was almost entirely in the hands of the Jews, and consisted in the export of these manufactures, and of some grain, oil, wax, fruits, and wool. The Algerines took, in return, light cloths, glass, and toys, but showed a great preference for fire-arms and powder; while the European merchants have been reproached, not only for supplying them with these articles, but even for purchasing the proceeds of their piratical expeditions. The fishery of coral, carried on by European vessels, produces an annual value of about 100,000*l*.

5165. *That turbulent and piratical system*, of which Algiers was the centre, is now become a subject only of history. The country was long domineered over by a body of Turkish troops, not supposed to exceed 15,000, and who were recruited from the meanest classes in the ports of the Levant. This body, at short intervals, strangled the Dey, electing in his stead the boldest and bravest of their number. The corsairs formed a kind of separate republic, carrying on their barbarous trade under the sanction of the prince, who received a large share of the slaves and booty. These marauders, in 1816, suffered a severe chastisement from the English fleet under Lord Exmouth. Again, after they had for some time set France at defiance, that country, in 1830, fitted out a formidable expedition, by which Algiers was entirely subjugated. The French, however, have said very little as to any benefits derived from this acquisition. According to the statement made by M. Duboc, in

his account of Oran in 1832 (*Annales des Voyages*), the Arabs, who inhabit nearly the whole of the territory, are in a state of constant hostility, either open or secret, against the French; they are masters of all the open country, and can assemble in a few days 30,000 men, skilled in partisan warfare; so that they keep the invaders nearly blockaded in the principal seaports. In these circumstances, colonisation, which was viewed as one of the objects of the expedition, has not been even attempted.

5166. *The population* of this territory is judged of only by estimates, which are very wide of each other, varying between 1,000,000 and 3,000,000. We have conjectured 2,500,000. Yet a recent estimate in the *Annales des Voyages*, which seems to be made with some care, states, of Arab cultivators, 1,200,000; Independent Arabs, 400,000; Berbers, 20,000; Jews, 30,000; Turks, renegadoes, and their descendants, 40,000: in all, only 1,870,000. These are distributed into three great provinces: Titterie, in the centre; Tremecen, or Tlemsen, in the west; and Constantina, in the east.

5167. *Algiers, the capital*, is situated in the province of Titterie, though without being considered as forming part of it. The streets are built on the declivity of an eminence facing the Mediterranean, and rising by successive stages above each other, with loftier hills above: they make thus a magnificent appearance; hence, too, it is said, almost every house commands a view of the sea. On entering the city, however, all this beauty disappears; and it is found a labyrinth of steep, narrow, and dirty lanes. There are, however, several splendid edifices, particularly the palace of the dey, and the principal mosques. The barracks are also fine structures, adorned with fountains and marble columns; and the naval arsenal is spacious and commodious. The *bagnios*, as the quarters formerly destined for the slaves were called, are huge, but gloomy and dirty edifices. The estimates of the population vary from 50,000 to 200,000; M. Balbi supposes 70,000. The French expedition captured 2,000,000*l.* sterling in money, besides an ample supply of ships, artillery, and ammunition. The fortifications towards the sea are very strong, but on the land side by no means formidable; so that, when the French had effected a landing with a superior force, they soon became masters of Algiers.

5168. *In the western quarter* of the Algerine territory, the most distinguished place is Tremecen, or Tlemsen, once the capital of a powerful kingdom, still containing about 20,000 inhabitants, situated in a beautiful and finely watered district. Mascara, about a mile in circuit, on the face of a mountain which commands the view of a fertile and well-cultivated plain, is an agreeable but ill-built city. Oran, on the sea coast, long a subject of contention between the Moors and the Spaniards, remained in possession of the latter people till 1792. The fortifications have been injured by earthquakes; but the spacious magazines built of stone remain entire. It has a roadstead with good anchorage, but so exposed, that vessels are obliged to land their cargoes at the point of Mers el Keber, about a mile from the city. Oran is much declined; and, though the French have repaired some of the edifices, and converted an old mosque into an hospital, their occupation has hastened its decay, by inducing the whole of the Arab population to leave the place. The inhabitants are now about 4000. Arzew, on a gulf which affords a good harbour, is chiefly noted as containing the shattered ruins of the ancient Arsenaria. Dr. Shaw saw here a Corinthian capital supporting a smith's anvil, and through the rents of a ragged carpet he discovered a mosaic pavement. In its vicinity are large salt pits. Tenis, also on the coast, once the metropolis of a little kingdom, consists now only of a few mud hovels. El Callah, in the interior, seated on an eminence amid branches of the Atlas, is remarkable, as well as its neighbourhood, for an extensive manufacture of carpets and bornouses. Medea and Bleeda, the chief places in the province of Titterie, are both flourishing, and surrounded by a fine country.

5169. *In the eastern part of Algiers, Constantina*, celebrated under the name of Cirta, the ancient and strong capital of Numidia, ranks still second to Algiers, and is supposed to contain at least 40,000 inhabitants. It is boldly situated on a rock precipitous on one side, where it overhangs the broad stream of the Rummell. The surrounding country is fine; but the modern city presents nothing remarkable. The site, however, is distinguished by splendid monuments of antiquity; and the ground in one place is entirely covered with the remains of broken walls, columns, and cisterns. The bridge, still in good preservation, several gates, a triumphal arch, called by the natives the Giant's Castle, with various altars and other fragments adorned with Corinthian columns, and with rich friezes and sculpture, rank among the most elegant remains of classic antiquity. Boujeiah, celebrated as a strong and piratical sea-port, retains still marks of the breaches made upon the walls in 1671, when it was stormed by Sir Edward Sprague. The fortifications are now barely sufficient to hold the wandering Arabs in check; but it derives some importance from its iron manufactures, and the export of wax and oil. Bona, having its site covered with considerable remains of the ancient Hippo, was in modern times the chief settlement of the French African Company, which they lost during the revolutionary war. It derives consequence from the coral fishery carried on in its vicinity; and the same cause gives value to La Calle, and the neighbouring island of Tabarca, which were also long in possession of the French.

5170. *Tunis* has a territory very differently situated from that of Algiers. From the frontier of that country, the coast continues to extend eastward, with a slight inclination to the north, till it reaches Cape Bon, the most northerly point of Africa. It then makes a sudden bend southward, and, with some windings, follows that direction as far as Cape Jerbi for a space of about 250 miles. This coast, with the country reaching for upwards of 100 miles inland, composes the territory of Tunis. It is not so extensive as that of Algiers; but it is not so closely hemmed in by the branches of the Atlas, nor are they so steep or so lofty; and there intervenes between them and the sea a spacious plain, watered by the noble river Bagrada, or Mejerda, and profusely covered with all the riches of culture and vegetation. The people, also, though composed essentially of the same elements as those of Algiers, have imbibed a considerably greater share of polish and civilisation. The situation of the territory, projecting into the Mediterranean, and at an easy distance from the finest shores of southern Europe, fitted it to be the seat of the most celebrated commercial republic of antiquity. Carthage, by her commerce, rose to such grandeur as to dispute with Rome the empire of the world; and, even after being completely vanquished, and her walls levelled with the ground, she continued one of the chief Roman cities, and the capital of the African provinces. The Saracens, however, in the successive kingdoms which they founded, fixed their capital, first at Kairwan, and then at Tunis; and Carthage was entirely deserted. In the sixteenth century, Tunis was occupied by the corsair Barbarossa; and, notwithstanding a successful expedition by Charles V., was, in 1574, completely subjected to the Ottoman power.

Since its decline, it was at first domineered over, like Algiers, by the Turkish soldiery; but the Beys, within the last half century, have succeeded in crushing the influence of this body, and have made themselves hereditary and almost absolute sovereigns. They have governed mildly, doing much to mitigate the former violent and bigoted system, and to introduce European improvements.

5171. *The city of Tunis*, only ten miles south-west from the site of Carthage, and on the same spacious bay, possesses all the advantages which raised that city to such a height of prosperity. It is, in fact, the largest place in Barbary, the population being estimated at from 100,000 to 130,000. It cannot, on the whole, be said to be well built, the streets being narrow, irregular, and dirty; yet the principal mosque is very spacious; and the new palace, constructed at great cost, in the Moorish style, is one of the finest edifices in Barbary, though with the incongruity of the ground floor being entirely composed of shops. This city has entirely renounced its piratical habits, and addicted itself to several branches of useful industry. There are extensive manufactures of velvets, silk stuffs, and the red caps generally worn in the Levant. The exportation of grain, absurdly prohibited in the other ports on this coast, is allowed under a *tickery*, or licence from the dey, though at the exorbitant duty of 15s. a quarter on wheat. The Tunisian olive oil, being well packed, and not liable to become rancid, is in high estimation; and the wool of the south-eastern districts is said to be little inferior to the best Spanish. The soap, made from olive oil and barilla, is of excellent quality, and has no unpleasant smell. There is also a considerable traffic with interior Africa for its staples of gold, ivory, and ostrich feathers. Tunis takes a variety of European manufactures, East India stuffs, and colonial produce. That species of woollen cloth called scarlet long ells is the British commodity most in demand.

5172. *The remains of Carthage* are a little to the east of Tunis; but no destruction can be more entire than that which has overwhelmed that celebrated city. The inquisitive traveller may even look over that renowned site, without perceiving that a city ever existed on it. Even the few broken walls which remain bear evident marks of Moorish construction. It is not till he penetrates into its subterranean recesses that he finds clear marks of ancient greatness. He then discovers the spacious cisterns in which water was retained for the use of the inhabitants; and he can trace the line of that stupendous aqueduct by which it was derived from mountains fifty miles distant. It is probable that farther traces might, by diligent search, be still detected.

5173. *Of the other cities of Tunis*, the chief is Kairwan, or Cairoan, founded by the Saracens, and long the capital of their possessions in Northern Africa. The great mosque, supported by 500 granite columns, is said to be at once the most magnificent and the most revered of any in Africa. Tozer, on the lake of Lowdeah, is only a large village, but enriched by trade with the country of dates and interior Africa. On the west coast, Porto Farini, near which are the ruins of Utica and Biserta, have both some trade in grain; though the fine harbour of the latter is now so choked up as to allow only small vessels to enter. Of the towns on the coast, reaching southward from Tunis, Almahdia is distinguished by the remains of a commerce which rendered it once the principal haven on this coast; Monasteer and Cables by a flourishing modern trade, which gives to the one a population of 12,000, and to the other of 20,000. Sfax carries on traffic on a smaller scale; and the island of Jerbi is noted for manufacturing industry. Near El Gemme are the remains of a magnificent amphitheatre.

5174. *Tripoli* presents a different aspect, and one by no means so grateful and smiling as the western regions of Barbary. That great mountain range, which has diffused through them verdure and fertility, terminates, and the great plain of sand which generally covers Northern Africa presses close upon the cultivated territory. The district in which the city stands forms only an oasis, and one not very extensive; and he who takes his departure from it in any direction finds himself soon in the heart of the desert. Tripoli thus cannot equal the other capitals of Barbary, and its population is not supposed to exceed 25,000. Even this is supported rather by commerce and industry, than by the limited productions of the soil. It is, however, the chief theatre of the intercourse with Bornou and Houssa, the most fertile countries in the interior of Africa; over which it exercises even a species of dominion. Fezzan, the great emporium of the caravan trade, is tributary to the pacha; and he possesses a powerful influence over the courts of Kouka and Sackatoo. This prince has shown a more enlightened spirit, a greater desire to cultivate intercourse with the European powers, and to introduce the improvements of civilised life, than any other in Barbary. A singular absence of that jealousy which usually actuates Mahometan courts has been displayed in the welcome given to the British expeditions of discovery, and the zeal displayed in promoting their objects. Tripoli cannot be called a fine city; yet its palace, and the generality of its mosques, have some beauty; and there is a triumphal arch and several other interesting remains of antiquity.

5175. *To the eastward of Tripoli*, and in its close vicinity, begins a dreary portion of the *Great Desert* of Africa. A few days, however, bring the traveller to the district of Lebeda, where thick groves of olive and date are seen rising above the villages, and a great space is covered with luxuriant crops of grain. This territory is considered much superior to that round Tripoli, and was more highly prized by the ancients, who founded on it the flourishing colony of Leptis Magna. Remains of its magnificent edifices and shattered columns are still seen half buried under the sand which the wind and sea have accumulated over them; but the country people are daily carrying off the fragments, and using them as mill-stones. A similar country continues to Mesurata, to the west of which is also a plain singularly fertile, compared even by Herodotus to that of Babylon. Mesurata carries on a manufactory of carpets, and a considerable trade with Central Africa. At the termination of this plain commences the awful and desolate expanse of the Syrtis. Captain Beechey thus describes the opposite spectacle presented by the two points of view:—"To the west, endless groves of palm trees and olives, among which are scattered numerous villages and gardens, rich tracts of corn land, flocks of sheep and goats, and every where a moving and busy population: to the eastward, a tenantless and desolate waste, without a single object rising from its surface, lies stretched in one long and unbroken line, as far as the eye can reach."

5176. *The Gulf of Sert, or the Syrtis*, about 400 miles in length, presents some striking features. For about forty miles it is bordered by a marsh covered with a thin saline crust, which often gives way beneath the horses' feet, and discovers hollow spaces, many of which are of great depth, with water at the bottom. This dangerous swamp, combined with the general sandy character of the region, seems to have suggested to the ancients the idea of quicksands, which they very decidedly attached to this shore; though it is positively stated that nothing is found in any part of it strictly answering to the term. At the end of this marsh, the Syrtic region, though extremely wild and dreary, affords from time to time little valleys, or detached spots, traversed by the Arabs with their flocks, herds, and movable tents. The dangers of this gulf, painted by the ancients in such direful colours, consist in a flat and shallow coast, full of concealed rocks and

banks, against which a heavy surf is continually breaking. The same perils still exist, increased by the heavy swell brought in by the north wind blowing across the greatest breadth of the Mediterranean; but this gulf, so terrible to the ancients, who were unable to navigate at any distance from land, and doomed by a fatal necessity to cross it on their way from Egypt to Carthage, is little dreaded by the moderns, who in this course systematically stand out to sea.

5177. *The ancient Cyrenaica*, and modern Barca, commences at the termination of the Gulf of Syrtis, and exhibits a very improved aspect. It is traversed by a steep and high ridge abounding in springs which, according to Arab report, amount to 360, and sprinkle the surrounding desert with valleys of the most brilliant verdure and fertility. On this coast the Greeks founded Cyrene, one of their most flourishing colonies. At present it is abandoned by all civilised and industrious nations, and, with the exception of a few poor villages, is occupied exclusively by the wandering Arabs with their flocks and herds. Bengazi, the Hesperis of the earliest writers, the Berenice of the Ptolemies, is now only a miserable village. Every trace of the ancient city appears to have been buried under the sands of the surrounding desert. Yet the modern Arab still finds in it ample building materials: he begins to dig, and speedily arrives at fragments of splendid columns and rich entablatures. To suit his purpose, however, these must be pounded into minute portions; and the elegant volute, the rich triglyph, the flowering acanthus, are soon reduced into shapeless fragments, which, however, being ill cemented with mud, form by no means very secure habitations. The range of valleys east of Bengazi is singularly picturesque, their sides being in many places steep and rocky; yet every cleft filled with a brilliant vegetation. "The white pine and the olive," says M. Pacho, "adorn the sides of the mountains, whose summits are crowned with forests of thuja and arborescent juniper. The rocks, overhung with dark groves, present sepulchral grottoes, the only vestige of towns, which have disappeared, with their ancient inhabitants. These pious excavations, the funereal tree which covers them, with the hoarse and savage songs of the Arabs, which are echoed from valley to valley, arrest the pensive traveller, and fill him with solemn and tender recollections." In this tract are found the two ancient, now entirely deserted, cities of Teuchira and Ptolemeta. The edifices of the former are entirely reduced to rubbish; yet its walls, a mile and a half in circuit, have by their Cyclopean strength resisted the powers of destruction, and form a very perfect specimen of ancient fortification. Ptolemeta has one magnificent gateway and the remains of an amphitheatre, two theatres, and of the columns and tessellated pavement of a palace. The area is covered partly with grain, partly with lofty shrubs; while the cry of the jackal and hyena, and the noise of owls and bats, alone afford any symptom of life.

5178. *The ruins of Cyrene itself*, which may be said to be a recent discovery, form the most striking object in this remarkable region. They are finely situated on a high table plain, descending abruptly towards the sea, by successive stages, along each of which is a smooth rocky path, still marked by the wheels of the ancient chariots. The view from the brow of the eminence, upwards of 2000 feet high, over the rocks, plains, and the distant Mediterranean, is singularly beautiful. There are the remains of a spacious amphitheatre, numerous statues, and several fine springs, particularly one called the Fountain of Apollo, much resorted to by the wandering Arabs; but the city is totally destitute of permanent inhabitants. The most remarkable feature in Cyrene consists of its necropolis, or city of tombs (*fig. 815*). Eight or nine rows of sepulchral grottoes

815

TOMBS OF CYRENE.

are arranged in terraces along the mountain. Around them are grouped tombs and sarcophagi, rich in ornaments and inscriptions, and extending for a mile and a half along the roads leading to Cyrene, so as to present the appearance of gay and splendid streets. Derne and Apollonia contain ruins of similar character, but not on so great a scale.

5179. *The ancient Marmarica* extends from this point eastward; a bleak region, destitute of those smiling groves of laurel and myrtle which crown the mountains of Cyrenaica. It is crowded with beasts and birds of prey; and human existence is indicated only by the bleating of distant flocks and the dark tent of the Arab. Yet there is cultivation in favoured spots; and the traces of cisterns and canals of irrigation mark the former existence of a civilised and even somewhat numerous population. M. Pacho estimates the Arabs of Marmarica at 38,000, those of Cyrenaica at 40,000; and the addition of those who wander over the Syrtis may perhaps raise the whole of this wandering population to 100,000.

CHAP. VI.

WESTERN AFRICA.

5180. *Western Africa* seems the only general name under which it is possible to comprise that wide range of coast, excluding the Great Desert, which extends along the Atlantic from the Senegal, to the river of Benguela. The greater part is known to Europe under the appellation of Guinea, which, however, is confined to the shores of the vast gulf so called, commencing at Cape Mesurado. It even applies most strictly to the northern shores of that gulf, terminating with the rivers of Benin; for the term Lower Guinea, applied to Loango,

Congo, and the neighbouring territories, is in much less frequent use. The territories on and between the Senegal and Gambia are, by the French, called Senegambia; but these names are all European, and unknown to the natives. The whole region is split into a multitude of states, mostly small, and without any political connection. There is a general resemblance of climate, nature, aspect, and character, which justifies us in classing them under one head.

SECT. I. *General Outline and Aspect.*

5181. *This immense range* of maritime country is included between the thirteenth degree of south and the seventeenth degree of north latitude, forming thirty degrees in a direct line; but, allowance being made for the windings of the coast, and the deep bays by which it is indented, the entire length cannot be less than 4000 miles, running in a direction generally from north-west to south-east. The breadth varies much more; indeed, it is founded upon an arbitrary division, which Europeans have made, between Western and Central Africa; vague regions, which are separated by no precise line of demarcation. In general, the boundary fixed by nature seems marked by the heads of the rivers that fall into the Atlantic. This dimension has been ascertained in the case of the Senegal and Gambia, and forms a depth of 700 or 800 miles, on the other side of which lies the upper course of the Niger. In the lower course of that great river, as now ascertained, no such line can be drawn; and the extensive countries situated on its banks belong in their character and relations so decidedly to Central Africa, that the region so called, must, in this quarter, be brought much nearer to the coast. Immense deserts bound this maritime district, both at its northern and southern extremity.

5182. *The coast of Western Africa* presents, in general, a flat surface, though Cape Verd, and some others, project bold headlands into the ocean. All the great ranges of mountains are in the interior, and their line and position are still imperfectly ascertained. The most important is that very extended chain, in the interior of Senegambia, usually called the Mountains of Kong, which appears in some measure to stretch across the continent, till it connects with the Mountains of the Moon, on the opposite side of Africa. This chain, running from east to west, becomes parallel to those coasts, which form the northern boundary of the Gulf of Guinea. Congo is, in many parts, rugged and hilly; and there are, undoubtedly, great chains of mountains in the interior.

5183. *The western rivers of Africa* are conspicuous features, though not of that immense magnitude which has been sometimes imagined. The Senegal is no longer identified with the Niger, nor supposed to draw its waters from the interior depths of the continent; but it is about 900 miles in length from its source, in the western extremity of the Mountains of Kong, not very far distant from that of the Niger. Its early course is swelled by numerous streams from the same mountains, among which the Ba-fing, the Ba-lee, and the Faleme, are the most important. After passing Gallam and the falls of Felu, it descends into a dead level, and rolls along the borders of the desert, till, near Fort Louis, it finds a passage, obstructed by heavy bars of sand, into the Atlantic. The Gambia rises from a point of the same chain not very distant, and rolls a more powerful and rapid stream, forming at its mouth a considerable estuary; but its course is not more than two thirds of that of the Senegal. The Rio Grande, and the Mesurado, which come down from the southern side of the same mountains, have not attained the character of streams of the first order when they reach the sea. The waters of the ivory and gold coasts of Guinea are little better than mountain torrents, pouring down from the high grounds; but from the western limit of Whidah to Calabar, a space of above 200 miles, the Gulf of Benin receives a continued succession of large estuaries, which convert the whole territory into alluvial and partially inundated islands. These channels, the sources of which were long the subject of conjecture, are now, by the discoveries of Lander, ascertained to compose the delta of the Niger; though the course of that mighty river must be considered as belonging to the central regions of Africa. Farther south, the Congo pours its ample volume of waters into the Atlantic, which it freshens to a considerable distance; but though the expedition under Captain Tuckey penetrated 300 or 400 miles upwards, the higher part of its course is still enveloped in mystery. The Coanza likewise appears to come from a considerable distance in the interior, and may rank high among rivers of the second class.

5184. The waters of Western Africa do not accumulate into lakes of any importance.

SECT. II. *Natural Geography.*

SUBJECT. 1. *Geology.*

5185. *Western Africa.*—*The African coast*, from Sierra Leone to the mouth of the Orange River, is very imperfectly known in a geological view. The hills around Sierra Leone are said to be of granite; the geology of the grain coast and ivory coast of Guinea is unknown, and nothing satisfactory can be offered in regard to the slave coast. In Benin there are mountains (those of Camaroon, on the sea coast), said to be 13,000 feet high. The extensive district through which the Zaïre flows was examined during part of its course, and

the rocks met with were *granite, syenite, primitive greenstone, gneiss, mica slate, clay slate, and primitive limestone or marble*. The kingdom of Angola is remarkable for the great extent of its salt mines; it also affords copper and iron. The mines of Loango and Benguela, so often mentioned by travellers, afford principally iron ores.

SUBJECT. 2. Botany.

5186. *Western Africa*, containing, as it does, a vast extent of country, both in the northern and southern hemispheres, including the tropics, must, of course, possess an extremely varied vegetation, of which, unfortunately, a very great portion is unknown. Islands present a more interesting field for the geographical distribution of plants, than the continent. In the first place, therefore, we shall offer a few remarks upon that of Madeira, which we are the better enabled to do from the observations of Dr. Kuhl, given in the *Botanische Zeitung*, and the interest of which is increased from the relative situation of this speck in the ocean being such as to form the connecting link between the vegetation of Europe and that of the western continent of Africa, to which country it naturally belongs. "Here," says this traveller, "every stranger must be struck with the entire absence of Oaks, Firs, Birch, Willows, &c. All our European fruits are cultivated; but such as are not planted in a soil that is properly manured, are far inferior to ours in point of flavour; at least those we had the opportunity of eating. The Grapes, indeed, must be excepted, which possess much richness, and are mostly red. The wine is a true claret, and the good old Madeira has the exact colour of Rhenish wine. The red, which is not a claret, is rare. All the native trees have coriaceous leaves, and one only bears an esculent fruit, which is an arborescent *Vaccinium* (*V. padifolium* Smith), the rest have been introduced by the Portuguese. One single species of Fir, it is said, was found on the island when it was discovered; but that was soon extirpated by the use made of it in building, for which purpose the Chestnut is now employed and cultivated. Of the thick stems of the arborescent Heaths (*Ericæ*), which crown the top of the Pico Ruivo, and whose wood is of a beautiful red colour, they make props for their vines, which are not, as with us, trained upright; but horizontally, just above the ground, forming a green covering. As the climate of the respective regions varies according to the relative heights of the mountains, so we meet with very different plants at different elevations, and the several belts, or regions, may thus be characterised:—

5187. "1. *Region of the Cacti*, which, according to our calculations, reaches to an elevation of 630 feet above the level of the sea. — Von Buch gives the same extent to this region at Teneriffe. In Madeira, however, the succulent *Euphorbiaceæ* and other African plants, which abound in Teneriffe, are wanting. The Indian or Prickly Fig (*Cactus Opuntia*), grows alone upon the bare rocks, and Vines, Canes, Figs, Arums, Musæ, and other southern fruits, are cultivated in the fields. This district is rich in wild plants: we found one

ADIANTUM CAPILLUS VENERIS.

Cryptogamous species, *Adiantum Capillus Veneris* (fig. 816.); seven *Monocotyledones*, viz. three *Panica*, a *Cynodon*, *Andropogon*, *Setaria*, and *Milium*; sixty *Dicotyledones*, among which (besides the genera which abound with us, such as *Rumex*, *Convolvulus*, &c.) were *Crotalaria*, *Physalis*, *Asclepias*, *Helminthia*, *Atractylis*, *Ageratum*, *Sida*, *Myrtus*, *Cassia*, &c. The Pomegranates, Figs, and Bananas, which are planted about the houses, together with the bright green of the Arums, gave a singular charm to this district. Of the sixty-eight species now enumerated, seventeen extended as far as the region of the Vine, and only two of them were met with again, at a height of 5300 feet.

"2. *Region of the Vine*. — The culture of this plant may be said to commence at the sea shore; but the Cactus does not accompany it above 630 feet. The Vine ascends to an elevation of 2030 feet; but higher than that the fruit will not ripen. In this region, the Arum, Cane, Mulberry, &c., Potatoes, Corn, and Onions, are cultivated; but not the Bananas and Cacti. The hedges consist of Myrtle and Chestnut. Agriculture is more successfully carried on here than elsewhere; on which account, few wild plants are met with, but such as we had already found in the lower region, and of those, three that grew at a still higher elevation.

"3. *Region of the Chestnut*. — This commences at 2030 feet, and is eminently distinguished by the tall stout stems of the Chestnut, which tree ascends to about 2950 feet. Those that are found still higher, are smaller, distorted, and bear no fruit. We staid longest in this region, and our success in collecting plants was proportionably great. We found twenty-three *Cryptogamiæ*, viz. twelve Ferns (one *Darea* and *Woodwardia*) five Lichens, *Anthoceros*, *Marchantia*, *Boletus*, two *Jungermannia*: — twelve *Monocotyledones* of our common genera; only one *Carex*, and a beautiful *Cyperus*: — sixty-six *Dictyledones*, viz. five *Rumices*, *Clethra*, *Lobelia*, *Andryale*, *Chamæmelum*, an arborescent *Euphorbia*,

two shrubby species of *Teucrium*, *Cineraria*, *Disandra*. We found nine of these species in the next region.

"4. *Region of the Spartium*. — This terminated at a height of 3920 feet, and is singularly poor in its vegetation. We found but one plant we had not seen before, or did not meet afterwards in the following region. The whole region is covered with *Spartium* alone.

"5. *Region of the Heath (Erica)*. — This extends to the summit of Pico Ruivo, the highest point in the whole island, and, according to our reckoning, 5300 feet above the level of the sea. It is very rich in interesting plants. Towards the centre of it are trees with coriaceous leaves, an arborescent *Vaccinium*, and two trees, called Till and Vintratico, which for want of flowers, we could not determine. Between the fourth and fifth region is a tract almost covered with *Pteris aquilina*, and some other Ferns, especially another *Pteris*. On many ridges, these abound to the exclusion of all other plants, and remarkably so at a height of 3920 to 4080 feet; while below them the *Spartium*, and above them the *Ericas*, maintain possession of the soil. But again, not far from the top of the Pico, is a tract where the *Ericas* are supplanted by the *Spartium*; only, however, for a short space, for the summit is covered by the thick stems of the Heaths. Besides fifteen species, common to the lower regions, we found, of *Acotyledones*, twelve; *Peziza* and *Lichens*: — seven *Monocotyledones*, among them two *Sciuri*, two species of *Cynosurus*, an *Aira* and *Agrostis*: — thirty-seven *Dicotyledones*, among them a *Sideritis*, a beautiful shrubby *Echium*, with a blue spike, *Crocodylium*, *Pyrethrum*, *Phyllis*, two *Semperviva*, *Sedum*, *Cotyledon*, &c. There is no Pine Region. It would take too much space to name all the genera we collected: but a comparison of the relative proportion they bear to one another, shows the island to be deficient in the northern families of *Amentaceæ*, *Saxifragæ*, and *Caryophyllææ*, especially the second. It is poor, likewise, in the predominant families of the tropics, the *Euphorbiaceæ*, *Malvaceæ*, and *Corymbiferaæ*, which latter are only in the proportion of 1 to 19; but at the Cape 1 to 5, and, in other equatorial countries, 1 to 6. But the *Cichoraceæ*, which belong to the temperate zone, are here numerous. In our walks on the shore, we found whole banks of *Fuci*."

5188. In the same way does the celebrated Humboldt divide the famous Peak of Teneriffe, in the Canary Islands, into five zones, to which he gives the name of the *Region of Vines*, the *Region of Laurels*, the *Region of Firs*, the *Region of the Retama (Spartium nubigenum)*, and the *Region of the Gramineæ*. These zones, which lie one above another, like terraces, occupy an elevation of 10,500 feet on the steep sides of the Peak; while, fifteen degrees more northerly, on the Pyrenees, the snow covers all, above the height of 7800 to 8400 feet. If vegetation does not, at Teneriffe, reach the very summit of the volcano, it is not because eternal snows and a cold atmosphere prevent it; but because lava and pumice-stone do not admit of plants growing upon the very brink of the crater.

5189. The first Zone, that of the Vine, extends from the sea-side to a height of from 1200 to 1800 feet: it is the most inhabited, and the only one where the soil is carefully cultivated. In these low regions, at the sea-port of Orotava, and wherever the winds have a free access, the thermometer never rises so high in summer, nor falls so low in winter, as at Paris and Petersburg; as was ascertained by observations made by M. Savaggi, in 1795 to 1799. The climate seems to hold a mean between that of Naples and the Torrid Zone. In spite of the analogy existing between the climate of Madeira and Teneriffe, the plants of the former island are in general much less delicate, when cultivated in Europe, than those of Teneriffe. Thus *Cheiranthus longifolius*, from Orotava, is killed by the cold at Montpellier, and *C. mutabilis*, of Madeira, stands there in the open air all winter. The summer heats are shorter at Madeira than at Teneriffe.

5190. The *Region of Vines* presents, among its vegetable productions, eight kinds of arborescent *Euphorbias*, some *Mesembryanthemums*, which abound from the Peloponnesus to the Cape of Good Hope, the *Cacalia Kleinia*, the Dragon tree, and other plants, whose naked and tortuous stems, succulent foliage, and glaucous hue, indicate the vegetation of Africa. In this zone are the Date, the Banana, the Sugar Cane, the Indian Fig, the *Arum Colocasia*, whose roots afford the lower classes a wholesome farinaceous food, the Olive, the European fruit trees, the Vine, and the *Cerealia*. The corn is cut from the end of March to the beginning of May, and the Bread-fruit tree promises to succeed well, as also the Cinnamon tree from the Moluccas, the Arabian Coffee, and the American Cocoa Nut. At many parts of the coast, the landscape presents all the character of a tropical scene, and the *Region of Palms* may be easily seen to extend far beyond the Torrid Zone. The Palmetto and the Date grow very well on the fertile plains of Murviedro on the coast of Genoa, and in Provence, near Antibes; some trees of the latter, planted within the limits of the city of Rome, resist even the cold of 2.5° below the freezing point. But if Western Europe shares but little in the productions that grace the zone of the Palms; the island of Teneriffe, placed under the parallel of Egypt, of Southern Persia, and of Florida, glows with almost all the vegetable glories which enhance the majesty of Equatorial Regions. Among its indigenous plants, however, the trees with pinnated foliage, and the

arborescent Gramineæ do not appear; nor has any species of the numerous family of Sensitive Plants migrated so far as the Canary Islands.

5191. *The second Zone*, that of the Laurels, includes the wooded portion of Teneriffe: it also is the region of the springs, which bubble up in its ever-verdant turf. Splendid forests crown the hills which adjoin the volcano, among them are four species of Laurel, an Oak, very similar to *Quercus Turneri* of Thibet, the *Visnea*, *Mocanera*, the *Myrica Faya* of the Azores, an indigenous Olive (*Olea excelsa*), the largest tree in this zone, two species of *Sideroxylon* with beautiful foliage, *Arbutus callicarpa*, and other evergreen trees of the myrtle tribe. Climbers, and an Ivy quite different from that of Europe (*Hedera canariensis*) twine round the stems of the Laurels, at the foot of which grow numberless Ferns, of which but three species grow so low as in the Vine Region. Every where the soil, which is covered with mosses and fine grass, shines with the blossoms of the golden *Campanula* (*C. aurea*), of *Chrysanthemum pinnatifidum*, *Mentha canariensis*, and several shrubby kinds of *Hypericum*. Plantations of wild and grafted Chestnuts form a broad band round the region of the springs of water, which is the most verdant and agreeable of all.

5192. *The third Zone*, or Region of Firs, begins at an elevation of 5400 feet, and there the last groupings of *Arbutus*, of *Myrica Faya*, and the fine Heath, which the natives call

817

PINUS CANARIENSIS.

Texo, disappear. This zone, about 2400 feet in extent, is wholly occupied by a vast forest of Firs, mingled with the *Juniperus Cedro* of Broussonet. The Firs (*Pinus canariensis* Von Buch) (fig. 817.) have very long and stiff leaves, which often grow in pairs, but more frequently three in each sheath. As we had no opportunity of examining the fruit, we are ignorant if this species, which has all the habit of the Scotch Fir, is truly distinct from the eighteen species of *Pinus* which are already known in the Old World. A celebrated traveller, who has much advanced the cause of science, M. De Candolle, considers the Fir of Teneriffe as alike distinct from *Pinus atlantica* and *P. halepensis*. On the slope of the Peak, at 7200 feet, we saw the last Firs: on the Cordilleras of New Spain, under the Torrid Zone, the Mexican Fir grew at an elevation of 12,000 feet. But whatever may be the analogy existing between different species of the same genus, each requires, for its perfect development, a certain degree of temperature and of rarification of the atmosphere.

5193. *The fourth and fifth Zones*, the Regions of the Retama and the Gramineæ, occupy an elevation corresponding with the highest and most inaccessible points of the Pyrenean mountains. This is the desert portion of the island, where masses of pumice-stone, obsidian, and shivered lava forbid the progress of vegetation. We have already alluded to the flowery tufts of alpine Broom (*Spartium nubigenum*), which form so many oases in this vast

818

DRAGON'S-BLOOD TREE.

wilderness of ashes. Two herbaceous plants, *Scrophularia glabrata* and *Viola cheiranthifolia*, rise somewhat higher. Beyond the scanty grass which is parched up by an African sun, *Cladonia paschalis* covers the arid soil; and the shepherds often set it on fire, till the blaze extends to considerable distances. Towards the summit of the peak, *Urceolarias* and other individuals of the Lichen family are always tending to effect the decomposition of the scorified matter. Thus, by an uninterrupted action of organic force, the empire of Flora is continually gaining ground on these islands, whose whole structure has been, as it were, deranged by volcanic fire.

5194. It is in the Canary Islands that the Dragon's-blood tree (fig. 818.) appears to arrive at its highest degree of perfection, and to attain a most astonishing size. "This gigantic tree," as is observed by M. de Humboldt, that first of travellers, in his *Tableaux de la Nature*, when speaking of a very celebrated

specimen of the Dragon's-blood tree, "is now included within the precincts of M. Franchi's garden, in the small town of Orotava, one of the most delicious spots in the world. In 1799, when we climbed the Peak of Teneriffe, we found that this enormous vegetable was forty-five feet in circumference, a little above the root. Sir George Staunton affirms that, at ten feet high, its diameter is twelve feet. Tradition relates that this particular *Dracæna* was venerated by the Guanchos, as the Elm of Ephesus was by the Greeks; and that in A. D. 1400 it was as large and as hollow as it is now. The gigantic Dragon's-blood tree, which I saw in the Canaries, was sixteen feet in diameter, and, enjoying a perpetual youth, was loaded with flowers and fruit. When the MM. Bethencourt, French adventurers, conquered the Fortunate Islands, in the sixteenth century, the *Dracæna* of Orotava, as sacred in the eyes of the natives as the Olive tree that grew in the citadel of Athens, was of colossal dimensions, as it is now. In the Torrid Zone, a forest of *Cæsalpinia* and *Hymenæa* is perhaps the monument of 1000 years. As the growth of the Dragon-tree is extremely slow, we may be sure that the Orotava tree is extremely old. Doubtless this tree and the Baobab are the oldest inhabitants of our planet. It is singular that the Dragon's-blood tree has been cultivated in the Canaries, Madeira, and the isles of Porto Santo, from the remotest antiquity, though originally derived from India. This fact contradicts the assertion of those who represent the Guanchos as a race of men of the Atlantic, who were completely insulated, and had no intercourse with the people of Asia and Africa."

5195. *The trunk of the Dracæna Draco* cleaves open in many parts, and distils, at the time of the summer solstice, a fluid, which condenses into red tears, soft at first, afterwards hard and friable: this is the true Dragon's blood of the shops, and must not be confounded, though dry, friable, blood-red, and inflammable, with other resinous substances known under the same name, and derived, the one from a species of *Calamus* (*Rotang*), and the other from a *Pterocarpus*. To the Dragon's blood are attributed astringent, desiccatory, and incassating virtues. It is administered internally for dysentery, hæmorrhage, violent bowel complaints, and inward ulcers: and externally, to dry up running sores, to heal wounds, and to strengthen the gums. The painters make use of it, in the red varnish with which they colour the Chinese boxes and chests.

5196. *Our observations* upon the vegetation of the coast itself, of Western Africa, must be very brief, and chiefly confined to the Tropics; while for a more full account we must refer to a learned paper, by Dr. Robert Brown, given in the Appendix to *Tuckey's Voyage to the Congo*, and content ourselves with little more than a few extracts from that paper, on a comparison of the vegetation along the line of the Congo, with that of other parts of the West Coast to Equinoctial Africa.

5197. *It appears that from* the river Senegal, in about 16° N. lat., to the Congo, which is in upwards of 6° S. lat., there is a remarkable uniformity of vegetation, not only as to principal orders and genera, but even, to a considerable extent, in the species of which it consists. More than one third part of the plants from the Congo have been observed pre-

viously on various parts of the coast. Many of the Trees, the Palms, and several other remarkable plants, which characterise the landscape, as *Adansonia*, *Bombax pentandrum*, *Elais guineensis*, *Raphia vinifera*, and *Pandanus Candelabrum* (*fig. 819.*) appear to be very general along the whole extent of coast. *Sterculia acuminata*, the seed of which is the Cola, mentioned in the earliest accounts of Congo, exists, and is equally valued, in Guinea and Sierra Leone, and, what is remarkable, it bears the same name throughout the West Coast. The Ordeal Tree, called by Professor Smith, Cassa, and by Captain Tuckey, erroneously, a Cassia, if not absolutely the same plant as the Red Water Tree of Sierra Leone and the Gold Coast, belongs at least to the same genus. A species of the Cream Fruit, remarkable in affording a wholesome and pleasant saccharine fluid, used by the natives of Sierra Leone to quench their thirst, though belonging to that generally deleterious family the *Apocynæ*, was also met with. The *Sarcocephalus* of Afzelius, which is probably what he has noticed under the name of the Country-fig of Sierra Leone, was found on the banks of the Congo.

819

PANDANUS CANDELABRUM.

Anona senegalensis, whose fruit, though smaller than that of the cultivated species, is said to have a flavour superior to them all, and appears to be a general plant along the whole extent of coast; and *Chrysobalanus Icaco*, or a nearly allied species, is equally common from Senegal to Congo.

5198. We may here introduce a few remarks on the Esculent Plants of the Congo; the cultivated, as well as the indigenous species, being very similar throughout the West Coast. On the banks of the river, the principal articles of vegetable food were the Indian Corn, or Maize (*Zea Mays*), Cassava, both sweet and bitter (*Jatropha Manihot*), two kinds of Pulse extensively cultivated; the *Cytisus* Cajan and a *Phaseolus* (?), with Ground Nuts (*Arachis hypogæa*). The most valuable fruits are Plantains (*Musa sapientum*), the Papaw (*Carica Papaya*), Pumpkins (*Cucurbita Pepo*), Limes and Oranges, Pine Apples, the common Tamarind, and Safu, a fruit the size of a small plum, which was not seen ripe. One of the most important plants, not only of the Congo, but of the whole extent of coast, is *Elais guineensis* (fig. 820.), or the Oil-Palm, which also affords the best Palm Wine.

820

ELAIS GUINEENSIS.

Wine is likewise obtained from two other Palms, *Raphia vinifera* (?) and a *Corypha* (?). Among the other alimentary plants, of less importance, or imperfectly known, are the Shrubby *Holcus*, the common Yam, only seen near Cooloo; and another *Dioscorea*, found wild only, and very inferior to the Yam, requiring, it is said, four days' boiling to free it from its pernicious qualities. On Mr. Lockhart's authority, two kinds of Sugar Canes, and Cabbages, were seen sparingly; *Capsicum* and Tobacco are generally cultivated, and in the herbarium is a specimen of *Malagnetti* Pepper. A second kind of Ground Nut or Pea (*Glycine subterranea* ?) which is extensively grown at Madagascar, also appeared. A species of *Ximenia* (*X. americana* ?) was likewise found; the fruit yellow, the size of a plum, and acid, but not unpleasant, in the higher parts of the river, where it is generally planted. An *Antidesma*, perhaps like that mentioned by Afzelius, as having a fruit of the same size and taste as a currant, is also in the herbarium.

5199. It is particularly deserving of notice that most of the above plants, enumerated as cultivated on the Congo, and especially the important species, have probably been introduced, and do not even belong to the continent of Africa. Thus Maize, Manioc or Cassava, and Pine Apples, have been brought from America, as also, perhaps, Papaw, *Capsicum*, and Tobacco; while the Banana or Plantain, the Lime, the Orange, the Tamarind, and the Sugar Cane, may be considered as of Asiatic origin.

5200. In connection with these observations of Mr. Brown's, we may here introduce a list of the Edible Fruits of Sierra Leone, drawn up by Joseph Sabine, Esq., from the Journal and Notes of Mr. George Don, who was charged by the Horticultural Society of London to collect the useful vegetables of that most interesting country.

5201. The Peach of the Negroes (*Sarcocephalus esculentus*) (fig. 821.) is a large, fleshy,

821

SARCOCEPHALUS ESCULENTUS.

and solid fruit, hard and eatable throughout, and full of small seeds, not much unlike a strawberry in flavour and consistence. The tree grows plentifully throughout the colony of Sierra Leone, 10 to 15 feet high; the leaves are large and elliptical, the flowers pink, produced in globular heads, and seated on a receptacle which afterwards becomes the fruit. The *Anona senegalensis*, or African Custard Apple, of which the fruit is not much larger than a pigeon's egg, and with the same or a superior flavour to the rest of the species. The Monkey-bread (*Adansonia digitata*) is much used by the negroes: its fruit, which is of considerable size, and of an oblong shape, is full of seeds, and tastes like gingerbread, with a pleasant acid flavour. The Locust Tree of Sierra Leone (*Inga biglobosa*) is a beautiful tree when in blossom, covered with compact biglobular heads of fine vermilion-coloured flowers; which are succeeded by compact bunches of pods, con-

taining a yellow farinaceous substance, of which the natives are very fond. It is mentioned by Park as affording an agreeable and nutritive food. The Country Cherry is rare, growing on the mountains, and bearing a small oval reddish fruit, somewhat like a Plum in flavour, and produced in clusters on the topmost branches. *Anisophyllea laurina*, the Monkey Apple, is a fruit of the size of a pigeon's egg, red on one side and yellow on the other, with a flavour between the nectarine and plum. Country Grapes are the produce of *Vitis cæsia*, they are black, austere, and acid, chiefly eaten by the negroes. Country Currants resemble elderberries, and are found plentifully on the mountains. The shrub (*Ficus Brassii*) which bears the Large Fig grows about the colony: the fruit would be very pleasant, if the ants did not generally get in and spoil it; and the same may be said of a smaller fig, that bears abundantly, and is the size of a hazel nut. Afzelius speaks of Wild Guavas (*Psidium pyrifera*) as natives of this country, and Mr. Don saw and tasted the fruit, but he could not exactly identify the plant with the West Indian Guava. The Hog Plum is the fruit of *Spondias Myrobalanus*; it is well tasted, and sharper than the plum of our gardens, but the stone forms half the bulk of the fruit. The Grey Plum tree (*Parinarium excelsum*) is more valuable for its compact and durable wood than for the fruit, which, though large and abundant, is dry and farinaceous, with a very large stone: an allied species, *P. macrophyllum*, is called by the colonists Gingerbread Plum. Of four other fruits, called Plums, the Small Pigeon Plum (*Chrysobalanus ellipticus*), the Yellow Pigeon Plum (*C. luteus*), the Black Plum (*Vitex umbrosa*), and the Sugar Plum, it may be said that the first three, though good, are inferior to the latter, which is sold in large quantities in Sierra Leone, and is one of the very best fruits in the colony. The tree is very handsome, sixty feet high, and bears many fruits of the size of a bullace: at ten feet from the ground, the stem throws out roots like a mangrove or Pandanus, but its botanical affinities are not known. From the fruit of the Sweet Pishamin (*Carpodinus dulcis*), a quantity of sweet milky juice exudes, the pulp is also pleasant and sweet: the Sour Pishamin (*C. acidus*) though sharp, acid, and rather bitter, is much relished by the natives. The Mammee Apple (*Mammea africana*) is a lofty tree, with useful wood and a very large fruit. The Butter and Tallow Tree (*Pentadesma butyracea*) abounds in a yellow greasy juice, to which it owes its name, and which is given out plentifully when the fruit is cut; this is mixed by the natives with their food, on account of its turpentine flavour, which renders it disagreeable to the European settlers. Two kinds of Star Apple (*Chrysophyllum macrophyllum* and *C. obovatum*) are very inferior to the West Indian Star Apple (*C. Cainito*). Tonsella pyriformis bears a rich and sweet fruit, like a bergamot pear. There is a tree called Pomegranate, said to be excellent: but having no affinity to *Punica*. The seeds of *Sterculia acuminata* are called Cola by the negroes, who hold them in great esteem, as possessing the same virtues as Peruvian bark. They are like horsechestnuts, and produced in pods, which grow two to five together. A somewhat similar seed, named Tola, is used in the same way. Velvet Tamarinds, the fruit of *Codarium acutifolium*, are produced in beautifully black velvety pods, and possess an agreeably acid taste, while Brown Tamarinds differ little, except in the colour and larger size of the pod. Pine-apples (*fig. 822.*) both grow wild and are cultivated by

PINE-APPLE.

the natives: they abound in the woods, so as to obstruct the passage through them in every direction, shooting most vigorously, and yielding fruit abundantly. The profusion in which these plants are seen, even in unfrequented spots, sanctions the common opinion of the colonists, that they are indigenous to the soil; contrary to the doctrine of scientific botanists, who maintain that Pine Apples have been carried from America into Africa and Asia; yet it is remarkable how such an exotic can have assumed all the characters of a native, and even sported into varieties, strikingly different from the appearance of the plant in the country of which it is supposed to be the original inhabitant. Two kinds only, the Black and White, are grown at Sierra Leone: though not so large as those cultivated in England, the flavour is superior. The wild varieties are innumerable; and a very pleasant kind of wine is made in the colony from the juice. Besides

the fruits already mentioned as found wild near Sierra Leone, the following are cultivated: Plantains (*Musa Sapientum*), Bananas (*M. paradisiaca*); the Cocoa Nuts are still rare, and Papaws (*Carica Papaya*) are only seen near the settlers' houses. Oranges are abundant, and have now grown wild, Lemons are rare, but Limes plentiful. Cashew Nuts have been cultivated in large quantities of late: Rose Apples (*Eugenia Jambos*), and Tamarinds from the West Indies, Love Apples (*Solanum Lycopersicon*), Melons, Water Melons, Cucumbers, Gourds, &c. of many kinds and qualities: among the Melons, some which having the smell of Musk are called Musk Melons. Two sorts of Capsicum are grown, and do not appear to be natives of the country.

5202. The Baobab, or Monkey Bread, above mentioned (*Adansonia digitata*), may be deemed one of the most valuable productions of Western Africa. It is likewise said to be found in Egypt and Abyssinia, and is cultivated in many of the warmer parts of the world. There seems to be no question that it is the largest known tree; its trunk being sometimes no less than thirty feet in diameter. Many interesting particulars of this tree are given in Adanson's account of his visit to Senegal, especially respecting its size and great age, whence it has been called *arbre de mille ans*. The height of its trunk by no means corresponds with the thickness which it attains, according to Adanson's calculations, which go to prove that its successive growth from one year old, when its diameter is one inch, and its height five inches, to 30 years old, when the diameter has attained to two feet, while the height is but 22 feet; and so on, till, at 1000 years old, the Baobab is 14 feet broad, and 58 feet high, and at 5000 years, the growth laterally has so outstripped its perpendicular progress, that the trunk will be 30 feet in diameter, and only 73 feet in height. We must confess that the disproportion is truly enormous. The roots, again, are of a most extraordinary length; so that, in a tree with a stem 77 feet round, the main branch or tap root measures 110 feet in length. A figure of the whole tree may be seen in a beautiful vignette (p. 141.) of *Lord Macartney's Embassy to China*, drawn from a fine specimen in one of the Cape de Verd Islands. The foliage there, indeed, is not so abundant as to conceal the vast proportion of the trunk; but it often happens that the profusion of leaves and of drooping boughs almost hide the stem, and the whole forms a hemispherical mass of verdure, 140 to 150 feet in diameter, and 60 to 70 feet high. The wood is pale-coloured, light, and soft, so that in Abyssinia, the wild bees perforate it, and lodge their honey in the hollow, which honey is considered the best in the country. The negroes on the western coast, again, apply these trunks to a very extraordinary purpose. The tree is liable to be attacked by a fungus, which, vegetating in the woody part, without changing the colour or appearance, destroys life, and renders the part so attacked as soft as the pith of trees in general. Such trunks are then hollowed into chambers, and within them are suspended the dead bodies of those to whom are refused the honour of burial. There they become mummies, perfectly dry and well preserved, without further preparation or embalming, and are known by the name of Guiriots. The Baobab, like all plants of the same Order (*Malvaceæ*) is emollient and mucilaginous. The pulverised leaves constitute *lalo*, a favourite article with the natives, which they mix with their daily food, to diminish excessive perspiration, and which is even used by Europeans in fevers, diarrhœas, &c. The fruit is perhaps the most useful part of this tree; its pulp is acid and agreeable, and the juice expressed from it, mixed with sugar, constitutes a drink that is deemed a specific in putrid and pestilential fevers. Owing to these circumstances, the fruit forms an article of commerce. Bowdich mentions that it possesses such an agreeable flavour, and is so abundant, that it constitutes a principal article of food with the natives, who season many of their dishes with it, especially their corn gruel. The Mandingoes convey it to the eastern and southern districts of Africa, and through the medium of the Arabs, it reaches Morocco, and even Egypt. If the fruit be injured, it is burned, the ashes being mixed with rancid palm oil, and serving for soap. The flowers are large, white, and handsome, and on their first expansion, bear some resemblance, in their snowy petals and violet mass of stamens, to the White Poppy (*Papaver somniferum*). Both the flowers and fruit are pendent. The Baobab tree loses its leaves before the periodical rains come on.

5203. The *Arachis hypogæa* (fig. 823.) deserves notice on account of the singular economy of its fruits. It belongs to the very few plants which mature their seeds under ground; the flower-stalk, after the blossom has withered, bending downwards, and burying the germen in the soil, where it soon increases in bulk, and perfectly ripens.

ARACHIS HYPOGÆA.

The fruit is a pod, containing one or two seeds, the size of small nuts, with a flavour of almonds; the natives of several countries eat them, either boiled or fried, and make very pleasant confections of them, the taste resembling chocolate. A valuable oil is also extracted from the seeds of the *Arachis*, alike useful in food and for supplying lamps, as it never turns rancid. Many attempts have been made to naturalise this plant in Europe; but the climate is too cold for it every where north of the southern coast of France.

SUBSECT. 3. Zoology.

5204. Our remarks on the Zoology of this portion of Africa must be chiefly confined to Senegal, the neighbouring coasts of Guinea, and the colony of Sierra Leone: these, in short, are the only districts hitherto visited by naturalists, whose researches, moreover, have been but slight, and confined to the districts immediately surrounding the European factories.

Yet, whatever may be the nature of the interior zoology, that of the coast is strikingly distinguished from Northern Africa. A rich vegetable soil, and a luxuriance of foliage, is here not uncommon; heavy rains are perpetually nourishing the earth, and animal life is multiplied under a variety of new and striking forms, totally unknown in the arid and sandy deserts of Northern Africa. We may thus safely consider the Great Desert as a natural demarcation between the zoology of the two regions; but under what degree of latitude we may fix the commencement of the southern zoological range, it is impossible to guess. The whole extent of this side of the continent, from Sierra Leone to the great Orange River, has never even been visited by a naturalist, and its productions are absolutely unknown.

5205. In the following lists are enumerated the chief quadrupeds of Western Africa, arranged under those countries where they have been particularly observed:—

Senegal.
Cercopithecus ruber. Red Monkey.
Cercopithecus sabæus. Green Monkey.
Megaderma frons. Foliateous Bat.
Tapozous senegalensis. Senegal Bat.
Oryx beoastica Sm. Senegal Oryx.
Gazella Dama Sm. Swift Antelope.
Tragelaphus scripta. Harnessed Antelope.

Guinea.
Cercopithecus nictitans. White-nosed Monkey.
Cercopithecus petaurista. Vaulting Monkey.

Cercopithecus diana. Palatine Monkey.
Cercocebus fuliginosus. Smoky Monkey.
Cercocebus æthiops. Ethiopian Monkey.
Cynocephalus papio. Guinea Baboon.
Papio Mormon. Mandrill.
Papio sylvicola. Wood Baboon.
Canis cancrivorus. Crab-eating Wolf.

Sierra Leone and Congo.
Simia troglodytes. Chimpanzee.
Colobus polycomos. Full-bottom Monkey.
Gazella mytelopes Sm. Broad-footed Antelope.

Antilope redunca. Nagor Antelope.
Cephalophus sylvicultrix Sm. Bush Antelope.
Cephalophus quadriscopa Sm. Four-tufted Antelope.
Cephalophus mergens. Ducker Antelope.
Cephalophus Grimmia. Guinea Antelope.
Cephalophus Maxwellii Sm. Maxwell's Antelope.
Cephalophus Philantomba Sm. Sierra Leone Antelope.
Tragelaphus phalerata Sm. Ribbed Antelope.

5206. The most interesting quadrupeds of Senegal appear to be the Red Monkey, the Green Monkey, and the two Antelopes named Dama and Scripta. Of the former, M. Adanson has left us some interesting details.

5207. The Red Monkey is a pretty animal, but capricious, mischievous, and little susceptible of attachment. Our author gives an interesting account of their curiosity. During his aquatic excursion, they descended from the tops of the trees to the extremity of the branches, earnestly noticing, and apparently much amused by, the boats passing up the river. After a time they took courage, and began to pelt the travellers with pieces of wood, thus provoking a most unequal contest. Upon being fired upon, they uttered the most frightful cries, and, although many were killed, the survivors returned to the contest with redoubled courage, and with a most determinate spirit: some flung stones at their adversaries, while others even collected their own excrements for the same purpose.

5208 The Green Monkey (fig. 824.) is so named from the upper parts being of a greenish-yellow colour: the lower are greyish; and the tail is terminated by a long pencil of yellow hairs; the face, ears, and hands being black.

GREEN MONKEY.

Adanson found this species in immense numbers. They remain on the trees in large troops, and preserve the most profound silence, even when they are wounded. He did not at first notice them, from the similarity of their colour to that of the foliage, until they suddenly began flinging at him pieces of the dead branches; and although he killed twenty-three of them in less than an hour, they did not appear in the least frightened by the discharge of his guns. In confinement, it is stated by M. Cuvier to be remarkably beautiful and gentle; fond of being caressed by those it knows, and seldom exhibiting any malicious propensity: when fully contented, it expresses satisfaction by a peculiar gentle grunt, which may be compared to the syllable *grau*.

5209. The Dama Antelope was first described by Buffon, from a skin brought home by Adanson from Senegal; this so closely resembles the species so named by M. Rüppell, and found by him in the deserts of Nubia, that they are probably one and the same.

5210. The Harnessed Antelope (fig. 825.) is a most beautiful animal, first noticed by

HARNESSED ANTELOPE.

Adanson by the native name of *Gerib*. It is about the size of a fallow deer: the ground colour of a bright bay, but marked with stripes in various directions, and with such regularity as to give the idea that a harness, of some white material, was thrown over its body. It has been thought to extend from Senegal to Caffraria; but Mr. Burchell's observations do not confirm this idea. Another species, closely resembling this, is named by Major Smith the Ribbed Antelope (*A. phalerata*): it inhabits the barren plains above the great falls of the Zézere, or Congo; where it was first observed by Professor Smith.

5211. The quadrupeds of Guinea and Congo must be far more numerous in species than what would appear from our list, but the climate is too deadly to

the European constitution to permit the researches of science; while the notices given by ordinary travellers only lead to error. These regions present, indeed, a singular feature in geographic zoology, since we find within it the least developed races of mankind, and those animals most approaching to his conformation. The damp and impenetrable forests give shelter to innumerable Monkeys; and large Baboons, of the most grotesque but repulsive forms, are common in this part of Africa.

5212. *The Papiou, or Common Baboon* (fig. 826.), abundant on the coast of Guinea, is of a yellowish green, verging more or less to brown: the visage black, and the tail long. It varies in size according to age: when adult, it is a most ferocious and disgusting animal. From the same country comes the Mandrill Baboon (*Simia Maimon* Lin.), of an olive colour: its chin has a small yellow beard, and the cheeks are naked, blue, and furrowed. In the adult males, the nose grows red, and the end is sometimes of a bright scarlet, while the buttocks are of a beautiful violet. M. Cuvier well remarks that it is impossible to conceive an animal more extraordinary and more hideous. It very nearly attains the height of man, and is looked upon by the negroes with great fear.

COMMON BABOON.

this animal are given in the narratives of the old voyagers; and although its distinction from the Orang-Otan of India is now established, its history, in other respects, is still shrouded in great obscurity. It was designated by Linnæus as a variety of the human species, under the name of *Homo troglodytes*. The Chimpanzee appears to have an affinity, if not identity, with the large African apes so often mentioned by travellers, or to the Barris, or great Wild Man of the African woods: but the few specimens that have yet reached Europe have been young. In the adult state its size is said to exceed that of the Orang-Otan, and to exhibit the same docility, submissiveness, and gentleness. It appears confined to intertropical Africa, and is heard of more especially in Congo. The Perruque or Full-bottom Monkey (*Colobus polycomos* Geof.) appears more restricted to the forests of Sierra Leone and Guinea; it is thus named from the neck being furnished with a variegated mane of long hair, fancifully compared to a full-bottom wig, but truly representing the Lion in its own family.

5214. *Several of the Antelopes are very elegant*, but we must content ourselves with shortly noticing two.

5215. *The Bush Antelope* (*A. sylvicultrix*) (fig. 827.) is called, by the colonists of Sierra Leone, the Bush Goat: it is of a considerable size, and measures five feet in length: it is found on the bushy acclivities of the open mountains, quitting the covers about sunrise to feed, when it is shot by sportsmen; the venison being excellent: it is not so fleet as other antelopes.

BUSH ANTELOPE.

5216. *The Ducker Antelope* (*A. mergens*) is remarkable for its great timidity, being alarmed at the least unusual noise, and concealing itself on hearing thunder. It lives solitary or in pairs: its peculiar name originates from its singular habit of rising upon the hind legs to look round, making a blowing noise with its nostrils, and then stooping and flying under cover of the vegetation, to stand and rise up again. Another species, the Dodger Antelope of Major Smith, also from Western Africa, appears to resemble this very much.

5217. *The Lamantin, or Sea Cow* (*Manatus senegalensis*), an amphibious quadruped of great dimensions, occasionally frequents the mouth of the Senegal. It is essentially herbivorous, and of a mild and inoffensive character. Adanson describes it as full eight feet long, having some resemblance to a seal: four nails are at the edge of the fins, and the tail is horizontally flat; the eyes very small, and the ears not visible. The negroes call it *Cercou*.

5218. *To enumerate the variety of Birds inhabiting this richly-wooded portion of Africa would be hopeless*, while a list of all the species would little interest the general reader: we must, therefore, merely notice the more curious or the more beautiful species.

5219. *The Rapacious Birds are few*. It appears singular that only one species of Vulture is yet known to inhabit Western Africa; where their services, in removing putrid animal matter, might be supposed so necessary. This is the Angola Vulture of Latham, which is probably the same with the *Vultur percnopterus* of Egypt and Southern Europe; although Latham's name has recently been erroneously applied, in an English translation of Cuvier's *Animal Kingdom*, to a totally different bird.

828

CROWNED EAGLE

5220. *The Crowned Eagle of Guinea* (*F. coronatus*) (fig. 828.) is not more than two feet in length, or one third the size of the larger European eagles: it is only occasionally seen on the Gold Coast, and is remarkable for a crest over each eye, while the legs are clothed with feathers to the toes. The *Senegal Fishing Eagle* feeds almost entirely upon fish, in the manner of our Osprey. Five other falcons, peculiar to this country, have only recently been noticed; a proof how little we are acquainted with the ornithological riches of Western Africa. The Grey-necked Shrike (*Malaconotus olivaceus* Sw.), the Barbary Shrike (*Malaconotus barbarus* Sw.), and two or three other species of the same group, equally conspicuous for the richness of their plumage, occur in Senegal, and, probably, also in the neighbouring states.

5221. *The beautifully coloured Sunbirds* (*Cinnyridæ* Sw.) are met with in great numbers, sipping the nectar from the odoriferous blossoms. The Senegal, the Long-tailed, and the Chalybeate, are three species of exquisite beauty; and not larger in size than many of the American humming-birds. Here likewise are seen numerous flocks of golden-coloured Orioles of different species. Migratory Rollers, decked with the brightest tints of azure, purple, and green, occur in large

flocks ; with crested Hoopoes, and beautiful Bee-eaters. Many other tribes, interesting both to the common observer and to the scientific naturalist, might be mentioned. The water birds are but imperfectly known.

5222. *The Gallinaceous Birds*, so numerous in India, and even in America, under the same parallels of latitude, are here very few. Some of the partridges, loosely mentioned by travellers, are probably of that particular race called Sand Grouse, found only in the hot latitudes of the Old World (*G. Picrocles* T.), while the rest cannot be referred to their true species. The only gallinaceous birds of any size, peculiar to tropical Africa, are the Guinea Fowl. Of these, the most common species (*Numida meleagris*) has long been domesticated in Europe. In a wild state, these birds associate in numerous flocks of 200 or 300 each : they chiefly frequent marshes and morasses, where they seek for worms, insects, and seeds. During the night they perch on high places, and are well known as restless and clamorous birds.

5223. *Four of the most remarkable land birds* still remain to be noticed ; namely, the Plantain-eater, the Touracco, the Beef-eater, and the Long-shafted Goatsucker of Sierra Leone.

5224. *The Plantain-Eater* (*Musophaga violacea*) (fig. 829.) according to M. Isert, its first discoverer, is found

PLANTAIN-EATER.

also is very thick. The bird is not so large as a thrush, and is plainly coloured : another species is said to inhabit Abyssinia.

5225. *The Touracco, or Web-crest*, of Senegal, is of the same natural family ; rather smaller in size, but living equally and exclusively upon fruits : the wings are also of a crimson lilac, but the rest of the body is green. On the head is a compressed and erect crest of thin and delicate feathers. It lives in the deepest forests, and perches only on the loftiest trees.

LONG-SHAFTED GOATSUCKER.

5226. *The Beef-eater* (*Buphaga africana* L.) receives its name from its habit of alighting on the backs of cattle, and picking from their hides the troublesome insects by which they are infested, climbing round their bodies, much in the same way as the creepers or wood-peckers do on trees : this is rendered apparent by the formation of their claws and tail, both of which are of the scansorial structure ; the bill

is also very thick. The bird is not so large as a thrush, and is plainly coloured : another species is said to inhabit Abyssinia.

5227. *The Long-shafted Goatsucker* (*C. macrodipterus*) (fig. 830.) is peculiar to Sierra Leone. It is varied with brown, yellowish, and black, much like the European species, yet it is smaller ; its most remarkable character is a very long single feather, issuing from the wing covers, measuring near twenty inches, the shaft of which is only expanded into a broad web at the end. We are totally ignorant of the peculiar use which nature has, no doubt, designed for this extraordinary appendage.

5228. *The rivers and coasts abound with many fish*, beautiful in their colours or nutritious for food ; while the swarms of alligators, serpents, and other reptiles need not be enumerated. Many of these, however, are not only harmless, but highly beneficial. Mr. Smeathman, who lived many years on the African coast, observes that the snakes get into the thatch of the houses in pursuit of the rats and cockroaches ; the former being very harmless, and the two latter destructive. The patient negroes, it seems, no less than the rational traveller, is not without consolation amidst this heterogeneous crowd of inmates. They see with pleasure the spiders always upon the watch for wasps and cockroaches ; the last of which are intolerable. The lizards, again, attack all sorts of insects ; the large Tarantula, as it is called, not excepted. The lizards not unfrequently fall a prey to the fowls, as the rats do to the snakes. The land-crabs are frequently enclosed (as in the West Indies) in a small yard, and fed with vegetables, upon which they fatten exceedingly ; and, when stewed, become delicious eating. Thus, as our traveller observes, either lizards, rats, snakes, or land-crabs occasionally serve as delicious repasts to the improvident inhabitants, who thus " thrive under evil."

5229. *The Insects are innumerable*, but we must refer the scientific reader to the third volume of *Drury's Illustrations*, which is almost entirely devoted to the Western African insects discovered by Smeathman. We shall, however, repeat the more general observations of this truly scientific observer, more particularly as they are highly interesting, and appear to be very little known. The whole of tropical Africa, says Mr. Smeathman, is one immense forest, except where the sandy plains are too unsettled to afford a proper footing for vegetation. Whenever a plantation is to be made, the trees are cut down and burned, to fertilise the ground : the people never sow two years together on the same spot ; but suffer the trees

to grow again, for two or three years, by way of fallow, before they attempt to get another crop. It is these spots, called recent plantations, which afford an amazing variety of insects; in the second and third year, they become impassable to human feet.

5230. *There are a variety of edible Insects*, which, Mr. Smeathman affirms, supply a wholesome, if not a delicious food. The larvæ or caterpillars of all the beetles that feed upon decayed wood are rich and delicate eating, so that every forest affords the traveller plenty of wholesome nourishment, did he know where to search for it. Of this kind are the *Termites*, or white ants, subsequently described; and even the locusts in general are not only wholesome, but palatable to many. The children in Africa, at the proper season, are busily employed in digging out of the ground the females of a particular sort of cricket, which are then full of eggs, and so enclosed in a bag, as to resemble part of the roe of a large fish: these, when roasted, are deemed very delicate food.

5231. *The number of Locusts and Cicadas* is every where striking; but in the sandy plains thinly covered with grass their numbers are immensely greater; their chirping is intolerable; and they are seen of various kinds, sizes, and colours, skipping or flitting about in all directions, at every step of the traveller.

5232. *The myriads of Ants*, which swarm in tropical Africa, can scarcely be conceived by those who have never visited hot climates. They are of numerous species, but all seem intent on removing from the face of the earth every animal or vegetable substance no longer necessary or useful. Like the destroying angel, they walk steadily forward in the line ordained them, and spare neither magnitude nor beauty, neither the living nor the dead. One species, which seems at times to have no fixed habitation, ranges about in vast armies: being armed with very strong jaws, they attack whatever animal impedes their progress, and there is no escape but by immediate flight, or instant retreat to the water. The inhabitants of the negro villages, as Mr. Smeathman has himself witnessed, are frequently obliged to abandon their dwellings, taking with them their children, &c., and wait until the ants have passed. So numerous are these hosts, that a deer, hog, &c. being killed, and left on the ground, in one night will have the flesh entirely cleaned from the bones, and made a complete skeleton. There are near twenty other species in Western Africa, of different sizes and colours, each possessing peculiar habits. Some attack the collections of the botanist, and, in spite of weights laid upon his books of drying plants, get in, cut the leaves and flowers to pieces, and carry them away! Others attack all sorts of victuals. Mr. Smeathman has had four large sugar dishes emptied in one night, when the least opening was left; some assail the sideboard, and cover every glass that has had wine or punch left in it; nay, innumerable multitudes frequently even ascend the table, and drown themselves in the very bowls and vessels before you. (*Pref. to Drury's Insects*, vol. iii.)

5233. *The Termites, or White Ants* (fig. 831.), constitute the most extraordinary feature in the natural history of Western Africa. We are entirely indebted to Mr. Smeathman for a knowledge of their wonderful economy; an economy, indeed, which nearly exceeds the wisdom and policy of the bee, the ant, or the beaver. They build pyramidal or conical structures (fig. 832.), divided into appropriate apartments, magazines for provisions, arched chambers, and galleries of communication. These are so firmly cemented that they easily bear the weight of three or four men; and, on the plains of Senegal, appear like the villages of the natives. The destruction they effect is wonderfully rapid: they destroy food, furniture, books, clothes, and timber of whatever magnitude, leaving merely a thin surface; and in a few hours a large beam will be eaten to a mere shell not thicker than writing-paper. On emerging from the egg, the insect is in its larva state, furnished with a great hard head and strong toothed jaws, but is destitute of eyes. These are

WHITE ANTS.

the labourers who, although not more than a quarter of an inch long (a), build these edifices, procure provisions for the community, and take charge of the eggs. On changing to the pupa state, they become larger and more powerful (b): the head is nearly as big as the body, while the jaws project beyond the head, they are very sharp, but without teeth. They now become *soldiers*, and assume higher

WHITE-ANT NESTS.

duties; never working themselves, but superintending the labourers; they act also as guards to defend the common habitation from intrusion or violence. When a breach is made in the dwelling, they rush forward and defend the entrance with great ferocity; frequently beating their jaws against the walls as a signal to the other guards, or as encouragement to the labourers; they then retire, and are succeeded by the labourers, each with a burden of tempered mortar in his mouth, and who diligently set about and repair the injury. One soldier appears to attend every 600 or 800 labourers when building a wall; he takes no active part himself, but frequently makes the noise above mentioned, which is constantly answered by a loud hiss from all the attendants, who, at this signal, evidently redouble their diligence. The next change brings the pupæ, or soldiers, to their perfect state as male and female winged insects. They then emerge into the air either during the night, or on a damp and cloudy day: in a few hours, however, the solar heat causes the wings to wither and become dry; the insects then fall to the ground, and are eagerly sought after by hosts of birds, lizards, and even by the negroes themselves, who roast and eat them. The few which survive this general destruction are collected by the labourers and soldiers, who enclose them, by pairs, in apartments made of clay, the entrance to which is so narrow that they cannot migrate; but where they are diligently fed and attended by the labourers, whose bodies are small enough to admit an easy entrance. After impregnation, the abdomen of the female extends to an enormous size, exceeding the rest of her body nearly 2000 times; in which state it is filled with an immense number of eggs, protruded to the amount of about 8000 in 24 hours. These are instantly taken away by the labourers, and conveyed to separate chambers; where, after they are hatched, the young are attended and provided for till they are able to shift for themselves, and take their share in the labours of the community. (*Smeathman, Phil. Trans.*, vol. lxxi.) Such is the history of one of the most extraordinary insects in creation: an insect, insignificant in its size, almost deformed in its shape, and contemptible in appearance; one, also, to whom Providence has denied the power of sight. Yet this little creature

evinces more wisdom, prudence, skill, courage, and foresight, than those savage races of mankind who tread him in the dust. Truly may we exclaim, O God! wonderful are thy works; thy ways are past finding out!

5234. *Other species of Termites* build their nests on trees of an oval form, while that of another (*T. arda*) is cylindrical, two or three feet high, terminated by a round vaulted dome, and surrounded by a prominent terrace.

MONEY COWRY.

5235. *On the Mollusca and Shell-fish*, Adanson is the only author worth consulting. The *Voluta cymbium* and *scæpha*, two large volute shells, the animals of which are carnivorous, appear to be in profusion towards Senegal. Cones, olives, and various other predacious races, are no less common; and it is well known that *Cypræa moneta*, or money cowry (*fig. 833.*), passes current among the negro tribes as coin, of a very low value.

SECT. III. *Historical and Political Geography.*

5236. *Western Africa cannot be considered as a region within the domain of history.* Whether it was known to the Carthaginians or the Romans, and whether their navigators ever passed the shores of the desert, is a question which the few though curious documents extant, will scarcely ever perhaps enable us with certainty to solve. The Arabian geographers appear to have had only a vague and conjectural idea of this region. The coast was entirely unknown to Europe during the middle ages; and until the Portuguese, under Prince Henry, began their career of discovery, in 1432, it was thought a mighty achievement to pass Cape Bojador; but, that obstacle being overcome, the shores of the desert, however uninviting, were rapidly traced, and in 1441 a settlement was formed on the island of Arguin. Successive navigators discovered the Senegal, the Gambia, the Gold Coast, Benin; and, in 1484, Diego Cam sailed up the river of Congo. Of all this vast extent of coast, possession was taken, according to the usual European pretension, in the name of the king of Portugal. Settlements were formed at all the leading points, embassies sent into the interior, and great exertions made to convert the natives to the Catholic religion. Portugal, however, in the decline of her power, lost all these territories, and retains only some possessions on the most southerly part of the coast. In 1643, the Dutch drove her from El Mina, and about the same time from all her possessions on the Gold Coast, of which that people now claimed the sole dominion. From this pretension they were forced to recede by the rising naval power of the English, who, in 1661, took from them Cape Coast Castle, and, having formed an African company, built a number of forts upon the coast, with a view to the trade in slaves and gold. The English, about the same time, formed settlements at the mouth of the Gambia, while the French established the principal seat of their African power at St. Louis, on the Senegal. Both these last settlements were founded on the belief then prevalent in Europe, that these rivers were the embouchures of the Niger, by which a communication might be opened with the inmost regions of Africa. Spirited attempts were made by the two nations, and particularly the French, to carry this navigation into effect; but various obstacles arrested their progress. Park's journey finally proved the limited extent of the two rivers, and ascertained the Niger to be a distinct stream, flowing easterly. The expedition of Lander, which has shown the Niger to fall by a succession of estuaries into the Gulf of Benin, promises to give a new importance to Western Africa, as the quarter whence barks may penetrate into the most interior regions of the continent. Allowing for some vicissitudes, originating in their wars with each other, the two nations have continued to occupy these several points. Among the numerous native states, also, a continual fermentation prevailed; and little barbarous thrones were alternately raised and subverted; but these can rank only as local changes, not affecting the general character of the region.

SECT. IV. *Productive Industry.*

5237. *In the arts which minister to subsistence and wealth*, all the nations along this coast have made some progress. They are decidedly advanced beyond the hunting and even the pastoral state, and derive their chief support from a certain species of agriculture. The whole coast being situated between the tropics, and generally well watered, is, in most cases, capable of yielding an abundance of all the richest treasures of the vegetable kingdom. The products are maize, millet, some rice, to which are added yams and potatoes, sugar, coffee, cotton. All the objects of culture which enrich the West India islands might be raised here with advantage. There are some spices, particularly that called Guinea pepper, but none of them possess the high and delicate flavour which distinguishes those produced in the Eastern seas and islands.

5238. *These natural advantages are improved by agriculture only in a very limited degree.* In general, the great mass of the negro territory consists of an immense and impenetrable forest. Unless in a very few spots, there is no such thing as property in land, but an ample portion lies waste for any one to clear and cultivate who chooses, and can obtain the permission of the king or head of the village. In general, only a certain extent round each village or town is cleared of wood and brought under tillage. Farming does not constitute any distinct profession, nor are domestic animals employed to aid the labour of man. For a few days only at seedtime or harvest, the people of a whole village assemble as to a festival, the king at their head, and issue forth to the sound of musical instruments. Each man carries a hoe, or little spade, with which he scratches rather than digs the ground, when just moistened by the rains; and in this happy climate it is fit to receive the seed after such superficial culture. The ground belonging to the king or the public is first worked; and

then successively the fields of different individuals. The palm tree, a spontaneous production, yields a juice or wine, which has an intoxicating quality, and forms one of the greatest luxuries of the natives, and its oil is now the chief staple of African commerce.

5239. *Manufacturing industry* seems to rank still lower. Cotton is, indeed, formed into those loose robes which are generally worn; but it is mostly of a coarse fabric, and made by the females of each family for domestic consumption. Fine cotton cloth is indeed made in Africa, but only at a considerable distance in the interior. The smith exercises his trade with considerable dexterity, and is an important personage as furnishing arms to a warlike people; yet he has not acquired the skill requisite to fabricate a gun. The gold, however, which is brought from the interior is worked into ornaments which excite the admiration even of Europeans. Mats are woven with considerable neatness and skill, being the staple articles of furniture, used for sitting and sleeping upon, and also as partitions to the houses. Moore even saw them pass as money.

5240. *Fishing* is carried on by the negroes with great activity, and supplies, indeed, almost the whole of their animal food. The most delicate species are the Dorado, called by the English, Dolphins, and by the Dutch, gold-fish. The Albicore is a fish of extraordinary magnitude, often five feet long, and as thick as a man's body; but the flesh is not agreeable. They have also cod, pilchard, sole, mackerel, and other species that frequent our seas. They go out to fish in canoes sometimes forty feet long, cut out from the trunks of their enormous trees, and holding from twelve to eighteen men. From 600 to 800 canoes will issue of a morning from one of their large towns, row to the distance of two or three leagues, and continue fishing till noon. They practise also most of the known modes of catching fish; with stake nets, with lights during the night, by which the fish are attracted, and then either pierced with spears, or taken up in baskets. In their habits, the people on the sea-coast are almost amphibious. They have no modes, however, of salting the fish, which serve only for immediate consumption, and cannot be made an article of export.

5241. *Commerce* is not actively pursued by the natives of the African coast. Their canoes are obviously unfit for maritime traffic on any extensive scale, nor do they send often or far into the interior such immense caravans as traverse the whole of Central Africa. In general, the natives are content to deal with European vessels, and with merchants from the interior. The Barbary caravans seldom arrive on the Gold Coast or other parts of Guinea Proper; but they are occasionally seen in the rivers of Benin. From the mouths of the Gambia and Senegal, coffles, or kafilas, are occasionally sent up to some distance inland for gold and slaves.

5242. *The slave trade*, unfortunately, has ever been the grand staple of the intercourse with Europe, if trade it can be called, which is founded on the violation of the rights of humanity, and consists in a uniform series of acts of violence. Sometimes the chiefs may make their captives taken in war subservient to this nefarious traffic; but, in general, its victims are the product of expeditions undertaken for that express purpose, without even the slightest pretence of right. The king, who wishes to replenish his treasury by the sale of slaves, fixes upon some village either in his own or a neighbouring territory, surrounds it in the night, sets fire to it; and the wretched inhabitants, in attempting to escape, are seized, and hurried on board a European vessel. Slavery is made also a punishment for offences; but this is productive of various disorders; for not only is the judge strongly biassed against the criminal, of whose condemnation he is to reap the benefit, but it has even become a trade to entrap men into crimes, in order to acquire the advantage of selling them. During the full career of the slave trade, the number annually carried off from the coast of Africa was estimated at 80,000. Britain, however, after a long course of philanthropic exertion, was induced, not only to renounce this traffic, but to employ her influence with the nations of Europe to procure its general abolition. At present, through the concurrence of the governments of France, Holland, and America, it cannot legally be carried on to the north of the line, and Britain exercises the power of searching for, and bringing back to Africa, all slaves conveyed from the coasts so situated. A considerable contraband still exists; and the Spaniards and Portuguese carry off the victims in great numbers from the southern coasts. The unhappy wars, also, which have desolated some of the finest of these districts, have diminished the tendency of the abolition laws to promote civilisation and improvement.

5243. Although the slave traffic has unhappily been long the staple of West African trade, there are *articles of commerce* which it has always produced, and the exportation of which might be considerably extended: of these, the most important is gold, brought down the Senegal and Gambia from Bambouk, Manding, and the other mountain districts at the head of those rivers. But the most ample store is found in that part of Guinea which, from this product, is called the Gold Coast. The greater part is brought from some distance in the interior, and from the opposite side of the same mountains. No account is taken of the importation of this article; but in the beginning of the last century it was estimated by Wadstrom at from 200,000*l.* to 300,000*l.* in value. That of ivory, or elephants' teeth, also from the interior, is from 10,000*l.* to 15,000*l.* The gums are important articles, particularly gum Senegal, drawn from vast forests of acacia, which grow in the half desert tracts to the north of the river Senegal. Teak wood is an important commodity, to which is added several kinds of ornamental and dye woods, particularly that called red or cam wood. But of late years, palm oil, from its use in manufactures, and the abundance with which it is supplied, has acquired an importance greatly surpassing that of any other article. Sugar, cotton, and other grand tropical staples have never been raised for more than native use; and it would seem that a complete change must take place in the habits of the people, before they will cultivate them to any extent which can produce an exportable surplus.

5244. *Among the articles received by the negroes* in return, cotton goods are the most extensive. Till of late, those of India were greatly preferred; but British manufactures of this class are now so much improved, or, at least, made so cheap, that they have almost driven out their Eastern rivals. The export of woollen goods is also very considerable. Brass, iron, and steel, are in considerable demand. Guns, gunpowder, brandy, and rum, were largely given in exchange for slaves; and for the two former there still exists a great and effective demand. Cowries, from the Malabar coast, are largely introduced to form the medium of circulation through all the negro countries.

5245. *The imports and exports* between the western coast of Africa and Britain appear, by M'Culloch's *Dictionary of Commerce*, to have amounted, in 1829, the former to 258,573*l.*, the latter to 350,361*l.* Under the head of imports, the leading articles were, palm oil, 179,900*l.*; bees' wax, 21,800*l.*; ivory, 13,100*l.*; dye and hard woods, 11,100*l.*; teak wood, 10,200*l.*; hides and skins, 7,400*l.*; gums, 5,900*l.*; coffee, 500*l.* The exports from Britain were chiefly cottons, 141,500*l.*; woollens only 3,200*l.*; guns and pistols, 57,400*l.*; swords and cutlasses, 7,100*l.*; gunpowder, 65,300*l.*; iron, wrought and unwrought, 22,700*l.*; hardware and cutlery, 4,500*l.*; brass and copper, 3,200*l.*; salt, 6000*l.*; glass and earthenware, 1,900*l.*; linens, 1,900*l.*

SECT. V. *Civil and Social State.*

5246. *Of the population of a territory, of which the interior is so little known*, and has such vague limits, it is very difficult to form even an approximated estimate. In the Supplement to the *Encyclopædia Britannica*, reasons are given, founded partly upon actual enumeration, for supposing that the density may be about twenty-six to the square mile. If, then, we estimate the length of coast at 4000 miles, and assume an average breadth of 300, this will give 1,200,000 square miles, and a population of 31,000,000. Yet, after all, considering that there are desolate tracts of very great extent, this number may be beyond the truth, and, perhaps, at a rude guess, we may fix the population of this great tract of tropical Africa at about 20,000,000.

5247. *In this region human nature cannot be said to appear under a dignified form.* Even the external aspect of the negro is, in our eyes especially, mean, coarse, and ugly. The deep black of his complexion has been supposed by some to be connected with the barbarism of his habits, though it appears to us sufficiently accounted for by the long-continued action of the intense solar heat. But the thick lips, flat nose, woolly hair, and the line of the face sloping backwards, are at variance with every idea of beauty, and suggest very little of the exercise of intellectual energy.

5248. *The character of the negroes*, of course, varies extremely, according to the variety of situation and government, among such a multitude of little communities. In general, they have made little progress in that which constitutes improved and civilised life. They are strangers to literature, the ornamental arts, and refined luxuries. Yet, whenever adequate objects are presented, they display energies sufficient to refute the cruel theories which would represent them as a degraded race, incapable of reaching any high degree of mental culture. In governments of a popular character, they display an eloquence, address, and activity surpassed by few of the most civilised nations. Even in their absolute monarchies we discover a regular subordination, polished manners, and skill in the art of war, which, among a people destitute of arts and letters, cannot but appear surprising. There is no room whatever to doubt that, placed in favourable circumstances, the negro would attain to as high a degree of civilisation, as the men of any other race. Ferocity in war is a universal feature of savage character; and in some of the sable nations it is carried to an extraordinary pitch. In his domestic character, the negro presents much that is amiable and pleasing; he is cheerful, gay, hospitable, and kind-hearted. The negroes appear to great advantage compared with the Moors, who, from the north, have over-run so great a part of Africa, and to whose gloomy and austere bigotry the black natives are entirely strangers.

5249. *Of religion*, as embracing the belief in a supremely wise and good ruler of the universe, and in a future state of moral retribution, the negroes have very obscure conceptions; while almost every superstition which can degrade the human mind reigns in full sway. To express generally what is sacred, what is forbidden, what is endowed with supernatural powers, either beneficent or malignant, they employ the term *fetiche*. Every thing which strikes the fancy of a negro is made his *fetiche*. The grand or national fetiches are rocks, hills, or trees of remarkable size and beauty. But there are fantastic objects of veneration, which each individual adopts, and carries about with him. Such are, a piece of ornamented wood; the teeth of a dog, tiger, or elephant, a goat's head, a fish bone, or the end of a ram's horn. Some merely carry branches of trees, or a bunch of cords made of bark. They set up these fetiches in the houses, the fields, or the centre of the villages; erect altars to them, and place before them dishes of rice, maize, and fruits. The framing of these fantastic objects of African worship, and the selling them at an enormous price, forms the chief occupation of the African priesthood. All the good fortune of the negroes is supposed to arise from the favour of the *fetiche*, and every evil to proceed from offence taken by it. Every man fixes upon some act of self-denial, something from which he is to abstain, in honour of his *fetiche*; and the engagement thus contracted, he will, in many cases, die sooner than violate. This superstition is often employed as an instrument in judicial proceedings, which are so conducted as to involve an appeal to superior powers, who it is expected will directly interpose to discover the truth and punish falsehood. If a negro eats a crust of bread, tastes a drop of liquor, or throws sand upon his head, wishing at the same time that the *fetiche* may kill him on the spot if he tells a falsehood, more reliance may be placed on his words, than on those confirmed by the oaths of rational men taken before our courts. It frequently happens, that when tests are propounded, the most hardened criminal at once confesses himself guilty, rather than encounter the terrible alternative of denying his guilt. In the case of any solemn engagement, the person taking it is presented with his "swearing liquor," which he drinks under the dread of the most awful penalties if he violates the accompanying promise. The people cherish the general belief of a future state, little connected, however, with any idea of moral retribution. The question is, whether they have faithfully observed the promises made to the *fetiche*, and forborne every thing by which he could be offended. According to their ideas, the future world will be a counterpart of this; will present the same objects to the senses, the same enjoyments, and the same distinction of ranks in society. Upon this belief are founded proceedings not only absurd, but of the most violent and atrocious description. A profusion of wealth is buried in the grave of the deceased, who is supposed to carry it into the other world; and human victims are sacrificed, often in whole hecatombs, under the delusion that they will attend as his guards and ministers in the future mansion. This savage superstition prevails to a peculiar extent in those great interior monarchies, which in other respects are more civilised than the rest of Western Africa.

5250. It is impossible to name a region tolerably peopled, where any progress at all has been made in the arts, which is so completely *illiterate*, as *Negro Africa*. It is not enough to say that it has neither books, authors, nor learned men. In no part of this extended region is there an alphabet, or a hieroglyphic, or even a picture or symbol of any description.

All those refined processes, by which the ideas of one mind are made to pass into those of another, are entirely unknown. The facility of subsistence, and the absence of circumstances tending to rouse the intellectual energies, are doubtless the causes of this singular deficiency; for, as already observed, there can be no ground to presume any original want in the capacity of the negro. Their powers of oratory, and their skill in politics and war, indicate talents which, under proper impulse, would lead to excellence in literary composition. In the more improved nations, there has been found to exist an oral literature, traditionary songs and poems, the recitation of which is listened to with delight.

5251. *The universal amusements of the negro*, above those of mere sensation, are dancing and music. The former is invariably performed in the open air. As soon as the sun declines, and its intense heat abates, there is dancing from one end of Africa to the other. Four thousand years ago, Hanno and his companions were surprised, immediately after sunset, to see lights glittering along the shore, and to hear on every side the sound of musical instruments. The passion, however, with which this amusement is pursued, has not led to any refinement in the art. Their performance consists chiefly of violent and grotesque movements; leaping, stamping on the ground, bowing their heads, and snapping their fingers. In their music, also, noise appears the chief if not the sole object. Their drums and their trumpets, or rather horns, produce a horrid dissonance, against which, according to some travellers, a whole bale of cotton would be required to stop the ears. Others represent it as more tolerable; and add, that the negroes have also a kind of castanet, a flute, musical tongs, and a sort of cittern; and the performers, gaily and even fantastically attired, attract to themselves the admiration of the multitude (*fig. 834*).

834

DANCING AND MUSIC OF THE NEGROES.

5252. *Polygamy*, throughout all tropical Africa, has no limit but that of the ability to maintain a considerable number of wives. By the great it is practised to the utmost extent that their circumstances can admit. To have numerous wives and children is considered a matter of state, and is always made their first boast. It forms even a source of wealth; for, except the principal wife, who is mistress of the household, and the sacred wife, who is consecrated to the fetiche, all are made to work hard, both in tilling the fields, and in manufacturing mats and cloths. Even the principal wife often urges her husband to take fresh mates, as a means of increasing the importance of the establishment over which she presides; it is also customary to make her a handsome present on the occasion. In the towns on the coast the more wealthy take usually from three to twenty wives, while the kings raise the number to eighty or a hundred; but in Ashantee, Dahomey, and other despotic interior kingdoms, the privilege knows no bounds, and the number is often carried to several thousands. It is swelled, not only by captives taken in war, but by the selection which the king has a right to make of the fairest and most accomplished females within the circuit of his own dominions. A great part of the nation are thus reduced to celibacy, and very dissolute habits prevail. In many of the towns on the Gold Coast, a body of courtesans are maintained by the state, and are considered as public servants. Not a few even of the wealthy are willing to derive a profit from the irregular conduct of their secondary wives. Notwithstanding the overgrown families of some of the great, such habits cannot fail to keep down the amount of population, and, by causing a neglect of education, to lower the intellectual standard of the people.

5253. *In architecture*, and even in masonry, the negro nations rank very low. There is not, perhaps, in all native Africa, a house built of stone; wood, earth, leaves, and grass, are the only materials. One traveller compares their villages to groups of dog-kennels rather than of houses. The trunks of four large trees are driven into the ground, and connected by poles; this framework is then covered with earth or clay. The roof is formed by a number of branches meeting at the top, and covered with leaves or grass. The doors not being above two or three feet high, the intrant creeps rather than walks in, and he cannot stand upright unless in the part of the roof which is left hollow like a pent-house. The floor being raised about three feet from the ground to avoid the damp, and the apartment being open in front for the admission of air, the dwelling resembles a good deal a mountebank's stage in Europe. The houses of the rich are scarcely better, though more in number; for each wife has a house, and the whole establishment is surrounded by a wall of earth or twigs. Princes assign similar houses to their principal officers, and the group is enclosed with a general high wall, so as to make a sort of little town. It may be observed, however, that the houses of the great kings in the interior, though of the same materials, are of a somewhat superior description. The regal dwellings display brilliant colours on the outside walls, while the apartments are sometimes so spacious as to resemble a good English barn. In the cities where the people have a share in the government, there is a hall of assembly, which is open at the sides, having merely a roof supported by poles.

5254. *The furniture of the house* bespeaks as much poverty as the house itself. A few seats, cups, and pots, all of wood or earth; coverlets of rushes, and perhaps a mat to sleep upon, form the entire amount of their accommodations. The rich distinguish themselves by fine mats, and occasionally by a brass kettle.

5255. *In point of clothing and ornament*, the negroes are not quite content with the same simplicity. The lower classes, indeed, think it enough if they can cover the lower part of their bodies with a *paan*, or loose wrapper of the coarse cloth of the country. Until the age of twelve or thirteen, indeed, no attire of any description is considered requisite. The rich, however, must appear in costly robes of silk, velvet, India chintz, or other imported materials. The females of rank wear long veils and mantles, which they throw over the shoulder; red is their favourite colour; and they ornament their dress with gold and silver lace, and also with ribands. But the great rage is for bracelets and rings, which last are accumulated on the ears, arms, and the small part of the leg. The rich wear them of gold, or at least of brass or ivory; but the poorer classes are fain to content themselves with copper, tin, or, in default of better materials, even with iron. They

have been seen with no less than forty small iron rings on their arms. The arrangement of the hair, or rather wool, is a matter of profound study to both sexes. They rub it with palm oil, curl and dress it in various forms, and largely entwine it with gold, and with a species of coral valued at its weight in gold. Some of the negro belles paint their face with red and white spots, till it looks like a piece of flowered damask. A certain degree of tattooing, or marking their skins with figures of flowers or other natural objects, is also practised.

5256. *In regard to diet*, if the negroes observe a degree of simplicity, it is chiefly the result of necessity. Butcher's meat, poultry, and rice, are only within the reach of the opulent. The poor must content themselves with fish and millet, which, when boiled together into a thick mess, and palm oil poured over them, form the staple dish. They are alleged to eat coarsely and voraciously, thrusting their hands together into the common dish; but this is a custom universal throughout Africa. When good fare is placed before them, they are careful to indemnify themselves for former privations. On such occasions, they have been known to manifest a sort of canine appetite, eating as much as six Europeans. The drink of the country is palm wine, with which chiefly they enliven the social circle; but intercourse with Europeans has taught them the more pernicious use of brandy.

SECT. VI. *Local Geography.*

5257. *With the country called by the French Senegambia*, or the region watered by the two rivers Senegal and Gambia, we commence our survey of Western Africa. It would be difficult and almost idle to attempt to fix the limits of this vast territory; but they may be stated at about 250 miles along the coast, and reaching 500 into the interior. It is divided among a vast variety of little kingdoms, whose boundaries and condition are continually varying. This part of Africa is most remarkable for the great negro races who inhabit it, and who are in general more peaceable, more industrious, and more amiable than any of the others upon the western coast. They are chiefly three, the Foulahs, the Mandingoes, and the Jalofs.

5258. *The Foulahs* have been supposed to come from Fooladoo on the Upper Senegal, but others suppose them of the same race with the Fellatahs in Central Africa; in which case they must be traced to a foreign origin. They have now spread over all the banks of that river, besides the great kingdom of Fouta Jalloo to the south, and many districts on the banks of the Gambia. They have not the extreme negro characteristics; neither the deep jet hue, the flat nose, nor the thick lips; on the contrary, their features are high, with an olive tint, and an agreeable expression. They have embraced the Mahometan faith, but without that bigotry which almost universally accompanies it. Their manners are peculiarly courteous and gentle; they practise the most liberal hospitality, and relieve the wants not only of their own aged and infirm, but even of those belonging to other tribes. Their employments are pastoral, and their habits, in some degree, nomadic. Occupying countries where there is no fixed property in land, they drive their flocks, according to the season, to the tops of the mountains or the banks of the rivers. At night they collect their herds within the circle of the tents, and light large fires to deter the approach of wild beasts. Such is their good conduct and industry, that it is considered infamous to injure them, and a blessing is said to rest on any territory that contains one of their villages. Their internal government is republican, under chiefs of their own; and this form they insist upon retaining, even when they settle under a sovereign of another tribe.

5259. *The Mandingoes* are a race more numerous and more decidedly negro, both in form and disposition. Though capable of great occasional exertion, they have by no means the steady industry of the Foulahs. Their employments are chiefly a slight agriculture, fishing with nets and baskets, and, above all, traffic, in which their enterprise exceeds that of the other negro races. They conduct large kafilas to a considerable distance in the interior, and their language is well understood in all the commercial districts. They are cheerful, inquisitive, credulous, and so gay, that they will dance for twenty-four hours without intermission to the sound of the drum or balafou. Polygamy is practised to a peculiar extent, and the numerous households to which it gives rise live in tolerable outward harmony, which must not, however, be considered very secure, since it requires to be cemented by the extraordinary expedient of Mumbo Jumbo. This bugbear of the African ladies is called into service whenever the simpler expedients of scolding or beating fail to quell domestic dissension. Mumbo Jumbo, being then summoned, arrays himself in a fantastic coat hung for his use on a neighbouring tree, crowns his head with a tuft of straw, and soon after dusk marches into the market-place. Thither the unhappy fair one being summoned dares not disobey, and the love of stir and mischief causes her to be soon followed by the bulk of her fellow-citizens. In their presence she is stripped naked, and undergoes a severe whipping, inflicted by the rod of Mumbo Jumbo, amid the applause of all the spectators. They have some more refined tastes than are usual among Africans; particularly in poetry, the extemporary composition and recitation of which forms one of their favourite amusements. The original country of the Mandingoes is the elevated territory of Manding; but they are now widely diffused over all this region, and particularly along the banks of the Gambia.

5260. *The third great race are the Jalofs.* They occupy nearly the whole of that inland territory which intervenes between the Gambia and the Senegal, and the extent of which is estimated by Golberry at 4800 leagues. A number of them are subject to a powerful inland prince, called Burb-y-Jalof, who boasts of himself as anciently the sole ruler in this part of Africa. The Jalofs, though of a deep black complexion, and with the decided negro features, are considered a handsome race. They boast of their

antiquity, and in many respects excel their neighbours. Their language is softer and more agreeable; they manufacture finer cotton cloth, and give it a superior dye; they rival the Moors in horsemanship, and are fearless and expert hunters. They have a singular mode of numeration, reckoning by fives instead of tens, in reference apparently to the fingers, which, for want of the faculty of writing, are the sole instruments employed in calculation. Their ingenuity, however, is unfortunately too often employed in dexterous thieving, effected by a skilful movement of the toes, which may be said to rival, in this respect, the fingers of the most expert European pickpockets.

5261. *We shall close this catalogue with the Feloops, a wild and rude race, who inhabit the shores to the south of the Gambia. Their country is fertile, abounding in rice, poultry, and honey, from which last they prepare an intoxicating liquor. Provision is drawn from them for the settlements on the Gambia; but the English, having never taken the trouble to learn their language, cannot hold any direct communication with them; and the traffic is managed through the Mandingo merchants, who are suspected to take advantage of their own exclusive knowledge to cheat both parties.*

5262. Among European nations, *the river Senegal has for more than a century been entirely French; and extraordinary efforts have been made by successive African companies to raise it to importance. Fort St. Louis, the capital, is situated on an island in the river, a mere sand-bank, without any water which can be drunk without being filtered, and dependent entirely for provisions on the southern coast, which, however, yields them in abundance. St. Louis never became a large settlement. Golberry, in 1786, reckons not above sixty Europeans settled there for the purposes of trade. The military and civil servants of government amounted to 600, the natives to 2400. The French lost St. Louis during the revolutionary war, but had it restored to them on the friendly peace which succeeded in 1814. The disastrous fate, however, of the expedition sent out in the *Medusa* frigate has been unfavourable to any attempt to restore and extend the prosperity of the colony. It is said, however, to have experienced an increase within the last few years, and to contain now about 6000 inhabitants. The original hopes of its greatness were founded on the supposed identity of the Senegal with the Niger, and on the prospect of a communication by it with the inmost regions of Africa. All the efforts founded upon this erroneous theory proved of course abortive; and the commercial advantages of the colony (the procuring of slaves not included) have been confined to the gum trade, and the gold trade of Bambouk.*

5263. *The gum which, from this river and settlement, is called Gum Senegal, is the produce of some scattered oases, or verdant spots, that occur in the vast desert of sand to the north and west of the Senegal. The species of acacia from which it exudes has every appearance of a stunted and desert tree: its aspect is crooked and rough, its branches are thorny, its leaves of a dry or dirty green. The mere blowing of the harmattan causes the bark to crack in numberless places, and the gum to flow in large transparent drops, which remain attached to the surface. The harvest of gum is in December, when the Moorish tribes, of whom the *Trarshaz* are the most powerful, break up from their usual camps, their kings and princes at their head, and proceed in a confused and tumultuous crowd to the forests, of which each claims one or more. After six weeks spent in collecting the gum, they put it in large leathern sacks, with which they load their camels, and proceed in the same tumultuous array to the spot fixed on for the gum market, between Fort Louis and Podor. This plain, which is one of the most desolate spots in nature, is suddenly covered with an innumerable multitude of people enveloped in clouds of dust. The kings appear mounted on beautiful horses, their wives seated in baskets on the backs of camels, the crowd on foot; the air resounds with the cries of men, women, children, and animals. A cannon is fired as the signal for commencing the treaty. A dreadful scene of wrangling and higgling immediately ensues. The French accuse the Africans of most dishonest arts in order to enhance the value of their commodity. They themselves, it appears, are not far behind, since they have not scrupled to adopt the policy of insensibly augmenting the size of the *cantar* by which the gum is measured, a change which escapes the notice of their rude antagonists. The French take off annually about 250,000 lbs. of gum, which sells in Europe at from 15*d.* to 20*d.* per lb. The returns are taken almost exclusively in East India cotton cloths dyed blue, which are called pieces of Guinea, and for which it has been in vain attempted to substitute the manufacture of Europe.*

5264. *The kingdom of Bambouk, situated near the head of the river, and so enclosed between its main stream and the great branches of the Kokoro and the Faleme, as to form almost a complete island, is the next object of commercial importance to the French on the Senegal. It is almost entirely a country of mountains, whence flow numerous streams, almost all of which roll over golden sands. But the main depositories, where the metal is traced as it were to its source, are two mountains, Natakou and Semayla. The former composes almost an entire mass of gold, united with earth, iron, or emery. The first four feet of depth consists of fat earth, from which the grains of gold are extracted by agitation with water in a calabash. Afterwards the precious metal begins to appear in small grains or spangles, and at twenty feet in small lumps of from two to ten grains. The pieces become always larger as the work descends; but the natives having no means of propping up the sides, these often fall in, and bury the workmen. Semayla, a mountain 200 feet high, presents a different structure. The gold is here embedded in hard sandstone, which must be reduced to powder before the extrication can be effected. Part of it also is found in red marble, a substance which to the natives is perfectly unmanageable. Bambouk is said to have been early conquered by a Mahometan force, and afterwards by the Portuguese; both have been driven out; and the French never made any serious attempt to establish themselves in it. They calculated, indeed, that 1200 men would be sufficient for its conquest; but were wisely deterred by the difficulty of retaining possession of so difficult a country, in so unhealthy a climate.*

5265. *The point at which the French attempted to carry on the commerce of the Upper Senegal is at Fort St. Joseph, in the kingdom of Gallam, or Kajaaga. A voyage thither was reckoned to produce cent. per cent.; but the unhealthiness of the climate, the difficulties of the navigation, and the constant hazard of being plundered by a succession of barbarous chiefs, who occupy the banks, rendered it a very precarious speculation. At present the fort is abandoned, and in ruins; but the Serawoolies, who inhabit this fine country, are*

among the most industrious of the African tribes, and have engrossed the trade of Bambouk, Manding, and most of the upper countries on the Senegal and Niger.

5266. *In descending the Senegal*, we find several populous and powerful states, among which is that of Fouta Torra, extending considerably both to the south and north of the river, but of which the interior has not been explored by Europeans. The king is a zealous Mahometan, and, under pretext of making converts, has endeavoured to subdue the almost pagan Damel, or Burb, of the Jalofs. The latter, however, by the strength of his country and a prudent system of warfare, has been able to baffle his attempt. On the middle Senegal, the most important personage is the Siratic, who holds his court at Ghiorel, considerably to the north of the river. Nearer the sea is the kingdom of Hoval, governed by a petty prince, called the Great Brak, which, in the language of the country, signifies King of Kings.

5267. *The coast between the Gambia and Senegal* is chiefly occupied by the kingdom of Kayor. It is stated, by Golberry, to extend 750 miles in length, and to contain 180,000 inhabitants, who are Jalofs. At the little island of Goree, on this coast, the French have established the capital of all their African settlements. Its advantages consist solely in its almost inaccessible situation on a rock, three sides of which are perpendicular, and the fourth very steep. The rock is fortified, but not, it is said, in the most skilful manner. The town contains 3000 inhabitants, and presents a very bustling scene, being the entrepot of all the trade with the opposite coast, and also a place of refreshment for French ships on their way to India. It lies on the northern side of the peninsula, which terminates in Cape Verde, the most westerly point of the African continent. Though the soil be sandy, it bears a number of those immense trees called Baobab, which give to the Cape that verdant aspect whence it derives its name. On the northern side, two hills, 600 feet high, mark this striking geographical position, and serve as a guide to mariners.

5268. *The Gambia* is almost entirely an English river; the attempts to form settlements upon it having, for nearly two centuries, been confined to that nation. They have erected James Fort in the middle of the river, by which they are enabled to command its entrance. They have also a small factory at Pisanía, about forty miles up; but, like the French on the Senegal, they have never been able to realise any of those splendid expectations, with a view to which the settlements were founded. All attempts to penetrate, by ascending the river, to the regions watered by the Niger, proved abortive. Yet it was not till the expedition of Park that the failure was fully traced to its true cause, the structure of the continent, and the want of communication between the two rivers. Hence these settlements have never risen to any great importance.

5269. *The Gambia* is bordered on its north bank by several flourishing little kingdoms. That immediately on the sea is Barra, said to contain 200,000 inhabitants. The capital is Barra Inding; but the chief place of trade is Jillifrey, where the king has a custom-house, to levy the duties on vessels passing up and down. Boor Salum is a still more extensive kingdom, situated on a small river that falls into the Gambia, and containing, it is said, 300,000 inhabitants. Above it, occur successively the two smaller kingdoms of Yani and Woolli. The territory of all these states is flat and fertile, abounding in rice, grain, and other provisions, but not producing any articles for the market of Europe. The inhabitants are chiefly of the Mandingo race, and carry on a considerable trade into the interior. At Barraconda, about four hundred miles up the river, are falls, or rather rapids, above which sand-banks and flats soon render the navigation difficult, while the crowd of crocodiles and hippopotami, and the multitude of wild beasts that roam on its banks, render the navigation alarming, and even somewhat dangerous.

5270. To the south of the Gambia nothing of great importance occurs, till we come to the alluvial estuaries of the Rio Grande, a river supposed, as its name imports, to be of some magnitude; but Captain Owen found it a mere inlet, receiving some inconsiderable streams. At its mouth occur a number of islands, which, with a group opposite to them, in the open sea, form what is called the Archipelago of the Bissagos. The inhabitants of the same name, called also Bijugas, are a tall, robust, warlike people, who have driven out the peaceable race of the Biafaras, the original tenants, and have compelled them to confine themselves to the continent and the banks of the Rio Grande. Bissao, the largest of these islands, is inhabited by the Papels, also warlike and enterprising. In 1792, an association was formed in England, with a view to planting a settlement in the Island of Bulama; but, though no opposition was made in the first instance, the difficulty of establishing a new colony under circumstances so unfavourable, and especially amidst the hostility of these rude neighbours, soon obliged the English to desist.

5271. Along the heads of the Rio Grande lies the important kingdom of Fouta Jallo, said to extend about 350 miles in length, and 200 in breadth. It appears to be the most improved of all the states in this part of Africa. The inhabitants are Foulahs, and of the Mahometan faith, but not bigots; and their marabouts are held in high reputation for learning. They manufacture cloths of considerable fineness; they work in iron, dug from extensive mines in the country; also in silver, wood, and leather; and they conduct large caravans into the interior, as far even as Timbuctoo and Cassina. Here, where they are the ruling people, they by no means display that pacific character which distinguishes the tribes on the Gambia and Senegal. They can bring into the field 16,000 men, and the king is engaged in almost continual war, for the base purpose of procuring slaves for the European market. On being reproached upon this subject by Messrs. Watt and Winterbottom, he declared that he had no other means of obtaining European goods, otherwise he would gladly give up this violent and criminal mode. Timbo, or Teembo, the capital, is said to contain 7000 souls, and Laby, 5000.

5272. To the south of Fouta Jallo is Soolimana, also warlike and considerable. It borders on the Niger in the highest part of its course, though the sources of that river are placed in the hostile territory of the Kissi. The king is at present Mahometan, but the bulk of the nation pagan. They are a gay, thoughtless, stirring race. The two sexes seem to have reversed their occupations; the women till the ground, build the houses, act as barbers and surgeons; while the men tend the dairy, sew, and even wash the clothes. The king expressed to Captain Laing the same willingness to give up the slave-hunting system, and complained of the same difficulty which had been expressed at Teemboo. On the eastern side of the Niger is the country of Sangara, still more extensive and more warlike; the people of which would, it is supposed, have by this time conquered Fouta Jallo, had they been united among themselves. At present, whenever the Soolimas are inclined to go to war, they can easily command ten thousand auxiliaries from beyond the Niger.

5273. *In returning to the coast*, we pass through the Koorango country, inhabited by the Mandingoes, who, as usual, are gay, thoughtless, hospitable, and enterprising. Farther down are the Timmanees, a more depraved race, who were the chief agents in the slave trade. They are described as hospitable, treacherous, and avaricious. Captain Laing met a woman who accused her two children of witchcraft, and on that ground

offered to sell them to him at a low price. Their agriculture is peculiarly rude, and the cloths of their manufacture very coarse. They abuse the English as having deprived them of almost their only source of wealth, which consisted in the sale of slaves. This people are oppressed by a singular association called Purrah, who, united by a bond and always supporting each other, have become almost masters of the country, and often exercise their power in a very tyrannical manner.

5274. The country of the Timmanees borders on that part of the coast where Britain, with the most philanthropic views, has founded *the colony of Sierra Leone*. Its principal seat, at Freetown, is on the south side of the bay, which receives the river formerly called by the same name, but now more usually the Rokelle, and which arises in the Soolimana country. The first colonists consisted of a number of free negroes, who, having been dismissed from the army and navy at the end of the American war, gladly accepted the proposal made by a number of benevolent individuals, of a settlement in their native region. They did not, however, possess all the habits necessary for struggling with this difficult undertaking. The rains came on; a pestilential fever carried off numbers; and the attack of an African chief obliged the remainder to take shelter on Bance Island. The zeal for the improvement of Africa, however, continued unabated in this country; and in 1787, the Sierra Leone Company was formed, with a charter for thirty-one years. They sent out five vessels with stores and articles of trade, and obtained a large reinforcement from the free negroes who, in the American revolution, had adhered to the royal standard, and had been obliged to take shelter in Nova Scotia. The establishment was then conducted with fresh spirit; but it had many difficulties to encounter. It was disturbed by internal dissension; it was involved in contests with the bordering native states; and, in 1794, was plundered by a French squadron. Under all these disasters it continued active; though the Sierra Leone Company were obliged to resign their concerns into the hands of government, which placed them under the African Institution. A great reinforcement to its population was derived from the negroes taken in slave ships, and brought back to Africa, in consequence of the laws made against the slave trade; though it has been somewhat difficult to initiate them into the habits of civilised life. With this view, the Church Missionary Society have undertaken to furnish schools and religious instructors; and upwards of two thousand children are now educated on the national system. The population of Freetown and its suburbs has extended to nearly five thousand; eight or ten little towns or villages have been established in its vicinity, forming an entire population of twelve thousand; and another, called Bathurst, has been founded on the Gambia, in a healthy situation, and communicating with the populous countries on that river. Notwithstanding all this, it appears too true, that Sierra Leone has not yet made any impression upon Africa, and that there is no radius of civilisation proceeding from it. It labours under two great disadvantages; the extreme unhealthiness of the climate, which both keeps down its population, and renders it difficult to procure well qualified persons to go out, and also, its unfavourable position, in contact only with a few turbulent tribes, not with any of the great and leading states of the continent. These disadvantages, joined to the death of four successive governors, among whom was Col. Denham, the celebrated traveller, led government to hesitate as to the expediency of supporting this colony, after 3,000,000*l.* had been expended in its formation. To withdraw it, however, would be attended with many evils, so that an attempt has been made to maintain it on a more limited scale. The European troops have been removed, and their place supplied by negroes, and the annual expenditure has been reduced to about 40,000*l.*, of which 17,000*l.* is for liberated Africans. The number of these, in 1829, was 21,205, of whom about 5000 were in Freetown, the capital; the rest dispersed in Regentstown, Gloucester, Wellington, and other large villages in the vicinity.

5275. *The space from Sierra Leone to the commencement of the Grain Coast of Guinea*, an extent of about two hundred miles, is chiefly marked by the entrance into the sea of the considerable rivers of Sherbro and Mesurado. The former is navigable twenty leagues up, and has a tolerably large island at its mouth. On the banks is found a species of pearl oyster. The Mesurado is a still larger stream, and very rapid. According to the natives, it requires three months' navigation to reach its source, which would appear to be in the mountains of Kong, not very far from that of the Niger. The banks are described as finely wooded, fertile, and, in many places, very well cultivated. The states here are entirely negro in religion and manners, none of the Mahometan institutions having penetrated so far. Travellers enumerate the kingdoms of Bulm, Quoja, Monon, and Folga, which they sometimes even dignify with the title of empires. The sovereigns are in general absolute, and their obsequies are celebrated with human sacrifices, though not to the same frightful extent as in some of the countries to the west.

5276. The Americans, in 1820, formed a settlement on this coast, which was called *Liberia*; while its capital, on an island at the mouth of the Mesurado, was named Monrovia. The object was to obtain an asylum for liberated negroes, who, notwithstanding their emancipation, are, by the barbarous prejudices of the country, excluded from caste, and regarded as beings of an inferior order. In spite of disastrous events, which obstructed its progress, it had attained, in 1830, a population of 1500. The population of Monrovia amounted to about 700; the rest were distributed in eight different stations along 150 miles of coast from Cape Mount to Tradetown. The territory is healthy and fertile, the colony has been well conducted, and has opened a friendly intercourse with the natives, from which happy effects are confidently anticipated.

5277. From the Mesurado to Cape Palmas extends what is commonly called the *Grain or Malaghetta coast of Guinea*. The species of pepper to which it owes its name is produced from a small parasitical plant, with

beautiful green leaves, and the fruit of which, resembling a fig, presents, when opened, aromatic grains, forming the valuable part. At its first introduction into Europe, where such articles were little known, it received the flattering appellation of "Grains of Paradise." After the diffusion, however, of the fine species of India, it fell into total disrepute; and this coast, producing no other articles of export, has been the least frequented of any part of Guinea. The two rivers of Sestro and Sangwin, near the centre of the coast, are rather considerable; and their banks are said to be fertile and populous. The state of society seems to be nearly the same as in the countries last described; the sovereigns absolute, human sacrifices prevalent to a certain extent, and also self-immolation, the wife being, in many cases, expected to sacrifice herself at the grave of her husband. Great sway is in the hands of a peculiar priesthood, called the *belli*. The youthful candidate for a place in this body must qualify himself by a long initiation, during which he is withdrawn from all his friends, and lodged in the depth of a sacred forest, where, it is said, he is kept in a state of entire nudity. Among the tests of his proficiency is the performance of songs and dances of a very extravagant and often indecent nature; but peculiar knowledge is also supposed to be communicated on various high points; and those who have gone through the course with success, and are called the "marked of the belli," look upon all the rest of the community as *quoiga*, or idiots. They not only administer all the concerns of religion, but conduct the judicial proceedings; most of which are made dependent on some form of ordeal. Although the Portuguese have lost all their settlements in this part of Africa, considerable numbers of their posterity reside there, mixed with the natives, by whom they are treated with some degree of respect.

5278. Beyond Cape Palmas, the coast, turning to the north-east, and reaching as far as Cape Apollonia, is called the *Ivory Coast*. The name is evidently derived from the quantities of that valuable product, obtained from the numerous elephants on the sea shore, and in the interior. The teeth are of good quality, and uncommonly large, weighing sometimes not less than 200 lbs. Towards the east, at Issini and Apollonia, a considerable quantity of gold is brought down from the countries behind the Gold Coast. There is also a good deal of ivory at the ports of Cape Lahoo, and Great and Little Bassain. There are no European settlements upon the coast, except an English fort at Apollonia, which perhaps belongs rather to the Gold Coast. Navigation along this as well as the Grain Coast requires much caution, as the shore is flat and destitute of any conspicuous landmarks, while a heavy surf, borne in from the whole breadth of the Atlantic, breaks continually against it. Early navigators describe the natives as the most violent and intractable race on the whole African coast. Their teeth filed to a point, their long nails, their harsh and guttural language, almost resembling the cry of wild beasts, inspire disgust; they have even been accused of cannibalism; and their suspicion of Europeans is usually said to be so great, that nothing can induce them to go on board a vessel. It is but justice to observe, however, that Captain Adams, the most recent visiter, gives a much more favourable account. He even says, that almost all the business is transacted on board European ships, though, when he did go on shore, he was hospitably received.

5279. From Apollonia to the Rio Volta extends what is called the *Gold Coast* of Africa. It was long the most frequented by European traders, particularly English and Dutch, both for that highly prized commodity which its name indicates, and for slaves, while they were a permitted article of trade. The coast presents the appearance of an immense thick forest, only detached spots of which are cleared and cultivated. The soil near the sea, being light and sandy, is scarcely fit for any important tropical product, except cotton; but six or seven miles inland, it improves greatly, and might be made to produce sugar and others of the richest West India products, provided habits of industry could be introduced among the inhabitants. Maize is the grain principally cultivated. The gold, which forms the staple commodity, is chiefly brought down from mountainous districts far in the interior. In many places, however, even upon the coast, a small quantity may be extracted from the earth by mere agitation with water in a calabash. Little or no ivory is exported. The ruling people on the coast are the Fantees, a clever, stirring, turbulent race. They exert more ingenuity in the construction of their dwellings and canoes than the nations to the west. The form of government is republican, and each village has a large public hall, roofed, but open at the sides, where an assembly is held, and public affairs are debated. The *pynims*, or elders, however, possess considerable authority, and the administration of justice is chiefly in their hands. An excessively litigious disposition prevails, particularly against those who are supposed to have accumulated great wealth, and who, unless they can disarm public envy by moderation or popularity, are often, between suitors and lawyers, stripped of every thing. The dreadful custom of immolating human victims over the tombs of the great men very generally obtains, and is accompanied with several days of tumultuous feasting and intoxication. As usual, in this state of society, all the laborious offices devolve upon the female sex, except fishing, which is considered an employment sufficiently dignified for the lords of the creation. Yet the Fantee ladies find time to spend an hour or two at the toilette, in which they employ various cosmetics, not omitting paint, which is generally white. The Fantees have of late suffered severely by the invasion of the Ashantees, which had been provoked perhaps by their own violent conduct, and which their want of courage renders them quite unable to resist. Britain, which, perhaps imprudently, interfered in their support, has suffered severely in the attempt; and the terror of her arms alone maintains the Fantees at present in a state of doubtful independence.

5280. The capital of the British settlements is at Cape Coast Castle, built upon a rock, and defended by strong walls of stone and brick, and by ninety pieces of cannon. The approach on the sea-side would be difficult for an enemy; but the fort has the disadvantage of being too near a large, dirty native town of eight thousand souls. The country round has been a good deal cleared, and laid out in pleasure grounds by the British, to whose health, however, the climate in this and the other settlements is extremely unpropitious. To the west of Cape Coast, the English have Dix Cove and Sucondee, in the Ahanta country, a very fertile tract, and to which purer gold is brought than to any other part of the coast. The inhabitants are also peaceable and tractable, and the chances of improvement, as Mr. Meredith conceives, are on the whole favourable. It is to the east that the British have their principal settlements. That at Anamaboe was formerly the great mart of the slave trade. The fort is compact and regular, and in 1809 it withstood, with a garrison of twelve men, the attack of 15,000 Ashantees. Winnebah, in the Agoona country, though in an agreeable situation, has been abandoned; but Fort James, at Accra, would, in peaceable times, afford great conveniences for trade, as no other on the coast has such extensive intercourse with the interior. It and Cape Coast, indeed, are now the only places where any garrison is maintained.

5281. The capital of the Dutch Settlements is El Mina, or the Castle; first founded by the Portuguese, and taken from them in 1637. It is about fifteen miles west of Cape Coast, in an open country, close to a large dirty town of 15,000 inhabitants. The fort is well built, on a high situation, and vessels of a hundred tons can come close to the walls; but its strength has been doubted. The Dutch maintain here a garrison of 150 men, and keep their establishment, on the whole, upon a more reputable scale than the British. Their forts along the coast are almost numberless; particularly in the Ahanta country, where there are no less than seven. The Danes have a respectable fort at Accra, called Christianborg Castle, and also one at Ningo, near the eastern extremity of the coast.

5282. The country behind the Gold Coast, when first known to Europeans, was divided among a number of considerable kingdoms; Dinkira, Akim, Warsaw, and Aquamboe; but all these have now sunk beneath the overwhelming sway of *Ashantee*. This warlike power has also reduced the interior countries of Gaman, Inta, Dagwumba, and others, of which some are more extensive and populous than itself. Ashantee Proper is estimated to contain 14,000 square miles, and about a million of people; but this last number would be more than quadrupled, if we were to include all its subjects and vassals. The attire of the sovereign and his principal chiefs displays a peculiar and barbarous splendour; their persons

being loaded with golden rings and ornaments, waving plumes and superstitious amulets (*fig. 835*). The people are, on the whole, of a superior class to those on the coast; their

ASHANTEE CHIEF.

houses are larger, more commodious and ornamented; they manufacture finer cloths. Their manners are more polished and dignified, and their general conduct more orderly. The king is absolute, with the exception of a military council of four principal officers, whom he is obliged to consult on questions of peace and war, and who usually give their voice in favour of the latter. There are, however, some features in this monarchy which surpass in barbarism those of almost any other. The fury with which war is conducted is, indeed, too general among barbarians, but Ashantee is horribly distinguished by the vast amount of human sacrifice. There are two annual *customs*, as they are called, in which the king and chief men seek to propitiate the manes of their ancestors by a crowd of victims. Foreign slaves and criminals are selected in preference; but, as each seeks to multiply the number, unprotected persons cannot walk the streets, without the hazard of being seized and immolated.

At the death of any of the royal family, victims must bleed in thousands; and the same is the case when the king seeks from the powers above favourable omens respecting any great projected undertaking. The abuse of polygamy also is carried to the highest pitch. The legal allowance of wives for the king is upwards of three thousand, selected from the fairest damsels in his dominions. These unfortunate creatures are in general no better than slaves, and, on any capricious disgust, are treated with the greatest cruelty, and often put to death. Yet this barbarous king is not without a desire to civilise his subjects, and to adopt European arts and improvements. He has occupied himself in erecting a palace of stone, in the European style, under the direction of an artist from El Mina, instead of the structures of earth and straw to which the architecture of Africa has hitherto been confined. He seeks also to promote by every means the commerce of his subjects, and to open a communication with the sea, to which, however, the late unhappy difference with Britain has been a considerable bar. Gold is now the most valuable article of export, not produced within the country, but brought in large quantities from the mountainous regions in the north. He still clings to the slave trade, a mode of procuring European luxuries too congenial with his habits; and so natural did he consider it, that he could with difficulty be dissuaded from sending fifty boys and the same number of girls as presents to the King of England.

5283. On the eastern side of the Rio Volta commences what Europeans have called *the Slave Coast*, because slaves were there procured of the most docile and tractable character. It consisted originally of the two kingdoms of Whidah and Ardrah, forming the most populous and the best cultivated part of the African coast. The vast and impenetrable forests which cover so much of that continent had here been cut down, leaving only what was requisite for ornament and convenience. The whole country was like a garden, covered with fruits and grain of every description. Amid this abundance, the Whidans, having become luxurious and effeminate, were unable to make head against the warlike power of Dahomey, in the interior, which invaded and conquered them at the beginning of the last century. The first ravages were dreadful, and rendered their country almost a desert, nor has its peaceful submission ever allowed it to regain its former prosperity.

5284. *Dahomey*, which is thus predominant both over the coast and over the interior, to a depth of about two hundred miles, is governed upon the same system as Ashantee, and with all its deformities, which it carries to a still more violent excess. The bloody *customs* take place on a still greater scale; and the bodies of the victims, instead of being interred, are hung up on the walls and allowed to putrefy. Human skulls make the favourite ornament of the palaces and temples, and the king has his sleeping apartment paved with them. His wives are kept up to an equal number with those of the king of Ashantee. All the female sex is considered as at the king's disposal, and an annual assemblage takes place; when, having made a large selection for himself, he distributes the refuse among his *grandeens*, who are bound to receive them with the humblest gratitude. In short, this ferocious race allow themselves to be domineered over in a manner of which there is no example among the most timid and polished nations. The greatest lords, in approaching the king, throw themselves flat on the ground, laying their heads in the dust; and the belief is instilled into them, that their life belongs entirely to their sovereign, and that they ought never to hesitate a moment to sacrifice it in his service. The king of Dahomey has been lately worsted in his wars with Eyeo, by which he is now held in a species of vassalage. His country consists of an extensive and fertile plain, rising from the sea by a gradual ascent. The soil is a reddish clay mixed with sand, and nowhere contains a stone of the size of a walnut. Though capable of every species of tropical culture, little is actually produced from it that is fitted for a foreign market; so that, since the abolition of the slave trade, small advantage has accrued from continuing the intercourse with it, and the English fort at Whidah has been abandoned.

5285. *Whidah*, now commonly called Griwhee, may be considered the port of Dahomey, from which a route of about a hundred miles reaches through Favies and Toro to Abomey, the capital. Griwhee is situated in a fertile country, still highly cultivated, and is plentifully supplied with all the necessities and conveniences of African life. Captain Adams, whose estimates on this point are unusually low, represents it as containing about 7000 inhabitants. The despotic and capricious manner, however, in which foreign residents are treated by the tyrant of Dahomey, has gradually induced the different European powers to withdraw their factories. *Ardrah* is still larger and more flourishing; containing, according to the same authority, 10,000 inhabitants. It is situated about twenty-five miles inland, on a long and beautiful lake or lagoon, running parallel to the sea, with which it becomes connected at its eastern extremity by the River of Lagos. The Ardranese are industrious in the manufacture of cotton interwoven with silk; they make also soap, baskets, and earthenware,

and are skilful in working iron. Their market is the best regulated of any on the coast, and exhibits the manufactures of India and Europe, tobacco from Brazil, cloth from Eyeo and Houssa, and every other article that is here in demand. Though so close to Dahomey, the people appear to enjoy a republican form of government. A considerable number of Mahometan residents have made their way hither, and have introduced the management of horses, and the use of milk, to both of which the negroes in general are strangers. Badagry, though it has suffered by recent contests with Lagos, appeared still, by Lander's report, to be a large and populous place, situated in a fine plain, and divided into four districts, each governed by a chief, who assumes the title of king. Lagos is built upon a small island, or rather the bank at the point where this channel communicates with the sea on one side, and on the other with the Cradoo lake, a parallel piece of water. The town is scarcely a foot above the lake, and is over-run by water rats from it. It has 5000 inhabitants, with a good deal of stir and trade. Its petty despot assumes all the airs of the greatest African monarchs, never allowing his courtiers to approach him unless crawling on the ground. Some barbarous customs prevail, such as impaling alive a young female, to propitiate the goddess who presides over rain, and hanging the heads of malefactors to some large trees at the end of the town. The currency here consists of cowries, which are imported in large quantities, and transmitted into Houssa and other interior countries, where they form the universal circulating medium.

5286. At the termination of the Cradoo lake commences a large tract of coast, of a peculiar character, which, from the principal state, receives the name of *Benin*. It extends upwards of two hundred miles, and presents a succession of broad estuaries, now discovered to be all branches of the Niger, of which this country forms the delta. They communicate with each other by creeks, and, frequently overflowing their banks, render the shore for twenty or thirty miles inland, a vast alluvial wooded morass. The natives, having thus very extended water communications, are the most active traders any where in Africa; but, except slaves, the commodities in which they deal are entirely changed. Gold has disappeared; ivory is again found in considerable plenty; but palm oil is the great staple of the eastern districts. A great quantity of salt is made at the mouths of the rivers, both for consumption at home and in the interior. This tract, however, from its low, marshy, and woody character, is excessively pernicious to the health of Europeans.

5287. *The first leading feature is the river Formosa*, two miles wide at its mouth: on a creek tributary to it lies the capital of Benin. This city appeared to Captain Adams the largest he had seen on the coast of Africa; he therefore probably under-rates its population at 15,000; and, being built quite irregularly, and consisting of detached houses, it occupies an immense space of ground. The surrounding territory is well cultivated, though not so thoroughly cleared of wood as that round Ardrah and Whidah. The king is not only absolute, but fetiche, or a god, in the eyes of his subjects; and all offences against him are punished in the most cruel and summary manner, not only as treason, but impiety. Gatto, about fifty miles below, is the port of Benin; accessible to vessels of sixty tons. The trade on this river has greatly declined.

5288. *Warré, or Owarri*, is another state and city, situated on another creek, communicating with the Formosa, on its opposite side. It consists of a somewhat elevated and beautiful island, appearing as if dropped from the clouds amidst the vast woods and swamps by which it is surrounded. Here, too, the king is absolute, and carries polygamy to a very great extent. A late traveller, happening to get a peep into the seraglio, saw about fifty queens, busied in various employments from the toilette to the washing-tub. New Town, on the Formosa, is the port of Warré.

5289. After turning Cape Formosa, and passing several estuaries, we come to that of the *Brass River*, called, by the Portuguese, the river of Nun. Though not the largest estuary of the Niger, yet being most directly in the line of the main stream, and that by which Lander entered the Atlantic, it at present enjoys the reputation of being the principal channel. It is divided into two branches; but the navigation is greatly impeded, and the trade limited, by a dangerous bar at its mouth. Brass Town is built not on either branch, but on one of the numerous creeks connected with both, and in a country overgrown with impenetrable thickets of mangrove. It is a poor place, divided by a lagoon into two parts, each of which contains about 1000 inhabitants. Bonny River forms the next important estuary, having on its opposite sides the towns of Bonny and New Calabar. Being only a few miles up, they are in the midst of the morasses which overspread all this country. The people support themselves by the manufacture of salt and the trade in slaves and palm oil. Bonny, in particular, is become the great mart for these last commodities, and is supposed to export annually about 20,000 slaves. The dealers go in large canoes two or three days' sail to Eboe, the great interior market, which will be described under the head of Central Africa. The king is absolute, and more barbarous than the rest of his brethren on this coast. He boasts of having twice destroyed New Calabar, and ornaments his fetiche house with the skulls of enemies taken in battle.

5290. *After Bonny is the estuary of Old Calabar river*, the broadest of all, and navigable for large vessels sixty miles up to Ephraim Town, governed by a chief, who assumes the title of duke. It appears to contain about 6000 inhabitants, carrying on a considerable trade; and the duke has a large house filled with European manufactures and ornaments of every kind, received by him in presents. This river is followed by that of Rio del Rey; and then by the Rio Cameroons. These rivers are very unhealthy; but they yield a good deal of ivory and palm oil. The continuity of that vast wooded flat, which has extended along the coast for more than 200 miles is now broken by some very lofty mountains, the principal of which is supposed to reach the height of 13,000 feet.

5291. *Several islands which lie in the Gulf of Benin* may terminate the description of this coast. They are, Fernando Po, a fine high large island, lately occupied only by a lawless race, composed of slaves or malefactors escaped from the neighbouring coast. The British government, however, upon the disappointment experienced in regard to Sierra Leone, formed, in 1827, a settlement at this island, the mountainous and picturesque aspect of which afforded hopes of a healthy station; but these have been completely disappointed. Of thirty European settlers taken out, nineteen died; and Col. Nicholls, the governor, was three times attacked with fever. Hopes have been held out, that by a change in the situation

of the town, this evil might be greatly mitigated, and Fernando Po would then acquire a double importance, from its vicinity to the mouth of the Niger. Prince's Island is high and wooded; St. Thomas is large and fertile; the pretty little isle of Annabona is inhabited by a simple native race. These run in a chain to the south-west from the Rio Calabar; and the last three are in nominal subjection to the crown of Portugal.

5292 The next division of Western Africa consists of *Congo and Loango*, to the coast of which navigators generally give the name of Angola. The principal feature is the Zaire, or Congo, a powerful and rapid river, which rushes by a single channel into the Atlantic. Its course was traced upwards by Captain Tuckey, in his unfortunate expedition, about 400 miles, yet nothing was ascertained as to its origin and early course; though the hypothesis of its forming the termination of the Niger is now completely refuted. The natives of Congo are rather of small size; they are cheerful and good-humoured, but unreflecting, and possessed of little energy either of mind or body. The negro indolence is carried in them to its utmost excess. The little cultivation that exists, entirely carried on by the females, is nearly limited to the manioc root, which they are not very skilful in preparing. Their houses are put together of mats made from the fibres of the palm tree; and their clothes and bedding consist merely of matted grass. The population along the river is very small; the largest villages, Cooloo, Embomma, and Inga, containing only from 300 to 600 inhabitants. The interior capital of Congowar, however, mentioned as the residence of the Blindy N. Congo, to whom all the chiefs pay a species of vassalage, is probably what the Portuguese called St. Salvador; and where, according to Mr. Bowdich, they still maintain a mission; but no recent details have been obtained respecting it. There is a regular distinction of ranks, the Chenoo, or chief, hereditary in the female line; the Mafoots, or collectors of the revenue; the Foomoos, or cultivators; and the domestic slaves, not numerous. The chiefs have many wives, whom they make the victims of the most scandalous traffic; frequently tendering their favours to Europeans at a very trifling rate.

5293. *The slave trade*, for which alone this part of Africa is now frequented, is chiefly carried on at Malemba and Cabenda, on the north side of the river. Malemba has been called the Montpellier of Africa. It stands on a hill about 100 feet high, commanding a beautiful prospect of the windings of the Loango Louisa through an extensive plain. Its dry and elevated situation preserves it from those deadly influences which elsewhere operate so fatally on the health of mariners. Cabenda, near the mouth of the river of that name, also a beautiful city, is situated at the foot of a conical wooded mountain, and has been called the Paradise of the Coast. It is a great mart for slaves, who are brought from the opposite territory of Sogno; but the natives, contrary to their general character in this region, are rude and difficult to treat with.

5294. *The country to the south of Congo* is called Benguela, and its commerce is still almost entirely in the hands of the Portuguese. They frequent the bay and river of Ambriz, in which there is a tolerable roadstead; but their great settlement is at St. Paul de Loanda, a large town in an elevated situation. It exports annually, 18,000 or 20,000 slaves, chiefly to Brazil. S. Felipe de Benguela, in a marshy and unhealthy site, is now considerably declined; and its population does not exceed 3000, mostly free negroes and slaves. There is also a smaller port, called Nova Redondo. The Portuguese claim a certain jurisdiction over the native states for several hundred miles in the interior, obtaining presents and purchasing slaves. Farther inland is the country of Jaga Cassanga. The Jagas are celebrated by the writers of travels, two centuries ago, as a formidable devastating tribe, addicted to the most ferocious habits; and rumour does not represent any change as having taken place in their character. Behind them, and in about the centre of the continent, is said to be the nation of the Molouas, represented as more numerous, more intelligent, and to have attained a higher degree of industry and civilisation than any other in Africa under this latitude. The country abounds in valuable copper. The king, however, is absolute, and the atrocious custom of human sacrifice prevails.

CHAP. VII.

SOUTHERN AFRICA.

5295. *Southern Africa*, by its mere name, sufficiently indicates the part of the continent to which the somewhat vague appellation is applied. Generally speaking, it is given to the territory discovered and partly colonised by Europeans, from that important settlement which they formed at the Cape of Good Hope.

SECT. I. *General Outline and Aspect.*

5296. *The surface of this region* is striking and peculiar, presenting three successive mountain ranges, running parallel to the coast and to each other. The first, called Lange Kloof, is between 20 and 60 miles from the ocean, the breadth of the intermediate plain being greatest in the west. The second chain, called the Zwaarte Berg, or Black Mountain, rises at an interval nearly similar behind the first, is considerably higher and more rugged, and consists often of double or even triple ranges. Behind, at the distance of 80 or 100 miles, rises the Nieuweldts Gebirgte, the loftiest range in Southern Africa. The summits, to a great extent, are covered with snow; from which circumstance the eastern and most elevated part is called the Sneuwberg, or Snowy Mountains, whose highest pinnacles are not supposed to fall short of 10,000 feet. The plain nearest the sea is fertile, well watered, richly clothed with grass and trees, and enjoys a mild and agreeable climate. The plains between the successive ranges are elevated, and contain a large proportion of the species of arid desert called Karroo. The southern plain, in particular, is almost entirely composed of the great Karroo, 300 miles in length and nearly 100 in breadth, covered with a hard and impenetrable soil, almost unfit for any vegetation. Along the foot of the Sneuwberg, however, there is a considerable tract finely watered, and affording very rich pasturage. Beyond the mountains, the territory is for some space bleak and sterile; but it gradually improves till it opens into the extensive pastoral plain occupied by the Boshuanas. So far

as this has been explored to the southward, it becomes always more fertile, though to the west there has been observed a desert of very great extent. The eastern coast also consists chiefly of a fine pastoral plain, occupied by the various Caffre tribes, and broken by some chains of mountains, the direction of which has been very imperfectly explored.

5297. *Rivers* do not form a prominent feature in a country of which the general character is arid. The principal are those which flow down from both sides of the great boundary chain of the Nieuweldt Mountains, particularly in the eastern quarter, where it becomes both more lofty and more distant from the coast. On the side of the colony, it gives rise to the Camtoos, the Zoondag, and the Great Fish River, which last, though the most considerable, has not a course of much more than two hundred miles. The smaller and more westerly streams of the Breede, and the Gansely, with its tributary the Oliphant, are chiefly fed from the inferior chains along whose base they flow. On the northern side, the waters which descend from the Snowy Mountains unite and form the Orange River, which, having flowed, first north-west and then due west, through long ranges of rude and desert territories, falls into the Atlantic in about $28^{\circ} 30' N.$ lat., after a course, which, with its windings, must considerably exceed a thousand miles. In the Caffre territories, several estuaries open into the Indian Ocean, the early course of which is little more than conjectured; but travellers through the Boshuana territory crossed streams which, from their direction, appeared likely to reach that receptacle.

SECT. II. *Natural Geography.*

SUBJECT. 1. *Geology.*

5298. This district is bounded on the north and east by the Orange and Fish rivers; on the west and south by the ocean. The country extends from S. lat. 26° to S. lat. $33^{\circ} 55' 40''$, that of the Cape of Good Hope.

5299. *Peninsula of the Cape of Good Hope.* — The rocks of which this tract is composed are granite, gneiss, clay slate, greywacke, quartz rock, sandstone, and augite greenstone, or dolerite. Of these the most abundant are granite and sandstone; the next in frequency are clay slate and greywacke; and the least frequent are gneiss and dolerite. In some parts, as Steinberg, the sandstone is traversed by veins of red iron ore. The Neptunian formations, viz. the gneiss, clay slate, greywacke, quartz rock, and sandstone, are variously altered and upraised by the granite, and traversed by veins of the augite greenstone. The hill named *Lion's Rump* is composed of clay slate, greywacke, and sandstone; granite forms a considerable part of the *Lion's Head*; the *Table Mountain*, in its lower and middle part, is composed of red sandstone, clay slate, and greywacke, which rest on granite: the upper part of the mountain exhibits magnificent displays of horizontally stratified sandstone. The *Devil's Peak* has the same general structure and composition as the Table Mountain.

5300. *The ranges of mountains* which run northward from the Cape peninsula to Orange or Gariep River are composed of granite and slate, with vast deposits of sandstone and quartz rock, with numerous table-shaped summits; thus showing a similarity of composition in these mountains to those of the Cape peninsula. The three great ranges of mountains that run from east to west are of the same general nature, and characterised by the vast abundance of sandstone reposing in horizontal strata upon the granite and slate, forming the middle and very often the highest parts of the chain.

5301. *Geology of the Table-land.* — From the third range onwards to lat. $30^{\circ} S.$, the prevailing rock in the plains and hills is sandstone. At Dwaal River, the frontier of the

			a Gusaqupa	

colony, there are rocks of augite greenstone and basalt, probably traversing the sandstone. The Kareebergen, or Dry Mountains, beyond the limits of the colony, are principally composed of sandstone, in horizontal strata, and every where exhibit beautiful table-shaped summits. This sandstone rock continues onward to lat. 30° S., to near Mud Gap, where true quartz rock and vesicular trap appears. In lat. $29^{\circ} 15' 32''$ S., mountains, called the *Asbestos Mountains*, composed of clay slate, disposed in horizontal strata, occur; thin veins of asbestos traverse the slate. In the same mountain green opal and pitchstone occur. To the north of these mountains, at Klaarwater, are vast beds of *limestone*, disposed horizontally, enclosing organic remains. In conclusion, it may be remarked, that, as far as is known at present, the whole of the table-land of Africa to the north of the Orange River is composed of *limestone* in horizontal strata, *clay slate*, *sandstone* and *quartz rock*, *granite*, *greenstone*, *serpentine*, and *potstone*.

SUBSECT. 2. Botany.

5302. *If our botanical observations on certain countries* are often limited for want of information, it is far otherwise with regard to the region in question, which, almost ever since it has been known to Europeans, has been a never-failing source of botanical novelty to the green-houses and conservatories of our country: and in proportion to the multiplicity of subjects is the difficulty of selecting, consistently with brevity, what is most useful and interesting. "All that I had pictured to myself," exclaims Mr. Burchell, one of the most enlightened of modern travellers, "respecting the riches of the Cape in botany, was far surpassed by what I saw in one day's walk. At every step a different plant appeared; and it is not an exaggerated description of the country, if it should be compared to a botanic garden, neglected and left to grow in a state of nature; so great was the variety every where to be met with. As I walked along," he continues, "in the midst of the variety and profusion, I could not for some time divest myself of feelings of regret, that at every step my foot crushed some beautiful plant; for it is not easy, during one's first rambles in this country, to lay aside a kind of respect with which it is customary in Europe to treat the *Proteas*, the *Ericas*, the *Pelargoniums*, the *Chironias*, the *Royenas*, &c. To give some idea of the botanical riches of the country, I need only state, that in the short distance of one English mile, though the most favourable season had passed, and many of the bulbous and herbaceous plants had disappeared under the influence of the drought, I collected, in four hours and a half, 105 distinct species; and I believe that more than double that number may, by searching at different times, be found on the same ground."

5303. *Nothing, perhaps*, is calculated so much to strike the attention of a stranger, as the great extent of certain groups, and the vast number of different kinds included in them. Among them may especially be enumerated the Heaths (*fig. 837.*), for which the Cape has

long been celebrated, and the beauty and delicacy of which are familiar to all of us from the great number cultivated (no less than 500* species and varieties) in the green-houses of our gardens. Yet in the colony, notwithstanding their elegance and beauty, so little do they strike the attention of the people, that they have not even a name; but when spoken of, are indiscriminately called *bosjes* (bushes). It does not appear, however, that the range of the Heaths is very extensive; for, on coming to the Karroo Pass, Mr. Burchell observes, "four of the strongest and most characteristic features of Cape botany, the *Ericæ*, the *Diosmæ*, the *Proteaceæ* and *Restiaceæ* tribes, entirely disappear; nor did I meet again with any of them till two years afterwards, when I re-entered the same botanical parallel at Zwart-

water Poort, lying in the same parallel of latitude as Karroo Pass, but at 6° long. more to the eastward. The Heath was *Erica Plukenetii*. This lovely tribe had attended me the whole way from Cape Town, till now that I was arrived at the very door of the desert, beyond which the scorching heat rendered it impossible for them to exist; and it seemed as if this handsome species had accompanied me till the last moment, to take a long farewell in the name of the whole family." It is probable, therefore, that in Europe, the single species, the common Heath, or Ling (*Erica vulgaris* Lin.), extending as it does from Lapland to Italy in the plains, and on the mountains even to Morocco, occupies a greater extent of surface

"empurpled with the Heather's dye"

than the 300 species which are enumerated as natives of the Cape of Good Hope. "Amidst

* Loudon's *Hortus Britannicus*.

all these beauties," says Captain Carmichael, "the Cape Heaths stand confessedly unrivalled. Nature has not restricted these elegant shrubs to one particular soil or situation. You meet with them in the marshes, and on the banks of rivers; in the richest soil, and on the bare mural cliffs; on the acclivities of the hills and the tops of the highest mountains. The form of their flowers is as varied as their colours; some are cup-shaped, some globular, some exhibit the figure of a cone, others that of a cylinder contracted at the mouth, or swelled out like a trumpet; some are smooth and glossy; others covered with down, or with a mucilage. The predominant colour is red; but you meet with white, green, yellow, and purple; of every colour, in short, but blue; a fact which deserves notice, when we consider the almost unlimited extent of the genus."

5304. The *Proteaceæ* (fig. 838.) constitute an equally striking feature at the Cape; a

838

PROTEACEÆ.

tribe of plants almost wholly confined to the southern hemisphere. Nearly 200 species are known to be natives of Southern Africa; and of these, many are conspicuous for the extreme beauty and magnitude of their flowers, which excite the admiration of the most careless observer. Those who have visited Cape Town cannot fail to be acquainted with the Silver tree, no less remarkable for the delicate silky covering of its foliage than for its large and showy blossoms; yet this is the common fuel of the place. Near Cape Town is a village called Witteboom, a name which with great propriety it has received, on account of the numerous plantations of large Witteboom, or Silver Tree, which grow about it. The native

station of this handsome tree is the sloping ground at the foot of the eastern side of Table Mountain; and at present very large groves occupy the northern side, next the town. That this place, Mr. Burchell observes, should be the only part in all the colony where it grows wild, can be no object of wonder to any person who has the least knowledge of the character of Cape botany; since the natural places of growth of a multitude of other plants are circumscribed by limits equally contracted. "Next to the Heaths," says a late

839

PROTEA REPENS.

intelligent naturalist, "for variety and beauty stand the Proteas. In the stem, the leaves, the flower, and the fruit of these plants, there appears such diversity, as if nature had created them with a view to setting botanical arrangement at defiance; and the name imposed on the genus would seem to indicate that she has been in some degree successful. The Silver tree (*Protea argentea*) grows to the height of a middling-sized tree; while the *Protea repens* (fig. 839.), at the other extreme, creeps along the sand, and bears on its slender stem, a flower, which, from its size and colour, might at first sight be mistaken for an orange. The intermediate space is occupied by upwards of sixty species,

which display an extraordinary diversity in form and habit. Some have small blossoms that attract the attention of no one except the botanist; others, at the elevation of a few inches, bear a flower that exceeds in size the crown of a hat, and strikes with wonder the most

840

PROTEA MELLIFERA.

indifferent passenger. In the inflorescence of some species, particularly the *Protea mellifera* (fig. 840.), a vast quantity of honey is secreted, which attracts swarms of bees, beetles, and other insects, whose variegated colours and active movements heighten the interest of the scene; nor is this interest at all diminished, when the Cape Humming-bird (*Certhia chalybea*) joins the animated group, and, perching on the border of the chalice, darts its tubular tongue into the bottom of the flower, or snaps at the insects as they buzz around.

5305. The colony owes some gratitude to the person who introduced the Pine to an acquaintance with the Silver tree. The contrast is not stronger between a black man and a white than between these trees: yet, like them, they possess several striking points of resemblance. The seeds in both, for instance, are contained in cones; when once cut down, neither of them revives in shoots from the trunk; the annual branches in both spring out in a circle round the stem; and in both, the branches,

as well as the minute twigs, are covered with leaves. But the leaves of the Pine are mere

lines, without breadth, smooth, rigid, and of a dark green colour; whereas those of the Silver tree are lance-shaped, soft, and clothed with a white shag, more delicate than silk, which, blending its hue with the white parenchyma of the leaf, gives it the appearance of sky-blue satin. The effect of a strong wind on the mingled foliage of these trees is peculiarly pleasing.

5306. *The Silver tree* is diœcious. The fertile flowers are separated by the scale of the cone. After the germ has been fecundated, the scales begin to grow, and at length overtop the petals, gathering them in a bunch, entirely concealed from view. When the fruit is become ripe, the sun begins to act on the scales; they curl out at the top and contract at the base, gradually squeezing out the nut, until it arrives at the aperture, when, spreading out the white hairy border of the corolla, it assumes a feathery appearance, like the seed-down of a syngenesious plant. In this state it remains, ready to be wafted by the first gale that blows: but to ensure the ultimate object of nature, the transportation of the seed, the long capillary style and its round stigma remain attached to it, and, the latter being too large to slip through the narrow throat of the corolla, the seed is thus suspended by the style, and descends to the ground somewhat in the manner of an aeronaut in his parachute.

5307. More numerous than the Proteaceæ, though of humbler growth, and bearing smaller but not less brilliant flowers, are the Fig Marigolds (*Mesembryanthemum*), a genus almost peculiar to Southern Africa. The principal species of this plant, of which upwards of 300 have been enumerated, seem admirably adapted for fixing the loose shifting sand, with which a great part of the country is covered, spreading over the ground from a central point; a single specimen shades a great extent of surface, and affords a singular relief to the eye, fatigued by the powerful refraction of light. In its thick fleshy foliage, it possesses a magazine of juices, which enables it to bear, without shrinking, a long privation of moisture, at the same time that it gives shelter to the nascent shoots of other plants which spring up in its bosom. The mucilaginous capsules of the Hottentot Fig (*M. edule*) are the chief material of an agreeable preserve. Nature has made a beautiful provision for the increase of some of the annual kinds of Fig Marigold, in the property of the capsule, which, contrary to most fruits of the kind, is firmly closed in a period of drought and only opens and discharges the seed in wet weather, when the parched and sandy deserts which this plant inhabits are moistened with the prolific rain. Even after having been long gathered, the capsule retains the same property, being shut in a dry atmosphere and readily expanding wide in water, and very rapidly in warm water. *Mesembryanthemum coriarium* of Burchell is employed by the Hottentots for tanning leather.

5308. *The Stapeliæ, or Carrion flowers* (fig. 841.), are a numerous and highly curious

841

STAPELIAS.

genus, with square, succulent, leafless stems and flowers resembling Star-fish. They derive their latter appellation from their abominable odour, which so much resembles that of putrid meat, that insects are deceived by it, and even in our hot-houses (where 110 species are now cultivated), they deposit upon them their eggs, which are hatched by the heat of the sun, when the larvæ perish for want of animal food. This is not the only service which these unsavoury plants render. Spielmann brought home a species, well known to the Hottentots by the name of Gnuap (*Stapelia pilifera*): it has an insipid, yet cool and watery taste, and is used by them for the purpose of quenching thirst; for which purpose it would seem Providence has designed it, by placing it only in hot and arid tracts of country. "In pass-

ing through the Karroo, I expected to have seen abundance of Stapelias, but scarcely half a dozen appeared. No part of the colony seems to be so rich in them as the dry sandy regions of the western coast, where they cover a tract of many degrees of latitude in extent, disappearing to the eastward, though their associates, Aloes, *Mesembryanthemum*, and Aizoon, were now and then much farther north."

5309. *Aloes* certainly are far more numerous than Stapelias, and more remarkable for their varied mode of growth, and the curious form of their succulent leaves, than for the elegance of their flowers, though many of them, especially the larger kinds, are not destitute of beauty. Mr. Burchell observed in his excursions, when halting for the night in a rocky situation, near a small river, the fine scarlet blossoms of a new kind of Aloe (*A. claviflora* Burch.) decorating the barren rocks, and giving a certain gay and cultivated look to a spot, which, without it, would have appeared a rude neglected waste.

5310. As it is not possible to preserve the Aloe tribe (fig. 842.) for the herbarium, and as they have not been studied in their native deserts, all that we know of them, or nearly so, is from the species cultivated in our green-houses, and these amount to 170 different kinds. Among

them, the *Aloe dichotoma*, is not the least remarkable; the Cokenboom, or the Quiver

842

GROUP OF ALOES.

tree of the Hottentots, so called, because natives of the western coast make their quivers of its wood. *Aloe spicata* is said to be extensively cultivated at the Cape of Good Hope, to obtain from it Hepatic Aloes, like that of the Barbadoes Aloe (*A. soccotrina*). The place of the Cactuses (a genus wholly unknown to the Old World) seems to be occupied by a peculiar and very extensive group of Euphorbias, which have the fantastic and varied forms of that singular tribe, and occupy the very same arid and rocky situations. Many of them rise to a vast height, with their highly succulent and often prickly and angled stems and branches not unlike candelabra. The acrid milky juice is in them highly elaborated; and while, on the one hand, men and cattle suffer from the great abundance of these plants, on the other hand, they afford a most powerful poison (especially *E. mammillaris*), by which the wounds inflicted by arrows and assagays are rendered most deadly. Vaillant mentions the great sufferings he underwent, by treading with his bare feet upon the thorny *Euphorbia meloformis* (fig. 843.). *E. tuberosus*, and

many other species, are reported to occasion the strangury at a certain time of the year to cattle browsing upon them; and this statement seemed to be confirmed by Mr. Burchell's

843

EUPHORBIA MELOFORMIS.

oxen being taken ill of that disorder in spots where those plants abounded. The *Tamus elephantopus* (fig. 844.) (*Testudinaria* Salisb. and Burch.) is a very remarkable plant, now well known in the green-houses of the curious. The mountains of Graaf-Reynet, says the latter author, are the native soil of this extraordinary production, which is called Hottentot's Brood (*Hottentot's Bread*). Its bulb stands entirely above ground, and grows to an enormous size, frequently three feet in height and diameter. It is closely studded with angular ligneous protuberances, which give it some resemblance to the shell of a tortoise. The inside is a fleshy substance, like a turnip in consistence and colour. From the top rise several annual

twining stems. The Hottentots eat the inner substance, which is considered not unwholesome, baked on the embers. It will easily be believed that this food may not be very unlike the East Indian Yam, since the plant belongs to a very closely allied genus. Other remarkable genera, or tribes, inhabiting the Cape, are the Irideæ, whose gaudy flowers, for a short season, give beauty and life, as it were, to the sandy deserts, after which their light and scaly or tunicated bulbs are dispersed far and wide by the winds; the interesting terrestrial Orchideæ (fig. 845.), whose large and brilliant blossoms are scarcely exceeded by

844

TAMUS ELEPHANTOPUS.

845

ORCHIDEÆ.

those of the parasitic species of Tropical America; the Restiaceæ, a family which the Cape shares in common with New Holland, some individuals of which, especially *Restia tectorum*, afford excellent thatching for houses; numerous grasses; shrubby Boraginæ, with vivid blossoms, particularly belonging to the genus *Echium*; numerous species of *Celastrus*,

of Lobeliaceæ, of Phylica, Brunia, Thesium, and Chironia; the splendid Strelitzia (*fig. 846.*),

STRELITZIA.

so named by Mr. Aiton, in compliment to the queen of George III., "and which stands," says Sir J. E. Smith, "on the sure basis of botanical knowledge and zeal, to which I can bear an ample and very disinterested testimony;" — numerous plants of the Natural Order Rutaceæ, to which belongs the Diosma, the powerfully scented Buku* of the Hottentots (who take delight in mixing it with grease and smearing their bodies with it), and now of our Pharmacopœias; Apocynæ (including Stapelias), several Umbelliferae, some of them very remarkable, among which is the Tondelblad, or tinder-plant (*Hermas depauperata*), whose down supplies the natives with tinder, and which may be removed from the leaves in an entire mass (so closely are the fibres interwoven), and stretched out so as to be modelled into little caps, stockings, &c., to which the impression of the veining of the leaves gives a beautiful appearance: in this form the tomentum is often brought to this country: numerous kinds of Rhus, Cluytia, Pharnaceum, Statice, Crassula, and other genera of the same family, Ornithogalum, Anthericum, Lachenalia, Asparagus, Juncus, among which we may mention the Juncus serratus: — "Many rivers," Mr. Burchell observes, "are choked up with the plant called Palmiet (*Juncus serratus*) by the colonists, and from which one river, in particular, derives its name. Some idea of the appearance of this plant may be gained by imagining a vast number of Ananas, or Pine-apple plants, without fruit, so thickly crowded together as to cover the sides, and even the middle, of the stream, standing seldom higher than three or four feet above the surface, but generally under water, whenever the river swells above its ordinary height. The stems which support them are of the thickness of a man's arm: black, and of a very tough and spongy substance; generally simple, though not rarely divided into one or two branches. They rise up from the bottom, not often in an upright posture, but inclined by the force of the current. They have very much the growth of Dragon-trees (*Dracæna*), or of some palms, from which latter resemblance they have obtained their name:" — Cliffortia, a curious genus in Rosaceæ; numerous Salviæ, several species of Scrophularinæ and Selagineæ; a remarkable genus of Cruciferae, Heliophila, many of whose species have blue flowers, an unusual colour in that natural order; a vast quantity of Geraniaceæ, particularly of the genus Pelargonium, which are almost peculiar to the Cape; Hermannia, and some Malvaceæ. Polygalæ abound; as do Leguminosæ, among which are several confined to that country, and highly ornamental, as Lebeckia, Rafnia, Liparia, Hypocalyptus, Sarcophyllum, Aspalathus, Hallia, &c. Indigofera prevail very much, and the Acacias, which present some remarkable species. *A. vera* and *A. capensis* are often loaded with large lumps of very good and clear gum, and they have so great a resemblance to the true Acacia of the ancients, or the tree which yields the gum-arabic, as to have been considered the same species. Wherever these trees are wounded, the gum exudes; and it is probable that a large crop might thus be annually obtained without destroying them. If a computation could be made of the quantity that might be obtained from those trees, only, which skirt the river Gariep and its branches, amounting to a line of wood (reckoning both sides) of more than 2000 miles, it might be

ACACIA CAPENSIS.

worth while to teach and encourage the natives to collect it, which they would readily do, if they knew that tobacco could always be had in exchange. Indeed, the supply thus obtained would be more than equal to the whole consumption of Britain. The *Acacia capensis* (*fig. 847.*) (*Doornboom*), or Thorn tree, Wittedoorn (*Whitethorn*), and Karrodoorn (*Karrothorn*) has straight white thorns, two to four inches long, and is certainly the most abundant and widely disseminated tree of the extra-tropical parts of Southern Africa. *Acacia Giraffæ* abounds in the Bichuana country, and was first noticed by Mr. Burchell, who saw it there for the first time, and describes it as a remarkable species, having thick brown thorns and an

* "A Hottentot being severely wounded by the bursting of a gun, his companions expressed so much faith in the powers of Bockoe-azyu (*Bookoo vinegar*) as a wash to cleanse and heal the wound, that I allowed it to be used. Our small stock of this liquid soon failing, we had recourse to an infusion of the Diosma leaves in brandy, with which the wound was washed night and morning for two or three weeks, the effect of this application being very satisfactory. This Bockoe or Bucku-azyu is made by simply putting the leaves of *Diosma serratifolia*, or some other species of the same genus, into a bottle of cold vinegar, and leaving them to steep; the vinegar being esteemed in proportion to the time during which the infusion has been made, and sometimes turning to a mucilage."

oval pod of a solid mealy substance within, and which never opens as those of other *Acacias*: in this resembling only the *A. atomiphylla*. The head of it is thick and spreading, and of a highly peculiar form, which distinguishes it at a great distance. It is called Kameel-doorn (*Camel-thorn*), because the camelopard browses chiefly on it; and is one of the largest trees in these regions. Its wood is excessively hard and heavy, of a dark or reddish brown colour, and is used by the Bichuanas for their smaller domestic utensils, as spoons, knife-handles, &c. Though other species resemble the *A. Giraffæ* in form and growth, yet the pod alone is sufficient to distinguish it easily from all others. *A. detinens* is so called by Mr. Burchell from the following circumstance. Describing the country about Zand Valley (Sand Valley) in lat. $29^{\circ} 48'$, he says: — “The largest shrubs were nearly five feet high, a plant quite new to me, but well known to the Klaarwater people by the name of Haakedoorn (*Hookthorn*). I was preparing to cut some specimens, when, though proceeding with the utmost caution, a small twig caught hold of one sleeve. While trying to disengage myself with the other hand, both arms were seized by these rapacious thorns, and the more I tried to extricate myself, the more entangled I became: till, at last, it seized hold of my hat also, and convinced me that there was no possibility of getting free but by main force, and at the expense of tearing all my clothes. I therefore called for help, and two of my men came and released me by cutting off the troublesome branches. In revenge for this ill-treatment, I determined to give to the tree a name, which should serve to caution future travellers against venturing within its clutches.” The roots of *A. elephantinum* constitute a favourite food of the elephant. The *Compositæ* are extremely widely dispersed; many being woody kinds, especially of *Aster*, while the number and

GNAPHALIUMS AND XERANTHEMUMS.

848

variety of the *Gnaphaliums* and *Xeranthemums* (fig. 848.) are quite astonishing: many of them retain the form and colour of the flower long after they have been gathered, and hence derive their name of Everlastings. A great variety of timber is found along the tract of coast that stretches to Plettenberg's Bay, a distance of nearly 200 miles; but the indolence or apathy of the Dutch rendered it of little use to the colonists. The only kind that has been introduced into general use is the Geel Hout (*Taxus elongata*), which is employed in house-building. For furniture, they occasionally use Stink Hout (*Laurus teterima*), though the execrable odour it diffuses for some time after it has been worked, forms a well-

grounded objection to its general adoption. It possesses the colour, hardness, and durability of the heart of oak.

5311. The vegetable productions of the country surrounding Algoa Bay are, in many respects, different from those of the vicinity of Cape Town. The Heaths and Proteas almost disappear, and in their room are numerous species of Aloe and Euphorbia. These, for the most part, garnish the rocks and precipices, the Aloe perfoliata alone occupies the plains, and, with its superb scarlet spikes, resembles, at a distance, skirmishing parties of British soldiers. A singular species of Euphorbia (*E. Caput Medusæ*?) grows also in the plains among the grass, where it appears as a round ball, without stem or leaves, and bears a striking resemblance in shape to the common Echinus. In dry weather the cattle eat it for the sake of its juice. Many useful plants grow here, “the stem of *Zamia cycadifolia*, when stripped of its leaves, resembles a large Pine Apple. It is called the Hottentot Bread Fruit. These people bury it for some months in the ground, then pound it, and extract a quantity of farinaceous matter of the nature of sago. With infinite labour they dig the root of a species of *Antholyza*, which lodges at the depth of a foot or more in the hardest gravelly soil. To accomplish this, they are under the necessity of using an iron crow-bar, and the produce of half an hour's toil, which they call Untjie, does not exceed the bulk of a chestnut. Various other bulbs of the classes Hexandria and Triandria are esculent; but the long period of time requisite for their full development will for ever prevent their cultivation as an article of food. The flowering spikes of the *Aponogeton distachyon*, known by the name of Water Untjie, are in high repute as a pickle. The *Arctopus echinatus* has recently acquired a considerable share of reputation as an antisiphilitic. It was tried by some British medical men, whose report was favourable. The discovery of its virtues is due to the Malays, who have long used it. The root bears some resemblance to that of the parsnep, and is the only part employed, being boiled in water, and the decoction administered to the extent of a quart daily, operating without any perceptible effect on the constitution. The Candleberry Myrtle (*Myrica quercifolia*) grows along the coast, on dry sandy plains, exposed to the sea air, where hardly any other plant will vegetate. The wax is in the form of a rough crust, investing the berries, and is extracted by boiling them in water, straining the decoction, and suffering it to cool. It is of

a greenish colour, and possesses the hardness, without the tenacity, of bees' wax. When made into candles, it gives a very fine light.

5312. *Fungi, as well as Lichens and Mosses*, are so very rarely to be met with in the interior of Southern Africa, that, of the *Fungi*, the first which Mr. Burchell saw on his journey was at Klaarwater, after travelling for five months. Indeed, it could be hardly expected that the parched soil of the Cape would suit the growth of the *Cryptogamiæ*, which mostly delight in moisture.

5313. *It is well known that Table Mountain* is an object of attraction to every one who has visited the Cape: its flat top, called the Table Land, is about two miles in length from east to west, and of various breadths, but nowhere exceeding a mile. The height is estimated at 3500 feet above the level of the sea. It is a common saying among the inhabitants of Cape Town, that when the Devil spreads his tablecloth on the mountain, you may look for a strong south-east wind. In the whole system of meteorology, there is not a more infallible prognostic. The Devil's tablecloth is a thin sheet of white vapour, which is seen rushing over the edge of the precipice, while the sky all around is serene and unclouded. The rapidity of its descent resembles that of water pouring over the face of a rock. The air, at the same time, begins to be agitated in the valley; and in less than half an hour, the whole town is involved in dust and darkness. Instantly the streets are deserted, every window and door is shut up, and Cape Town is as still as if it were visited by the plague. Sometimes, instead of a sheet of vapour, an immense cloud envelopes the mountain, and, stretching out on all sides, like a magnificent canopy, shades the town and the adjacent country from the sun. The inferior boundary of this cloud is regulated, probably, by various circumstances; among others, by the strength of the wind and the temperature of the air in the Table Valley. The influence of the latter is to be inferred from the fact, that though the cloud never descends farther than half way into the hot parched amphitheatre of Cape Town, it may be observed on the side of Camp's Bay, rolling down in immense volumes to the very sea, over which it sometimes stretches farther than the eye can follow it. Nothing can be more singular than the appearance of this cloud. It is continually rushing down to a certain point on the side of the mountain, and there vanishing. Fleeces are seen, from time to time, torn from its skirts by the strength of the wind, floating and whirling, as it were, in a vortex over the town, and then gradually dissolving away. But the main body remains, as if it were nailed to the mountain, and bids defiance to the utmost efforts of the gale. There is a constant verdure maintained on this mountain by the moisture deposited from the atmosphere, and it is no wonder that it is frequented by botanists. M. Ecklon gives the following account of his ascent, in a work very little known in this country, namely, the *Botanische Zeitung*, for July, 1827, published at Ratisbon; and with this we shall conclude our already, we fear, too much extended account of the vegetation of this celebrated promontory:—

“Numerous violent showers, accompanied with hail, had, almost daily, for four long weeks, frustrated every attempt of ours to undertake a botanical tour, in which we hoped to examine the vegetation of Table Mountain, during the winter season. The top was constantly covered with clouds, which rendered the ascent impossible: but as the unusual cold of this year gave reason to expect that ice would be found on the summit, I was the more curious to see the effect which it would produce on vegetation; and the occurrence of two fine wintry days enabled us to start. My friend Heil, the companion of all my wanderings, accompanied me on this occasion. It was a beautiful day, scarcely a cloud dimming the clear blue sky. Our ascent lay among the gardens at the foot of the mountain, where the fresh verdure, interspersed with the many-coloured blossoms of *Oxalis* and *Hypoxis*, that were called forth by the rain, ornamented the lower region. By the garden walls flowered the shrubs *Muraltia*, *Heisteria*, *Senecio rosmarinifolius*, *Othonna abrotanifolia*, *Nottea (Selago) corymbosa*, *Cluytia pulchella*, &c. The water of the great stream from the Table Mountain rolled down with great violence. The road ceases at the water-mill above

CALLA ÆTHIOPICA.

the gardens, and we ascended briskly, finding *Erica baccans*, *Phylica buxifolia* with seed, *Achyranthes aspera*, *Mora grandiflora*, and *Cluytia polygonoides*. A little bird (*Sylvia Pastor*?) enticed out by the beauty of the morning, whistled his grasshopper note in the miller's fig trees, and even here, amid all the riches of Flora, the lingering wish that we could but hear the nightingale of our native land, convinced us that there is nothing in this wide world capable of completely satisfying the wider wishes of the human heart. While ascending the rock still more toward the table land, and between the pieces of rock, *Penæa mucronata*, *Agathosma villosa*, *Blechnum australe*, *Pteris calomelanos*, *Cheilanthes capensis*, *C. hirta*, *C. pteroides*, *Asplenium furcatum*, and at the great brook, *Lomaria capensis* and the *Calla æthiopica* (fig. 849.), now appeared with multitudes of blossoms. The beautiful day had attracted another party to the Table Mountain, as we perceived by a

white flag waving on the summit. The vegetation at Plalle Klipp, owing to the late continued wet weather, had assumed quite an European aspect. I gathered *Cyperus lanceus*, *Viola angustifolia*, a *Campanula*, *Cema turbinata*, *Stachys æthiopica*, and *Moræa collina*. We were here in the region of the Silver tree, 1000 feet above the level of the sea. *Leucadendron argenteum* forms a small forest, at between 500 and 1000 feet from the Lowenberg, running along the northern side of the Devil's Berg and Table Mountain to Constantia. The lovely *Protea mellifera*, with red, reddish and white flowers, was here in full bloom, and a *Thesium*, by the great brittleness of its stem, was near letting me fall, as I clung to it to aid me in the ascent. *Cassytha filiformis* had almost covered a tree of *Virgilia capensis*, above 20 feet high. Plalle Klippe consists of granite, striped with horizontal layers of grey greenstone; at some hundred feet higher up is the Witte Klippe, a large granite rock with a sloping top, over which the water runs, and as there was abundance of water at this season, it formed a most beautiful scene. The view was romantic: before us rose the tall steep mass of rock of the Table Mountain, not a cloud obscured the clear sky, and only in the greater distance to the north, a thick whitish fog intercepted the prospect of the whole chain of mountains. The highest point of the Hottentot's Holland Mountain, Stettenbosch, Drakenstein, and Tulbagh, which may be considered as 1000 feet higher than Table Mountain, were covered with snow. The onward road led through various shrubs, among which I observed *Bubon galbanum*, *Royena glabra*, *R. hirsuta*, *Celastrus lucidus*, *Plectronia ventosa*, *Cassinia Maurocenia*, *Rhus angustifolium*, *R. tomentosum* and *lanceum*, *Polygala myrtifolia*, an *Aster*, *Martynia acris*, *Gnidia oppositifolia*; while among these, in the sandy spots, *Romulea fragrans*, *Lichtensteinia lævigata*, and *Bulbine recurva*, began to shoot up and blossom. Numerous cows, one of which had a calf that suffered us to drive it away far more patiently than a German animal would have done, hurried from us, and they made their escape into flowering plants of *Diosma oppositifolia*, *Hydrocotyle tomentosa*, an *Aster* with blue flowers, *Adenandra uniflora*, *Asclepias arborescens*, *Euphorbia tuberosa*, and *E. latifolia*. In the third region, about 1700 feet above the sea, a beautiful waterfall invited us to rest and refresh ourselves. A thermometer which we had brought indicated 55° in the shade and 70° in the sun, at 10 A. M. Round the waterfall I saw *Kiggelaria africana* with fruit, *Cunonia capensis* out of flower, *Hypocalyptus canescens*, *Todea africana*, *Eriocephalus racemosus*, *Myrica serrata*, *M. quercifolia*, *Berckheya cihata*, and *Protea lepidocarpon*. Proceeding onwards, and still ascending, we approached the right cleft, which leads to the summit, between steep rocky walls. But, to our great mortification, we found the entire flora of the place destroyed by a fire that had been kindled about two months ago. Nothing but burnt stumps remained of the lovely shrubs that had excited my admiration on a previous excursion, and long must it be ere their former beauty can return. Such fires are kindled and kept up during calm weather by the proprietors of Silver tree plantations, to prevent such a circumstance accidentally occurring during the prevalence of the before-mentioned strong south-east winds, which not only might destroy all the trees, but prove highly dangerous to the town. Only an *Oxalis variegata* appeared between the consumed stumps, and behind a piece of rock we observed a shrub of *Brunia*, with all its leaves and most of its blossoms burnt off. Pieces of broken glass and old shoes, which lay scattered every where on the ground, showed the difficulty of ascending the Table Mountain. The fire had not, however, reached the great defile, where some African plants appeared; but nature, in general, seemed as dead, and only *Arnica piloselloides*, an *Arctotis*, and some leaves appeared, where I had before found *Agapanthus minor*, *Amaryllis sarniensis*, and *Atragene angustifolia*. To the eye of a botanist, the scorched ground and consumed vegetation looked like Sodom and Gomorrah. *Gnaphalium capitatum* and *Arnica lanata* now appeared in separate spots, and broken branches covered with *Parmelia* and *Usnea* lay scattered at our feet, wafted by the wind from the ravines of the rock. We were now about 2500 feet above the level of the sea, and here the fire had stopped. At this elevation we found *Aster cymbalarifolius*, a *Buchnera*, and *Solanum nigrum* among the crevices of the rocks. The view around us was truly majestic; added to which, the drops of rain, driven by the wind from the lofty rocks and steep cliffs, reflected back the clear sunbeams, and presented all the colours of the rainbow. A sudden whirlwind lifted up a broken bush of *Erica* that lay far beneath us, and carried it in a moment high over the Table Mountains. We had accomplished two thirds of the ascent at 11 A. M., and arrived at a small cavern in the rock, where there is always some water, that proves in the warm season a great refreshment to the weary traveller. There *Erica purpurea*, and some *Restiones*, were still in bloom. The defile now became narrower, and the pieces of rock over which we must clamber increased in size: the cold was also more sensibly felt at our fingers' ends, the thermometer standing at 43°. Several mosses grew on the moist sides of the rock. We sought the sunshine now as gladly as in this situation we generally court the shade; but its beams gave no more warmth than the March sun does in Germany. An *Anthyllis*, many species of *Restio*, and the *Osteospermum ilicifolium*, an inhabitant of the plain of Table Mountain, here greeted our eyes; and the latter first manifested its presence by the strong smell of its leaves. Many specimens of the Klipp dachren (*Hyrax capensis*)

peeped out from among the pieces of rock, but escaped immediately on seeing us; still their curiosity is so great that they soon reappear, and a person, by standing quietly a little while, may easily shoot them. Their flesh is good eating, and has the flavour of hare. Not a bird could be either seen or heard: but the frogs and grasshoppers made plenty of noise. On the sides of the rocky projections are Chinese characters, and many names, which are designed to perpetuate the memory of the heroes who had accomplished this ascent before us, gave assurance that we had attained the highest point, and at 11 $\frac{1}{2}$ A. M. we had accordingly issued from the defile and gained the plain. The party whose flag we had seen from below was preparing to descend. The horizon to the south-east was covered with thick clouds, which intercepted the otherwise beautiful prospect over the semi-insular Cape, and warned us to prepare for our return. No delay was possible, as the mountain would shortly be covered with clouds. Indeed, every object presented a most wintry appearance. *Erica physodes* and some plants of *Aster linearis* exhibited a few blossoms; while others, as *Drosera cuneifolia* and *Villarsia ovata*, were beginning to throw out young shoots. The wind now commenced blowing violently from the north-west, and black clouds covered the Kasteelsberg before us, so that we hastened to regain the defile, lest, being enwrapped in clouds, we should lose our way and be precipitated from the steep sides of the rock; as it is common for the dense mist to hide every object beyond two feet before us. Besides the defile by which we ascended, there is another, that goes down on the western side over Van Kamp's Bay; but the steepness of the rocks about the middle do not allow it to be used. About eighty feet from the summit, in this latter defile, is the only spring that is on the top of the Table Mountain, and which never fails in the driest weather. Here we found *Erica physodes* abundantly in full flower; also *E. purpurea*, *Staavia glutinosa*, *Protea cynaroides*, and *P. speciosa*, both in seed, *Othonna abrotanifolia*, *Agathosma imbricata*, *Gnaphalium cephalophorum*, *Erica Lebana* in seed, *Phyllica ericoides*, *Gnidia scabra*, and a red lichen on the pieces of rock. There were very few plants in blossom in this generally rich defile. The thermometer indicated 43° in the shade and 55° in the sun at 1 P. M.; at which hour it was 66° in the shade at Cape Town. Being very hungry, we sat down in the shade to take our dinners, encamping beside the stream, where our tablecloth was spread of the young verdure of *Restiones*, *Penæa mucronata*, *Lobelia pinifolia*, *Hermas capitata*, *H. depauperata*, *Clutia tabularis*, *Osteospermum ilicifolium*, *Senecio purpurea*, and *Aster filiformis*. Van Kamp's Bay, below us, was covered with white clouds as far as the eye could reach, extending, like a mass of snow, over the Southern Ocean. The wind blew strong through the tops of the surrounding rocks, and lifted the clouds still higher and nearer towards us, though a clear blue sky still appeared immediately over-head. After our meal we again sought for mosses on the rocks, and found, besides an *Erica*, a *Campanula*, and *Cliffortia*, but not in blossom. *Cunonia capensis*, likewise past flower, grew in the fissures of the rock, and *Schizæa pectinata* with dried fructification. Above us, on the high rock that surrounded us, we noticed a beautiful shrub, that seemed to be covered with red flowers: my friend determined to obtain it, though I assured him, from telescopic observation, that the apparent red blossoms were only the red fruit of *Leucadendron pyramidale*, and such it proved to be, though he also brought down fine flowering specimens of *Penæa squamosa* and several *Ericæ*. At about half past 2 P. M. we returned to the northern defile, and there began our descent, going back by the way we came. My friend had the misfortune to sprain his foot while returning, which rendered our walk slow and difficult, but, happily, no disagreeable consequence ensued; and, in spite of this delay, we regained Cape Town by moonlight, at about 7 P. M."

SUBSECT. 3. Zoology.

5314. *Of the zoological peculiarities of Southern Africa, we have already spoken. In no region of the globe does there appear so great a number of quadrupeds, and these, too, of the largest dimensions. The limits of this zoological region is very uncertain; inasmuch as of all this part of the African peninsula, we know little beyond the Gariep to the north-west; while the borders of the Great Fish River (forming the boundaries of the colony on the south-western coast), are the farthest limits, in this direction, hitherto reached by scientific travellers. Mr. Burchell, indeed, has penetrated the interior deserts to lat. 26° south, and his researches lead us to believe that the animals of central equinoctial Africa do not materially differ from those of the Great Karroos which bound the territories of the Cape Colony. The chief seat, therefore, of the zoology of Southern Africa must be sought for in that immense line of forests which border the coast, and have been traced from Bosjesveld to the bounds of the Great Fish River: these extend, in all probability, to an immeasurable distance farther, and form a belt of eternal verdure, between the arid deserts of the interior and the more fertile borders of the coast.*

5315. *The surprising number and variety of quadrupeds which naturalists have detected in this region will be better understood by the following list; equally interesting both to the scientific zoologist and to the future traveller:—*

Cercocebus pygerythreus. Red-vented Monkey.
Cynocephalus porcarius. Pig-faced Baboon.
Pteropus Leachii Sm. Leach's Bat.
Rhinolophus Geoffroyi Sm. Geoffroy's Bat.
Nycteris capensis Sm. Cape Nycteris.
Nycteris affinis Sm. Allied Bat.
Vespertilio capensis Sm. Cape Bat.
Sorex capensis. Cape Shrew.
Macroscelides Smithii Nob. Smith's Shrew.
Chrysochloris capensis. Cape Mole.
Chrysochloris hottentotus Sm. Hottentot Mole.
Ratelus Ratel. Ratel Glutton.
Putorius Zorella. The Zorello.
Lutra inunguis. Clawless Otter.
Canis aureus. Jackall.
Canis mesomales. Cape Jackall.
Hyæna venatica. Hunting Hyæna.
Mangusta cafra. Caffrarian Ichneumon.
Mangusta urinatrix Sm. Aquatic Ichneumon.
Mangusta Levaillantii. Levaillant's Ichneumon.
Ryzæna capensis Ill. Surckate.
Proteles Lalandii. Cape Proteles.
Hyæna crocata. Spotted Hyæna.
Felis leo. The Black-maned Lion.
Felis serval. The Serval.
Felis capensis. Cape Cat.

Felis nigricans. Black-footed Cat.
Otaria Peronii. Peron's Seal.
Phocaena Horneii Sm. Cape Seal.
Myoxus avellanarius. African Dormouse.
Myoxus murinus. Murine Dormouse.
Myoxus africanus. African Dormouse.
Mus Donovanii. Donovan's Mouse.
Bathyergus maritimus. Coast Bathyergus.
Bathyergus capensis. Cape Bathyergus.
Bathyergus Ludwigii Sm. Ludwig's Bathyergus.
Pedetes capensis. Cape Pedetes.
Dendromus dorsalis Sm. Dorsal-striped Treelover.
Sciurus ginginianus. Gingi Squirrel.
Sciurus oculatus Sm. White-spot Squirrel.
Lepus africanus. Cape Hare.
Lepus rufinucha Sm. Rufous-naped Hare.
Lepus saxatilis. Rock Hare.
Orycteropus capensis. Cape Anteater.
Rhinoceros africanus. African Rhinoceros.
Rhinoceros sinuatus. Burchell's Rhinoceros.
Hyrax capensis. Cape Hyrax.
Equus quagga. Quagga Zebra.
Equus zebra. Common Zebra.
Equus montanus. Mountain Zebra.

Antelopes.

Aigocerus leucophaea. Blue Antelope.
Aigocerus equina. Roan Antelope.

Aigocerus barbata. Bearded Antelope.
Oryx cafra. Caffrarian Oryx.
Gasella pygarga. White-faced Gazel.
Gasella euchore. Springer Gazel.
Antelope melampus. The Pallah.
Redunca eleotragus. Reitboek Antelope.
Redunca isabellina. Cream-coloured Antelope.
Redunca villosa. Riet Rhieboek.
Redunca scoparia. Orebi Antelope.
Tragulus oreotragus. Klipspringer.
Tragulus rupestris. Sheenboek.
Tragulus rufescens. Vlackte Steenboek.
Tragulus grisea. Grysboek.
Tragulus pallida. Bleekboek.
Cephalophus platous. Broad-eared Antelope.
Cephalophus Burchellii. Burchell's Antelope.
Cephalophus caerulea. Slate-coloured Antelope.
Cephalophus purpusilla. Kleeneboek.
Tragalaphus sylvatica. Boschboek.
Damalis Caama. The Caama.
Damalis lunata. Lunated Sassaby.
Damalis Oreas. Impoof.
Damalis Canna. Canna.
Damalis strepsiceros. Koodoo.
Catoblepas Gnu. Gnu.
Catoblepas taurina. Kokoou.
Catoblepas gorgon. Brindled Gnu.
Bos caffer. Cape Buffalo.

5316. From this list we can only select a few for particular notice. The Antelopes are the most conspicuous tribe, and range over the vast karroos, or deserts, with astonishing swiftness. Some, however, inhabit only the forests, while others prefer the mountains.

SPRING-BOK.

5317. The Spring-bok or Mountain Antelope (fig. 850.), called by Lichtenstein the Antelope pygarga (*Trav. Af.*, 317. 340.) frequently go in troops of not less than 3000. They run for some time extremely quick; and then, if a bush or piece of rock crosses their path, they spring to the height of four or five feet, clearing at one leap ten or twelve feet of ground. They then stand still a few minutes, till the rest are passed; after which they all set off again, running with astonishing fleetness. The beautiful form of this animal, its elegant markings, and the incredible lightness and grace of its motions, render it extremely interesting.

5318. The African Elephant (fig. 851.) is, at first sight, distinguished from the Asiatic species by its much larger ears, which descend towards the legs: they are, indeed, so large, that at the Cape they are said to be made into sledges to draw agricultural implements to and from the fields, and even to convey the sick. It is found from the Cape of Good Hope to

Senegal; but whether it extends along the eastern coast is uncertain. The annexed figure was taken by Mr. Landseer, from a young and very docile specimen, living in 1830, in the Garden of Plants. This species, although not yet tamed in its native country, has all the docility and wonderful sagacity of the Asiatic Elephant.

AFRICAN ELEPHANT.

5319. The Hunting Hyæna (*Hyæna venatica* Burch.) (fig. 852.) is a beautiful animal, first discovered by Mr. Burchell, and, from uniting the characters of the Hyenas and the Dogs, has been thought worthy of a subgeneric name. It is remarkable for hunting in regular packs: though in general a nocturnal animal, it frequently pursues its prey by day; and as it is well formed by nature for speed, none but the fleetest animals can escape. Sheep and oxen, therefore, are particularly exposed to its attacks; the latter are approached by stealth during their sleep, and frequently suffer by the loss of their tails.

5320. To notice, however briefly, the remaining quadrupeds, would far exceed our limits. The diversity in the size and habits of the Antelopes exhibits every intermediate link from the smallest and the most delicate to the largest and strongest Buffalo; while the Lion, the true Jackall, and several species of Hyæna, are well known inhabitants of Southern Africa.

HUNTING HYÆNA.

5321. The ornithological subjects are numerous; but, on the whole, less beautiful than might be imagined. Flocks of Vultures of several species are every where seen in the deserts, where the remains of so many quadrupeds, killed either by beasts of prey or by the course of nature, require to be removed. The Eagles and Falcons are also numerous,

and keep under subjection the smaller quadrupeds and birds; while the Snake-eater (*Gypogeranus serpentarius* Ill.) (fig. 853.), peculiar to Southern Africa, roams over the sandy plains, carrying on a perpetual warfare with all sorts of reptiles. The Barn Owl and Great-horned Owl of the Cape are supposed to be of the same species as those of Europe. Among the

853

SNAKE-EATER.

lesser birds of prey are several true Shrikes: the Drongoes, called by the Dutch *Devil birds*, from their uniform black colour, assemble in the morning and evening, and hunt after insects, not unlike swallows: the Puff-backed Shrikes (*Malacoti Swains.*), on the contrary, search for eggs and young birds in thick bushes; while the Caterpillar-catchers (*Ceblepyrinæ Swains.*) only frequent the loftiest trees, for the sake of the soft insects from which they derive their name.

5322. In the perching order of birds, we find many of beautiful plumage, and others of wonderful

instinct. The Crested Kingfisher (*Alcedo cristata*) (fig. 854.) is much smaller than our European species, but far surpasses it in the splendour of its colours: the head is adorned

854

CRESTED KINGFISHER.

with a full crest of narrow and arched feathers, alternately barred with black and brilliant blue: the under plumage is of a rich cinnamon, with the throat nearly white; the bill and legs bright crimson. The Cape Honeysucker (*Melliphaga cafer* Sw.) (fig. 855.) and the Cape Coly (*Colius capensis* L.) (fig. 856.) are both small birds, of dull-coloured plumage, but rendered conspicuous for the great length of their tails: the first subsists chiefly upon the nectar of flowers: it is remarkable as the only genuine Honeysucker (*Melliphaginæ Sw.*) found in Africa; and it seems abundant at that extremity of Africa which is nearest to Australia, the chief metropolis of its tribe. The Cape Coly is less than a sparrow; of a delicate drab colour, and has all the four toes placed forward, nearly similar to the Swifts: the shortness of the wings very much impedes its flight. M. Le Vaillant says these are called, at the Cape, Mouse

Birds, not only on account of their delicate and soft plumage, but from their creeping about the roots of trees like that quadruped. This and several other species found in

855

CAPE HONEY-SUCKER.

Southern Africa appear to live entirely upon fruits: their nests are placed in clusters, and they sleep in a most curious manner; each close to the other in the same bush, and suspended to the branches by one foot, with the head lowermost; a position which has not yet been detected in any other genus of birds. The Colies are generally very full of flesh, and are delicious eating.

5323. The two most extraordinary birds in their respective instincts, are the Honey-Guide and the Republican.

5324. The Honey Guide (*Indicator Sparrmannii Sw.*) (fig. 857.) was first discovered and circumstantially described by the celebrated traveller Sparrmann. This bird is smaller than a thrush, grey-brown above and whitish beneath; and is principally found in the forests on the eastern coast towards Caffraria. It feeds chiefly on bees and their honey, and, as if unable always to procure the latter, it would seem to call in the assistance of man, in the following manner:

— The morning and evening are the times of feeding: the note of the bird, well known to the African hunters, is then shrill; the latter answer this note from time to time till the bird is in sight: it then flies forward, by short flits, towards the spot where the hive is situated, and thus secures a portion of the spoil from its grateful allies. These birds are, of course, held in much esteem, almost amounting to veneration, by the Hottentots; and the killing of them, by Dr.

856

CAPE COLY.

Sparrmann, was much resented.

857

HONEY GUIDE.

Le Vaillant observes, that, on opening the stomach, he found nothing but wax and honey; the skin was itself so thick, as scarcely to be pierced with a pin: this latter fact we have ourselves ascertained from the dead bird. It is a peculiarly wise provision of Providence to fortify this bird against the stings of those insects which constitute its principal food. The ignorance of Bruce, who knew nothing of natural history, but who has presumed to ridicule Dr. Sparrmann's account of this bird, which happens to differ from another species found in Abyssinia, deserves notice, as affording a warning to travellers not to write about scientific matters they do not understand.

5325. *The Republican Weaver* (*Loxia socia* L.), like several other birds of the same family, lives in vast societies, uniting their nests under one common roof, sometimes to the number of 800 or 1000 in a single community. These little towns, indeed, are the

progressive increase of several years, for the birds are observed to add to the size of their common dwelling every season, until the trees, unable to support any further weight, not unfrequently fall to the ground; when the birds, of course, are compelled to seek a new site for their habitation. Mr. Paterson, who first made us acquainted with these extraordinary ornithological villages, affirms that there are many entrances, each of which formed a regular street, having rows of nests on each side, at about two inches' distance from each other. He describes the bird itself, however, so loosely, that the precise species is very doubtful. The whole of this tribe of birds (*Plocianæ* Sw.) spread over India and Africa, are celebrated for the skill with which their nests are constructed.

5326. *The Scarlet Weaver* (*Euplectes* Orix Swains.) (fig. 858.) is a superb species; with a plumage of the

858

SCARLET WEAVER.

brightest crimson relieved by a velvety black, and is, indeed, one of the most beautiful birds of Southern Africa. It frequents reedy, marshy places, among which it constructs a curious nest composed of twigs closely interwoven with cotton, and divided into two compartments; there is but one entrance, and the whole is so compact, that it is impenetrable to the weather. It has been said that the innumerable flocks of these birds among the green reeds are inconceivably beautiful, the brightness of their colours giving them the appearance of so many scarlet lilies. Both Dr. Latham and Mr. Barrow have confounded several species under this name.

5327. *The insects of the interior*, according to Dr. Smith (*in litteris*), are more numerous than on the coast, being chiefly composed of such carnivorous coleopterous families

as live in sandy tracts. But the forests on the western coast appear, from Mr. Barrow's *Travels*, to abound with beautiful Moths. The Locusts and Grasshoppers, on the Karroo plains, are in profusion. Mr. Burchell mentions one that was so exactly alike in colour, and even in shape, to the surrounding stones, that he should never have discovered it but by its motion. Strikingly opposed to this in brilliancy of colour is the *Gryllus morbillosus*, or Red-winged Locust, having livid tubercles on its thorax exactly resembling the early pustules occasioned by the small-pox.

5328. *Fish of large size*, and mostly of unknown species, abound. It is singular that Eels

859

GARIEP SILURUS.

are only found in those rivers which lie eastward of the Cape; while the Gariep Silurus (*Silurus gariepinus* Burch.) (fig. 859). is equally restricted to those of the west: the latter is called *Platte-Rop*. The shells are not attractive: various Limpets, and the *Haliotes* *Midæ*, or Great Earshell, are com-

mon; but those of the land and fresh waters have not been attended to. Among the former, however, is that large and beautiful snail, *Achatina zebra*.

5329. *The Ox is the chief domestic animal*, being used throughout Southern Africa for all purposes of draught, and even for the saddle. The Zebras, common in the interior, have never been tamed. Horses are scarce; the breeds in the colony have been partly introduced from Europe, South America, and even from Persia: the latter breed is still preserved in much of its purity in the northern districts of the colony: they are very tall, without being strikingly handsome, strong, and endure much fatigue: the hoofs grow so hard as not to require shoes. (*Lich. Tr.*) The increase of horses in Graaf Reynet, from 1804 to 1811, was only 9084, while that of the draught and breeding oxen was 78,384, or had very nearly doubled in seven years. The Bachapin and Bichuana nations of the interior, Mr. Burchell observes, have no horses, nor are any to be found among the Bushmen tribes or some of the Hottentots. At Litakun there are plenty of dogs, but cats are unknown. The Nimiquas, according to Le Vaillant, possess the most handsome and vigorous breeds of domestic animals of any in Southern Africa. The oxen are equally as strong as those of the colony, but are trained into three different classes: beasts of burden or draught, saddle oxen, and war oxen. These saddle oxen are much superior to the horse in supporting fatigue, and only inferior to him in swiftness. The war oxen seem peculiar to this nation. They are chosen from the most savage and ungovernable, and, being driven against the enemy, they become furious at the sight of the adverse host, and rush on the men like wild bulls. These formidable creatures are not only capable of repelling wild beasts, but will even attack them. The sheep of the colony are of the fat-tailed breeds; but those of the Nimiquas resemble the European, but stand higher, and are larger.

SECT. III. Historical Geography.

5330. *The discovery and settlement by Europeans* is the only circumstance connected with this region which bears any historical character. The Cape, which forms its most remarkable feature, was descried and rounded, in 1493, by Bartholomew Diaz; but that navigator, appalled by the stormy aspect produced by currents from opposite oceans, returned, and named it the Cape of Tempests. Emanuel, however, who then reigned in Portugal, inspired by a bolder spirit, called it the Cape of Good Hope, and equipped Vasco de Gama, who, in 1497, passed with safety, and even with ease, round this dreaded boundary into the seas of India. The Portuguese, however, engrossed by vast schemes of Eastern discovery and conquest, scarcely deigned to cast an eye over this rude border of Africa. They were content if their vessels, in passing, could be supplied with water and provisions.

5331. *The Dutch*, a prudent and economical people, when they obtained the dominion in the Indian seas, soon discovered the advantages to be derived from a settlement on a coast to which its situation attached so much commercial importance. In 1650 they founded Cape Town, and, from the rude and sluggish character of the people thinly scattered over this immense tract, easily extended their settlement to its present limits of the Nieuweldt Mountains in the north, and the Great Fish River in the east. In consequence, however, of the political union of Holland with France and consequent war with this country, Cape Town was, in September, 1795, attacked and reduced by a British naval force. It was restored by the peace of Amiens, but, on the renewal of hostilities, was recaptured in January, 1806, and was one of the few Dutch possessions retained by Britain in the treaty concluded at the congress of Vienna.

SECT. IV. *Political Geography.*

5332. *Little, in a general view, can be said under this head.* The country consists partly of the Cape territory, which is governed on the usual system of British colonies, partly of a region divided among a multitude of small separate tribes. The usual government is that of a rude monarchy irregularly controlled by the independent spirit of simple and pastoral races. The details respecting both the *government* and *productive industry* of a territory split into so many minute portions, can only be given with advantage under the local divisions.

SECT. V. *Civil and Social State.*

5333. *The population* of a region of which the very boundaries are yet so undetermined cannot even be made a subject of conjecture. We shall, however, be afterwards able to state that of some particular places and districts.

5334. *The classes of inhabitants* in this part of Africa exhibit a considerable variety. They consist of—1. The British, comprising the officers of government, the troops, and a few thousand agricultural emigrants, whose numbers are not, however, increasing. 2. The Dutch, who farm most of the lands in the territory, and constitute the most numerous part of the population of Cape Town. 3. The Hottentots, the native race, reduced to degrading bondage under the Dutch. 4. The Bosjesmans, a miserable and savage tribe of Hottentots, inhabiting the mountainous districts, carrying on a constant predatory war against the settlers. 5. The Caffres, a fierce pastoral race, inhabiting the country beyond the eastern limit of the colony extending along the Indian Ocean. 6. The Boshuanas, a pastoral and partly agricultural race, of a different character, possessing the country that stretches northward from the boundary chain of mountains. These different classes will be best treated of under the local divisions to which they belong.

SECT. VI. *Local Geography.*

5335. *The three great divisions of Southern Africa* are, 1. The Cape colony. 2. The country of the Caffres. 3. The country of the Boshuanas.

SUBSECT. 1. *The Cape Colony.*

5336. *This colony*, of which the general boundaries and aspect have already been described, is estimated by Mr. Barrow to extend 588 miles in length, and 315 in its greatest breadth; but the average breadth does not exceed 200, and the surface consists of about 120,000 square miles. A great portion consists of mountains of naked sandstone, or of the great Karroo plains, whose hard dry soil is scarcely ever moistened by a drop of rain, so that seven tenths of the territory never exhibit the least appearance of verdure. Along the coast, however, and also far in the interior, along the foot of the Sneeuwberg Mountains, there are extensive plains covered with rich pastures. The banks of the rivers are in many places fertile, though liable to inundation. The hills in the vicinity of the Cape are employed in the production of a wine which, by the encouragement of low duties, has been imported into England; but it is very little esteemed, with the exception of that delicate species made from grapes reared near the village of Constantia, the quantity of which, it is said, might, with good management, be greatly augmented. The grain is raised almost exclusively within three days' journey of Cape Town, and serves merely for the supply of that place; all the rest of the territory is devoted to pasturage.

5337. *The Dutch farmers*, or boors, of whom grazing forms thus almost the sole occupation, hold very extensive premises, reaching often for several miles in every direction. Yet spacious limits of domains do not prevent frequent boundary-feuds, which are, indeed, fomented by the plan of measuring them, not by the rod and line, but by the pace of an officer employed for that purpose, who is alleged sometimes to measure his strides according to the favour with which he regards the parties. The boor having covered this extensive possession with flocks and herds, resigns himself to supine indolence, devolving the sole labour on his slaves, who are usually Hottentots. He draws from his farm neither wine, fruits, nor vegetables; nor does he make his herds yield milk or butter. The pipe never quits his mouth except to take his *sopié*, or glass of brandy, and to eat three meals of mutton soaked in the fat of the large-tailed sheep. The mistress of the mansion, in like manner,

remains almost immovable on her chair, with hot coffee on a table always before her. The daughters sit round with their hands folded, rather like articles of furniture than youthful and living beings. A teacher is usually employed; but, in addition to his proper functions, he is obliged to employ himself in the most menial offices. Yet they are hospitable in the extreme. A stranger has only to open the door, shake hands with the master, kiss the mistress, seat himself, and he is then completely at home. Those who occupy farms on the borders of the Sneeuwberg, where they are exposed to the depredations of the wild Bosjesmans, acquire, in consequence of the necessity of defending their property, more energetic and active habits.

5338. *The Hottentots*, the original inhabitants of this country, have now been completely enslaved, not being indeed liable to sale, but fixed to the soil as bondmen. They have been branded as presenting man in his rudest state, and his closest alliance with the brute; and certainly they have spared no pains to render their external appearance hideous and disgusting. Their persons are studiously invested with a thick coating of grease, which, mingling with the smoke, in which they are almost perpetually involved, forms a black thick cake, through which the yellowish-brown colour of the skin is scarcely ever discernible. For this ornamental purpose, butter is employed by the rich, while the poorer classes besmear themselves with fat from the bowels of slaughtered animals. Yet this coating is said to be really useful in defending them from the solar rays, and preventing cutaneous disorders. Hard and coarse hair in irregular tufts, and prominences of fat jutting out in places where they are least ornamental, complete the picture of deformity. All their habits of life are filthy and slovenly. When a sheep or an ox is killed, they indulge in beastly gluttony; ripping open the belly of the animal while yet half alive, and tearing out the entrails, which they throw on the coals and greedily devour. Their villages, or *kraals*, compose a labyrinth of little conical hovels, reared of twigs and earth, and so low that the inmates cannot stand upright. Yet their aspect of sluggish stupidity seems, in a great measure, induced by the degrading bondage in which they are held. They pursue wild animals with swiftness and dexterity, directing with a sure aim their darts and arrows. They carry on various little manufactures, tanning and dressing skins, forming mats of flags and bulrushes, bowstrings from the sinews of animals, and even moulding iron into knives. In their free state they had a republican form of government, and were led to battle by their *konquers*, or captains, to the sound of the pipe or flageolet; they had also the same passion for the dance and song which is general throughout Africa. The charge of their having been strangers to every religious idea seems now completely disproved.

5339. *The Bosjesmans* appear to belong to the same original race with the Hottentots; but, from the rude haunts which they occupy, have preserved a precarious independence. They inhabit the most inaccessible valleys of the Sneeuwberg and Nieuweldt, and the desolate tracts extending thence to the Orange River. Of all human beings, their condition is perhaps the most forlorn. Their food is obtained only by scrambling over the rocks in pursuit of wild animals, swallowing the larvæ of ants and locusts, or carrying off cattle in wild foray from the plantations in the plains beneath. Yet they display energy, activity, and even gaiety. They shoot their little poisoned arrows with surprising accuracy; and, when pursued, bound from rock to rock with an agility which defies European pursuit. They can endure long fasts, during which, however, their frames become extremely lank and meagre; but when they succeed in obtaining a supply of animal food, they devour it voraciously in amazing quantities. Considerable ingenuity is shown in the pictures of animals drawn by them upon the rocks. On moonlight nights, they dance without intermission from sunset till dawn; and sometimes, when cheered by the prospect of fine weather, continue this exercise for several days and nights. They are in a state of continual warfare with the settlers in the plains beneath; not only carrying off their cattle, but putting to death, in a cruel manner, all who fall into their power.

5340. *A British agricultural colony* was some years ago attempted in the district of Albany, the most easterly part of the territory, lying between the Zoondags and the Fish Rivers. The fertility of the soil rendered the situation promising; and about ten years ago several thousand emigrants were located upon it. The experience of three disastrous seasons, however, in which the crops were ruined by alternate drought and inundation, appeared to prove the district unfit for tillage, and suited only to pasturage, for which the allowance of a hundred acres made to each emigrant was too small. The distress became extreme, and partial relief was afforded by a subscription of 3000*l.* raised at the Cape. A number quitted the settlement, in consequence of which the lot of the others was improved; but no temptation has been afforded to future emigrants to follow their example.

5341. *Cape Town*, the capital of Southern Africa, and the most important European settlement on the continent, is situated near the isthmus of a peninsula, formed by False Bay on the east, and Table Bay on the west, on which last the city itself is built. Immediately behind rises precipitously the Table Mountain, 3582 feet above the sea, and consisting chiefly of steep cliffs of naked schist and granite. The Devil's Hill, 3315, and the Lion's Head, 2160 feet high, rise on each side. This triple summit forms a most conspicuous

object from the sea, over which also these spots command a very striking prospect. Table Bay affords an abundant supply of excellent water, and is capable of containing any number of vessels; but from May to September they are in danger from heavy westerly gales, and it

CAPE OF GOOD HOPE.

is advisable to take a station at the head of False Bay. Cape Town (*fig. 860.*), being the only good place of refreshment for vessels between Europe and America, on one side, the East Indies, China, and Australia, on the other, must always be a great commercial thoroughfare.

The territory itself affords for exportation wine, hides, and skins, with aloes, argol, and a few other articles, which amounted, in 1829, to 23,800*l.*; in 1830, to 171,000*l.* British manufactures were also imported to the value of 257,000*l.* in 1829, and of 330,000*l.* in 1830. The foreign imports amounted in 1829 to 36,000*l.*; in 1830 to 78,000*l.* The Dutch society at the Cape is extremely mercantile, and *koopman*, or merchant, is held as a title of honour; but the prevalence of slavery has diffused habits of indolence, even among the lower ranks, who consider it degrading to engage in any species of manual labour. Since the occupation by Britain, the residence of civil and military officers and the great resort of emigrants and settlers have given it much the character of an English town. A *South African Journal* has been established, which has already produced some valuable papers. The population, in 1824, was 18,668; and has probably, by this time, increased to upwards of 20,000.

5342. *The other places in the colony* are, in general, only *drosdys*, or villages, which, in a country entirely agricultural, derive their sole importance from being the seat of the local administration. Constantia and Simon's Town, in the close vicinity of the Cape, are supported, the one by the produce of wine, the other by docks for shipping. Stellenbosch and Zwellendam, the chief places in the two most flourishing agricultural districts adjoining, contained, some time ago, the one only seventy, the other thirty houses. Graaf Reynet and Uitenhagen, at the head of extensive districts in the east, are not more important. Gnadenthal has been made a neat village by the missionaries, who have fixed it as their principal station. The only place which has risen to any importance is Graham's Town, in the district of Albany, near the eastern extremity of the colony. The troops stationed there to watch the Caffre frontier, with the recent colonists, who, disappointed in their agricultural pursuits, sought other employment, have swelled its population to about 3000. It is described by Mr. Rose as "a large, ugly, ill-built, straggling place, containing a strange mixture of lounging officers, idle tradesmen, drunken soldiers, and still more drunken settlers." It is romantically situated in a deep valley, surrounded by hills and glens, through which heavy waggons are seen coming often from a great distance, not only with provisions and necessaries, but skins of the lion and leopard, buffalo horns, eggs and feathers of the ostrich, tusks of the elephant and rhinoceros, and rich fur mantles.

SUBJECT. 2. *The Territory of the Caffres.*

5343. *This territory extends* from the eastern boundary of the colony along the coast of the Indian Ocean, the north-eastern direction of which it follows. On the west, it is bounded by the country of the Boshuanas, at the distance of about 200 or 300 miles from the sea; but this frontier has never been precisely explored. To the Caffrarian coast, which reaches about as far as Delagoa Bay, the Portuguese have given the name of Natal; which has been followed by navigators, though it is, of course, quite unknown to the natives.

5344. *The Caffres* (a name given by the Portuguese) are extremely handsome in their external appearance. The men, especially, are tall, robust, and muscular, yet of the most elegant symmetry of form. Their manners are easy, and their expression frank, generous, and fearless. The females are less beautiful, their persons are somewhat short and stunted, and the skin of a deep glossy brown; but their features are almost European, and their dark sparkling eyes bespeak vivacity and intelligence. The Caffres are, perhaps, of all nations the most completely pastoral. They lead a roaming life ill suited for agriculture; they have not applied themselves to fishing; and game is scarce: but they understand thoroughly the management of cattle. The men not only tend but milk the cows, and have the skill, by a particular modulation of the voice, either to send out a herd to graze, or recall it to the enclosures. They subsist generally on milk, and never kill a cow but on high occasions. Several branches of manufacture are practised with skill, as making baskets of grass, sharpening iron by stones, though they cannot smelt it. They have engaged in repeated wars with the European settlers; but the blame, in many instances, seems to have been on the side of the latter.

5345. *The Caffres are divided into several distinct tribes.* The Tambookies, more remote than those which border on the colony, appear to be more industrious, and distinguished for their skill in working both silver and iron. Beyond them are the Zoolas, or Hollontontes, the most numerous and powerful of all the Caffre tribes. Their king, Chaka, according to Mr. Thompson, has a force of 15,000 men constantly equipped for war, and on urgent occasions can arm 100,000 men, who comprise, we presume, the whole adult male population. He has been the most formidable conqueror in this part of Africa. He has driven before him a number of the neighbouring tribes, who, under the name of Mantatees, or wanderers, seeking new habitations, have desolated a great part, first of the Boshuana and then of the other Caffre territories, and even threatened the colony. Lieutenant Farewell, in 1824, founded a small English colony at Port Natal, with full encouragement from Chaka, the continuance of whose favour, however, could not be very securely depended upon.

5346. *The country of the Boshuanas, or Bichuanas, occupies a considerable extent of Southern Africa, extending northward from the colony, from which, however, it is separated by a considerable interval, in which are found the Sneeuwberg Mountains, the banks of the Orange River, and the pastoral district of the Corana Hottentots. On the east, it has the Caffre territory; on the west, extensive deserts; while on the south is the domain of a numerous and powerful tribe, the Macquanas, or Makooanas, supposed by Mr. Salt to extend as far as Mosambique. The very existence of this people was not suspected by Europeans till 1801, when Messrs. Trutter and Somerville, being sent from the Cape to procure a supply of cattle, after journeying for a long time through pastoral wildernesses, arrived very unexpectedly at Lattakoo, a town so large and regular that it might almost be termed a city. The country was not only covered with numerous herds, but showed considerable signs of cultivation. To improve this discovery, Lord Caledon sent Dr. Cowan and Lieutenant Denovan, with a party of twenty men, to penetrate through the territory to Mosambique. They reached considerably beyond Lattakoo into a country which their accounts described as still improving in beauty and fertility; but, having arrived in the territory of a hostile tribe, and neglected the necessary precautions, they were surprised, and entirely cut off. Since that time, however, Mr. Campbell, animated by a laudable zeal to diffuse Christianity among the African people, has not only twice visited Lattakoo, but has penetrated 200 miles farther to Kurreechane, the most southern and the largest of the Boshuana states. Two intelligent travellers, also, Dr. Lichtenstein and Mr. Burchell, though unable to advance so far, have made accurate observations on the manners and social state of these tribes.*

5347. *The Boshuanas are not in their persons so tall and handsome as the tribes of Caffraria; but they have made a considerably greater progress in industry and the arts. Instead of the nomadic and purely pastoral life which the latter pursue, they dwell in towns of considerable magnitude and regularly built. The houses are commodious, constructed of wood, plastered with earth, and in many places encircled by a stone wall, and ornamented with painting and sculpture. They cultivate the ground, rearing millet, two species of bean, gourds, and water melons. A space round every town is appropriated to culture, while a wider range beyond is pastured by the cattle, which are every night brought within the protection of the walls. The labour, indeed, not only of tilling the ground, but of building the houses, is devolved upon the females; but the men, as in Caffreland, both tend and milk the cows. The favourite wives of the kings and principal chiefs are exempted from labour, and are loaded with fantastic ornaments, their large mantles, as well as their persons, being profusely bedecked with furs, feathers, coral, beads, and brass rings (fig. 861.). The first discoverers painted their character in the most flattering colours; and they appear really to be honest and friendly to each other, and to strangers who have gained their good-will. But the enmity between neighbouring tribes is as deadly, and the mode of conducting war as barbarous, as among the rudest African hordes. They place their glory in *commandos*, raids or forays, undertaken with the view of carrying off cattle and murdering the owners. In consequence of this mutual hostility, the population is almost entirely concentrated in the towns or their immediate vicinity; the open country, though extremely fertile, is covered with luxuriant grass growing to waste, and tenanted only by a few wandering Bushmen. Notwithstanding their simple manners, a considerable inequality of rank prevails, founded chiefly on wealth, which those in power find the means of increasing during their incessant predatory contests. Mateebe, king of*

QUEEN OF LATTAKOO.

YOUNG KING OF MAROOTZO.

Lattakoo, used to squat on the ground chattering and exchanging pipes with the lowest of the people. The greatest chiefs, in going to war, are provided merely with a light shield, a few darts, and the skin of a wild beast flowing over their shoulders, and leaving the greater part of the body naked (fig. 862.). They enjoy even a species of republican constitution, the most important affairs being decided by an assembly of the chiefs. Even in their way to the meeting, they indulge in strange gambols, leaping into the air and brandishing their weapons, as if to attack and stab a mortal enemy. The circle being formed, they join in a song, which the principal person often follows by a dance. The proceedings also are prefaced by dances and cries imitating the barking of dogs; yet when they come to the speeches, these are replete with good sense, and even a rude species of eloquence. The females stand behind, cheering those whose sentiments they approve, and loudly deriding whatever they consider ridiculous.

5348. *The towns*, in consequence of the circumstances already mentioned, which have induced nearly the whole population to assemble in them, possess greater magnitude than might have been expected from the state of cultivation and society. Lattakoo was the first visited, and the name remains, though, in consequence of a schism in the tribe, the town has been transferred to a spot about sixty miles farther north. New Lattakoo is supposed to contain about 6000 people. Meribohwey, capital of the Tammahas, is not of equal importance. Mashow, to the north, where the territory of the Barolongs commences, is a fine town with 10,000 inhabitants, beautifully seated on a hill, and surrounded by a number of lesser eminences. Within a circuit of twenty miles there are twenty-nine villages, and almost uninterrupted cultivation: the habitations and furniture are superior to those of Lattakoo. The population is estimated at 10,000 or 12,000. Melita, capital of the Wanketzens, also a tribe of Barolongs, is likewise an important place. But the largest and best built city in Southern Africa, and the one whose inhabitants have made the greatest progress in the arts of life, is Kurreechane (*fig. 863*).

KURREECHANE.

863

The people are in number about 16,000; they smelt iron and copper in large clay furnaces; their houses are surrounded by good stone enclosures, and the walls, of mud, are often painted, as well as moulded into ornamental shapes. Considerable skill is shown in the preparation of skins, as well as in the vessels of earthenware used for holding corn, milk, and other stores. This city was unfortunately sacked by the Mantatees in their late inroad. Bakarrakari, considerably westward of the places now described, in a country of extensive plains and forests, is as yet little known.

CHAP. VIII.

EASTERN AFRICA.

5349. *Eastern Africa* comprises an immense extent of coast, reaching from the Caffre country to the border of Abyssinia, a length of about 3000 miles. It may be considered as extending inland about 500 or 600 miles from the sea, but its contents, for the most part, and all its boundaries on this side, are unknown. This vast range of country contains many grand features of nature, and a large proportion of fertile territory, capable of yielding the most valuable productions; yet scarcely any part of the world is less known, or has excited less interest among Europeans. The Portuguese, as soon as they had discovered a passage into the Indian seas, occupied all the leading maritime stations, from which they studiously excluded every other people.

5350. Extensive, though ill-explored, *natural objects* diversify this region. The coast consists almost entirely of spacious plains, often of alluvial character, and covered with magnificent forests. It appears, however, undoubted, that at 200 or 300 miles in the interior, considerable ranges of mountains arise; geographers have even delineated a long chain parallel to the coast, called Lupata, or the Spine of the World; but Mr. Salt is of opinion that the prolongation of this beyond the region of the Upper Zambeze is very arbitrary. The rivers also are of great magnitude, though only their lower course is at all distinctly known. The Zambeze may rank in the first class, and, according to probable information and conjectures, appears to flow across nearly the entire breadth of the continent. It enters the Indian Ocean by four mouths, of which the principal are Cuama and Quillimane, each of which sometimes gives name to the whole river. Near Quiloa, several great estuaries enter the sea, of the upper course of which nothing is known. The same may be said of the mouths of the Quillimane, near Melinda; for its supposed identity with the river Zebee, which flows through the region south of Abyssinia, is still only conjectural. The only great lake hitherto mentioned is the Maravi, in the interior from Quiloa and Mosambique, which is generally represented as of great extent, and resembling an inland sea.

5351. *We are too ignorant of the line of coast* on the east side of Africa to attempt any notice even of its general vegetation, and shall content ourselves with noticing two interesting and useful plants, for a botanical knowledge of which we are chiefly indebted to the enquiring mind of C. Telfair, Esq. of the Mauritius.

5352. The first is the Colombo Plant (*fig. 864.*), of which the root is a well known article in the Pharmacopœia, as of singular efficacy in strengthening the stomach and bowels, and curing the cholera morbus, dysentery, and other diseases of the alimentary canal. It has been long used in the East Indies, though its history and native country were involved in much obscurity; some having supposed it to be a native of Colombo, in Ceylon, because of its name. It is now ascertained that it grows naturally in the thick forests that cover the shores of Oibo and Mosambique, as well as inland for several miles. The natives never cultivate it, the spontaneous produce being sufficient; after digging up the root, they cut it in slices, and, stringing them on cords, dry them in the sun. It is held in high esteem

by the people, who use it for the cure of dysentery, for healing ulcers, and as a remedy for almost every disorder. The late Sir Walter Farquhar, physician to the king, was very desirous to obtain the Colombo root in a living state, and, after many fruitless endeavours, made by his son, Sir Robert Farquhar, Governor of Mauritius, who was opposed by the Portuguese authorities on various pretences, but mainly because they were unwilling to permit the exportation of so valuable an article, he finally succeeded in obtaining, through Captain Owen, of his majesty's ship *Leven*, growing roots of the Colombo plant. These were distributed to the Mauritius, New Holland, the Seychelles Islands, &c. and it is thus to be hoped that this valuable plant may be naturalised in these countries, and that its culture may be rendered an object of industry and resource to the planters of the Mauritius.

864

COLOMBO PLANT.

5353. The second is the *Telfairia volubilis* (fig. 865.), a climbing plant lately discovered on the coast of Zanzibar, of very easy cultivation, and producing an esculent fruit, three feet long, and full of seeds as large as chestnuts (264 in one fruit), which are as

excellent as almonds, and of a very agreeable flavour: they also yield an abundant oil, equal to that of olives. It was originally brought by M. Bojer, of the Mauritius, from Pemba,

865

TELFAIRIA VOLUBILIS.

on the shores of Zanzibar, where it grows in the forests, enveloping the trees with its branches, and sometimes with a stem 18 inches in circumference. The seeds have been distributed to Bourbon and New Holland, and by the missionaries to New Zealand and Tahite. At Mauritius it has thriven so well, that it produced stems 30 feet high, and in the stove of the late R. Barclay, Esq. of Bury Hill, to whom Mr. Telfair sent seeds, it grew so luxuriantly, that the pruning knife was in constant requisition to prevent its filling the whole house. A plant so easy of cultivation must soon become common in all countries, and thus will Mr. Telfair have the honour of giving a most useful vegetable to mankind, as well as a name to a new and very beautiful plant.

5354. Our zoological knowledge of this portion of Africa is lamentably deficient. The whole extent of the eastern coast, from lat. 30° south to 10° north, has never yet been visited by the naturalist; and the zoology of Abyssinia and Egypt having already been noticed, leaves us nothing further to say on this head.

5355. This territory is generally occupied by *negro nations* in a state of barbarism, yet some of them numerous, and not destitute of arts and industry. The coast, however, has, in modern times, been chiefly in possession of two foreign powers. The Portuguese, when, in the close of the fifteenth century, they made their way round the Cape, found almost all the maritime stations in the hands of the Arabs, whom they called Moors, and whom they succeeded in driving successively from each, and occupying their place. It would be illusory to attempt delineating, under regular heads, the political, commercial, or social state of a region composed of such various parts, so imperfectly known; but, in a successive view of its local divisions, we shall endeavour to concentrate the little that modern observation has ascertained on the subject.

5356. Beginning from the south, we find *Sofala*, which at the time of the first arrival of Europeans was very important, as the emporium of the gold and ivory brought in great quantities down the Zambeze. Since Quillimane became the channel by which these commodities were conveyed, Sofala has sunk into a village of poor huts. The Portuguese, however, still maintain there a fort, which holds supremacy over the more southerly stations of Inhambane and Corrientes. An annual vessel comes from Mosambique, with coarse cotton and other articles, in return for which it receives gold, ivory, and slaves. The place is situated on a considerable river; but, in consequence of extensive sand-banks and shoals, which appear to have increased, it is difficult of approach unless for small vessels. The natives seem to be of the Caffre race, well armed, brave, and independent.

5357. *Inhambane*, to the south, has an excellent harbour, and is defended by a fort and 150 men. The other Portuguese do not exceed twenty-five; but there is a numerous coloured population. Few slaves are procured here, the natives being fierce and warlike; but about 100,000 lbs. of ivory, and some wax, are sent to Mosambique. Quillimane, at the mouth of the Zambeze, is now the chief seat of trade on this coast. From eleven to fourteen slave vessels come annually from Rio de Janeiro, and each carry off, on an average, from 400 to 500 slaves. The situation is swampy and unhealthy; but the population is nearly 3000, though only twenty-five houses are occupied by Portuguese or their descendants.

5358. *Mosambique* is the principal establishment of the Portuguese in Eastern Africa. Though it derive its importance from being the emporium of the gold, ivory, and slaves, brought down the Zambeze, it is situated about 300 miles from the mouth of that river, and the trade is in a great measure transferred to Quillimane. It is built on an island, which has a good roadstead and a commodious pier, but affords by no means either a convenient or healthy situation. The principal inhabitants have their houses at Mesuril, on the continent, at the extremity of the peninsula of Caboceiro. The trade in slaves, the most extensive, has been much diminished since the British obtained possession of Madagascar and the Cape, and laudably pro-

hibited the introduction of them into these colonies. The export is not supposed, by Mr. Salt, now to exceed 4000, sent chiefly to Brazil; yet Mr. Bowdich states the number in 1818 at 8164. The population is reckoned, by Mr. Salt, at only 500 Portuguese, 800 Arabs, and 1500 negroes; but the narrative of Captain Owen's voyage reckons the whole at 6000. There is a fort sufficient to defend it against the pirates who infest these seas, but not to secure it against the attack of any regular force. Yet the government-house displays still remnants of the former splendour of the viceroys of Eastern Africa. Like the custom-house, and other public structures, it is spacious, and built of stone, though falling into decay. The governor, and even his negro attendants, are richly loaded with golden ornaments; tea, to which the principal inhabitants are every evening invited, is presented in a full service of gold. The dominion of the Portuguese scarcely extends beyond the peninsula of Caboceiro: and they are with difficulty able, by alliance with the chiefs of Quintangone and Sereime, to make head against the Makooa, a populous and warlike tribe, occupying a great extent of the coast.

5359. *In the interior, on the Upper Zambeze*, the Portuguese possess merely the small forts of Sena and Tete, erected with a view to the protection of their trade, with two still smaller in the more remote stations of Zumbo and Manica. In these settlements, joined to that of Quillimane, they maintain 264 troops, and have a population of 500 Christians, with 21,827 slaves. The ground being generally fertile, and abounding particularly with honey, wax, senna, and other dyeing drugs, they draw from the land attached to these stations a revenue of 2,900,000 reis. Monomotapa, or more properly Motapa (since Mono is merely a general term for kingdom), has been dignified in the early narratives with the title of empire. If it ever deserved such an appellation, it is now broken into fragments, the largest of which is held by Changamera, who, under the title of Quiteve, resides at Zimbao, the ancient capital. He belonged to the Maravis, a race of daring freebooters, who neglect agriculture, and devote themselves entirely to plunder. Farther to the north are the Monjous, inhabiting the country which figures in the early maps as the empire of Monumugi. They are negroes of the ugliest description, of a deep shining black, with high cheek-bones, thick lips, and small knots of woolly hair on their heads. Their only weapons are bows and arrows. Manica is celebrated as the country chiefly affording the gold for which this part of Africa is famous. A Portuguese expedition, in 1569, penetrated thither: they found the mines by no means to answer their reputation, but to consist chiefly of gold dust in small quantities, embedded in sand and earth, from which the metal was laboriously extracted. A small fort, as already observed, is maintained in this district. The Cazembes, a numerous people far in the interior, are completely subject to the will of a despot; yet their country yields in abundance iron and copper, and is the seat of a very considerable trade in ivory and slaves. The Movizas are a comparatively peaceable and industrious race. The Bororos are a great people, reaching, it is said, nearly as far as Mombaza; but they are very little known.

5360. *In the coast north from Mosambique* occur the Querimba Islands, giving name to the opposite coast. They were laid waste by the Portuguese at their first arrival, but were afterwards repopled by colonists from Mosambique. They have suffered, however, by attacks from the Madagascar pirates. Quiloa, about 100 miles north-west from the bold promontory of Cape Delgado, was found by the Portuguese a great seat of power and commerce. About the end of the seventeenth century it was wrested from them by the Imâm of Muscat, whose officers have since governed it. It is now dwindled into a miserable village. Mombaza is situated on an island about three miles long and two broad, surrounded by cliffs of madrepore, which make it a kind of natural castle. The country is fertile in corn, and fit for the sugar cane, and the small shells called cowries are collected in great abundance on the shore. The harbour is excellent, and a considerable trade is carried on along the coast in dows, often of 250 tons burthen. Britain, for two years, maintained a factory there, but withdrew it in 1827. Melinda, long the handsomest and most flourishing city on this coast, has been completely destroyed by the Galla. Patta, once of great importance, is now much decayed, and a great part of its trade transferred to the neighbouring port of Lamoo. Parallel to this coast, at the distance of about twenty or thirty miles, are the small but fine islands of Pemba, Zanzibar, and Monfia. They are of coral foundation, but the surface is flat, and covered with a soil highly productive in grain and sugar. The climate, however, especially that of Zanzibar, is very unhealthy. They are partly independent, partly subject to the Imâm of Muscat.

5361. *Magadoxa*, called also Mukdeshu, is a considerable town, lying to the northward from Melinda. The prince having succeeded in maintaining his independence, and repelled all European intercourse, allows the country to be very little known. The British ship *Albemarle*, in 1707, sent a boat on shore, but it was detained, and never recovered; and a party from Captain Owen's vessel were kept in a species of prison. The city makes a handsome appearance from the sea, containing many lofty stone fabrics: but these belong to a part which, containing only tombs, may be called the City of the Dead. The habitations of the living are only low thatched huts. Brava, within the territory of Magadoxa, is also a port of some consequence. The whole coast, from Cape Delgado to the northern limit of Magadoxa, is commonly known by the name of Zanguebar. This territory, when discovered by the Portuguese, was occupied by the Sowhylese, a peaceable and industrious people; but the coast has now been mostly wrested from them by the Arabs of Muscat, while the whole interior is possessed by the Galla, the same ferocious race who have over-run Abyssinia, and who, in the course of a furious warfare, have destroyed every sea-port which was not protected by an insular position.

5362. *The coast of Ajan*, the Azania of the ancients, extends from the northern termination of Zanguebar to Cape Guardafui, where Africa ceases to border on the Indian Ocean. This tract is generally arid and sandy, though in the northerly parts it becomes hilly and fragrant, like the neighbouring one of *Berbera*. That coast, extending from Cape Guardafui to nearly the Straits of Bab el Mandeb, is situated on neither the Indian Ocean nor the Red Sea, but on an intermediate gulf, bounded on the opposite side by the coast of

Arabia. It is hilly and beautiful, and may be considered the native country of incense, myrrh, and odoriferous gums. The celebrity of Arabia, and particularly of Aden, for those elegant productions, is chiefly acquired by its large imports from this coast. The inhabitants consist of the various tribes of Somaalis, an active, industrious, and yet peaceful race, who export the productions of their own country, which is thus less known than it deserves to be. At the town of Berbera is an annual fair, where, according to Lord Valentia, there are sold 15,000 bahars (320 lbs. each) of gum, at 3*l.* 12*s.*; 2000 bahars of myrrh, at 4*l.* 12*s.*; frankincense, to any extent demanded, at 2*l.* 14*s.* Even gold and ivory are said to be brought from Hanim, a country situated twenty days' journey in the interior.

5363. *The country in the interior from this coast*, though most imperfectly known, appears to be occupied by the Galla and other tribes, who surpass in barbarism even the rest of Africa. Here, in a wild and mountainous region, is the kingdom of Gingiro, described by Antonio Fernandez as ruled by a despot, elected with strange and superstitious ceremonies, and who celebrates his accession by the death of his predecessor's ministers and favourites, with whose blood the walls and gates of the palaces are dyed. We stand much in need, however, of recent information respecting this part of Africa.

5364. *Adel, or Adaiel*, and Hurrur, form the most westerly part of this coast, and adjoin to the Straits of Bab el Mandeb. The inhabitants, united under the standard of the Mahometan faith, waged long and bloody wars, embittered by religious enmity, against Abyssinia. For a century back, their power has been broken, and they have been divided into a number of small separate states. Zeyla, the capital, is a place of considerable trade, and, though irregularly built, contains some good habitations.

CHAP. IX.

CENTRAL AFRICA.

5365. The appellation of *Central Africa* may with propriety be given to an extensive and fruitful region, in the most interior part of that continent. Consisting of spacious plains, watered by noble rivers, and begirt on the south by lofty mountain chains, it forms one of the finest countries on the globe, and is inhabited by nations who have made considerable progress in industry and civilisation. Separated, however, from the sea-coast, and from the rest of the civilised world, by immense deserts tenanted by fierce and warlike banditti, it remained till lately almost unknown to Europeans, who heard only by vague rumour of its beauty and wealth. It is only within the last forty years that the daring enterprise of British travellers has traversed this region, and purchased, at a costly price, a tolerably accurate and extensive knowledge of it.

SECT. I. *General Outline and Aspect.*

5366. *The extent and boundaries* of a region like this, composed of various detached states and kingdoms, are exceedingly vague. From Western Africa it is separated by the limits already delineated (p. 1210.). On the north it has the uniform boundary of the Great Desert, into which its fertile plains pass by rapid gradations. On the east, the great expanse of the lake Tchad, the sea of interior Africa, separates it from countries almost wholly unknown. The southern boundary, formed by tracts still more completely unexplored, cannot be drawn with any approach to precision. On the whole, however, we may esteem Central Africa as lying between the 15th degree of east and the 4th of west longitude, and the 8th and 16th of north latitude. It may thus include 1300 miles in length, and 560 in breadth, and form a square surface of about 700,000 miles.

5367. *A continuous chain of mountains*, celebrated by the ancients under the appellation of the Mountains of the Moon, traverses the whole territory from east to west. It exerts a most beneficent influence in diffusing through this region coolness and moisture, and redeeming it from that arid desolation to which so great an extent of the continent is doomed. These mountains appear first on the western coast near Sierra Leone, where their lofty peaks, called the Mountains of the Lions, overlook the Atlantic. They then traverse the countries of Foota Jallo and Kankan, giving rise to the Senegal and Gambia; while the Niger, in its upper course, flows through their deep valleys. In this quarter the range is not very lofty, but presents a varied and picturesque aspect. Park, in passing through Konkodoo and Satadoo, was much struck by the appearance of its glens and precipices, and the variety of forms which the rocks assumed, resembling ruined castles, spires, and pyramids. One granite mass had exactly the aspect of a Gothic abbey, with niches and ruined staircase. The same chain was crossed by Captain Clapperton, in the country of Yarriba, where its highest pinnacles were only between 2000 and 3000 feet; but the passes were exceedingly narrow and rugged, enclosed by huge granite blocks 600 or 700 feet high; yet every level spot was covered with fine crops of yams, millet, and cotton, and large towns were built on the very summit of the ridge. Farther to the east, these mountains afford an opening, through which the Niger, swelled to a river of the first magnitude, forces its prodigious mass of waters; but their cliffs overhang the river, which dashes roughly over the rocky bed that it has worn for itself. Farther east still, south of the great plain of Houssa,

Lander, in returning from his first journey, learned the existence of a very elevated region, inhabited by a savage race. But this chain appears to attain its greatest magnitude and loftiest height in the region south of Bornou. From the plain of Mandara (*fig. 866.*) above

MOUNTAINS OF MANDARA.

the capital, Mora, its bold steeps were seen rising, not more, indeed, than 2500 feet high; but they were understood to extend far southward, and to become much more elevated. This was confirmed by the appearance of several remote peaks in that direction, particularly one said to be thirty-five miles distant, and which had a most alpine character, much resembling the aiguilles of Mont Blanc, as seen from the Mer de Glace. They were known even to the rude natives by the classic appellation of the *Moon Mountains*.

5368. *The rivers*, which derive their supply from this great mountain range, form a still more grand and celebrated feature. The great stream of the Niger, long involved in such deep mystery, has at length, through the persevering exertion of British travellers, been very completely explored. Its source, though not actually visited, seems ascertained by Laing to exist in the high country of Kissi, about 200 miles in the interior from Sierra Leone. Thence it rolls through Fouta Jallo and Kankan, where Caillié describes himself to have found it a rapid and considerable stream. At Bammakoo, having received the tributary from Sankari in Manding, which Park mistook for the main stream, it begins its course over the fine plain of Bambarra; and at Sego, the capital, is described to be as broad as the Thames at Westminster. In this country it is called the Joliba, but lower down receives the name of the Quolla, or Quorra. Beyond Bambarra it flows through the lake Dinnie to Timbuctoo; and its course from that city to Youri is proved by the fact of Park having navigated from one place to the other. As far as Timbuctoo the Niger has flowed north and north-west; but beyond that city it changes to the south-east and south. From Youri, its course, traced by Lander, is, with some winding, almost due south, till, at Kirree, about 170 miles from the sea, it begins to separate into branches, and forms a delta, the greatest, undoubtedly, in the world, whose estuaries extend along the coast from the river Formosa to that of Old Calabar, a space of about 300 miles. The whole line of this noble river, allowing for all its windings, can scarcely be reckoned at less than 3000 miles, and for several hundred miles of its lower course it forms a magnificent expanse, resembling an inland sea. Thus, though it cannot rank with the Missouri and Orellana, those stupendous floods of the New World, it is at least as large as any of those which water the old continents.

5369. The *tributaries of the Niger* are of peculiar magnitude and importance. At no great distance above the point where the delta commences, the Tshadda, or Shary, nearly equal to the main stream, enters, after watering large and fruitful kingdoms, and having formed the theatre of an active navigation. At no great distance above, it receives a smaller tributary, the Coodonia, which was seen, by Lander, flowing through a fertile and highly cultivated country. Considerably higher is the Cubbie, a large stream, from the city and country of that name; and higher still the Quarrama, which has passed by Zirmie and Sackatoo. Between this point and Timbuctoo, we have no means of knowing whether any rivers fall into the Niger. The tributary which passes that city is of no great importance; but at the eastern boundary of Bambarra, Park describes the influx from the south of two great streams, the Maniana and Nimma. Those which fall in during the earlier part of the course consist of numerous mountain torrents, which swell the river, without themselves possessing very great importance. All the rivers in the eastern part of Central Africa fall into the great receptacle of the lake Tchad. The principal one is another *Shary*, the early course of which is unknown. Major Denham saw it at its mouth, where it was about half a mile broad, and flowed at the rate of between two or three miles an hour. Forty miles up, it was seen rolling in great majesty and beauty; but was not traced any higher. The Yeou, rising in the hills of Dull, to the south of Houssa, flows first north and then east through Bornou, till it falls into the western side of the Tchad. Even at the junction it was only about fifty yards broad in the dry season, and, though of great value for fishery, does not afford the means of any extensive trade.

5370. In regard to *lakes*, the Tchad is greatly pre-eminent, situated in the most central part of the continent, and on the frontier of Bornou. It may be about 200 miles in length and 150 in breadth, and forms thus one of the greatest bodies of fresh water in the world, though it cannot equal the mighty inland seas of Asia. The dimensions are augmented in an extraordinary degree during the rains, when a surface of many miles, usually dry, is laid under water. This inundated tract, when deserted by the waters, is covered with impenetrable thickets, and with rank grass of extraordinary height, and, though unfit for the residence of men, becomes a huge den of wild beasts. The lake contains numerous large islands, some of which are the residence of tribes and even nations. The Dibbie, or Dark Lake, formed by the Niger between Jenné and Timbuctoo, appears not nearly so large, since M. Caillié, in sailing across it, lost sight of land only in one direction. The other lakes yet known to exist in this region are small and local objects, though sometimes very picturesque.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5371. *Soudan, or Nigritia*, in the central and more elevated districts, affords *granite, gneiss, mica slate, clay slate, quartz rock, hornblende rock, limestone, &c.* These deposits are variously traversed by greenstone and other trap rocks. At Goree there are fine displays of columnar basalt. Great tracts of flat country extend to the eastern limit, including Soudan, of which the kingdoms are Houssa and Bornou. In the flat and desert regions, *salt lakes* and *natron lakes* occur. Beds of rock salt are also met with. The salt is arranged in beds several feet thick: it is mined into large slabs, which are afterwards sawn into blocks for the market. These mines form the riches of the country. *Gold* is found in different parts of Africa, but most abundantly in this region, which furnishes most of the gold which is sold on the western coast of Africa, as well as that which is brought to Morocco, Fez, Algiers, Cairo, and Alexandria. According to accounts furnished to Mr. Jacob, from the records of the late African Company, the whole quantity of gold brought to England by ships of war, from the year 1808 to 1818, both included, amounted to 81,905 ounces. Of this, in the seven years of war, from 1808 to 1814, there were 51,569 ounces, valued at 205,340*l.*, and in the following four years of peace, 30,569 ounces, valued at 125,380*l.* The eastern coast of Africa, where the Portuguese still retain some settlements for carrying on the slave trade, may be slightly noticed. According to some authors of the sixteenth century, Melinda, Sofala, Mozambique, and other tracts on that side of Africa, afforded large quantities of gold; but their accounts are not to be implicitly relied on. Mr. Salt, the latest traveller, who visited those places in 1809, represents their present supply of gold as very inconsiderable and has removed much of the delusion which prevailed respecting the ancient produce of that metal. After remarking that the only way by which gold is now procured is by washing the sands of the rivers, he says, "In this manner a considerable quantity is still annually accumulated, though it seems to be rapidly decreasing; for, in 1593, the governor of Mozambique collected for himself and the viceroy of India 100,000 crusades (a crusade is worth about 2*s* 6*d.*), and I do not believe that one third of this amount is now altogether annually produced."

SUBSECT. 2. *Botany.*

5372. *There are as yet no materials* for delineating the Botany of this part of the continent, which probably does not differ much from that of the western coast.

SUBSECT. 3. *Zoology.*

5373. *The little yet known on the Zoology of Central Africa* will scarcely allow of its being treated under a distinct head, particularly as it appears blended with that of Nubia and Abyssinia to the east, Congo and Sierra Leone to the west, and Southern Africa to the south. There are a few quadrupeds, however, stated to inhabit the inland provinces more particularly, and which we shall briefly notice:—

Manis longicauda. Long-tailed Manis.
Phascogærus africanus. Ethiopian Boar.
Camelopardalis antiquorum Sw. The Northern Giraffe.

Camelopardalis australis Sw. The Southern Giraffe.
Aligocerus grandicornis Sm. Long-horned Antelope.
Gazella corinna Sm. Corinna Gazelle.

Antelope forfex. Gambian Antelope.
Antelope adenata. Kob Antelope.
Neotragus pygmaea Sm. Pygmy Antelope.
Damalis senegalensis Sm. Roha Antelope.
Bos Pegasus. Pegasse.

5374. *The Manis* is analogous to the American Armadilloes, being, like them, entirely covered with an impenetrable coat of mail; this, however, is disposed not in rings, but like the scales of a fish. *The Ethiopian Boar* is a hideous animal, with long tusks and fleshy protuberances on each side of the head. *The Great-horned Antelope* is a species deserving the attention of future travellers: its horns, which have only yet been seen in Europe, are erect, with the point bent back, and are no less than two feet and a half long in a straight line. The animal is supposed to inhabit the interior of Western Africa. *The Gambian Antelope* has been also brought from the same region; its aspect is peculiarly soft and engaging, but it is uncommonly shy. *The Pegasse* is a species of Buffalo, inhabiting the interior of Congo and Angola, and thus intimated by two of the Catholic missionaries, Galleni and Carl:—"On the road to Loando, in the kingdom of Congo, we saw two Pacasses, roaring like lions, the male and female being always together. They are white, with rufous and black spots, with ears half a yard in length, and the horns straight. When they see human beings they do not flee, nor do they harm, but stand and look on." This vague account would not have deserved notice, had not Major Hamilton Smith detected a drawing of this very rare animal among those which formerly belonged to the great and famous Prince Maurice of Nassau, now in the Berlin library. *The Eland* is the only antelope on which a quantity of fat is found sufficiently hard to make candles.

5375. *The Giraffe* will be here noticed, as a genus whose geographic range appears more especially confined to the inland parts of Africa. The ancient writers appear to have understood these quadrupeds much better than the moderns; for Jonston was not only well convinced of their existence, but he figures several which he supposes are distinct species. The new and valuable information on the Giraffe of Northern Africa, published by Rüppell, first led us to suspect that it was, in reality, a distinct species from that of Southern Africa, and this idea has been fully confirmed by a further investigation of the subject, and by verbal information communicated by Mr. Burchell. We cannot, in this place, say more on this interesting discovery, the details of which we propose communicating to the public through a more appropriate channel. It will be sufficient to observe that the Giraffe of Northern Africa (*C. antiquorum* Sw.) was known to the Romans; but the moderns long doubted the existence of such a quadruped, until the Dutch traveller, Colonel Gordon, and our own countryman, Paterson, found the Giraffe of Southern Africa (*C. australis* Sw.), and brought its skin to Europe. In an adult state the latter is said to be sometimes near twenty feet high, and the specimen in the British Museum, brought home by Mr. Burchell, measures seventeen feet and a half. In a state of nature the manners of both, as far as we yet know, are nearly similar. They live in small families, principally in the plains of the interior, where there is occasional herbage or succulent vegetation. Their ordinary food, however, is the leaves of the mimosa trees. Their gait, when walking, is rather stately than awkward: but, as Le Vaillant well observes, it is ridiculous enough to see them trot, for the Giraffe then resembles a limping beast, with the head perched at the extremity of a long neck which never bends, swaying backwards and forwards; the head and neck playing in one piece between the shoulders, as on an axis. Their short horns appear useless as means of defence, but they kick with prodigious force, and the jerks are so quick, that the eye cannot count them. (*Vaill. Trav.* ii. 279.) The disposition of the Northern Giraffe is remarkably gentle; nothing can exceed the mild and beautiful expression of its full dark eye. It is certainly the most interesting quadruped we ever beheld; and we considered a journey to Paris well recompensed, had it only afforded us the gratification of contemplating the noble Giraffe, now living (1833), in perfect health, in the Garden of Plants, where Mr. Landseer sketched the figure given at p. 1179.

SECT. III. *Historical Geography.*

5376. *The history of this extensive region* is altogether unknown till the twelfth century, when, during the flourishing period of Arabian literature, the eminent geographers Abulfeda, Edrisi, and others, described the settlements formed by their countrymen on the southern side of the Great Desert. The Arabs appear to have migrated thither in numerous and probably successive colonies. The movement took place chiefly in consequence of the contest between the dynasties of the Abbasides and Ommiades, when the vanquished party sought refuge in the remotest extremities of Africa. Being probably possessed of superior skill in the military art, they easily prevailed over the undisciplined natives, and established powerful states along a river, which they called the Nile of the Negroes, but which appears to be only the Zirmie, or Quarrama, a tributary to that which we call the Niger. The principal kingdoms were Ghana (Kano), and Tocrur (Sackatoo), while to the east was the powerful negro state of Kuku (Bornou). The court of Ghana displayed a splendour, derived chiefly from the gold imported from the countries in the south, which appeared dazzling even to those who had witnessed the greatness of Bagdad and Cairo.

5377. *Various revolutions*, only imperfectly reported to us, appear since that period to have agitated this part of the continent. In general, one powerful chief seems to have aspired at, and in a great measure attained, a supremacy over the others, of which he was speedily deprived by the revolutions to which these turbulent states are liable. In the fourteenth century, Leo Africanus, visiting Timbuctoo, found it in possession of Izchia, a powerful chief from Morocco, who held then the chief sway over Ghana and the principal countries of Central Africa. At the end of last century, Mr. Lucas understood that Cassina had gained the supreme rule over the Mussulman states in this quarter. About the beginning of the century, however, Danfodio, chief of the Fellatahs of Sackatoo, not only asserted his independence, but made himself master of all Houssa, then conquered Bornou, and finally extended his dominion westward as far as the Niger. The Fellatah empire, thus founded, has since, however, suffered much dismemberment. The standard of independence was raised in Bornou by a native of Kanem, who, under the title of Sheikh el Kanemy, drove out the invader, and assumed the real sway over the country. In the heart of Houssa, Goober, Zegzeg, and other countries, have thrown off the yoke. Yet the Fellatahs, under other chiefs, are extending their conquests to the westward, and have even passed the Niger into Yarriba. Timbuctoo, meantime, has long lost the supremacy it possessed in the days of Leo. It became even tributary to the emperor of Morocco; and, though it has shaken off this yoke, the king's dominion does not now extend beyond the city and its immediate vicinity. Bambarra, when visited by Park, was found the most extensive and powerful kingdom on the upper course of the Niger; but it has since been dismembered by Sego Ahmadou, a Foulah chieftain, who has obtained possession of the flourishing city of Jenné, and the surrounding territory.

SECT. IV. *Political Geography.*

5378. *The government in the countries of Central Africa is completely despotic*; and in the native states the homage paid to rulers and grandees is even more abject and debasing than in any civilised empire. In Eyeo, the greatest lords, when they approach the sovereign, throw themselves flat on their faces, kissing the earth, and piling heaps of dust upon their heads. The sacrifice, on the death of any prince or chief, of his principal officers and favourite wives, though not carried to the same bloody extent as in Ashantee and Dahomey, is considerably prevalent in Eyeo and other native states. Yet the greatness of the monarchs is not supported by much of outward pomp and state. Their mansion, usual attire, and daily habits, differ little from those of their meanest subject. The king of Youri, one of the greatest of these potentates, received the English mission in a small square spot, which might be compared to a clean English farm-yard; and his audience of leave was given in an apartment unswept and dirty, with swallows flying about, and a number of naked girls and boys passing and repassing. The king of Wawa, to give his state reception, placed himself in a niche of the city wall. The pomp of the sovereign consists chiefly in the multitude of his wives; and it was the boast of the king of Eyeo that his queens, linked hand in hand, would reach from one end of the kingdom to the other. These ladies, however, are in a very different situation from that which in Europe is suggested by the word

queen: slave would be the more appropriate, so varied are the services of every description exacted from them. They act as body guards, perform the most menial offices, and are seen in every part of the kingdom, carrying on their heads heavy burdens from place to place, favoured only with an exemption from tolls. The Mussulman princes maintain courts more resembling those of Northern Africa, with fewer wives, and those more secluded, preserving greater pomp and exercising equal power, but not exacting the same degrading testimonies of homage. We may observe, moreover, that each city enjoys a species of municipal government, which, particularly in some parts of Bambarra, has even somewhat of a republican constitution, the mansa or governor being elected by the body of the people.

5379. *The revenue of these princes* does not appear to equal their power, or even to be derived from any regular source, if we except the dues exacted from the caravans. They enrich themselves by presents, and thus particularly appear to accumulate such an extravagant number of wives. They also carry on a good deal of traffic, and scruple not to employ both power and stratagem in turning it to their own advantage. Lander scarcely met one prince from whom he did not experience every species of roguery and extortion. The treasures thus acquired consist chiefly in articles of show and ornament, which are piled in huge heaps for the sake of boastful exhibition. Their peculiar delight is to display these to important strangers, as a child does his toys and gewgaws.

5380. *The armies of these princes* consist chiefly of turbulent militia, taking the field on the summons of the prince, and supporting themselves by plundering the country through which they pass. The cavalry of Bornou and Begharmi have a very martial appearance, the horses being small and active, and, as well as their riders, completely enveloped in chain and sometimes in plate armour. Unfortunately they want the power of standing any brisk charge from an enemy, but on every such occasion take precipitately to flight. They are serviceable only when the victory has been decided, and all the enemies' backs are turned, when they are very active in cutting down and plundering the fugitives. The

KANEMBOO SPEARMAN.

Kanemboo spearmen (*fig. 867.*), organised by the present sheik of Bornou, form the most regular and effective force in interior Africa. They march by tribes, almost naked, with only a skin round the waist, their only arms being a long shield with which they ward off the arrows of the enemy, and a spear with which they press forward to charge him; yet they have much of the organisation of a regular army, maintaining in front a chain of piquets, and the sentinels passing the war-cry along the line. The Fellatah archers, and those of a very rude people called the Mungas, fighting with poisoned arrows, have shown themselves very formidable; yet Lander saw the army of Sackatoo, 50,000 or 60,000 strong, employed in the siege of Coonia, a rebel city: but only a few chiefs, dressed in quilted armour, made some display of valour; the others, upon being struck by a false alarm, took precipitately to flight, upsetting every thing in their way, most of the men and animals tumbling over each other, and rushing together to save what they could by flight. A camp, as elsewhere seen by Clapperton, was like a village, composed of a number of huts, resembling bee-hives arranged in regular streets; and was "filled with weavers, tailors, women spinning cotton, others reeling off; some selling foofoo and accassons, others selling yams and paste; little markets at every green tree, holy men counting their beads, and dissolute slaves drinking roa bum." The musket is almost wholly unknown in the wars of those nations. The greatest monarchs have only a few, which they keep as objects of pride and curiosity. The Arab caravan followers, armed with those weapons, and possessing a certain degree of discipline, are superior to thousands of their opponents, and often decide the battle between the mightiest monarchs.

SECT. V. *Productive Industry.*

5381. Almost the whole of this extensive region may rank with *the finest and most fruitful* on the surface of the globe. Though placed nearly beneath the line, and scorched by the intensest rays of a tropical sun, it suffers from this cause less than almost any other country in the same situation. The great chain of mountains by which it is traversed in some degree tempers the severity of the heat, and, by the numerous streams which they pour down, affords throughout the means of irrigation. Even their declivities, sometimes to the very summit, are covered with copious harvests. Thus nearly the whole territory is fitted for the productions of the tropical, and, through the variety of surface, occasionally even of the temperate, zone.

5382. *Agriculture* is practised over the whole of Central Africa, though not by any elaborate or scientific processes. The plough appears never to have passed the desert; the only instrument for turning up the ground being the hoe, which does little more than scratch the surface; yet this slight tillage, on grounds moistened by inundation or artificial watering, is sufficient to produce abundant crops. It has even been doubted whether a deep furrow would not be injurious, by laying the ground too open to the influences of the tropical sun. Considerable pains are bestowed upon irrigating the grounds; and in Houssa the grain is stored in large granaries raised on poles, as a security from the insects. Watch is diligently kept to scare away the numerous birds which would devour the grain. In Bornou, indeed, the imperfect industry of the people produces only gussub, a species of millet, which, instead of being formed into bread, is merely boiled into a paste. So supine is their culture, that in this fine climate they do not rear a vegetable of any description, except a few onions; nor a fruit except limes, and those only in the garden of the sheik. In Houssa, however, two crops of wheat are raised in the year, and the markets are abundantly supplied with fruits and vegetables. Rice is produced copiously on the inundated banks of the Niger, particularly in the kingdom of Youri. Cotton, the material of the staple and universal manufacture, is every where grown, and the beautiful and valuable fabrics woven from it, afford a presumption in favour of its quality. Indigo for dyeing is produced in great abundance, and excellent. Oxen are reared in great numbers, and often of very valuable breeds, but almost exclusively by the Arabs and Fellatahs; and there appears a presumption that they have been imported by these races from Northern Africa, since in the districts purely negro, the domestic animals consist only of sheep, goats, pigs, and poultry, reared often beneath the same roof with their owners. The forests and the inundated swamps on the great rivers abound with wild animals, — the lion, the elephant, the leopard, the hyena, — which commit formidable ravages; yet their spoils form frequently objects of trade, particularly the tusk of the elephant, composing the valuable substance of ivory. The swarms of insects are tormenting, and sometimes even dangerous; but the bees afford an abundant supply of honey, the chief dietetic luxury. Gold is extracted in considerable abundance from the sands of almost all the streams that descend from the western part of the great mountain chain.

5383. *Manufactures* are not numerous, but carried on with considerable skill and activity. The most important, by far, is that of cotton cloth, which is said to be beautifully woven, and skilfully dyed with fine indigo. This appears to be quite a negro manufacture, being carried to the greatest perfection in countries occupied exclusively by that people; Loggun in the east, and Nyffé westward on the shores of the Niger. The manufactures in Houssa are chiefly conducted by slaves from the latter country. Denham describes the people of Loggun as steeping their cloth thrice in indigo, then laying it on the trunk of a large tree, and beating it with wooden mallets, till it acquires the most brilliant gloss. Mats, being universally used to sit and sleep upon, form also an extensive branch of manufacture, which is carried to peculiar perfection at Rabba in Nyffé. The gold found along the western part of the chain of mountains is worked with considerable skill into rings and ornaments.

5384. *Commerce*, throughout this region, is carried on with considerable activity, though in modes somewhat peculiar. Maritime trade is precluded by its situation, far distant from any coast. Even river navigation is not practised with much diligence, unless on the Niger, and that chiefly on its lower course, as it approaches the sea. Waggon's are unknown, and would perhaps be too cumbrous for the rude tracts through which they would have to be conveyed. Single travellers, also, could not proceed with safety through routes of such length, many parts of which are beset by predatory tribes. Commodities are conveyed by large troops, sometimes resembling little armies, called caravans, kafilas, or coffles. Those which pass between Northern and Central Africa, across the immense expanse of the desert, employ camels, whose patience of thirst, and their soft and elastic hoofs, almost exclusively fit them for travelling over this wide surface of sand. In the rugged and mountainous tracts, burdens are chiefly conveyed by means of asses; but in the great fertile plains of Houssa and Eyeo, the human head is the most frequent vehicle: those of females, not excepting the wives of the great men, and even of the monarch, are decidedly preferred. These fair bearers have been seen carrying with alacrity loads which it required the labour of three men to place on their heads. The African caravan merchant is a very different person from him who, while his vessels are traversing the ocean, remains seated in a snug counting-house, reckoning the silent accumulation of his profits: he must accompany his investments to their remotest destination, through desolate tracts, the domain of warlike and ferocious tribes. Passing through regions which own no law but that of the strongest, he is obliged to arm himself and his followers, and to defend as a warrior what he has earned as a merchant. Unhappily, he is often tempted to imitate those with whom he contends, and to consider plunder as a cheap and even not dishonourable mode of completing his assortment of goods. He holds himself thus equally ready, according to circumstances, to act as thief, pedlar, merchant, prince, or warrior. His band being armed with muskets, and forming a little standing army, are truly formidable to the nations of interior Africa. They form there a sort of state within the state, and are at once courted and dreaded even by great sovereigns. As commodities, in crossing the desert, rise in value from 150 to 500 per cent., and sometimes are procured by mere violence, the merchant who passes safely through a series of such adventures acquires immense wealth, and can often rival the pomp of princes. The caravans which traverse on foot the negro countries in the west, and which consist in a great measure of females, though often very noisy, and addicted to convivial and even dissolute habits, bear by no means the same warlike character. The female traffickers act not merely in a servile capacity as bearers, but carry on extensive transactions, and acquire considerable property.

5385. *The commodities* conveyed across the desert, and exposed for sale in the markets of Central Africa, are chiefly of a showy and ornamental kind: coarse woollen cloths of gaudy colours, and red silk thread to be woven into their cotton robes; coarse French writing paper, beads, rings, and ornaments made of silver, glass, coral, amber, and even pewter; and with regard to the material of these articles imposition is very easily practised. Scissors and knives, with other iron implements, and, still more, arms, are in constant demand. A welcome is even given to the gaudy cast-off dresses of the Mamelukes, and to the old sword-blades of the knights of Malta. Salt, in large quantities, is brought from pits in the interior of the desert; and goora or kolla nuts, — a favourite luxury, which is even called the African coffee, — are transported from the western to the eastern parts of this region. The returns made to Northern Africa from Timbuctoo consist partly of gold and ivory; but slaves are the chief article sent from thence, and almost the sole one from Houssa and Bornou. These unfortunate victims are caught by armed expeditions in the mountainous regions to the south, the inhabitants of which, being mostly pagan, are considered by orthodox Mussulmen as lawful prey. These inroads are undertaken not by private marauders, but by powerful chiefs, and even by the greatest princes. On occasion of the marriage of the sheik of Bornou with the daughter of the sultan of Mandara, a combined expedition was sent against the Musgow nation, which, after a desperate struggle, brought in 3000 slaves; and the nuptials were celebrated with barbaric pomp, furnished out of the tears and captivity of so many victims.

5386. *Neither roads, canals*, nor other modes of improving the interior communications, are employed in this region. The routes are merely spaces left vacant, and beaten by the continued tread of men and animals. They are often encumbered by swamps, trees fallen across, and even by the large nests of white ants. Where they are crossed by broad rivers or lakes, a large raft is placed on the bank, by which, not without some difficulty and danger, the caravans are ferried over.

SECT. VI. *Civil and Social State.*

5387. *The state of society*, though it has not passed the limit of what must be denominated barbarous, has yet made a greater approach towards civilisation than among any other African nations, except those which border on the Mediterranean. Nor is this solely owing to the migrations from that region, though these have been numerous, and a great part of the population is derived from them. The states purely negro, which have imbibed no portion of Arabic religion and literature, have made nearly an equal advance in arts and improvements. The total absence, however, of alphabetic writing, and of any written or even painted records, seems to place these last decidedly beneath the least improved among the great nations of the Asiatic continent.

5388. *In the moral existence of the African* there are many very dark features. War is carried on with all the ferocity of the most barbarous nations; many tracts, formerly flourishing, were seen, by the recent travellers, reduced by it to a state of entire desolation. Another deep blot is the extensive prevalence of robbery, practised not merely by desperate and outlawed individuals, but as the great national and state concern of almost every community, great and small. In other parts of the world, robbery is carried on by the poor against the rich: in Central Africa, it is equally or more by the rich against the poor; for there, he who is destitute of every thing else, has at least himself, who, converted into a slave, forms the richest booty that can tempt the plunderer. The treatment of the numerous bands of captives who are conveyed across the desert is also attended with many circumstances of remorseless cruelty. Yet it must not be concluded that an unbroken gloom hangs over the moral condition of Africa. There seems even to be something peculiarly amiable and engaging in the social feelings and habits there prevalent. Warmth of friendship, hospitality, and humanity, are virtues of which Park and other recent travellers have given many shining instances. They are furnished even by Moslems, notwithstanding the hostile feelings cherished by a bigoted creed. When Major Denham was fleeing from battle in a naked and miserable state, a young African prince pulled off his own trousers, and bestowed them upon him. Both Clapperton and Lander paint the Fellatah shepherdesses in the most

engaging colours ; describing their dress as arranged with taste, their hair braided with peculiar neatness, their manners artless and simple, their conversation at once modest and full of kindness.

5389. *In regard to religion*, the nations of this region are pretty equally divided between two systems, the pagan and Mahometan ; one native, the other introduced by migration and intercourse from Northern Africa. The Niger, in a general sense, forms the boundary of Moslem influence, which has, however, penetrated at several points beyond that river. The Fellatahs, who form the ruling people in the fine territory of Houssa, appear to have migrated from Egypt and Barbary, bringing with them the Mahometan religion. The people of Bornou, and of the adjacent countries of Mandara and Begharmi, have been converted to this faith, and profess it with a still more bigoted zeal. The Christian travellers were considered by them not only as doomed to perdition, but as destitute of any claim to the rights and courtesies of humanity. One fixed article of belief among all these nations is, that they may lawfully reduce to slavery all the *kerdies*, or pagans, who people the southern mountain districts. In other respects, they do not strictly conform to the recluse and contracted habits of life generally prevailing among nations of this profession : the females are not closely immured ; intoxicating liquors are not rigidly abstained from ; and various amusements which it proscribes are indulged in without scruple. The pagan tribes are free from this intolerant spirit ; but their superstition is mean and puerile in the extreme, consisting in implicit reliance upon fetiches, charms, and amulets of the most ridiculous nature. The barbarous system, also, of human sacrifice, though prompted by the extravagant veneration in which their great men are held, has evidently an intimate connection with superstitious impressions.

5390. *Learning*, throughout Central Africa, appears in a very depressed state. The reading even of the Koran is confined to a very few of the great *fighis*, or doctors. Its verses are chiefly employed as amulets to secure triumph over enemies, or success in the different pursuits of life. Its contents are frequently imbibed by writing the characters with a black substance on a wooden board, washing them off, and drinking the liquid. The Arabs, who possess somewhat greater information, often practise most scandalous impositions on the credulity of the negroes. The princes, both in Bornou and Houssa, show a disposition to enquire into and cultivate the arts and sciences ; but they have no channel of information, unless from Barbary, where these pursuits are in an almost equally depressed state. Sultan Bello and his minister had each a library, but no communication has been made to us as to the contents of either. Yet extemporary poetry, sung by the composers, is repeated at almost all the African courts. Singing men and singing women are constant attendants on the chiefs and caboceers ; and their songs, though conceived probably in terms of the grossest flattery, appear to contain a large portion of national history. The Arab caravan drivers also cheer their long expeditions by reciting poems, where the talent displayed is often considerable, and is derived less, probably, from any acquired literature, than from the excited state of passion and feeling, which arises in a life of wild and wandering adventure. In the most improved of the native states, there appears to exist a considerable taste for sculpture, and in their edifices, the doors, with the other ornamental parts, are adorned with pillars, on which are carved the exploits of their warriors, combined with the various movements of favourite animals.

5391. *The amusements of these nations* are not extremely refined. Wrestling and gaming are favourites in Bornou. The wrestling exhibitions are made by slaves captured from the neighbouring and hostile countries of Begharmi and Musgowy. The masters place their pride in the victories achieved by these slaves, cheering them during the combat, and often on a favourable issue throwing to them valuable robes and other presents. A powerful wrestling slave will sell for 100 dollars ; but a defeat, the disgrace of which is never forgotten, causes him to fall at once to four or five. Ladies, also, even of rank, delight in a strange exercise, where they beat particular parts of the body against each other with such force, that the vanquished party is thrown flat on the ground. The principal game, and one skilfully played, is a species of rude chess, carried on by beans, with holes made in the sand. At Kano, the most flourishing of the cities of Houssa, boxing is practised with some science, and such excessive fury, that a thorough set-to not unfrequently terminates in the death of one of the combatants. The performers exhibit for pay ; and when Captain Clapperton hired a party, the whole population, male and female, quitted their occupations, and thronged to view their favourite spectacle. In Eyeo, there is a species of dramatic exhibition, consisting, however, merely in a display of mimicry, tricks, and buffoonery. Persons enclosed in sacks pursue each other with surprising agility ; out of one comes a representative of the boa constrictor, who exhibits an excellent imitation of the movements of that animal ; there was also exhibited to Captain Clapperton the "white devil," a caricature of the European ; a thin figure, painted white, shivering with cold, and performing very naturally a variety of movements which appear strange in the eye of an African. We may conclude with dancing, which, over all native Africa, is the standing and universal amusement, continued often for whole nights, and practised in every form,

from slow movements resembling the stately minuet, to curvets that might rival those of Grimaldi. Even the kings place a peculiar glory in their skilful performance of this exercise; to be an expert dancer is thought almost as flattering as to be a successful warrior; and even those monarchs, whose advanced age disqualifies them from any real eminence in this performance, strain every nerve, by elaborate displays of it, to extort the flattery of their subjects.

SECT. VII. *Local Geography*

5392. *The eastern part of this territory, comprising the kingdoms of Bornou, Mandara, Loggun, and Begharmi, will be most convenient for commencing our survey of its local divisions.*

5393. *Bornou, one of the most powerful kingdoms of Central Africa, extends about 200 miles in every direction, on the westward of the great inland sea of the Tchad. The extent of that sea, and the variations on its surface, have been already described. When, in consequence of the rains, its waters swell, and overspread the large encumbered tract abandoned during the dry season, the numerous bands of wild animals which it harboured, elephants, lions, panthers, and hyenas, are obliged to quit their cover, and seek their prey among the habitations of men. At this disastrous period, travellers, and the slaves employed in watching the corn-fields, often fall victims to their fury; the hyenas have even been known to force their way into walled towns, and devour the herds that had been driven into them for shelter.*

5394. *With the exception of this peculiar district, Bornou, watered by the tropical rains, and often partially inundated, is a very fertile country. The soil, after being merely scratched with a hoe by the female slaves, and the seed scattered, rather than sown, yields very considerable crops. Cities, containing from 10,000 to 30,000 inhabitants, and many walled towns, rise along the shores of the lake. The markets present a most crowded scene, the principal one at Angornou attracting sometimes 100,000 people. Yet the nation is remarkably deficient, not only in refined and intellectual pursuits, but in the humblest of the useful arts. Instead of wheat or rice, they raise *gussub*, a species of small grain, which, being boiled to a paste, and having melted fat poured over it, is in Bornou considered the most delicate of dishes. Even iron tools, notwithstanding their value to a martial people, are handled in the most clumsy manner. The only fabric in which they have attained any kind of excellence is that of cotton cloth dyed blue with their fine indigo, the tobes or pieces of which form the current coin of the realm; yet even in this staple they do not equal the natives of Loggun and Nyffé. They have, however, the absolute necessities of life in abundance. Numerous herds of cattle are bred by Arab tribes, who have transported into Bornou all their pastoral habits. The most numerous are the Shouaas, who in the towns are described as deceitful, arrogant, pretended fortune-tellers, and greatly resembling gypsies; but in the country display greater simplicity of manners. Major Denham describes the daughter of a rich Shouaa loaded with ornaments of amber, silver rings, and coral, her hair streaming with fat, a black rim of kohol, at least an inch wide, round each of her eyes. She sits astride on a bullock, over which carpets and tobes have been spread, guides him by the nose, and tortures his sluggish form into something like caperings and curvettings. The Bornouese are characterised by simplicity, good nature, and ugliness. They have in excess the thick lips, face sloping backwards, and other characteristics of the negro. The principle of speculative curiosity is one to which they are not only strangers, but which they cannot at all conceive as swaying the human mind; and the recent travellers could by no means obtain credit for this motive in visiting Africa.*

5395. *The government of Bornou is absolute; but when the English mission lately visited the country, they found it in a somewhat singular political situation. The sheik, surnamed El Kanemy, who by his valour had rescued the kingdom from Fellatah invasion, possessed all the real authority, which he exercised with justice and vigour; but he found it prudent to confer the ostensible dignity of sultan on a member of the ancient royal family, who lived in empty pomp at New Bornou. There is probably no court of which the taste is so absurd, grotesque, or preposterous. The primary requisite for a fine gentleman and a courtier is a huge belly; and where feeding and cramming will not produce this beauty in sufficient perfection, the part is swelled out by stuffing and cushioning. This unwieldy bulk is then covered with ten or twelve successive robes of rich and varied materials. Fold after fold is wrapped round the head, till only a small part of the face, and that all on one side, can be descried. Numerous amulets, enclosed in green leather cases, envelope their clothes, horses, and arms. Surrounded by a train of such attendants, the sultan of Bornou received the British mission in a cage or crib, barely capable of containing his own person (*fig. 868.*). Thus attired, however, the Bornou cavalry take the field; but they are there totally inefficient. Indeed, the sultan, who ought to be still more protuberant and encumbered than the rest, is subject to the convenient necessity of never fighting; but if his army is defeated, and he cannot escape by flight, he seats himself in*

state beneath a tree, and quietly awaits the stroke of death. Lander heard it reported at Boussa, that the sheik had recently been put to death by the sultan, who had resumed the supreme sway.

AUDIENCE OF THE SULTAN OF BORNOUT.

5396. *The towns of Bornou are considerable, though not of the first magnitude. New Bornou, the present residence of the sultan, is said not to contain more than 10,000 people; and Kouka, where the sheik kept his court, is still smaller. Angornou is the largest place in the kingdom, containing at least 30,000 people, and, during the crowded markets held there, often from 80,000 to 100,000 are assembled. All these are in the heart of the kingdom, on the western bank of the Tchad. Angala, on the southern or Begharmi frontier, and Woodie on that of Kanem, are also considerable: at the latter, the caravans are made to stop till permission to proceed is obtained from the sovereign. Kanem, in the north, is a ruder district, partaking somewhat of the character of the bordering desert; but its inhabitants are peculiarly brave. Lari, the capital, is a town of 2000 inhabitants,*

consisting of clusters of rush-huts, in the shape of well-thatched corn-stacks. The largest cities, however, appear to have been formerly situated on the lower course of the Yeou; but they have been entirely destroyed, and the whole country laid waste, by the desolating inroad of the Fellatahs. The ruins of Old Bornou were seen covering a space of five or six square miles; and Gambarou, the former residence of royalty, displayed in its ruined edifices a degree of elegance not observable in any of the modern capitals. The territory round these cities, formerly in a state of the highest cultivation, is now covered with labyrinths of thickets, and the meadows overgrown with wild plants. It contains only a few scattered villages, whose inhabitants live in constant dread from the predatory inroads of the Tuaricks. Farther to the west, beyond a large town called Kabshary, are the almost savage tribe of Mungas, who fight with poisoned arrows, and yield a reluctant submission to the dominion of Bornou.

5397. Mandara, situated to the south of Bornou, consists of a fine valley, containing eight large towns, the principal of which is Mora. The whole country, and even the capital, are overlooked by the great central range of the Mountains of the Moon, which to the southward of this territory appear to attain their loftiest height. They are inhabited by numerous and barbarous races, comprehended, by the Mandaras, under the appellation of *kerdies*, or pagans, and thence considered as lawful prey. These people paint their bodies, wrap themselves in the skins of wild beasts, and subsist chiefly on fruits, honey, and the fish drawn from large lakes. The Musgow, the most distant and rudest of those races, were seen mounted on little fiery steeds, covered only with the skin of a goat or leopard, and having round their neck long strings of the teeth of their enemies. Dirkullah, a part of this mountain territory, is occupied by Fellatahs, who have their villages strongly fortified, and fight desperately with poisoned arrows, by which they once put to flight the whole force of Bornou and Mandara, though aided by a numerous and well-armed body of Arabs.

5398. Loggun, situated immediately to the south of the lake Tchad, and watered by the lower course of the river Shary, which falls into that great receptacle, appears to be one of the most improved and industrious countries in all Africa. The Loggunese, amid the furious warfare waged by the surrounding states, have, by a skilful neutrality, maintained themselves in peace. They work steadily and skilfully at the loom, an occupation elsewhere abandoned to slaves. Their cloth, after being thrice steeped in a dye of excellent indigo, receives a brilliant gloss by being placed on the trunk of a large tree, and beaten with wooden mallets. The tobes thus fabricated are much superior to those of Bornou, and only equalled in Nyffé. The people rank also above their neighbours, in having a coinage, though rudely made of iron, somewhat in the form of a horse-shoe. Provisions are abundant; the banks of the river are bordered with fine woods, and a profusion of variously tinted aromatic plants. The inhabitants, however, suffer cruelly from the multitude of tormenting insects. "Flies, bees, and mosquitoes, with immense black toads, vie with each other." It is impossible to stir out for two or three hours at mid-day, without the hazard of serious illness. Some seek a protection by building one house within another; others by kindling a fire of wet straw, and sitting in the smoke; but this remedy seems worse than the evil. The ladies of Loggun (*fig. 869.*) are described as the handsomest and most intelligent of the negro race, with a lively and agreeable expression and engaging manners. They are by no means distinguished, however, by those virtues which form the ornament of their sex,

and, in particular, used the utmost dexterity in snatching from Major Denham every thing they could reach, searching even the pockets of his trousers, and, when detected, treating

869

LADIES OF LOGGUN.

the whole as a jest. Loggun, the capital, is a handsome town, with spacious streets, finely situated on the Shary, about forty miles above its entrance into the lake.

5399. *Begharmi*, or *Begherme*, is a considerable country, to the south-east of the lake Tchad. The people, who are stout and warlike, wage almost continual war with Bornou, which boasts of having subjected them; but they always find a retreat beyond a considerable river, which flows through their country, whence they return and regain possession of their territory. Their chief force consists in mounted lancers (*fig. 870.*), which, with their

horses, are cased still more completely in iron mail than those of Bornou; but they do not in the field display any higher degree of courage.

5400. *The islands in the lake Tchad*, which are numerous, and many of them large, are inhabited by tribes that have made themselves formidable to the surrounding countries. The Biddomah, occupying the eastern quarter, have a fleet of a thousand large canoes, which they employ entirely in piratical inroads. They maintain the doctrine that their deity left them without grain or cattle; instead of which, he bestowed strength and cunning to snatch those good things from others who possessed them. This destination they zealously fulfil; there being not a spot round this wide expanse of water which is for a moment secure from their attack, the vicinity of the capital not excepted. They carry off many of the people as slaves, but treat them well, and even bestow wives upon them. No attempt to check their ravages seems made by the most powerful of the Bornou sovereigns,

LANCERS OF BEGHARMI.

who merely say, "The waters are theirs: what can we do?" The La Salas, a pastoral people, inhabit a number of small verdant islands near the southern quarter, separated by channels so shallow, that those acquainted with them can ride on horseback from one to the other. These islands are covered with rich pastures and numerous herds.

5401. *Houssa* is an extensive territory in the most central part of Africa, reaching from the upper course of the Yeou nearly west to the Niger; but its boundaries both on the north and south seem to be yet undecided. Although it is ascertained not to reach the main stream of the Quorra or Niger, it is yet well watered by the river Quarrama or Zirmie, which, with several tributaries, flows westward to join the Quorra. On the eastern border, also, it is traversed by the upper course of the Yeou, and on the southern by the Shary or Tshadda, which also falls into the Niger. This region derives its social character from the Fellatahs, descended apparently from the Arabs, who migrated thither in large bodies in the tenth and eleventh centuries, and have ever since continued to be the ruling people. It appears to be more elevated, and the climate less sultry, than that either of Bornou or the countries on the Niger; travellers have even occasionally suffered from cold. The face of the country exhibits evident marks of superior cultivation and a superior people. The fields are covered with large crops of wheat, two of which are annually produced, and the grain is stored in large granaries raised on poles as a security from insects. Irrigation is practised with diligence. The grain is made into bread, and the markets are well supplied with fruits and vegetables. The Moslem faith is professed, having the iniquitous right founded upon it, of carrying into bondage the southern tribes of *kerdies*, or infidels; yet the same bigoted spirit does not prevail, and the Arabs even allege that the Fellatahs are not true

Moslems. Their commercial habits, and intercourse with the negro nations to the westward, are probably the chief causes which introduce this more liberal train of ideas.

5402. *Sackatoo*, probably the Tocrur of the Arabians, situated nearly at the western extremity of Houssa, is at present the ruling country over that region. The territory appears to be fertile and populous, and its capital the largest city in interior Africa. The houses are built closer than usual, and more regularly laid out in streets. The place is surrounded by a wall between twenty and thirty feet high, with twelve gates, always shut at sunset. The dwellings of the principal inhabitants consist of clusters of cottages, and of houses built with flat roofs in the Moorish style, enclosed by high walls. There are two mosques, one of which, unfinished when Clapperton resided there, was 800 feet in length, supported by wooden pillars plastered with clay, and richly ornamented. The palace, as usual, forms a sort of enclosed town, with an open quadrangle in front; while a painted and ornamented cottage contains the hall of audience. Of late the residence of the court having been transferred to the neighbouring town of Magaria, Sackatoo is likely to experience a decline.

5403. The countries of *Goober* and *Zamfra*, or *Zanfara*, are of a ruder character, inhabited by a warlike race, who have sometimes ruled over Houssa, and are at present in open rebellion against the power of Sackatoo. Even the high road between that city and Kano is continually infested by them. The merchants venture to pass it only in numerous and close bodies, every one striving to be foremost, and exclaiming, "Wo to the wretch that falls behind, he will be sure to meet an unhappy end at the hands of the Gooberites!" In 1829, Coonia, the strongly fortified capital of Goober, repulsed with loss the whole military force of Houssa, amounting to 50,000 or 60,000 men. Zirmie, the capital of Zamfra, is represented as forming a sort of outlawed city, where runaway slaves find protection, and the inhabitants are esteemed the greatest rogues in all Houssa.

5404. *Kano*, though declined from its ancient greatness, is still the centre of commerce and civilisation in interior Africa; yet it is built in a very scattered manner, occupying only about a fourth of the circuit of fifteen miles enclosed by its walls. The inhabited part is divided into two by a large morass, dry during a part of the year, at which period is held a great market, the most crowded and best regulated in Africa. It is under the superintendence of a sheik, who has even the exorbitant power of fixing the prices. Such is the confidence established, that packets of goods are very commonly carried away without being opened; and if any fraud is discovered, the packet is sent back, and the *dylala*, or broker, is compelled to procure restitution. The market is crowded from sunrise to sunset every day, not excepting Friday, the Mahometan sabbath. The slaves, who constitute the staple commodity, have a special market, composed of two long ranges of sheds, one for males, and the other for females. The poor creatures, decked out for the purpose, are seated in rows, and are nicely scrutinised by the purchaser, who inspects the tongue, teeth, eyes, and limbs, causing them to cough, and move in different directions, so that any defect in their persons may become apparent. The current coin in traffic consists of the small shells called cowries, 480 of which are worth only a shilling, so that the task of counting them is laborious. Kano is supposed to contain 30,000 or 40,000 inhabitants.

5405. *Kashna*, or *Kassina*, to the north of Kano, is a considerable kingdom, which at no distant period held the supremacy over Houssa, and has even lately shaken off the yoke of Sackatoo. Its walls, like those of Kano, are of immense circuit; but the inhabited part does not amount to above a tenth of the enclosed space. It is still, however, the seat of a considerable trade with the desert, with Timbuctoo, and with caravans coming across the desert by the way of Ghadamis and Tuat.

5406. To the south of Sackatoo and Kano is the country of *Zegzeg*, one of the finest in all Africa. It is covered with plentiful crops and rich pastures, yields particularly good rice, and is beautifully variegated with hill and dale, like the finest parts of England. Zaria, the capital, is like an enclosed district, occupying a great extent of ground, which comprises even woods and corn-fields; the population is estimated at about 50,000. The country to the south of Zegzeg, though diversified by rising grounds, is still fertile and well cultivated, containing a number of considerable towns. Cuttup, a compound of 500 villages, or rather clusters of houses covering a beautiful plain, forms the market for a great extent of country. Farther south, however, there is stated to be a rugged and mountainous region inhabited by the Yam-yams, a savage race, represented as cannibals, and who, some time ago, had killed and eaten a whole caravan. The same people are mentioned, six centuries ago, by Edrisi, as bearing the same character. Dunrora is situated in a country fertile, though rocky; and about half a day's journey from it is Jacoba, described as a large city on the river Shary; while farther to the east, on the same river, is stated to be another great city, Adamowa: but here our knowledge in this direction terminates.

5407. The western tracts of Houssa do not contain any cities of great magnitude. Yet the late travellers mention Bershee, probably the Berissa of Edrisi; Katungwa, surrounded by a fine country; Zangeia, picturesquely situated amid rocky hills; and Girkwa, on a river of the same name, tributary to the Yeou. Katagum, capital of a province once included

in Bornou, contains 8000 inhabitants; and in the same district is Sansan, a large market-place, divided into three distinct towns. To the north is a rude tract, inhabited by the Bedees, a fierce, independent, pagan race, between whom and the Moslems a constant war is waged.

5408. *The countries on the lower course of the Niger* form an extensive and important part of Central Africa. Being copiously watered, and in many parts liable to temporary inundation, they are endowed with profuse natural fertility, yielding rice and other valuable species of grain in abundance; though, in approaching the sea, the ground becomes swampy, and overgrown with dense forests. A negro population, with its original habits and superstitions, generally fills this region; but the Fellatahs are making rapid encroachments; and several of the states have been converted, though, in a very superficial manner, to the Moslem faith. The kings hold generally an absolute though mild sway; their splendour consists chiefly in the multitude of their wives, who perform all menial functions, and even act as body guards: the royal exactions are chiefly from travellers and merchants, out of whom they draw as much as possible, both in the way of presents and trade. We shall begin from the northern or higher region of the river.

5409. *Youri, or Yaoori*, consists of a very fertile plain, partly overflowed by the Niger, and thus rendered peculiarly fitted for the production of rice. It is even cultivated with great diligence, though chiefly by an oppressed, half servile, but patient and industrious race, called the Cumbrie. Youri is a very large city: its walls of wood, rudely strengthened with plates of iron, enclose a circuit of twenty or thirty miles; but this space is covered to a great extent with pastures and corn-fields, among which clusters of huts are interspersed. The people, being numerous and brave, have repelled every attempt by the Fellatahs to subdue them. The king maintains a higher state than prevails in the neighbouring courts, yet both the structure and the accommodations of his palace would, in Europe, be considered extremely mean. This prince has incurred deep dishonour by the attack on Park, which terminated in the death of that celebrated traveller; and his conduct to Clapperton and Lander was far from praiseworthy. Below Youri the navigation of the Niger is obstructed by formidable cataracts, though it is passable during the rainy season for vessels of some magnitude.

5410. The kingdom of *Boussa*, immediately below Youri, was represented by the first accounts as forming one, and even the chief, of the states of a more extensive region called Borgoo; but Lander learned, in his last expedition, that neither it nor Wawa, over which it has a certain supremacy, are included in that region. Boussa is a considerable town, capital of a fertile and well cultivated country of the same name. It was at one time occupied by the Fellatahs; but they were afterwards expelled. The Niger, immediately above and below Boussa, presents a magnificent body of water; in passing that city it is obstructed by those rocks and straits in which Park was intercepted and perished. A little below Boussa is the ferry of Comie, which forms the principal passage for the caravans on their way from Houssa to the coast.

5411. *Wawa*, the capital of a small dependent kingdom, is situated in a very fertile country, particularly celebrated for producing excellent yams. The town, supposed to contain 18,000 inhabitants, is also enriched by the constant passage of the Houssa caravans. The people and merchants take advantage of their wealth, to indulge in feasting and jollity, and drink harder than in almost any other city of Africa. During the whole night, the town resounds with the song, the dance, the castanet, and the Arabian guitar.

5412. *Borgoo*, forming a cluster of states to the west and north-west of Boussa and Wawa, presents an aspect entirely different. It is composed, in a great measure, of rugged mountain tracts, though interspersed with fertile and beautiful valleys. The elevated districts are covered with extensive forests, crowded with wild animals of every description, and infested with numerous bands of robbers. Kiama, the only part of Borgoo visited by English travellers, is inhabited by a people proud, courageous, spirited, delighting in martial exercises, and warm both in their resentments and attachments. The king professes the Mahometan religion; yet his attachment to paganism is displayed by numerous fetiches and uncouth figures, stationed, as guardian powers, at the entrances and along the walls of his houses. Here the English travellers saw a great Mahometan festival, followed by a horse-race. The animals were gaily caparisoned, with strings of brass bells on their heads, pieces of red cloth, silk and cotton tassels, and little charms in coloured cases. The ladies, not subjected to the usual Moslem seclusion, appeared gaily adorned in coarse Manchester cloths, and bed-furniture of glaring and gaudy patterns, for which a high price had been paid. The palace, or rather hut, in which the king resides, is adorned with good prints of George IV., the Duke of Wellington, and other eminent British characters. Niki, however, is considered the chief of the states of Borgoo, its capital the largest, and its territory the most improved; it holds also a certain sway over the others. They are comparatively poor, with the exception of Loogoo, enriched by the commerce between Gonjah and the interior. Pandi has shaken off all dependence upon Niki, but has used its liberty only to organise a destructive system of plunder against the neighbouring states.

5413. *The banks of the Niger, below Boussa, are occupied by two great and flourishing kingdoms: Eyeo on the west, and Nyffé, or Nouffie, on the east.*

5414. *Eyeo, called also Hio, or more properly Yarriba, is a very extensive country, extending from the frontier of Boussa nearly to the coast, from which it is only separated by the territory of Badagry, while from the Niger it reaches west to the frontier of Dahomey. It is one of the most fruitful countries on the globe, and is also well cultivated and densely peopled. The fields are covered with thriving plantations of Indian corn, millet, yams, and cotton. The loom is busily plied, though its products are not equal to those in the neighbouring country of Nyffé. The scenery is beautiful, the woods exhaling a delicious fragrance, and being filled with myriads of brilliantly-tinted butterflies. The females, likewise, are actively employed in the conveyance of goods, which they bear on their heads, executing this laborious task with surprising cheerfulness. A range of rugged mountains, from 2000 to 3000 feet high, crosses one part of the country; yet such is the mildness of the climate, that cultivation, and even large towns, are found on their very summit. The government is most despotic; the greatest chiefs, in approaching the sovereign, throw themselves flat on their faces, and heap on their heads sand and dust. Yet, in the general administration of the government, there seem few instances of cruelty or wanton oppression. The property of the sovereign consists chiefly, as already observed, in his innumerable wives, and the various functions performed by them. The habitations are in general mere huts, and the residence of the chiefs is only distinguished by the number of these within an enclosing wall; but the gates and panels of some, though only of wood, are adorned with elaborate sculpture. The practice of human sacrifice prevails extensively, though not quite to the same degree as in Ashantee and Dahomey. On the demise of the king or of any great chief, his principal officers and favourite wives are doomed to die along with him. Most tragical scenes are thus presented, as the devotion is by no means voluntary, but the necessity of it imposed by public opinion produces the deepest distress both in the prospect and in its actual arrival. The Fellatahs, it appears, have already passed the Niger, and are preparing to attempt the conquest of Eyeo, in which it is thought that they will probably succeed.*

5415. *Among the cities of Yarriba, the first place is held by Eyeo, the capital, situated in a fine plain, and, like most African towns, covering a very large space. It is, indeed, fifteen miles in circumference, so that the mission had five miles to march from their quarters to the palace. There are, however, many fields and open spaces in this wide circuit, and the population can scarcely be even conjectured. Bohoo, the former capital, though much declined since the transference to Eyeo, is still a very large place, in even a superior country, resembling the finest parts of England. Since the Fellatahs obtained a footing, they have founded Alorie, which, being increased by runaway slaves from every quarter, is now reported to be greater than Eyeo. A number of other large towns are mentioned. Jenna is the first on the southern, and Keeshee on the northern frontier. Chaki, though on the very summit of the mountain ridge, is large and populous.*

5416. *Nyffé, on the eastern bank of the Niger, is a very fine country, occupied by the most industrious and improved of all the negro nations. Their cotton cloths are held in the highest estimation, and even the finest of those manufactured in Houssa are by slaves from Nyffé. It has, however, of late been dreadfully ravaged by the Fellatahs, who have made themselves nearly masters of the country; and who, though mild in their domestic intercourse, carry on war in the most desolating and ferocious manner. Rabba, the capital, is considered, next to Sackatoo, the largest town in possession of this people. The surrounding territory is highly productive, covered with rich crops, and with numerous and fine breeds of horses and cattle. The mats made there are reckoned superior to all others in Africa. Koofu and Kufu, two towns on the northern frontier, and on the high road of the Houssa caravans, being protected by strong walls, have escaped the desolation of the late wars, and are flourishing seats of trade. The people have been converted to the Moslem religion, which has not, however, introduced that gloomy bigotry, or that seclusion of the female sex, which usually accompanies it. The women, on the contrary, are the most active mercantile agents, going from market to market, and acquiring often considerable wealth. Lever, or Layaba, and Bajiebo are two thriving towns on the Niger; and the latter, being situated below a succession of shallows, enjoys an uninterrupted navigation down to the sea. Both have changed their site from the eastern to the western side of the river, in order to escape the ravages of the Fellatahs, but without fully attaining that object. The Niger spreads here into a most magnificent channel, from two to six miles in breadth, and contains several beautiful and fertile islands. Patashie is on the frontier of Boussa, while Belee, lower down, borders on Nyffé. But the finest by far is Zagoshi, immediately adjoining to Rabba. It is about fifteen miles long and three broad, in the mid-channel of the Niger, whose broad stream on each side separates it from the continent. The surface, scarcely raised above the level of the waters, is composed of mud, frequently inundated, and so soft, that a slender cane may be thrust even into the floors to any depth. Yet the island is highly cultivated and productive; and its manufactures pre-eminently*

display the general superiority of those of Nyffé. The cotton cloths there woven are valued beyond all others by the chiefs and great men throughout Africa. The people possess also numerous canoes, 600 of which, being armed and belonging to the sovereign, enable him to secure his country against those revolutions which have desolated the neighbouring continent. Egga, the town of Nyffé which lies farthest down the Niger, extends four miles along its banks, and has numerous boats belonging to it. The population is half Mahometan, half negro. With Egga terminates Nyffé, and with it the range of wealthy and populous kingdoms that extend along the Niger, from Youri downwards.

5417. *The states which succeed* consist of little more than single towns, each governed by its own chief, with little or no mutual dependence, and many of them addicted to fierce and lawless practices. Kacunda, however, composed of a cluster of three large villages, under the absolute sway of a single chief, though independent of Nyffé, contains a peaceable, industrious, and friendly people.

5418. About forty miles below Kacunda, several yet unknown towns intervening, *the Niger receives its greatest tributary, the Tshadda*, called sometimes the Shary, and which has been traced flowing by Jacoba on the south of Houssa; but its origin and early course is unknown. At the junction, it is little inferior to the main stream, and navigated by numerous boats. Funda, reported the greatest emporium of this part of Africa, is about three days' sail up the Tshadda. At the junction of the two rivers is a commercial town, of very considerable magnitude, named Cuttumcuraffe.

5419. *Towns of importance* continue to occur in the course of the Niger downwards. Bocqua, about eighty miles below Kacunda, is the seat of a very large market, frequented by numerous strangers from the interior, and from the upper and lower course of the Niger. It is followed by Atta, Abbazaca, and Damuggoo, the latter governed by an enlightened though despotic ruler. Here a commercial intercourse with Europe becomes manifest, and the people are dressed, though somewhat scantily, in Manchester cottons.

5420. *Kirree*, a large market town, the citizens of which possess numerous boats, is about fifty miles below Bocqua. Here commences the delta of the Niger, which, immediately above this place, detaches a branch, supposed to flow to Benin. The country ceases to be fertile and beautiful; the superabundance of moisture converts it into an alluvial swamp, covered with vast entangled forests, which conceal the villages. Grain no longer grows in the fields, nor do cattle feed on the meadows. The subsistence of the inhabitants is solely derived from the banana, the plantain, the yam, and from the fish caught in the river. The palm tree, however, affords not only a refreshing juice, but the material of an extensive trade in the oil which it yields.

5421. *Eboe*, about seventy miles below Kirree, is a very large town, called commonly the Eboe country. It forms the great mart from which the ports on the coast are supplied with slaves and palm oil. The people send up and down the river fleets of large armed boats, fantastically adorned with flags, and with representations of chairs, tables, decanters, glasses, and other European objects. Some of them are capable of containing seventy persons, many of whom have no habitation unless in the vessel. The place presents a scene of busy industry. The houses are superior to those in the interior, being composed of clay plastered over, adorned with wooden pillars in front, and surrounded by well-fenced court-yards planted with bananas, plantains, and cocoas. Yet the character of the people, corrupted by intercourse with European slave-traders, is bad, and even atrocious. They are ever ready to engage in deeds of violence, and indulge also in very dissolute habits, spending whole nights in carousal, and over their cups quarrelling with such violence, that the travellers imagined some one was suffering death amid the most inhuman tortures, till they heard the same wild tumult nightly repeated. Below Eboe the territory belongs to the coast, and has already been described.

5422. To complete the picture of Central Africa, it remains to describe *the countries on the upper Niger*, as celebrated as any of those now enumerated. For 400 or 500 miles above Youri, indeed, the shores of this great river are almost entirely unknown, as Park, unfortunately, never returned to relate his navigation down to that city. At the end of the above reach, however, occurs the most important city in this part of Africa.

5423. *Timbuctoo*, or *Tombuctoo*, the celebrated emporium of the commerce in gold, has always shone in the eyes of Europeans with a dazzling and brilliant lustre. Most of the daring and often tragical expeditions into the interior of the continent had for their object to reach that city. Yet its actual condition, and even magnitude, are still involved in very considerable uncertainty. The relation of Adams is of very doubtful authenticity. Major Laing resided there for a considerable time, and made the most diligent enquiries; but the result, in consequence of the catastrophe which terminated his career, never reached the European public. If, as has been surmised, his papers were transmitted to Tripoli, it was under circumstances which will probably prevent them from coming at all before the world. Caillié, supposing that he really visited Tombuctoo, which we are not disinclined to believe, was far from being a careful or an accurate observer. From the few positive notices, however, thus

obtained, we may infer that the city is neither so large nor so splendid as rumour represented it. That dominion which, in the time of Leo, it had extended over the neighbouring countries, and even over Houssa, has ceased for several centuries. It then became subject to the yoke of Morocco; and since this was shaken off, has been governed by a negro king, and the negroes have been the ruling people. The place is described as containing some handsome mosques, and a spacious enclosed palace; but a great proportion of the habitations, like those in other negro countries, are mere conical hovels, like bee-hives. Timbuctoo, however, being the place where the caravans from Morocco, and most of those from Algiers and Tunis, first touch on the fertile regions of Central Africa, must always possess great commercial importance; and a depôt is found there of the commodities which it affords for exchange with other countries. Gold, and still more slaves, are the staple articles. Timbuctoo, also, being situated in an arid and barren territory, is dependent upon Bambarra for grain and provisions, which are brought down the Niger, and landed at the port of Cabra, a small town about a day's journey distant, consisting merely of a range of houses along the water.

5424. *At some distance below Timbuctoo* occurs a very extensive lake, called the Dibbie, formed by the waters of the Niger. Its greatest dimension seems to be from east to west, on which side alone, in sailing across, its termination cannot be descried. Its shores are chiefly occupied by the kingdom of Masina, a pastoral country, inhabited by a tribe of Foulahs, who are ruled by a brother of Sego Ahmadou, the sultan of Jenné.

5425. *Jenné, or Jinnie*, is a city second only to Timbuctoo in commercial importance: it is situated, according to Park, on a tributary of the Niger, but according to Caillié, on a branch separated from, and then reuniting to, that river. It appears to collect from Bambarra and the countries to the south all the commodities wanted for the market of Timbuctoo, which it transmits by vessels of considerable size, though of slight construction, and merely bound together with cords. In Park's time it was subject to Bambarra; but it has since been occupied, with several of the neighbouring territories, by Sego Ahmadou, a Fellatah prince. The population, rated probably too low by M. Caillié at 8000 or 10,000, consists of a great variety of tribes, Foulahs, Mandingoes, Bambarrans, and Moors, attracted by the extensive commerce which centres there. Transactions on a great scale are carried on by thirty or forty Moorish merchants, while the negro traffickers conduct it on a more limited footing. The merchants are said to be hospitable, and polished in their manners.

5426. *The kingdom of Bambarra* consists of a beautiful and extensive plain, through which the Niger rolls for about 300 miles, from the point where it becomes navigable for large canoes. The territory is fertile and well cultivated, being to a great extent inundated during the rains. The hills to the south contain considerable quantities of golden earth, from which the metal is extracted and brought to Bambarra. Some of the northern districts partake of the character of the desert, and are covered by the Moors with their flocks and herds. Sego, the capital, in the centre of the kingdom, is divided by the Niger into two parts, the communication between which is maintained by ferries, which are under the control of the government. The place is surrounded by high mud walls, the houses are built of clay, but neatly whitewashed, the streets are commodious, and mosques rise in every quarter. The numerous canoes on the river, the crowded population, and the cultivated state of the surrounding country, exhibit altogether a scene of civilisation and magnificence scarcely to be expected in the centre of Africa. Park estimated the population at about 30,000. Sansanding is a great commercial town, higher up the Niger, supposed to contain 10,000 people. Its market was the best arranged and supplied that Park saw in Africa. Bammakoo, where the Niger first becomes navigable for large canoes; Maraboo, a great market for salt; Samee, and Silla, near the eastern frontier; are all considerable towns on the Niger.

5427. *Several small kingdoms intervene* between Bambarra and Gallam, which, with Bam-bouk, are included in Western Africa. Kaarta is extensive, but has a sandy soil, yielding little except the lotus. The capital is Kemmoo; but the king has the strong fortresses of Joko and Gedingooma, to which he retires when hard pressed by his neighbours of Bambarra and Ludamar. Kasson, between Kaarta and Gallam, is a small but beautiful and fertile kingdom; the capital is Kooniakary. Satadoo, Konkodoo, Dindikoo, Brooko, Fooladoo, are little kingdoms, extending along the upper course of the Faleme, Ba Fing, Ba Lee, and other streams, which combine in forming the Senegal. They are elevated, rocky, woody, with very picturesque sites; and gold, in considerable quantities, is found in the sand of their rivers.

5428. *M. Caillié* has described several territories to the east of Foota Jallo and the south of Bambarra. Among these is the district of Bouré, abounding remarkably in gold, which, as elsewhere, is found embedded in alluvial earth. It is carried southwards into Kankan, a fine country, traversed by the Niger in its early course. Kankan, the chief town, is the seat of a great market held thrice a week, where are exhibited not only gold, provisions, honey, and cotton cloth, but fire-arms, powder, Indian calicoes, and other goods obtained from

Europeans. To the east is Ouassoulo, a rich territory, diversified by numerous villages, inhabited by an industrious and hospitable people. Their neighbours of Sambatikila, through supine indolence, derive little benefit from the bounties of nature. To the east of them, however, is Timé, a very finely watered and cultivated territory, abounding in various fruits and vegetables, particularly the shea or butter-tree, and the goora or kolla nuts. A similar fine country continues to Jenné.

CHAP. X.

THE SAHARA, OR GREAT DESERT.

5429. *The Sahara, or Great Desert*, forms an immense range of territory, which would, indeed, cover the whole northern half of Africa, but for the partial exemption produced by the mountain range of Atlas, and the course of the Nile. Its actual and almost uninterrupted extent may be stated as from the 15th to the 30th degree of north latitude, and from the 30th of east to the 15th of west longitude. It may thus amount to nearly 3000 miles in length, and 1000 in breadth. This vast expanse, the most dreary and terrible on the face of the earth, forms an obstacle to the intercourse of nations greater than is opposed by the widest oceans. Yet the daring spirit of enterprise has induced human beings to occupy every extremity or corner in which subsistence could by any means be procured; and they have formed routes by which, though amid suffering and deadly peril, regular journeys may be performed across this vast and desolate region.

5430. *The surface of the Sahara* does not consist entirely of one uniform plain of sand. In the most level tracts it has been blown into heaps or hillocks, steep on one side, which remarkably increase both the dreary aspect of the region, and the difficulties with which the traveller has to contend. In other places it is traversed by dark ranges of naked rock, which sometimes approach so close as to leave only a narrow path for caravans to march through. The terrible spectacle of human bones which strew the ground, and sometimes crackle unexpectedly beneath the tread of the traveller or his camel, lends, at intervals, additional horror to the scene. The most dangerous encounter is that of the sand wind, (*fig. 871.*), when the sand, blown up by tempests from an extensive moving sur-

871

SAND WIND.

face, fills and darkens the air, and threatens to suffocate the passenger. Yet some covert can generally be found during its fury; and the disasters indicated by the bones which whiten the desert appear to arise almost solely from the failure of provisions, and particularly of water. The privation falls always first upon the slaves, who on such occasions perish in great numbers.

5431. *The most remarkable and important feature*, however, which diversifies the great African desert, consists in the *oases*. This eastern term, which signifies island, is very appropriately given to those detached spots, over which springs, bursting forth amid the desert, diffuse some partial verdure and fertility. The view of these spots inspires travellers with emotions peculiarly pleasing; sometimes from mere contrast with the encircling desolation, but sometimes also from the peculiarly elegant landscape which they themselves present. They are embellished with flowering shrubs of peculiar beauty; whole tracts are covered with forests of acacia, from which rich gums distil, and with groves of the date and lotus, yielding sweet fruits and berries, which form the food of whole tribes; while mild and graceful animals, chiefly of the antelope species, trip along the meadows. These districts, on a great scale, occur chiefly on the northern and southern borders, where the desert generally mitigates its stern aspect, and imbibes some portion of that moisture which fertilises Central Africa and the region of Atlas.

5432. *This vast central and flat region* of Africa is covered more or less completely with a quartz and calcareous sand. Here and there solid fixed rocks rise through the sandy covering, or even form tracts of country; and in the eastern part of the Sahara the rocks are principally secondary, and chiefly limestone, sandstone, gypsum, and rock salt, which in some places appear to be traversed by trap rocks. Fertile tracts, named *oases*, occur here and there in the desert, and also lakes, the waters of which are in some instances impregnated with carbonate of soda, in others with muriate of soda, forming the *natron* and *salt lakes* of travellers. The rocks on the sea-coast of the Sahara, and the islands that lie along it, are said to be principally composed of igneous rock, and chiefly basalt.

5433. *The Botany and Zoology* of this desolate portion of Africa are scanty, and too imperfectly known to admit of any regular description.

5434. *Inhabitants*, in as great numbers as the soil can support, are found occupying both the borders and the interior oases of this vast and desolate region. They are of various races, and have entered from different quarters. The large oases of Fezzan and Darfur appear to have been partly or wholly peopled from Egypt and Tripoli. Wandering tribes from Morocco have covered with their herds all the habitable tracts of the western desert nearly as far south as the Niger. The negro tribes have seldom quitted their fertile and wooded plains to encroach on this gloomy domain: they are found chiefly in Darfur and Kordofan. But the most interior tracts, to the south and west of Fezzan, are thinly peopled by tribes of peculiar character, the Tibboos and the Tuaricks, judged to be remnants of an aboriginal race, who occupied all Northern Africa, till it was covered by the tide of conquest and emigration from Asia. With a few exceptions, the character of all these desert tribes is gloomy and sinister, like that of the regions through which they wander. Agitated by want, and exempted by their position from almost any restraint, they seek, by violence and plunder, to wrest from the caravans which pass through their domain, or from the richer nations which border it, a portion of those good things which nature has denied to themselves. These habits, with the absence of culture, have given a rude and unsocial character, which, inflamed by bigotry in the Mahometan tribes, has rendered a journey through their territory peculiarly distressing and dangerous to Europeans. It would be nearly impossible, under general heads, to describe a region so vast, and composed of such varied portions. We shall therefore endeavour, under its different districts, to class all the little information which European research has been able to procure. The description may properly begin with the northern tracts.

5435. *Almost immediately west* from Egypt and the Nile the desert commences, presenting the aspect of a plain from which the sea has receded. It is covered as it were with the fragments of a petrified forest; large trunks, branches, twigs, even pieces of bark, all converted into stone. When ten days' journey have been passed without seeing a human habitation, the traveller descries Umme-sogair, a village perched on a rock, with 120 inhabitants, who live a peaceful life almost secluded from intercourse with all human beings. A day's journey westward is the larger oasis of Siwah, a deep hollow valley, watered by numerous springs, and fertile in dates, the staple product and food of this region. The people, estimated at from 1500 to 2000, form a turbulent aristocracy, but derive some wealth from the continual passage of the caravans. Yet the chief interest which attaches to Siwah arises from its being supposed to contain the celebrated shrine of Jupiter Ammon. The distance from Egypt nearly corresponds; and at Ummebeda, in the vicinity, are the remains of an ancient edifice, though not corresponding in magnitude or style of architecture with our idea of that celebrated temple. The difficulty is increased by the occurrence of other oases of similar aspect, and containing similar remains; though the preponderance seems, on the whole, to be in favour of Siwah.

5436. *Augila*, the Aegila of Herodotus, a few days' journey westward, is a dirty, ill-built place, about a mile in circuit. There are some more fertile spots in its vicinity; the country abounds in dates, and the inhabitants have established some active commercial relations with interior Africa. Farther to the westward is a most gloomy, rocky region, called the Black

Harutsh, a succession of narrow defiles, enclosed by rugged steeps, and obstructed by loose stones. West of it is the White Harutsh, a long range of limestone rocks, which appear as if glazed, and abound in shells and marine petrifications.

5437. *Fezzan*, which opens at the end of the mountain region of Harutsh, is a very large oasis, about 300 miles long and 200 broad, sometimes dignified with the title of kingdom. Nature has scarcely distinguished it from the surrounding desert: it is not irrigated by a stream of any importance. The inhabitants, however, by laborious processes, have raised up the water, which is always found at a certain depth under ground, and have thus formed a number of little oases, in which dates and a little grain can be reared, and where a few asses and goats, and numerous camels, are fed. It is the inland trade, however, that the inhabitants regard as the source of animation and wealth. Fezzan being due south from Tripoli, and about midway between Egypt and Morocco, is the most central point of communication with interior Africa. The arrival of a caravan on its frontier produces a species of jubilee; and on its reaching the capital, the demonstrations of joy are redoubled, and the sultan gives them a state reception. There are also very extensive merchants belonging to the country itself. Through these resources Fezzan is enabled to maintain a population of about 70,000. The sultan is tributary to the Bashaw of Tripoli. Mourzouk, in a low, unhealthy situation, but well watered, is the residence of the prince, and the chief seat of commerce. It contains remains of stone edifices; but the present structures are poorly built of mud. Germa, the Garama of the Romans, who made it the capital of this part of Africa, contains monuments of its ancient consequence, but is now much decayed. Zuila, Temissa, and Gatrone are small towns on the western frontier. Traghan, to the south, bordering on the desert, is an industrious place, with a thriving manufactory of carpets. Sockna, in the desert to the north, on the road from Tripoli, forms a great caravan station.

5438. *Gadamis, or Ghadamis*, an oasis to the west of Fezzan, derives importance from the passage of the caravans from Tripoli and Tunis to Timbuctoo, though these are not so considerable as those from Fezzan and Morocco. This place, and the surrounding villages, exhibit many traces of ancient Roman occupation. It has the singularity of being divided between two hostile tribes, each enclosed by a separate wall, with a common gate, which is shut when they are engaged in mutual warfare.

5439. *Taflet, Darah, and Sigilmessa*, to the south of the Atlas, and loosely appended to the empire of Morocco, enjoyed a great celebrity during the middle ages, but have been little heard of in modern times. The caravans to Timbuctoo, which once rendezvoused in this territory, now generally prefer the more westerly route through Suse, by which they avoid the steep passage of the Atlas. These countries, however, are understood to contain many fertile tracts, abounding in excellent dates, and producing a valuable breed of goats.

5440. The state of *Sidi Heschem, or Ischim*, on the southern extremity of Morocco, combining portions of Suse and of the surrounding desert, is now the chief theatre of the Moorish trade with Tombuctoo. The prince, who rules over a mixed population of Moors and negroes, has made himself nearly independent of the empire; and his country has become a depôt of the goods which pass and repass between Morocco and Timbuctoo. Akka and Tatta are the principal stations from which the caravans take their departure.

5441. We shall now survey the more southerly states enclosed in the Sahara, and the tracts by which they communicate with those on the opposite side.

5442. *Darfur* is a considerable country, almost due south from Egypt, and west of Senaar, whence it is separated by Kordofan. The route by which the caravans pass from Egypt is of the most dreary character, since travellers, after leaving the greater oasis, do not for about 700 miles meet with a human habitation; however, at Sheb and Selime they are refreshed by springs of water. The country itself is of a very arid character, destitute of every thing resembling a river or lake. The tropical rains, however, within whose influence it is, fall at the proper season with great violence, when they fill the dry beds of the torrents, and inundate a considerable extent of the country. The operations of a rude agriculture, carried on by the females, are then sufficient to produce, in a few places, wheat; and in a great number the inferior species of *dokn*, a kind of millet. Camels abound, and are noted for their power of enduring thirst; the horned cattle and goats are good; but horses, sheep, and asses are of inferior breeds. The people, not supposed to exceed in number 200,000, are a mixture of Arabs and negroes, the former of whom hold the chief power. They profess the Mahometan religion with bigotry, but do not submit to the secluded habits and abstinence from fermented liquors which it enjoins; on the contrary, they are jovial, and even licentious. The king is absolute, though obliged to court the soldiery, who, when discontented, sometimes depose and strangle him, electing in his room another member of the royal family. They are about 2000 in number, distinguished neither for valour nor discipline, but endowed with an almost preternatural endurance of thirst, hunger, and fatigue. Large caravans, at somewhat irregular intervals, pass between Egypt and Darfur, interchanging slaves, ivory, ostrich feathers, &c. for cloths, carpets, toys, and beads. A considerable intercourse of religion and trade is car-

ried on with Mecca by way of Jidda and Suakin. Cobbe, the capital, is not supposed to contain more than 4000 inhabitants; it is about two miles long, but consists merely of ranges of detached houses surrounded by wooded inclosures. The sultan resides at a neighbouring village, called El Fasher.

5443. *Kordofan*, on the west, and separated by deserts from Darfur, forms a country nearly similar. Its warriors, like those of Bornou, are invested in chain armour. Kordofan has been subjected at different times to Sennaar and Darfur, and in 1820 was obliged to yield to the arms of the Pacha of Egypt, who continues to claim the sovereignty, which, however, over so distant and rude a tract, must always be very precarious.

5444. *To the south of Darfur is Fertit*, inhabited solely by negroes, and containing valuable mines of copper. Farther south still is the mountainous country of *Donga*, possessed by a barbarous people, and in which, according to Mr. Brown's information, numerous streams unite in forming the Bahr el Abiad, or main branch of the Nile.

5445. *Bergoo*, called also Saley, Waday, or Mobba, is an extensive country, reaching eastward from Darfur to nearly the confines of Begharmi and Bornou. According to the imperfect accounts yet received, it appears to be greater and more populous than Darfur or Kordofan. Wara, the capital, is represented as a considerable city. Near it passes a large river, called the Bahr Misselad, which, according to Brown's information, traverses the country in a north-westerly direction. In this quarter, also, the great lake of Fittré is reported to exist, but our materials do not enable us to fix its site with any precision.

5446. The most interior part of the desert, between Fezzan and Central Africa, is occupied by two remarkable native tribes, *the Tibboos and the Tuaricks*. The former are found on the caravan route to Bornou; the latter, more westerly, on that to Kano and Kassina.

5447. *The Tibboos* are nearly as black as the negroes, but with a different physiognomy: their hair is longer and less curled, their stature low, their features small, and their eye quick. They subsist on the milk of their camels and the produce of a few verdant spots scattered amid the desert; this they seek to aid by a little trade with Fezzan, and not unfrequently by the plunder of the caravans. They are themselves, however, exposed to a mightier race of spoilers, the Tuaricks, who, at least once a year, make an inroad into their territory, sweeping away every thing, and sparing neither age nor sex. The cowardly Tibboo dare not even look them in the face; their only resource is to ascend certain perpendicular rocks with flat summits, beside one of which they take care to build each of their towns; and they are thus secured against enemies who have neither the means of escalade nor the patience to carry on a blockade. Though, however, they have lakes containing the purest salt, they are obliged to see the best part of it carried off by these sturdy marauders. Amid these distresses, the people are gay and thoughtless, delighting, like other Africans, in the song and the dance: they dance gracefully, with movements somewhat analogous to the Grecian. Bilma, the Tibboo capital, is a mean town, built of earth, and the other villages, of course, inferior. To the south of this town is a desert of thirteen days' journey, perhaps the most dreary on earth. There is neither a drop of water nor a vestige of animal or vegetable life. The sand, which often drifts in dark volumes through the air, forms hills, which rise and disappear in a night, and whose often perpendicular sides are passed with great difficulty. "Tremendously dreary are these marches: as far as the eye can reach, billows of sand bound the prospect."

5448. *The Tuaricks*, that barbarous race of warriors, who spread terror through the half of Africa, appear in their domestic character under a much more favourable light. Captain Lyon thought them, as to external appearance, the finest race he ever saw; tall, erect, and handsome, with an imposing air of pride and independence. Their skin is not dark, unless where deeply embrowned by exposure to the sun. They hold in contempt all who live in houses and cultivate the ground, deriving their subsistence solely from pasturage, commerce, and plunder, with a considerable preference of the latter pursuit. They keep all the borders of Soudan in constant alarm, carrying off great numbers of slaves. Yet at home they have been found frank, honest, and hospitable, paying an unusual respect to their females, and in their social life much resembling Europeans. They have even written characters, probably very ancient, which they inscribe, only indeed on the dark rocks that chequer their territory; but these are almost entirely covered with them. The chief Tuarick tribes are the Ghraat, in the neighbourhood of Gadamis; the Tagama, who border on Houssa; and the Kolluvi, who occupy most of the intermediate territory. They possess, in particular, the powerful kingdom of Asben, whose capital, Agades, has been long celebrated as a commercial emporium, and said even to equal Tripoli; but our information respecting it is very scanty.

5449. *In the western region of the desert*, the tribes occupying its scattered habitable portions appear to be all Moors or Arabs migrated from Morocco, and who have brought with them their usual pastoral, wandering, warlike, and predatory habits. These last they exercise with a relentless cruelty elsewhere unusual. A splendid booty is frequently opened to them by the vessels which suffer shipwreck on the dreary and dangerous shores of the Sahara, and which are always plundered with the most furious avidity: the only hope of

the wretched captives is to be able to tempt their masters, by the promise of a high ransom, to be paid at Mogadore. Yet these dreary regions are animated by the constant passage of the great caravans between Morocco and Timbuctoo. In the most western quarter, also, at Hoden, Tisheet or Tegazza, and Taudeny, are extensive mines of rock salt, an article which is wanting and in extensive demand over all the populous regions of Central Africa. The passage of these caravans, and the formation of depôts of salt, have given to Walet an importance said nearly to equal that of Timbuctoo. Aroan, also, in the very heart of the desert, derives from these two trades a population of about 3000 souls. Of these rude wandering tribes, it may be enough to name the Woled Dleim, or Ouadelim, the Labdes-seba, the Mongearts, Braknars, Trasarts. But the chief state occupied by the Moors is Luda-mar, on the frontier of Bambarra, which almost claims the title of kingdom. The bigotry and ferocity of the race were strongly marked by the treatment which Park met with during his captivity. Benowm, their capital, is merely a large Arab encampment of dirty, tent-shaped huts. In the heart of the desert, between Gadamis and Timbuctoo, is the district of Souat or Tuat, inhabited by a mixture of Arabs and Tuaricks, in no respect better than the rest of the desert tribes. Major Laing sustained among them a signal disaster. Aghably and Ain-el-Salah, their chief towns, are frequented as caravan stations.

CHAP. XI.

THE AFRICAN ISLANDS.

5450. Africa does not, like Asia or America, enclose within her bordering seas any grand archipelago. Yet she is begirt at a certain distance with *numerous islands*, some single, but the greater number, especially on the western coast, arranged in groups. These islands are mountainous, and many of them volcanic; they include a great extent of fertile territory, and present grand, picturesque, and often beautiful features. Yet they are so entirely distant and detached from each other, and possess so few objects in common, that they cannot afford room for any description under general heads; and our only division must be made by considering each island or group in succession.

5451. *The Azores, or Western Islands*, have, on plausible grounds, been referred to Europe; yet, on a general view of their site and aspect, we adhere to the old arrangement, which makes them African. They lie between the 37th and 40th degrees of north latitude, and the 25th and 32d of east longitude. They are nine in number: St. Michael and St. Mary, closely adjoining each other; Terceira, Fayal, Pico, Graciosa, St. George, nearly a group by themselves; Corvo and Flores, considerably to the westward. These islands bear evident marks of having been produced by the action of subterraneous fire, the symptoms of which are still visible, though no volcano is at present burning. Islets have even been thrown up from the surface of the neighbouring sea. In 1720, an English captain saw one emerge with an explosion resembling the discharge of a train of artillery. A similar phenomenon was observed in 1811; flames, like a host of sky-rockets, were seen bursting from under the sea; but the rocks ejected did not rise above the surface of the water. The internal heat, however, manifests itself by very striking phenomena. Such, on the island of St. Michael, are the *termas*, or warm baths, the springs supplying which are so hot as often to burn the hand which touches them. Elsewhere the *caldeiras*, or boiling springs, rise in columns, not exceeding twelve feet high, but of various diameters, and the burning vapours are formed into clouds, which exhibit a variety of fantastic figures and brilliant tints. The water will boil an egg in two minutes, the atmosphere is strongly impregnated with sulphur, and suffocating vapours issue from various fissures. Not far from the *caldeiras* is the Muddy Crater, a vast cavern filled with mineral substances in a state of constant ebullition, and making a noise mightier than the waves of the sea.

5452. Amid these turbulent elements, *the soil is extremely fertile*, yielding in the plains abundance of grain, while even from the crevices of the volcanic rocks grow the delicate oranges for which St. Michael is celebrated, and the vines, yielding a wine that resembles without equalling Madeira, which clothe the steep sides of the mountain of Pico. These, with grain, afford materials of an export trade, in exchange for European fabrics and colonial produce. The population is vaguely estimated at between 200,000 and 300,000.

5453. Though *St. Michael* is the largest island, being above 100 miles in length, and is also the most fertile, its capital, Ponte del Gada, is not the seat of the general government. This distinction is enjoyed by Angra, in Terceira, in consequence of its comparatively safe harbour. It also derived, of late, a considerable interest from being occupied by the adherents of Maria, the young queen of Portugal, in opposition to the usurpation of Miguel. By its good harbour it likewise obtains the exportation of the wine of Pico, which is hence known by the name of Fayal. The amount, in good years, has been stated at 8000 or 10,000 pipes; but England, in 1830, took only 2780 gallons.

5454. *Madeira*, in about 32° north lat., is a beautiful island, consisting of a cluster of mountains, or rather one single mountain with various peaks, rising abruptly from the Atlantic. It is covered all over with rich vegetation; and to the traveller, who penetrates into the interior of its valleys, nothing can be more picturesque than the varied forms of the rocks, the verdure which clothes them, the glitter of the streams, and the country seats, churches, and monasteries placed in striking situations. This fertile island was first distinguished for producing the best sugar known; but, after the rivalry of the West Indies rendered this culture no longer profitable, the islanders applied themselves to wine, which was soon raised to high perfection. Being favoured by the Methuen treaty, it was imported in large quantities into England, where it was used more extensively than any, except port and sherry, bearing a higher price than either. Of late, the frequency of adulteration and the preference of French wines have somewhat lowered its estimation. In 1830, the quantity consumed in Britain was only 228,000 gallons (about 2000 pipes). A considerable quantity is besides sent to America and the East and West Indies; and a voyage to tropical climates with a return to Europe is supposed to improve its quality. The very best, however, called "London particular," is imported direct to that capital. The island yields a small quantity of a very rich sweet wine called *Malmsey*. Funchal, the capital, is almost an English town, nearly all the opulent inhabitants being merchants of that nation employed in the wine trade, while the Portuguese are generally very poor. Madeira has adjacent to it Porto Santo, a small high island with a good roadstead; and two *Desertas* answering to their name; but these do not seem entitled to rank with it, so as to form a group.

5455. *The Canaries*, distinguished under the appellation of the Fortunate Islands, are among the most celebrated and beautiful groups of small islands in the world. They lie about the 28th degree of north latitude, and between the 13th and 18th of west longitude. They are properly seven, to which Humboldt, after Ledru, assigns, in 1790, the following dimensions and population:—

Teneriffe, -	73 sq. leagues;	70,000 pop.	Fuerteventura, 26 sq. leagues;	9,000 pop.
Grand Canary, 60	—	50,000	Gomera, - 14	— 7,400
Palma, - - 27	—	22,000	Ferro, - 7	— 5,000
Lancerola, - 63	—	10,000		

These islands, especially the two principal, consist of mountains which rise abruptly from the shore, and shoot to an amazing height. The Peak of Teneriffe, the great landmark to mariners through the Atlantic, is 12,000 feet high. The rocks rise from the shore in basaltic forms, whence they bear often the aspect of castles, for which they have even been mistaken by the passing navigator. In the interior, they are high and naked, bristling with sharp points, and presenting often singular indentations on their bold summits. Yet being often covered with forests of laurel, pine, arbutus, and other trees, they exhibit picturesque and even magical scenery. Humboldt considers the steep ascent of the peak as presenting the most rapid transition known from a tropical to an arctic vegetation. On the coast are valleys blooming with the orange, myrtle, and cypress; above, declivities crowned with the vine and the most valuable species of grain; higher up, forests of the laurel, chestnut, and oak; these are succeeded by the dark pine and Scotch fir; then a plain strewn with dust of pumice stone is followed by the Malpays, entirely composed of loose fragments of lava. The summit bears the marks of a volcanic crater not very long extinguished; for even early in the last century it made destructive eruptions.

5456. *The soil* in these islands displays much of that luxuriant fertility which distinguishes tropical countries, when profusely watered, like this, by the streams from the high mountains and the vapour from the ocean; yet their western sides are parched by arid and pestilential breezes from the African desert, the streams are often absorbed in the porous lava, or rush down in torrents which would sweep away the earth, were not walls formed to retain it. The principal exportable produce is that afforded by the vines, which grow on the lower declivities of the peak, and yield a wine which, though inferior to Madeira, has, from its cheapness, come into considerable use. The export has been estimated at 8000 or 9000 pipes; but the quantity consumed in Britain in 1830 was only 106,000 gallons (about 900 pipes). There is also some export of brandy, soda, and archil. The chief seat of this trade is Santa Cruz, in Teneriffe, which enjoys the advantage of an excellent roadstead, and is what Humboldt calls a great caravansary on the road to America and the Indies; where numerous vessels of all nations touch for refreshment. The place is, however, intensely hot, and the natives not engaged in business prefer the residence of Laguna, 2000 feet above the sea, which enjoys a delightful coolness. Grand Canary is more uniformly fertile than Teneriffe, supplying the other islands with grain, and yielding a little of the fine wine called sack. Las Palmas, its chief town, is the ecclesiastical capital; but the seat of government is at Santa Cruz. Ferro, small, arid, and rocky, was once supposed to form the most westerly point of the Old World, and has often been used by geographers as the first meridian.

5457. The native inhabitants of these islands were a remarkable race, called *Guanches*.

They had attained a considerable degree of civilisation, cultivated music and poetry, showed a high respect to the female sex, and had even a class of *magades*, or vestals, to whom they paid divine honours. They practised agriculture with diligence, and possessed the art of embalming bodies; the mummies, still found wrapped in goat-skins, prove them to have been a tall and handsome people. The Guanches maintained also, for nearly half a century, a most valorous struggle against the Spanish invaders, but were at length completely exterminated. The modern Canarians are a sober, active, industrious people, who have migrated to all the Spanish dominions in America and the Indies, and form the most useful part of the population.

5458. *The Cape Verd Islands*, about eighty miles from Cape Verd, in 16° to 17° north lat., are ten in number, three of which are large, St. Jago, St. Antonio, and St. Nicholas; the rest small, Mayo, Bonavista, Sal St. Vincent, St. Lucia, Brava, and Fogo. The large islands rise in the interior into high mountains, and Fogo (fire) contains a very active volcano. In general, however, the surface is arid, rocky, and much less productive than the Canaries. The chief growth is cotton, which is exported to Africa; and a very fine breed of mules and asses is reared, many of which are sent to the West Indies. Goats, poultry, and turtle abound. Salt is formed in large quantities by natural evaporation, particularly in Mayo, where there is an extensive pond, into which the sea is received at high water, and the salt completely formed before next tide. These islands are not much visited by vessels destined for America and the Indies, which, after quitting the Canaries, stand to the westward, in order to obtain the benefit of the trade-winds. The Portuguese, since the first discovery, have claimed the sovereignty, and maintain a governor-general, who resides at Porto Praya; but the natives have of late regained a good measure of independence.

5459. *Ascension* is a solitary rock, far out at sea, in lat. $8^{\circ} 8'$ north, long. $14^{\circ} 28'$ west. It is completely rocky, barren, and long uninhabited; yet from its situation ships often touched there, and letters were even lodged in the crevice of a rock, called "the sailors' post-office." Of late, the East India Company have formed a small settlement there.

5460. *St. Helena*, so celebrated lately as the ocean-prison of the greatest of modern warriors, has now reverted to its original destination, as a place of refreshment for the returning East India ships. It presents to the sea, throughout its whole circuit of twenty-eight miles, an immense perpendicular wall of rock, from 600 to 1200 feet high, like a castle in the midst of the ocean. On the summit is a fertile plain, interspersed with conical eminences, between which picturesque valleys intervene. The climate on the high grounds is very agreeable and temperate, though moist. There are only four small openings in the wall of rock, on the largest of which, where alone a little beach appears, has been built James Town, where the governor resides, and where refreshments, though on a limited scale, are provided for ships.

5461. Turning the Cape of Good Hope, and entering the Indian Ocean, we arrive at *Madagascar*, one of the largest and finest islands in the world, placed between 12° and 26° south latitude: it may be about 840 miles long, and 220 in its greatest breadth. The interior is traversed from north to south by a chain of very lofty mountains, of which the highest are Vigagora in the north, and Botishmenil in the south. Their aspect is grand and picturesque, and strikes with surprise the traveller who surveys their awful precipices, covered with trees as ancient, perhaps, as the world, while he hears the roar of stupendous, almost unapproachable, cascades. Beneath these, however, appear rural views, delightful hills, vast savannahs covered with cattle, and secluded valleys. The forests abound with varied and beautiful trees, palms, ebony, dyeing woods, enormous bamboos, orange, and citron. The plains along the sea, finely watered by numerous streams from these mountain recesses, are extremely fruitful in rice, sugar, silk; fitted, indeed, for almost every tropical product, though there seem few plants peculiar to the island. The mountains contain, also, valuable mines, especially of iron, but only partially worked.

5462. *The population of Madagascar* has been variously estimated at from 1,000,000 to 4,000,000: perhaps, with M. Balbi, we may take 2,000,000 as a probable conjecture. The people are not savages: they cultivate the ground, and practise some arts; yet are, on the whole, very rude and uninformed. They are described as a peculiarly gay, thoughtless, and voluptuous race, void of care and foresight, always cheerful and good-humoured. They are divided into a number of small tribes, who wage very frequent wars with each other. On the eastern coast are the Antavarts, within whose territory is the fine bay of Antongil; the Betanimenes, holding the most fertile tracts in the island, and having the large and commercial port of Tamatave; the Betimsaras, in whose limits is the frequented harbour of Foul Point; the Antaximes, having Malatane and Andevourante. On the western coast the principal people are the Muquez, a warlike race, in whose domain is St. Augustine, a port where the English, in their way to India through the channel of Mozambique, often seek refreshment; the Seclaves, an extensive country long ruled by a queen, and comprising the frequented port of Bembetoke, and the large town of Mouzangaye, asserted to contain 30,000 inhabitants. But the most important people, lately, have been the Ovas, occupying an extensive and high plain in the interior, whose sovereign, Radama, had reduced to vassal-

age the largest and finest part of the island. He had formed a train of artillery, and armed a great part of his troops with muskets, and had also sent a number of young natives to obtain instruction in Paris and London. With the aid of the English missionaries, he had established a printing-press, and trained a number of teachers, both male and female, who were distributed through different parts of the kingdom. Unhappily this prince, in July, 1828, was poisoned by his wife, who immediately raised an unworthy paramour to the throne. This event has introduced great anarchy, inducing several subject states to shake off the yoke; and there seems much room to fear that it will arrest entirely the career of improvement commenced under such prosperous auspices. The French have made frequent attempts to form colonies in Madagascar, which they even repeated in 1829, but never with any important result. They have small stations, however, at St. Mary, Tamatave, Foul Point, and near Fort Dauphin.

5463. *Bourbon*, about 400 miles east of Madagascar, though it can bear no comparison as to magnitude with that island, is not inconsiderable, being forty-eight miles long and thirty-six broad. It consists entirely of the heights and slopes of two great mountains, the most southerly of which contains a volcano in perpetual activity, throwing up fire, smoke, and ashes, with a noise truly tremendous. These substances are ejected, not from the crater, but by lateral openings, presenting at a distance the appearance of fiery cascades. Even in the northern mountains, basaltic colonnades, deep fissures, hillocks thrown into the valleys and the beds of the rivers, announce ancient and powerful volcanic agitations. A great part consists of what the French call burnt country, a complete desert of hard black soil, with numerous holes and crevices. The rest, however, well watered by numerous torrents, is favourable not only for the ordinary tropical products, but for some fine aromatic plants. The Portuguese discovered this island in 1592, but being taken by the French in 1642, and raised by M. de Flacourt to an important establishment, it was called Bourbon, which name it has resumed, after bearing, during the revolutionary period, that of Réunion. Coffee, brought from Mocha in 1718, succeeded so well, that the Bourbon coffee was considered second only to the Arabian. At a later period, its cloves came into some rivalry with those of Amboyna. All other objects of culture, however, have lately become secondary to that of sugar, which has been found profitable beyond any other.

5464. *The population of Bourbon* in 1831 was 97,231; of which 14,059 males, and 13,586 females were free; 46,083 males and 23,483 females were slaves. The exports were valued at 396,000*l.*, the imports at 293,000*l.* The island labours under the disadvantage of not having a secure harbour, or even a roadstead.

5465. *Mauritius* is about 120 miles west of Bourbon, not quite so large, yet still 150 miles in circuit. The rugged mountains, which cover a great part of the island, give it a somewhat sterile character, and it does not yield grain even for its limited population; yet the lower slopes produce coffee, cotton, indigo, and sugar of improved quality. The Portuguese in 1505 called it Cerne, for which the Dutch in 1598 substituted Mauritius, from the Prince of Orange; but neither nation formed any permanent establishment. The French, too, for some time, sent only a few casual settlers from Bourbon; but, in 1734, La Bourdonnaye, its able governor, raised it to a naval station of the first importance: it was called Isle of France, and became the capital of the French possessions in the Indian seas. It was considered impregnable, and remained in their undisputed possession, after the greatest disasters which befell their arms on the continent. It became, then, a strong-hold for privateers, who are said, in ten years, to have taken prizes to the value of 2,500,000*l.* At length, in 1810, it yielded to the arms of Britain with less resistance than was expected. Since 1812, when its sugars were admitted at the same duties as those from the West Indies, this branch of culture has taken a great precedence over all others; the produce, from about 5,000,000 pounds, having risen, in 1830, to about 64,000,000. In that year the export of coffee was only about 20,000 pounds. Its ebony, the finest in the world, and its tortoise-shell, are each worth about 9000*l.* The imports, in 1826, were estimated at 657,000*l.*, and the exports at 572,000*l.* The island, in 1827, contained 94,600 inhabitants, of whom about 8000 were whites, 15,000 free negroes, 69,000 slaves, the rest troops and resident strangers. Port Louis is a good harbour, with rather a difficult entrance: it affords every convenience for careening and refitting; but provisions, being all imported, are not very abundant.

5466. *A considerable number of islets*, single or in groups, spot the Indian Ocean to the east of Africa. Of dependencies on Mauritius, Rodriguez contains only 123 inhabitants, Diego Garcia 275, Galega 199. The Seychelles, nearly south from Madagascar, with the bordering group of the Amirantes, are a cluster of very small islands, high and rocky, and little fitted for any culture except cotton; but they abound with cocoa nuts, and their shores with turtle and excellent fish. The population in 1826 was 7665, of whom 6525 were slaves.

5467. *The Comoro Islands*, a group of four, between Madagascar and the continent, are very elevated and mountainous in the interior; but the lower tracts abound in sheep, cattle, and all the tropical grains and fruits. The inhabitants are mild and industrious, but they have been most dreadfully infested and their numbers thinned by the Madagascar pirates, who make an annual inroad, laying waste the open country, and blockading the

towns. Comoro is the largest, containing a mountain supposed to rise 6000 or 7000 feet high; but Anjouan, or Johanna, is the most flourishing, its chief town being supposed still to contain 3000 inhabitants. Mohilla and Mayotta are comparatively small.

5468. *Socotora*, forty leagues east from Cape Guardafui, is governed by a sheik dependent on the Imâm of Muscat. It is twenty-seven leagues long and seven broad, mountainous, rocky, and arid; yet it yields the best aloes in the world, and a small quantity of dragon's blood. Though the coast is bold, it affords excellent harbours; and ships may procure bullocks, goats, fish, and excellent dates, at reasonable prices.

Botany and Zoology.

5469. *Respecting the Botany and Zoology* of several of the African islands, we can communicate some curious particulars, which will be best collected under one general head.

5470. *Tristan d'Acunha*. — This island, if indeed it may be considered as belonging to Africa, is situated in 37° S. lat. and 11° W. long. The whole is a solid mass of rock in the form of a truncated cone, rising abruptly from the sea, and ascending, at an angle of 45 degrees, to the height of 3000 feet. This mass is surmounted by a dome, upwards of 5000 feet high, on the summit of which is the crater of an old extinguished volcano. The face of this mountain, as far up as the base of the dome, is mostly covered with brush-wood, intermixed with fern and long grass, that veil its native ruggedness. Along the N. W. side of the island there runs a belt of low land, constituting a plain about six miles long, and presenting to the sea a perpendicular front from 50 to 300 feet high. The whole is a mass of stony fragments, scoriæ, and other volcanic products, mixed with black indurated earth. Part of this plain has been cleared, by fire, of its wood, though the scorched trees still encumber the ground; and the rest is in a state of nature, covered with an impenetrable copse. This plain is the only part of the island that is in the least susceptible of vegetation; and, could the needful and laborious preparations be made, there is no doubt it might yield a fair return in all sorts of European grain.

5471. *The ascent to the peak*, which, though practicable in some places, is difficult and dangerous, was performed by the late Captain Carmichael, of whose remarks on the botany of the Cape we have already availed ourselves. Two plants he observed as particularly deserving of notice; the *Spartina arundinacea*, whose close entangled tufts much impeded the progress of the party, and the *Lomaria robusta*, a fern which trails along the ground, and the stems of which, like junks of old cable, cross and recross each other in so intricate a manner, that it required great circumspection to avoid falling over them. The ascent to the peak is extremely steep, and the rocks of so loose and incohesive a nature that it is dangerous to touch any one, lest it should bring down many more; while, in availing themselves of the branches of the arborescent *Phyllicæ* to aid their progress, the travellers saw no less a risk, the greater part of these being rotten, so that a fatal issue might follow any dependence upon them. No vegetation exists on the dome itself, not so much from the elevation, as from the total want of any soil wherein plants could fix their roots.

5472. *The climate of Tristan d'Acunha is so mild*, that the herbage remains unimpaired throughout the year. Snow never falls on the low land, but the island is almost constantly enveloped in fog or rain; which does not, however, prevent its being a very healthy spot. The Flora is perhaps as copious as the extent and situation of the island would lead us to expect; but, except the Cryptogamic tribes, there is nothing of peculiar interest. The only plant that approaches to the size of a tree is a species of *Phyllica*. This plant not only occupies all the plain, but has spread over the face of the mountain, wherever its roots could insinuate themselves into the crevices of the rock. In favourable situations it grows to the height of 20 feet and upwards, measuring from 12 to 18 inches in diameter. Its trunk is extremely crooked and twisted; but the wood is hard, close-grained, and, according to the report of a ship carpenter who examined it, would make excellent timber for vessels of sixty tons and under. Its bark possesses a slight degree of astringency. Owing to the lightness of the soil, and the frequency of high winds, these trees rarely stand upright, but lean against the ground, and cross each other, in such a manner as to make it a business of extreme difficulty to penetrate to any distance through the wood. Besides the *Phyllica*, there are only two shrubby plants on the island, both of which belong to the genus *Empetrum*, and may be but varieties of one species. They possess no quality to recommend them, but that they grow on the most barren spots, where nothing else could vegetate. But of the herbaceous plants, the most remarkable is the gigantic species of *Spartina* (*S. arundinacea*), above alluded to. This grass over-runs the whole island, from the upper edge of the table-land down to the sea shore, accommodating itself to all soils and situations. It springs up in large close tufts, which, when full grown, are borne down by their own weight, and lean on each other in such a manner, that a person may roll himself over them, without any danger of sinking. Its stems grow to the length of six or seven feet, and are of a solid almost ligneous texture, and covered with a profusion of leaves. This grass makes an excellent and durable thatch, and the young foliage is eaten by horses and oxen. The Wild Celery grows in great abundance over all the low ground, and attains

a great size, its stem sometimes measuring upwards of three inches in diameter. It possesses, in a high degree, the flavour of the Garden Celery, and by proper management might be brought to equal it in every respect. A species of *Chenopodium* (*C. tomentosum*), of a strong balsamic odour, is common. An infusion of the dried leaves of this plant is used as a substitute for tea by the Hottentots sent down in charge of the cattle. The soldiers use for the same purpose the leaves of the *Pelargonium*, which hardly yield to the others in strength of odour. The low ground is over-run with a species of *Acæna* (*A. sarmentosa*), a plant of no apparent utility, but an intolerable nuisance to such as have occasion to walk over the ground where it grows. Its fruit is a sort of bur, which, on the slightest touch, fixes itself on the clothes, and, falling in a hundred pieces, covers them with an unseemly crust of prickly seeds, not to be got rid of without infinite labour.

5473. On quitting the shores of the Cape of Good Hope, and directing our attention to the eastern side of Africa and the adjacent islands, we shall find that very little is to be collected that can convey any thing like a satisfactory idea of their vegetable productions. The Cape lies in the highway, if we may so term it, to the most important of our colonies, and it has consequently been frequented by men of science as well as by the sons of commerce. It is quite otherwise when we have rounded that vast promontory, and proceeded northward. Madagascar, which seems next to offer itself, though visited by Michaux, who found an untimely grave there, by Du Petit Thouars, who published some memoirs on the plants, by Dr. Thomson, F.L.S. staff surgeon, with a copy of whose manuscript journal we have been favoured by C. Telfair, Esq. of the Mauritius, by MM. Helsingier and Bojer, whose journal is published in the third volume of the *Botanical Miscellany*, and lastly, by Dr. Lyall; yet has been but imperfectly investigated by these able men, who could do little more than testify how much remains to be explored.

5474. Agriculture seems to be most carelessly performed throughout the vast island of Madagascar. The indolent natives stir the ground with a spade, and drop in a few seeds, when they are sure of reaping such a harvest as shall supply their wants throughout the year. Rice is the chief object of culture, and the principal article of food; it is grown on the low lands in the damp woods, and by river sides; sometimes being put into the ground as we do kidneybeans, but oftener transplanted, and it yields a hundred fold, without giving other trouble than that of keeping the soil free from weeds. Women and children only are employed in setting the rice, the men helping to clear the ground. Thus the inhabitants of Madagascar could hardly maintain themselves without the existence of those extensive marshes, which are necessary for the culture of rice, but which constantly exhale pestilential miasmata, and to which the insalubrity of the climate may justly be attributed. After Rice, Manioc and Batatas are the chief articles of food. The roots of Manioc often acquire an enormous size, measuring fifteen feet long, and almost a foot in diameter. Then come Maize, "seasoning Herbs, Giromonds," Calabashes, Earth Nuts (*Arachis*), Sugar Canes, Pine Apples, Bread Fruit, and the Vine, and among the articles of manufacture are Cotton and Hemp. Potatoes, that were introduced by Mr. Hastie, the British resident, have thriven admirably, and the same may be said of other European vegetables, as Beans and Peas. It is much to be regretted that the eager desire of gain which characterises the Malagassy rarely allows them to wait till the productions of the soil are ripe; they gather their vegetables and fruit and carry them to the bazaar not half matured, that they may secure some paltry pieces of coin.

5475. An exact enumeration of all the Indigenous Madagascar Plants is, and will long remain, a desideratum in botany. Centuries must previously elapse, and the knowledge can only be obtained through the exertions of Europeans, who will gradually render the climate of Madagascar less prejudicial by extending the limits of its cultivation, and exploring the hitherto undiscovered districts. The productions of the west, north, and southern coasts, and of all the interior, remain almost unknown, and the slender documents that have been furnished as to the vegetation of the north-east, by French naturalists, most of whom have perished from the effects of the climate, serve rather to stimulate than to satisfy a botanist's curiosity.

5476. Two plants, peculiar, we believe, to Madagascar, are eminently worthy of notice; the *Hydrogeton fenestralis* (fig. 872.), and the Tanghin tree (*Tanghinia veneniflua*). The first is an aquatic plant, bearing tuberous and esculent roots, and throwing up from these roots elliptical leaves, pierced with holes, arranged with the greatest regularity and in the form of parallelograms; or, in other words, the whole leaf seems to be composed of a latticework of vascular tissue, presenting the appearance of what is called the skeleton of a leaf. We possess beautiful specimens, gathered by the late Dr. Lyall, and we are informed by Mr. Telfair that living plants have been introduced to, and are cultivated at, the Mauritius.

5477. The famous Tanghin Poison is the fruit of *Tanghinia veneniflua* (fig. 873.), formerly called *Cerbera Tanghin*. Its botanical history and a figure of it were first published in the *Botanical Magazine*, tab. and page 2968; and, since, still more

HYDROGETON FENESTRALIS.

copiously, from communications by C. Telfair, Esq. in the *Botanical Miscellany*. To these works, therefore, we may refer for full details; and not to occupy too much space

TANGHINIA VENENIFLUA.

here, we shall confine ourselves to a relation of the extraordinary and truly diabolical use that is made of the seed of this plant in its native country, Madagascar. The kernel, though not much larger than an almond, is of so poisonous a nature, that a single one suffices to destroy more than twenty individuals. Radama, the late enlightened sovereign of Madagascar, abolished the use of it in the native ordeal; but it has been unhappily revived by his successor to an extended degree. It was with great difficulty that Radama could induce the chieftains to admit of the discontinuance of an usage which had existed from time immemorial, and whose unerring efficacy in the detection and punishment of crime had never been questioned, until Mr. Hastie, the British government agent, had acquired such an influence over the king's mind as to expose its fallacy. But this was the work of years; and though Radama was at last

himself convinced that nothing could be more unjust than the practice, yet he feared to shock the prejudices of his subjects, by commanding its discontinuance. Even the chief performers in the ceremony, the "skids" as they are called at Tannarivoo (the capital of Madagascar), who unite in their own persons the offices of priests and physicians, and who administer the poisonous kernel to the victims, never doubt its power of revealing guilt and clearing innocence. The last occasion on which the ordeal was practised in Radama's reign, and of which he availed himself to procure its discontinuance, personally regarded his court and attendants. The king was affected with a complaint of the liver, for which the "skid" prescribed some inefficacious remedies; and as the disease became worse, Mr. Hastie gave him calomel powders, which he had found, by experience, to relieve himself under similar circumstances. The disease vanished, but ptyalism was produced, and alarmed the king's family, who believed that he was poisoned, and insisted on all his immediate attendants being put to the ordeal of the Tanghin. The royal skid was most earnest in pressing to have it performed, although he himself, from his rank and place, would be among the first to whom it would be administered. In vain the king protested that he felt himself cured, and that the indisposition and soreness of the mouth were caused by the medicine that had relieved him, and would pass off in a few days. The skid insisted; the ministers and principal chieftains joined with the family in requiring the ordeal, to which the king reluctantly consented, stipulating that it should be the last exhibition of the kind, and bemoaning the necessity which thus deprived him of so many attached dependants, whose fate he predicted, while he protested his conviction of their innocence. The king's servants, including the skid, were more than twenty in number; they were shut up at night separately and forbidden from food. Next morning they were brought out and paraded in procession before the assembled people, the presiding skid had the Tanghin fruit in readiness: after some prayers and superstitious evolutions, he took out the kernel, which he placed on a smooth stone, and with another stone broke down a part of it, to a softness like pounded almonds. The victims were then brought separately forward, and each questioned as to his guilt: if he denied, his arms were tied behind, and he was placed on his knees before the skid, who put a portion of the pounded kernel on his tongue, and compelled him to swallow it. Thus the kernel was shared among all the king's personal servants. On some, the effect appeared in half an hour or less. The skid takes particular notice how they fall; — on the face, to the right hand or left, or on the back; — each position indicating a different shade of guilt. Convulsions generally came on, accompanied with violent efforts to vomit. Those whose stomachs reject the dose at an early period, usually recover: on this occasion there were but two with whom this was the case. The others were flung, in a state of insensibility, into a hole ready dug, and every person present at the ceremony was obliged to throw a stone over them. Thus their burial was soon completed. The royal skid was among the first that fell. Those that recover are supposed to bear a charmed life ever after, and are respected as peculiar favourites of the gods.

5478. *The isles of France (or Mauritius) and of Bourbon* have indeed been investigated by the labours of several naturalists; and the result, as far as regards their characteristic vegetation, has been communicated to us in a letter from M. L. Bouton, and the same has very recently been published in the twenty-fourth volume of the *Annales des Sciences Naturelles*, p. 247. This able and zealous botanist particularly notices the opinion of M. Achille Richard, and says: "After casting a rapid glance on the kind of vegetation that is observable in the islands of Bourbon, Mauritius, and Madagascar, M. Richard, in the introduction to his *Monograph of the Orchideæ*, considers, as do all geographers, these three islands as belonging to Africa, lying, indeed, as they do, much nearest to this continent.

'But,' continues M. Richard, 'in the character of their vegetation, they differ from that of Africa, and more assume the peculiarities of the Indian Archipelago, from which they are separated by widely extended seas.' Farther on, M. Richard thus expresses himself: — 'We may perceive that the Flora of Mauritius and Bourbon has more analogy with that of the Indian islands than with the vicinity of the Cape of Good Hope; and that, though geography may rank these islands as appertaining to Africa, they belong to India, and consequently to Asia, in consideration of their vegetation. Without presuming to give a satisfactory explanation of this phenomenon, we will simply add two observations, from which it seems easy to deduce such conclusions as may throw light on this point. 1. The regions of the Cape of Good Hope are extra-tropical; while the isles of France and Bourbon, and the Indian Archipelago, are situated within the tropics: and it is well known what an influence this situation exercises on the character of vegetation. 2. It appears that the prevailing winds of the Indian Archipelago are from the east and north-east; that is, exactly those which come in the direction of the Indian islands.' These remarks appear to me conclusive; the first, especially, is highly important. All naturalists, who have explored the most extensive regions of our globe, have observed an extraordinary identity in the productions of the tropics. On this subject I shall quote M. Dumont Durville, who, in a note communicated to the Institute on the voyage of circumnavigation performed in the *Coquille*, says, 'more than half our voyage lay in the torrid zone, and among the numerous archipelagoes that are scattered over the immense Pacific Ocean. In all these islands, starting, as it were, from the most easterly ones, to those that are on the confines of Asia and even of Africa, the Flora is but the same; herbs, shrubs, and even almost all the trees, are alike, and the only shade of difference is, that the number of species increases as we draw near the continents.' Mauritius, Bourbon, and Madagascar," proceeds M. Bouton, "are comprised in these general remarks; but the Cape of Good Hope, situated beyond the tropics, and fourteen degrees south of Mauritius, is necessarily an exception. The Flora of the African promontory is stamped with a peculiar character, that to me presents more points of affinity with that portion of New Holland which is placed nearly in the same parallel. Several identical genera may be observed in the mass of vegetation of these two localities. Many *Proteas*, certainly, grow at the Cape; but a few of the species are also found in New Holland; with very similar genera, as *Banksia*, *Embothrium*, *Hakea*, and *Persoonia*. *Gnaphalium*, *Elichrysum*, *Diosma*, and several genera belonging to the *Iridæ*, *Leguminosæ*, and *Ficoideæ*, grow equally at the Cape of Good Hope and New Holland. The prevailing natural families in the latter country are, according to M. Leschenault, the *Proteaceæ*, *Ericinæ*, *Synanthereæ*, *Leguminosæ*, and *Myrtaceæ*; now these families constitute the gross of the vegetation on the promontory of Africa. A third spot on our globe seems to present some traits of resemblance to the two localities I have just described, and that is the southern extremity of America, where there are many of the genera which grow in the

south-west of New Holland. Again, the vegetation that obtains in these three points has no resemblance to that of the Mauritius, while the productions of our island bear more analogy with those of that portion of Africa which lies under the same parallels as Madagascar, Bourbon, and the Mauritius. Now this wide extent is yet hardly known, the part lying near the sea alone having been explored; and this is pronounced by my esteemed friend, M. Bojer, who examined the coasts of Mosambique and Zanguebar, to possess many of the plants which grow in our islands, or others which hold a similar rank in the same natural orders. It is no less true that some genera do exist peculiar to the Mauritius, and which form, as M. Richard expresses it, its peculiar physiognomy; but every thing tends to confirm the opinion that these detached features will sink in the general mass, when we shall become better acquainted with the botany of that portion of Africa which lies between the tropics, and which, more than any part of our globe, contains the vegetable productions whose congeners exist in the Mauritius."

5479. About eight or ten degrees north of Madagascar lies a small group of islands, called the *Seychelles*, which are rendered famous by the pro-

DOUBLE COCOA-NUT TREES.

duction of a Palm, not known in any other part of the world, and whose history is too remarkable to be passed over altogether in silence. Even of this small group of islands, three only, lying within half a mile of each other, produce the Palm that bears the Double Cocoa Nuts (*fig. 874.*), or, as they are called, *Cocos de Mer*, from an erroneous idea that

they were marine productions. Until the discovery of these islands in 1743, Double Cocoa Nuts were only known from having been found floating on the surface of the sea, in the Indian Ocean, generally destitute of husk, and with the inner part decayed, but still so highly prized as to be spoken of by Rumphius as "*mirum miraculæ naturæ, quod princeps est omnium marinarum rerum, quæ raræ habentur.*" This author further assures us that "the Double Cocoa Nut is no terrestrial production that may have fallen in the sea and there become petrified, as others ignorantly stated; but a *fruit, growing itself in the sea*, whose tree has hitherto been concealed from the eye of man." The Malays asserted that the palm that bore it was sometimes seen at the bottom of the ocean; but that, if dived for, it instantly vanished: while the negro priests further affirmed that its submarine branches harboured an enormous griffin, which nightly came to shore, and, seizing elephants, tigers, &c., carried them as a prey to its nest; and, not satisfied with these, attracted such ships as came near to the spot, and devoured the luckless mariners. With such and even stranger ideas respecting its place of growth and history, there is no wonder that this nut should be highly prized; indeed, in the Maldivian islands, it was death to any man to possess it, and all that were found belonged to the king, who sold them at high prices or distributed them as regal gifts. From 120 to 150 crowns were paid for each nut, and even kings have been so greedy of obtaining these fruits as to give a loaded ship for one. Rumphius certainly states his suspicions that the Chinese and Malays may have, *perhaps*, set too high a value on the Double Cocoa Nut, when considering it an antidote against all poisons. The albumen, or meat which lines the nut, was thought to be the part where this virtue resided: it was mingled with red coral, black ebony, stags' horns, and many such anomalous ingredients, and drunk from vessels of porphyry. All inflammations of the body were likewise believed to be subjected to its powers: it was a preservative against colic, apoplexy, paralysis, *et id genus omne*. The shell, being less precious, was granted to the great men for drinking-vessels; a single slice being sufficient, if used as the lid, to neutralise the effect of any noxious ingredient that might mingle with the drink, tobacco, betel, &c. that were held in it. The discovery of the Seychelles islands, and the knowledge thus obtained that these mystical nuts grew upon trees, caused a speedy reduction in their value; though the botanical history of the Palm that produced them continued long a desideratum. Some imperfect notices served but to stimulate the curiosity that was finally gratified by Mr. Telfair, who entreated Mr. Harrison, a friend resident in the Seychelles, to obtain the necessary specimens and delineations. "To behold these trees," says Mr. Harrison, "growing in thousands, close to each other, the sexes intermingled, a numerous offspring starting up on all sides, sheltered by the parent plants, the old ones fallen into the sear and yellow leaf, and going fast to decay, to make room for the young trees, presented to my eyes a picture so mild and pleasing, that it was difficult not to look upon them as animated objects, capable of enjoyment and sensible of their condition." A new leaf is formed annually, which, falling off at the year's end, leaves a scar or ring, by counting which it is estimated that this Palm requires 130 years for its full growth. The foliage is finest on young plants, shooting up perpendicularly, folded close like a fan, to 10 feet or more. In this state it is pale yellow, and used for hats and bonnets; afterwards, it expands in all its beauty, and becomes green. The crown or cabbage, in the midst of the leaves, is eaten; the trunk is used for building, and the foliage serves for thatching, and even for the walls of houses, a hundred leaves sufficing to construct a house, including the partition, doors, and windows. The down, attached to the young foliage, serves for filling mattresses and pillows, while the ribs of the leaves make baskets and brooms. Vessels of different forms and uses are made out of the nut, some of them holding six or eight pints; and, being very strong and durable, they are much valued. Among other articles, shaving dishes, black, beautifully polished, set in silver and carved, are formed of these nuts.

5480. *The Zoology of Madagascar* is as little known now as it was a century ago, while the recent intemperate conduct of the French naval commanders towards the native authorities destroys all those hopes which had been raised for the success of a scientific naturalist of that nation, who left France, two years ago, to explore this most interesting country. The zoology of Madagascar, in fact, from the scanty gleanings that have as yet reached Europe, is of such a peculiar character, that it can scarcely be assimilated to that of Africa, while it appears equally distinct from that of Australia. It is said that neither the Lion, Tiger, Elephant, nor Horse is here known; while the Apes and Monkeys of Africa and the Asiatic islands are replaced in Madagascar by the family of Lemurs. A list of these curious monkey-like animals is here subjoined. Our knowledge of the ornithology is still more defective, although it is probably very distinct from that of the neighbouring continent. Some singular Shrikes, allied to the Vanga of Buffon, belong to this island; less known to the naturalist than any other of moderate size in the whole world.

5481. *The quadrupeds*, as intimated by various writers, are arranged in the following list: —

Lichanotus niger Ill. Black Indri Lemur.
Lichanotus laniger. Flocky Lemur.
Lemur Macaco. Ruffled Lemur.
Lemur rufus. Red Lemur.
Lemur Mongooz. Mongooz Lemur.
Lemur Catta. Ring-tailed Lemur.
Lemur niger. Black Lemur.
Lemur fulvus. Yellow Lemur.
Lemur albimanus. White-handed Lemur.

Lemur collaris. Collared Lemur.
Lemur albifrons. White-fronted Lemur.
Lemur nigrifrons. Black-fronted Lemur.
Lemur cinereus. Ashy Lemur.
Otolicnus madagascariensis Ill. Little Galago.
Otolicnus crassicaudatus. Great Lemur.
Tarsius fuscimanus Ill. Yellow-handed Tarsier.

Cheilomys madagascariensis Cuv. Aye Aye.
Pteropus Edwardsii. Edwards's Vampire.
Centenes semispinosus. The Tendric.
Centenes setosus. Taurec.
Sciurus madagascariensis. Madagascar Squirrel.
Sus larvatus. Masked Boar.

5482. *The native Zoology of the Mauritius*, as may be supposed, is but scanty; yet the judicious exertions of the French have introduced several animals beneficial to the island. The African Serpent-eater is said to have become domesticated, and is highly useful in

THE DODO.

destroying reptiles. The Locust-eater (a species of *Lamprosternus*?) has likewise been brought from the same continent, and has several times preserved the crops from complete destruction. The Goromy (*Osphroemus olfax* Com.), a small but most delicious fresh-water fish of China, is here completely naturalised, and has multiplied to such a vast extent, as to be considered the greatest delicacy of the island.

5483. *The celebrated Dodo* (fig. 875.), a bird no longer known to exist, was unquestionably a former inhabitant of the island of Mauritius. Old Tradescant, whose museum appears to have contained an entire specimen, mentions it as "not being able to flie, being so big." Some very interesting particulars on this strange uncouth animal have been collected and published by Mr. Duncan, the present zealous

and intelligent curator of the Ashmolean Museum, where the bill (probably belonging to the specimen named in Tradescant's catalogue) attests the veracity of the early voyagers; while a foot is in the British Museum. This latter induces us to view the Dodo as the Rasorial type of the order *Raptiores*, its relation to the *Rasores* being only analogical.

5484. *The few native quadrupeds* noticed by authors are the following: —

Pteropus vulgaris. Common Vampire.
Pteropus rubicollis. Red-collared Vampire.
Taphozous mauritanus. Mauritian Bat.

Centenes setosus. The Taurec.
Mangusta galera. Mauritian Manguste.

5485. *The Marine Shells* are conspicuous for their beauty and profusion; although very

MELANIA AMARULA.

M. SETOSA.

few are different from those species found in the Indian Ocean. The Olives, Harp-shells, Cowries, Cones, &c. might furnish a long list; but the Many-ribbed Harp (*Harpa nobilis*) must not be omitted. The fresh waters furnish the *Melania Amarula* Lam. and the *Melania setosa* Sw. (fig. 876.): the latter is of great rarity; it is crowned with vaulted spines, each of which encloses two or three setaceous bristles; a singularity seen in no other shell yet discovered.

BOOK IV.

AMERICA.

5486. *America is a vast continent*, comprising one of the grand divisions of the globe. The western hemisphere, in fact, contains scarcely any continental land that is not American; though it includes but a small portion of land, as compared with the eastern hemisphere. This continent, having remained for thousands of years unknown to the most learned and enlightened nations of the East, is called commonly the New World; while Europe, Asia, and Africa are called the Old World; and America includes an extent of territory nearly equal to half of the three united.

CHAP. I.

GENERAL VIEW OF AMERICA.

5487. *America is bounded* on each side by the greatest of the oceans. On the west, the Pacific separates it from Asia, and, from an almost immeasurable breadth, gradually narrows, till it terminates at Behring's Straits, where the two continents come almost into contact. On the north is the Arctic Ocean, divided by huge frozen islands into numerous bays and inlets. On the east the Atlantic separates it from Europe and Africa. On the south it presents a stormy cape to the expanse of the Southern or Antarctic Ocean. The whole northern boundary of America is now found to range about 70° N. lat., but Leopold South Island, its highest known and probably existing point, is in 74° . Cape Horn, then, being nearly in 56° S., these extreme points are situated at the interval of 131° from each other. Hence this continent comprehends the whole of the tropical and temperate, with part of the arctic climates, on both sides of the equator. This line, however, which would amount to above 9000 miles, cannot be considered as measuring the dimensions of a continent so irregular in its form, and of which the southern portion is so nearly detached, and lies almost entirely east of the northern. It seems, therefore, necessary to view these two portions separately. The greatest dimension of North America appears to be in about the 60th degree of latitude, where it extends east and west across about 100° of longitude, or 3500 miles. From its arctic boundary to the shores of the Gulf of Mexico (excluding the peninsular part of California) will be about 44° of latitude, or 3000 miles. South America, again, may be taken from 9° N. to 56° S. lat., a space of 4550 miles; while the greatest breadth, about lat. 6° S., will be 35° , or 2440 miles. This does not include the long winding range of territory including Mexico and Guatemala, by which the two continents are connected, but which seems not very strictly to belong to either.

SECT. I. *General Outline and Aspect.*

5488. *Mountain ranges*, peculiarly distinguished by their magnitude and continuity, pervade this quarter of the world. One chain, the longest, and, with a single exception, the loftiest on the globe, appears to extend from its northern to its southern extremity. By far the most distinguished portion is that colossal range which, under the name of Andes, traverses South America parallel to and at a small distance from the Pacific. Commencing at the northern border of Columbia, and throwing some lateral branches along its coast towards Coro and Caraccas, it continues in its progress southwards, always swelling in magnitude, till, almost beneath the equator, it shoots up into the summits of Chimborazo and Antisana, believed till lately the loftiest points on the earth; while it spreads terror by the tremendous volcanoes of Pinchincha and Cotopaxi. In passing through Peru, it continues still very lofty, and, on reaching its southern or upper region, forms a vast knot or mass, amid whose peaks tower Illimani and Sorata, which recent observation has proved to surpass even Chimborazo, though still inferior to the highest among the Himalayah. In its progress behind Chile, this great chain continues to form an immensely steep though not very broad ridge. It becomes less considerable as it approaches the southern limit of the continent, and the peculiarly dreary and desolate aspect which it there assumes is owing less to elevation than to the wintry severity of the climate. The heights on the adjacent isle of Terra del Fuego do not exceed 6000 feet; and even the formidable cliffs with which Cape Horn faces the tempests of the Southern Ocean do not rise higher than from 1500 to 1600 feet.

5489. *The same chain* must now be traced in its progress through the more northern parts of America. The Isthmus of Panama, indeed, that narrow neck of land which connects

Fig. 878.

these two great continental masses, is filled only by a ridge of moderate elevation, so as to allow hopes that a canal may unite the two opposite oceans. But after a short interval it swells into that great table plain, upwards of 6000 feet high, which covers the greater part of Mexico and Guatemala, and converts there a tropical into a temperate climate. From this level shoot up much higher the snowy conical peaks of Orizaba, Popocatepetl, and Toluca, the first two of which send forth formidable volcanic eruptions. Beyond Mexico this great elevation is partly prolonged in the great chain of the Rocky Mountains which run parallel to the Northern Pacific, and bounds on the west the valley of the Mississippi. Though their cliffs be steep and rugged, they by no means equal the elevation of the Andes, scarcely at any point surpassing 12,000 feet. Beyond the 55th parallel they rapidly sink, though a branch, about 2000 feet high, runs along the western bank of the Mackenzie River, and even along the shores of the Arctic Ocean. It may be observed that very high mountains are seen at different parts of the shore of the Northern Pacific; particularly in the 60th parallel, where Mount St. Elias is supposed to exceed 17,000 feet; but whether these form a parallel chain to the Rocky Mountains, or are branches detached from them, is not yet duly ascertained.

5490. *An eastern chain* pervading America, though not quite in so uniform and connected a manner, seems traced by Humboldt. In North America, the Apalachians, or Alleghanies, form a continuous ridge parallel to the Atlantic, and bounding the maritime territory of the United States. Detached, somewhat irregular, branches from them spread through Canada, Labrador, and the vicinity of Hudson's Bay. The mountains which, rising around the Gulf of Mexico, form the West India islands, appear to be elevated summits of the same range. After disappearing for a small interval in the delta of the Orinoco, it appears again in numerous ridges, which spread wide over Guiana, and of which the central mass appears to be the Sierra de Parime. On the southern side of the Amazons, again, Brazil is traversed by several successive ranges, which are in some degree prolonged to the La Plata, beyond which they sink finally into the vast plains of the Pampas. The whole of these eastern ranges are very low, when compared with the grand western chain; they reach generally from 2000 to 3000 feet, and seldom exceed 6000; they are not the seat of violent volcanic action. Several of the West India peaks, however, are somewhat higher than the above, and one or two are volcanic.

5491. *The plains of America* form almost as great and remarkable an object as its mountains. We may remark in this continent three systems. One is the plain along the Atlantic, between that ocean and the eastern range of mountains. To this belong the original territory of the United States, and that of Brazil, the former moderately, the latter luxuriantly, fertile. The second plain is that on the opposite side of the continent, between the great western chain and the Atlantic; it is narrow, moist, of very various aspect and produce. But the plains which extend through the centre of the continent, between the great ranges

of the eastern and western mountains, are of prodigious extent, exceeding even those which cover so great a part of Africa and Asia. While the latter two have a vast portion of their surface doomed to hopeless sterility by heaps of moving sand, the interior plains of America are almost throughout completely watered, and overgrown in many places with even an excessive luxuriance of vegetation. It is true they display solitudes as vast, and tenanted by races as savage, as the most dreary deserts of the Old World. But this backward state is evidently owing to the unfavourable and inland site of these vast tracts, destitute of maritime intercourse, and only of late become the theatre of European settlement. Even the rich moisture of the ground, covered with dense and entangled forests, and with gigantic grasses, though it marks the natural luxuriance of the soil, obstructs the first efforts of unimproved culture. But the tide of emigration has now completely set in to these vast interior tracts; great states have been founded in them; and it is evident that in a few ages they will be covered with a numerous and increasing population. This is remarkably the case with the great plain of the Missouri-Mississippi, between the Rocky Mountains and the Alleghanies, forming what is called the western territory of the United States. The plantations formed in this region are proceeding with such rapidity, that it must evidently, in a few generations, become one of the most populous and flourishing regions of the globe. This plain is prolonged without interruption northward to the country watered by the upper courses of the Mississippi and the St. Lawrence, and even as far as the Polar Ocean; so that, as Humboldt observes, one of its borders is covered with the palms and the splendid foliage of the tropic, while in the other the last buds of arctic vegetation expire. These northern plains, however, present a very gloomy aspect, overspread with dreary pine forests, intersected by frozen lakes, and affording shelter only to numerous tribes of the elk, the deer, and other fur-bearing animals. The extent of this plain is estimated by Humboldt at 2,430,000 square miles. Another, almost equally vast and luxuriant, occurs in the heart of South America, where it occupies the basin of the Amazons, between the Andes and the mountains of Brazil; but it is covered, as yet, with unbroken native forests, and tenanted by rude and savage tribes. The same great authority reckons it at 2,340,000 miles. In the northern quarter is that great expanse of the Llanos of the Orinoco, estimated at 261,000 miles, covered with gigantic grasses, yet still, too, almost uncultivated, while in the southern part of the continent, the immense surface of the Pampas, bordering the La Plata, displays its fertility only by the numberless herds of wild cattle, which have multiplied amid its pastures. The area, according to Humboldt, comprehends 1,215,000 miles.

5492. *Table-lands*, or elevated plains, form a characteristic feature in the geography of America, though not so striking as in that of Asia. The principal is the one which covers

the whole of Mexico, with part of Guatemala, rising to the height of 6000 feet. The Andes within their lofty ridges enclose very elevated sites, on which even cities are built; but, in general, these level spots are too limited to constitute more than a mountain valley hemmed in by lofty perpendicular steep; and often from the bed of the river to the top of the mountain is a continued and laborious ascent. Bolivia, or Upper Peru, with the bordering districts of La Plata, comprises certainly a very large extent of elevated land, and cities are built on a higher level than in any other quarter of the globe. Yet its general rugged and irregular surface seems to constitute rather a mountainous territory than a table plain.

5493. *The rivers of America* constitute perhaps her grandest natural features, or at least those in which she claims the most decided preeminence over the other quarters of the globe. They are unequalled both in the length of their course, and the masses of water which they pour into the ocean. The principal of these rivers take their rise in the great western chain, from its eastern side, whence, being swelled by numerous streams, they roll broad and spacious across the great interior plain, till they approach the eastern range of mountains. Thence they derive a fresh and copious series of tributaries, till, bearing as it were the waters of half a continent, they reach the ocean. Thus, the Missouri (which, notwithstanding the error which has given the name of Mississippi to the united channel, is undoubtedly, in a physical view, the main stream,) takes its rise in the Rocky Mountains, then flows westward into the deep valley, where it is joined by the Mississippi, and there receives from the Alleghany the copious tributaries of the Ohio, the Wabash, and the Tennessee. In its course thence southward, it receives tributaries both from the eastern and western range. In South America, again, the Amazons, after a long course along the foot of the loftiest Andes, and collecting all the waters which descend from them during a range of upwards of 1000 miles, rolls westward across the great plain, till it comes to receive ample tributaries from the eastern ranges, of Parime on one side, and Brazil on the other, and, before reaching the Atlantic, is swelled almost to an inland sea. The La Plata, after having by itself, the Pilcomayo, and other tributaries, collected all the southern waters of the Andes, in its south-western course across the continent, receives the Parana, which, after its long course through the valleys of the Brazilian chain, disputes the rank of principal; after which, the united stream, in its junction with the Atlantic, bears the magnitude of a great bay or inlet. There are other rivers which from different and much more limited sources swell to the first magnitude. In North America, the St. Lawrence and the Mississippi proper derive their ample stores not from any mountain chain, but from that cold watery region of forests and swamps which forms the northern prolongation of the great central plain. In South America, again, the Orinoco, though the Andes send to it some considerable tributaries across the Llanos, is formed chiefly during its winding course around the Parime and other ranges that traverse Guiana; yet such is the store lodged in this region of forests and swamps, that it pours by its seven mouths into the Atlantic a flood almost as ample as its greatest rivals. The rivers which flow through the comparatively narrow valleys which intervene on the east and west between the mountain chains and the nearest ocean, cannot reach any great magnitude; though often valuable for navigation, they belong only to the particular district which they traverse. The Coppermine, the Mackenzie, which flow through the north into the Arctic Sea, have a longer course, but, from the barren regions which they traverse, are of no commercial value.

5494. *Lakes* in the most northerly part of the continent are numerous and important. They are not, however, mountain lakes, nor formed by mountain streams. They originate in those great wooded watery plains whence the Mississippi and the St. Lawrence take their rise. The chain of connected lakes on the upper course of the former river, the Ontario, Erie, Huron, and Superior, form the largest bodies of fresh water in the world. Communicating with the sea by the broad channel of the St. Lawrence, and in a country whose population is rapidly increasing, they are becoming of the greatest advantage to commerce. Similar lakes extend northward as far as the Arctic Sea, — the Lake of the Woods, the Athabasca, the Great Slave Lake, the Great Bear Lake; but these, unconnected with any other sea, and frozen for the greater part of the year, cannot serve any commercial purpose. In the heart of the mountain region of Upper Peru is the great lake of Titicaca; but, generally speaking, the Andes, abrupt, lofty, and pouring their waters into deep and narrow valleys, form rivers, and not lakes.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5495. The *Geology* of this continent can only be properly described under the heads of its respective countries.

SUBSECT. 2. *Botany.*

5496. Of all the quarters of the globe, America offers, unquestionably, the most interesting field to the botanist, extending, as it does, from beyond the Arctic Circle in the north, nearly

to the Antarctic Circle in the south, and including a vast range of mountains, the most remarkable in the world, whether considered relatively to their height or their extent; for they literally stretch from one extremity to the other of the whole continent, and in such a manner as to divide it into two very unequal portions, the eastern and the western; thus forming a line of separation between the vegetation of the respective sides, more distinct than that constituted by many degrees of longitude. In relation to other extra-European countries, it may be said that a considerable part of the American territories has been explored by the man of science. North America can boast of Kalm, Bartram, Michaux, Pursh, Bigelow, Torrey, Elliott, Nuttall, Darlington, Boott, and Schweinitz, who have most successfully investigated the botany of the United States. Richardson, Drummond, and the officers of the various arctic expeditions, Lady Dalhousie, Mrs. Sheppard, and Mrs. Percival, have satisfactorily ascertained the vegetable productions of Canada and of the Hudson's Bay Company's territories to the eastward of the Rocky Mountains (or the Cordillera of North America); while the coast of the opposite side, washed by the Pacific Ocean, has been explored by Menzies, Chamisso, Douglas, and Scouler. The botany of Mexico has been described by Humboldt and Scheide. The name of the former highly-gifted individual is intimately connected with the tropical parts of South America, and almost all we know of the plants of the old and extensive kingdom of New Granada is from his labours and those of his companion Bonpland, and their predecessor, Mutis. Peruvian and Chilean botany were long considered the peculiar province of the Spanish literati, and we owe much to the investigations of Ruiz and Pavon; but still more, perhaps, to the indefatigable exertions of Haenke, Cruckshanks, Bertero, Pöppig, Cuming, Mathews, Bridges, Jameson, Hall, and Gillies; the latter, indeed, extending his researches into extra-tropical America, in the latitude of Mendoza, from the Atlantic to the Pacific Oceans. Brazil, whose productions seem inexhaustible, has had the good fortune to be explored by Spix and Martius, Auguste St. Hilaire, Pohl, Mikan, Sellow*, and already affords, perhaps, the most splendid flora of any spot of the globe. Casual, indeed, have been the visitors to the more southern parts and adjacent islands of the vast continent under consideration, and few the observations we can make upon them; nor, indeed, will our limits allow us to enter, as we could wish, upon the more particular nature of the vegetable products of any part of America. We have devoted more space than was contemplated to the former countries of the globe, and on that account are compelled to be more brief in characterising the botany of those that are to follow.

5497. *The most remote land*, the Ultima Thule of the southern hemisphere, that has been yet explored, constitutes a group of islands, called New South Shetland, lying off the southern extremity of America, in lat. 65°. "None of these islands," says the enterprising Captain Weddel, "affords any vegetation, save a short straggling grass, which is found in very small patches, on spots where there happens to be a little soil. This, with a moss similar to what is found in Iceland, appears in the middle of January, at which time the islands are partially clear of snow." The eye of the botanist would, perhaps, even here, discover some curious plants; though, undoubtedly, the majority of them, as in the highest northern latitudes, would prove to belong to the families of Mosses and Lichens, and probably are not dissimilar to those of the coldest parts of the South American continent. A few specimens, hastily gathered on the islands, have, indeed, though in a very imperfect state, come into our possession: amongst them, a *Polytrichum* without fruit. A very beautiful Lichen appears to be common there, bearing large deep chestnut-coloured fructifications. This is described by Dr. Torrey, in *Silliman's American Journal of Science*, under the name of *Usnea fasciata* (fig. 879.), and is figured in *Hooker's Botanical Miscellany*, vol. i. t. 14.; where its great

USNEA FASCIATA.

similarity with the *Usnea melaxantha* of the Andes of Peru, and the *U. sphacelata* of the arctic regions, is noticed. It is the same Lichen, probably, which is noticed by Lieutenant Kendal, when speaking of Deception Island, one of this groupe, in lat. 64°. "There was nothing," he says, "in the shape of vegetation, except a small kind of lichen, whose efforts seem almost ineffectual to maintain its existence, among the scanty soil afforded by the penguin's dung." Several very interesting plants have recently been gathered on Terra del Fuego and the Straits of Magellan, by the late expedition to survey these coasts, under the command of Captain King, but are unfortunately yet unpublished; so that, although the straits just mentioned are now much frequented by English and American vessels engaged in the seal-trade, almost nothing is known of their vegetation. Sir Joseph Banks landed

* While writing this, we learnt from the public journals that Mr. Sellow has fallen a sacrifice to his enthusiasm, and that his body was found last December (1831), near the cataracts of the Rio Doce. Pöppig has been more fortunate, and, after successfully exploring the natural history of the western side of South America, has crossed the Cordilleras to the source of the Amazons, and navigated down that great river to its confluence with the Atlantic Ocean.

on the main island of Del Fuego, in the Straits of Le Maire. As he approached the shore, he met with sea-weeds of a most enormous size; one of them in particular (*Fucus giganteus*), having leaves four feet long, and with stems, though not thicker than a man's thumb, yet 120 feet long. On shore, Sir Joseph and his party gathered upwards of 100 species of plants; among them several stems of a Wild Celery and Scurvy Grass (*Apium antarcticum* and *Cardamine antiscorbutica*); the famous Winter's Bark (*Drymis Winteri*) (fig. 880.), so called from its having been first discovered in Terra

880

WINTER'S BARK.

del Fuego by Captain William Winter, the companion of Sir Francis Drake, who in 1579 introduced this plant to the knowledge of European physicians as a valuable tonic, more especially useful in scurvy. It is, however, wholly neglected in the practice of physic; the Canella alba (a tropical aromatic plant, which is totally different from it) having been confounded with it in the shops, and no quantity having been brought to Europe, except as a curiosity, till the return of the ships under Captain Cook. Living individuals of this interesting plant are, we believe, in the garden of Mr. Lowe, at the Clapton nursery. The trees were found to be chiefly of one kind, a species of Birch (*Betula antarctica*), the stem of which is from thirty to forty feet in diameter, so that, in case of necessity, they might supply a ship with topmasts. The *Fagus antarctica* might likewise be employed as timber. Cranberries were also found in large quantities, both white and red.

5498. In the Straits of Magellan, the Evergreen Beech (*Fagus betuloides*) grows in the greatest abundance, and reaches a very large size. Trees of this species, three feet in diameter, are abundant; of four feet there are many, and Captain King says, there is one tree (perhaps the very same noticed by Commodore Byron) which measures seven feet in diameter for seventeen feet above the roots, and there divides into three large branches, each of which is three feet thick. Many of these fine trees, owing, perhaps, to the coldness of the schistose subsoil, are decayed at the heart. Captain King observed but few other timber trees in the Straits, besides the Evergreen Beech just mentioned. Such an appellation only belongs to the other species of Beech and the Winter's Bark. The last, which is also evergreen, is to be found mixed with the first in all parts of the Straits, so that the country and hills, from the height of 2000 feet above the sea to the very verge of high-water mark, are covered with perpetual verdure, which is peculiarly striking in those places where the glaciers descend into the sea; the sudden contrast in such cases presenting to the view a scene as agreeable as it seems to be anomalous. Vegetation, indeed, appears to thrive most luxuriantly, and large, woody-stemmed trees of Veronica and Fuchsia, such as in England are treated as tender green-house plants, are in full flower, within a very short distance of the base of a mountain covered for two thirds downwards with snow, and with a temperature at 36°. What is still more remarkable, these spots are frequented by parrots and humming-birds, the former feeding upon the seeds of the Winter's Bark, while the latter have been seen chirping and sipping the sweets of the Fuchsia and other flowers, after two or three days of constant rain, snow, and sleet, during which the thermometer has been at the freezing point.* The Fuchsia certainly was rarely found but in the sheltered spots: but not so the Veronica (*V. decussata*); for the inlets of the bays on the west side of St. John's Island at Port San Antonio are lined with trees of the latter, growing even in the very wash of the sea. This is the character of the vegetation in the middle of the strait. Towards the western extremity, the decomposition of the granite and other primitive rocks which are found there forms but a poor unproductive soil; so that, although the land is thickly covered with shrubs, they are all small and stunted, the most luxuriant of them seldom attaining a larger diameter than nine or ten inches. On the eastward, clay predominates, and from Cape Negro to the open sea not a tree is to be found; only small shrubs and grasses are seen; the former, thinly scattered over the extensive plains which characterise this region, but the latter are abundant, and, although of a harsh and dry appearance, must be nourishing, for they form the chosen food of numerous and large herds of guanacoës.

SUBJECT. 3. Zoology.

5499. The Zoology of the New World is as distinct from that of the Old, as the animals of Australia are from those of Africa and the Indian Islands. There is also a curious analogical resemblance between these two insular continents deserving notice. The northern latitudes of America present us with many of the animals of Europe and Asia; and the faunas of these three divisions unite in the arctic regions. The zoology of Australia, in like manner, assimilates to that of Southern Africa and the Indian Islands; or rather may be said to borrow many of the animal forms common to both. But to what zoological province of the world its southern extremity approximates, is still unknown; and this is precisely the case with America. Upon this question, involving many points of high importance to geographic zoology, we shall not at present dwell; since the only information which might lead to any satisfactory results, namely, a systematic list of the animals of Patagonia and Terra del Fuego, still remains to be supplied.

5500. The Zoology of America embraces the productions of such a vast and diversified region, that we must consider it more in detail under three divisions; namely, the arctic or northern, the temperate or intermediate region, and the southern or tropical; a fourth might be made to embrace the regions towards Cape Horn; but the animals of these latitudes, as before observed, are very imperfectly known.

* See King's Geography of Terra del Fuego and the Straits of Magellan, in the *Journal of the Royal Geographical Society*, vol. i. p. 169.

5501. In the arctic or northern division may be included those frigid regions commencing between 55° and 60° of north latitude, and extending to the shores of the Frozen Ocean; and we may name the great Polar Bear (fig. 881.) as the typical animal of these regions.

881

THE WHITE OR GREAT POLAR BEAR.

The above demarcation, however, is named from conjecture more than from positive evidence; for it is much more natural to conclude that, if any zoological peculiarities attach to the arctic regions of America, they would commence beyond the farthest points in this direction, which are annually visited by the migratory or summer birds of the United States. Many of these are well known to breed in Canada; while the more recent zoological researches of Dr. Richardson, in higher latitudes, prove that the migrations of

these birds extend beyond the latitude of 60° N. It seems, therefore, highly probable that the ornithological features of Arctic America are confined to much narrower limits than we

882

CANADIAN GROUSE.

have here assigned; and that these limits do not extend farther south than the "Barren Grounds" and "Prairies" of the arctic navigators, those extensive plains which appear to be the chief residence of the Canadian Grouse (*Tetrao canadensis*) (fig. 882.), and other species of the family peculiar to this continent. The second volume of the *Northern Zoology* has put us in possession of numerous facts on the ornithological geography of these regions; although much still remains to be discovered before these facts can be generalised. In the mean time we shall avail ourselves of the valuable information already communicated by this enterprising traveller, relative to the ferine inhabitants of Northern and Arctic America.

5502. The quadrupeds of these regions, according to Dr. Richardson, are geographically distributed in the following districts, under which they will be briefly noticed:—1. The remote islands of North Georgia. 2. The shores of the Polar Sea, and the Barren Lands. 3. New Caledonia. 4. The Rocky Mountains. 5. The Prairie Lands. 6. The Limestone District. 7. The Eastern District.

5503. (1.) In the islands of North Georgia, situated in lat. 75° north, there are only the nine following species of mammiferous animals, of which five are carnivorous and four herbivorous. The first two are only summer visitors; they arrive on Melville Island towards the middle of May, and quit it, on their return to the south, in the end of September.

Bos moschatus. Musk Ox.
Cervus Tarandus. Carabou Deer.
Ursus maritimus. Polar Bear.
Gulo luscus. Wolverine.

Mustela erminea. The Ermine.
Canis lupus. American Wolf.
Vulpes lagopus. The Arctic Fox.

Georychus hudsonius. Hudson's Bay
Leming.
Lepus glacialis. Polar Hare.

5504. (2.) The quadrupeds of the shores of the Polar Sea are the same as those inhabiting the Barren Grounds. This name has been applied by the arctic voyagers to that north-east corner of the American continent bounded to the westward by the Coppermine River, the Great Slave and other lakes, to the southward by the Churchill or Missinippi River, and to the northward and eastward by the sea. The rocks of this district are primitive, rising only into low hills, with a few stunted shrubs in the valleys; but the soil in general is a dry coarse sand, so poor as to afford no other vegetation than lichens. These dreary and dangerous wastes are destitute of fur-bearing animals. The abundance of lichens supply the favourite food of the small Carabou, or American Reindeer, and the Musk Ox, both of which animals are here common. The following quadrupeds are likewise found in the Barren Grounds:—

Ursus arctos? *americanus*. Barren
Ground Bear.
Ursus maritimus. Polar or Sea Bear.
Gulo luscus. Wolverine.
Putorius erminea. Stoat, or Ermine.
Putorius Vison. Vison Weasel.
Lutra canadensis. Canadian Otter.
Canis lagopus. Hare Indian Dog.
Vulpes fuliginosa. Sooty Fox.

Fiber zibethicus. The Musquash.
Arvicola xanthognathus. Yellow-cheeked
Mouse.
Arvicola pennsylvanicus. Wilson's Mouse.
Arvicola borealis. Northern Mouse.
Georychus trimucronatus. Back's Le-
ming.
Georychus hudsonius. Hudson's Bay
Leming.

Georychus groenlandicus. Greenland
Leming.
Arctomys Parryi. Parry's Marmot.
Lepus glacialis. Polar Hare.

The first eight on this list are more or less carnivorous or piscivorous; and prey much upon the remainder, which are herbaceous.

5505. (3.) The district of New Caledonia, on the west of the Rocky Mountains, was not visited by Dr. Richardson; but, from the notes of Mr. Harmon, its zoology presents some peculiarities. The summer is never very warm, and in winter the snow is sometimes five feet deep. This, Mr. Harmon imagines, is the reason why none of the large animals,

except a few solitary ones, are to be met with. The quadrupeds are not numerous. The Moose Deer is scarce, and the Black Bear more so. The lesser species consist of Beavers, Otters, Lynxes, Fishers, Martens, Minks, Wolverines, Foxes of different kinds, Badgers,

CANADIAN GOOSE.

Polecats, Hares, and a few Wolves. The birds are Swans, Geese, Cranes, Ducks of several kinds, and Partridges. The Canadian Goose (*Anas canadensis*) (fig. 883.) is here called a Bustard: it appears to be common, and has long been domesticated in both continents. All the lakes and rivers are well furnished with excellent fish.

5506. (4.) *The animals found on the Rocky Mountains* are thus enumerated by Dr. Richardson: —

Vespertilio subulatus. Say's Bat.
Sorex palustris. American Marsh Shrew.
Ursus americanus. American Black Bear.
Ursus ferox. Grisly Bear.
Gulo luscus. Wolverine.
Putorius erminea. Stoat, or Ermine.
Putorius vison. Vison Weasel.
Mustela martes. Pine Marten.
Mustela canadensis. Pekan, or Fisher.
Lutra canadensis. Canadian Otter.
Felis canadensis. Canadian Lynx.
Castor fiber. American Beaver.
Fiber zibethicus. The Musquash.
Arvicola riparius. Bank Meadow-Mouse.

Arvicola xanthognathus. Yellow-cheeked Mouse.
Arvicola nova-boracensis. Sharp-nosed Mouse.
Georychus helvolus. Tawny Leming.
Neotoma Drummondii. Rocky Mountain Leming.
Mus leucopus. American Field Mouse.
Arctomys empetra. Quebec Marmot.
Arctomys pruinosus. The Whistler.
Arctomys parryi. Parry's Marmot.
Arctomys guttatus. Spotted Marmot.
Arctomys lateralis. Say's Marmot.
Tamias quadrivittatus. Four-banded Squirrel.

Tamias hudsonius. Chickaree Squirrel.
Pteromys sabrinus (alpina). Severn River Flying Squirrel.
Hystrix pilosus. Canada Porcupine.
Lepus americanus. American Hare.
Lepus glacialis. Polar Hare.
Lagomys princeps. Little Chief Hare.
Cervus alces. Moose Deer.
Cervus tarandus? Carabou Deer.
Cervus macrotis. Black-tailed Deer.
Capra americana. Rocky Mountain Goat.
Ovis montana. Rocky Mountain Sheep.
Bos americanus. American Bison.

5507. *The country lying between the Rocky Mountains and the Pacific* is in general hilly; but the wide plains on the upper arms of the Colombia are inhabited by the same kind of animals as occur on the Missouri plains. These are principally as follows: —

Ursus ferox. Grisly Bear.
Canis latrans. Prairie Wolf.
Vulpes cinereo-argentatus. Kit Fox.

Meles labradoria? The Braro.
Cervus macrotis var. a. Black-tailed Deer.

Cervus leucurus. Long-tailed Deer.
Aplodontia leporina. The Lewellel.

5508. *The Bisons* are supposed to have found their way across the mountains very recently; they are still comparatively few, and very locally distributed.

5509. (5.) *The fifth geographic district* comprehends those extensive plains, termed *Prairies*, lying between the foot of the Rocky Mountains and the Limestone District subsequently noticed. These lands are in general level, and the traveller, when crossing them, must direct his course by the compass or by the stars, as an Arab would traverse the Great Desert. The soil, however, although dry and sandy, is tolerably fertile; as it supplies a thick sward of grass, which furnishes food to immense herds of the Bison. This abundance of pasture renders these plains the favourite resort of various ruminating animals, and the Buffalo and Wapiti abound. The following list will better exhibit these peculiarities: —

Ursus ferox. The Grisly Bear.
Canis latrans. The Prairie Wolf.
Vulpes cinereo-argentatus. Kit Fox.
Arctomys ludovicianus. The Wiston-wist.
Arctomys richardsonii. Tawny Marmot.

Arctomys franklinii. Franklin's Marmot.
Arctomys hoodii. Leopard Marmot.
Geomys talpoides. The Mole Sand Rat.
Lepus virginianus. Prairie Hare.
Equus caballus. The Horse.
Cervus alces. Moose Deer.

Cervus strongyloceros. The Wapiti.
Cervus macrotis. Black-tailed Deer.
Cervus leucurus. Long-tailed Deer.
Antelope furcifer. Prong-horned Antelope.
Bos americanus. American Bison.

5510. *The fur-bearing animals* also exist in the belts of woods, which skirt the rivers flowing through the plains above-mentioned.

5511. (6.) *The sixth district* is a very flat limestone deposit, bounded by a remarkable chain of rivers and lakes, among which are Lake Winnipeg, Beaver Lake, and the middle portion of the Missinippi River, &c., all to the southward of the Methy Portage; while its northern confines are marked by the Elk River, Great Slave Lake, Marten Lake, &c. The whole of this district is well wooded, and yields the fur-bearing animals in abundance; the following are found in this tract: —

Vespertilio pruinosus. Hoary Bat.
Sorex palustris. American Marsh Shrew.
Sorex forsteri. Forster's Shrew.
Condylura longicauda (South parts only). Long-tailed Shrew.
Ursus americanus. American Black Bear.
Gulo luscus. The Wolverine.
Putorius vulgaris. Common Weasel.
Putorius erminea. Stoat, or Ermine.
Putorius vison. Vison Weasel.
Mustela martes. Pine Marten.
Mustela canadensis. Pekan, or Fisher.

Mephitis americana. Hudson's Bay Skunk.
Lutra canadensis. Canadian Otter.
Felis canadensis. Canadian Lynx.
Castor fiber americanus. Amer. Beaver.
Fiber zibethicus. The Musquash.
Arvicola xanthognathus. Yellow-cheeked Mouse.
Arvicola pennsylvanicus. Wilson's Meadow Mouse.
Mus leucopus. American Field Mouse.
Meriones labradorius. Labrador Jumping Mouse.

Arctomys empetra. Quebec Marmot.
* *Arctomys hoodii.* Leopard Marmot.
* *Sciurus lysteri.* The Hackee.
* *Sciurus quadrivittatus.* Four-banded Pouched Squirrel.
Sciurus hudsonius. The Chickaree.
* *Sciurus niger.* Black Squirrel.
Hystrix pilosus. Canada Porcupine.
Lepus americanus. American Hare.
Cervus alces. Moose Deer.
* *Cervus tarandus (sylv.)* The Wood Carabou Deer.
Bos americanus. American Bison.

5512. *Those marked thus ** are but partially distributed. To this list must be added different varieties of the American Wolf, named the Grey, the Black, the Dusky, and the Pied: together with three varieties of Fox; namely, the Common American, the Cross, and the Black or Silver.

5513. (7.) *The seventh or eastern district* is formed by a belt of low primitive rocks, extending from the Barren Grounds to the northern shores of Lake Superior. It is about 200 miles wide, and, as it becomes more southerly, it recedes from the Rocky Mountains. It differs from the Barren Grounds principally in being clothed with wood. It is bounded to the east by a narrow stripe of limestone, beyond which there is a flat, swampy tract, forming the

western shores of Hudson's Bay: its western limits are the limestone deposit last mentioned, and its native animals are these:—

Sorex palustris. American Marsh Shrew.
Sorex Forsteri. Forster's Shrew.
Scalaps (sp. ignota). An unknown species.
Ursus americanus. American Black Bear.
Ursus maritimus. Polar Bear.
Gulo luscus. The Wolverine.
Putorius vulgaris. Common Weasel.
Putorius erminea. Stoat, or Ermine.
Putorius Vison. Vison Weasel.
Mustela martes. Pine Marten.
Mustela canadensis. Pekan, or Fisher.

Mephitis americana. Hudson's Bay Skunk.
Lutra canadensis. Canada Otter.
Felis canadensis. Canadian Lynx.
Castor fiber americanus. American Beaver.
Fiber zibethicus. The Musquash.
Arvicola xanthognathus. Yellow-cheeked Mouse.
Arvicola pennsylvanicus. Wilson's Mouse.
Georychus hudsonius. Hudson's Bay Leming.

Mus leucopus. American Field Mouse.
Meriones labradorius. Labrador Jumping Mouse.
Arctomys empetra. Quebec Marmot.
Sciurus Lysteri. The Pouched Squirrel.
Sciurus hudsonius. The Chickaree Squirrel.
Pteromys sabrinus. Severn River Flying Squirrel.
Lepus americanus. American Hare.
Cervus alces. The Moose Deer.
Cervus Tarandus (sylv.). The Wood Carabou.

5514. To these must be added several varieties of the American Wolf, with the four races of Foxes, called the Arctic, American, Cross, and Black. There seems, also, to be an undetermined species of badger. The Polar Bear does not go farther inland than about 100 miles over the swampy land which skirts the coast.

884

AMERICAN TUFTED DUCK.

5515. To the remaining tribes of the animal kingdom, as the birds, insects, fish, &c. of Northern America, we can devote but little space; nor has Dr. Richardson yet given to the world the results of his valuable geographic observations on these classes. It will therefore be sufficient to observe, that most of the European Arctic birds occur in the same latitudes in the American seas. Some, however, are found in these regions which are altogether peculiar to the New World.

5516. Among these latter birds may be noticed the American Tufted Duck (*Anas rufitoranes*) (fig. 884.), which

885

RUDDY DUCK.

much resembles the crested duck of Europe: the head, neck, breast, and upper parts are black, and there is a chestnut collar round the neck. The Ruddy Duck (fig. 885.), so called from its reddish-brown colour: the crown and neck above is black, the sides of the head and throat white. But the most elegant of this family is the Pied Duck (*Anas labradora*) (fig. 886.), whose plumage is prettily varied with deep black and pure white: it is a truly Arctic bird, being very rare in the middle states, even during winter. Vast flocks of the different sorts of Geese, Ducks, Gulls, &c., common to Arctic Europe, are spread over the whole of these regions. Yet, notwithstanding this similarity in the aquatic tribes, the land birds of the two polar regions are more distinctly marked. The European Great Snowy Owl, the short-eared and the long-eared species, and most of our Falcons, occur, indeed, in the high American latitudes: but, with the exception of the Crow and the Magpie, there are few among the numerous tribes of perching birds which appear to inhabit both continents. The river fish are also very different.

886

PIED DUCK.

large portion of these temperate

887

MOCKING-BIRD.

5517. The second grand division of American Zoology may be supposed to commence towards Canada, and terminate with the Gulf of Mexico; thus embracing the most temperate and healthful regions of the New World. In regard to its ferine inhabitants, little can be said; for, although the species have been described in systems, no traveller has yet taken those comprehensive views of their geographic distribution, which give such an interest and value to our preceding observations on the northern animals. Many of the northern quadrupeds range over a latitudes, while the others, not found towards the Pole, do not exhibit any striking peculiarities in the zoological distribution of genera. But the ornithology is more distinctly marked. Numerous tribes of insectivorous birds, unknown in the temperate latitudes of the Old World, or the equinoctial regions of the New, spread themselves over this fruitful portion of America, either as permanent residents or as annual migrators from the more genial shores of the Mexican Gulf. The most celebrated of these is the Mocking-Bird (*Orpheus polyglottos* Swains.) (fig. 887.); plain, indeed, in colours, yet endowed with a perfection of voice far surpassing any other in creation. Towards the beginning of May, when the insect world has just begun to assume life and activity, innumerable flocks of Warblers, Flycatchers, Woodpeckers, Starlings, Thrushes, and other families, appointed to keep the noxious insects within due limits, make their appearance in the United

States; prodigiously increasing the usual number of the feathered inhabitants, and making the woods resound with their notes. The process of incubation finished, and the young

sufficiently grown to undertake their autumnal passage, nearly the whole return to winter in latitudes less cold, and where their animal food does not fail. Very many of these species have been traced to the warm shores and the table-land of Mexico; others appear in some of the West India Isles, the Bahamas, &c.; but not more than one or two have yet been detected on the Terra Firma of Equinoctial America. The birds of game, in comparison with those of the northern regions, are few and insignificant; always excepting the Great American Turkey, for it is this part of the New World which first gave us this noble addition to our farm-yards. Increase of population has had its usual effect, and has long driven these birds from many of their former haunts; they still, however, are to be found in large flocks in the back settlements of Louisiana, &c.

5518. *Of other animals*, there are few which are the same as those of Europe. The Fish are numerous; but no one species, like the cod of Newfoundland, would seem to occur in sufficient profusion to create a distinct branch of commerce. Reptiles, in point of variety, seem also to abound. Morse has enumerated nearly forty kinds, found in the United States; and Virginia, in particular, produces great numbers. The most formidable of these are the well-known Rattlesnakes, of which there now appears to be more than one species: some few of the others are venomous, but none can be compared, in bulk, with the monstrous serpents of South America. The savannas and swamps abound with immense Bull-frogs, five times the size of the European; while a particular species of Alligator is said to occur in the southern rivers.

5519. *The third great division*, under which we are to view the Zoology of America, comprises the whole of the Southern Peninsula, from the Gulf of Mexico to the extremity of Paraguay, beyond which lie countries never visited by the scientific naturalist. No words can do justice to the splendour, the diversity, or the magnificence of the productions of this luxuriant region. Nature every where teems with life, under new and captivating forms, unknown to the naturalist who may be familiar only with the animals of milder climates, or of those distributed in the higher latitudes of the American Continent. This change becomes apparent on the table-land of Mexico; although it may be first traced in the southern parts of Carolina, Florida, and Southern Louisiana.

5520. *In respect to the Quadrupeds* of these regions, our information is brief, vague, and unsatisfactory. Hernandez was sent in the golden days of Spain, towards the close of the sixteenth century, and furnished by Philip II. with an ample salary, to investigate the productions of Mexico; but although he has been styled by some the Pliny of New Spain, his talents were below mediocrity, and both his authority and writings have long ceased to be regarded or quoted. Neither will the brief notices found in Clavigero, and writers of the same period, conduce to any solid information. The tribe of Monkeys begin to appear in Mexico, from whence two species have been recently received; while the increase of the family, both in numbers and variety, is very observable the nearer we approach the Torrid Zone. The different Lynxes of North America give place to the Jaguars, Pumas, Ocelots, and long-tailed Tiger-cats; the two former being the most formidable of the South American ferocious quadrupeds. Bears appear to be unknown, and the largest wild animals are probably

the Tapirs. Deer and Antelopes are sparingly scattered; for in this respect America offers a singular contrast to the opposite continent of Africa. Sloths and Armadilloes, on the other hand, characterise the hot countries of the New World, of which the Great Ant-eater (*fig. 888.*) is also a native; while bats, of almost innumerable species, swarm in the brief twilight of a tropical evening.

888

GREAT ANT-EATER.

5521. *The Ornithology of Tropical America*, as a whole, certainly exceeds, in splendour, that of any other region of the globe. This, in fact, is the chosen metropolis of the

889

RUFF-NECKED HUMMING-BIRD.

Humming-birds, of which near one hundred distinct species are already known to naturalists. Of these, one only (*Trochilus colubris* L.) is generally known throughout North America, where it appears to range over the whole of the United States, returning to the south in autumn. Cold, however, does not appear to affect these little creatures so much as might have been imagined; for Sir Joseph Banks discovered a lovely species (the Ruf-necked, *Selasphorus rufus* Swains.) (*fig. 889.*) in the chilly climate of Nootka Sound. The late Mr. W. Bullock, jun. assured us that, in Mexico, he has travelled

through woods of fir, with snow upon the ground, and Humming-birds on the trees. In

Brazil, where the thermometer is seldom below 68°, this beautiful tribe is particularly abundant; and Azara describes many others, peculiar to Paraguay. Another group of splendid little Honeysuckers (*Nectarinea* Ill.), but of which only three or four species are yet known, represent, on this continent, the Sun-birds of Africa (*Cinnyridæ*), and the Honey-feeders of Australia (*Melliphagidæ*).

5522. *The insectivorous Shrikes* (*Thamnophilinæ* Sw.) first appear in the warm humid woods of Carolina, from whence we derive two species. Several others occur in the West India Islands, but hitherto they have not been detected on the table-land of Mexico. As we approach Cayenne, the species rapidly increase, and continue in undiminished numbers, and in great variety, to the most northern parts of Paraguay that have been yet explored. This extensive family, together with the Ant Thrushes (*Myotherinæ* Sw.), seem peculiarly destined to devour insects concealed in foliage; while those tribes which venture beyond are exposed to the numerous tyrant Fly-catchers, who are continually darting after insects which fly past the particular station which each individual chooses for itself. In these climates, ants are the universal destroyers; but, had they no enemies, their numbers would increase to a frightful extent. The Ant Thrushes are therefore the counteracting agents: these little birds live almost entirely upon the ground, in thick forests, and are perpetually feasting upon these insects.

5523. *The Parrots*, of which only one species, the Carolina Parrot, is found throughout North America, constitute a most striking characteristic of the southern regions. Several species occur on the Mexican Cordilleras, but their numbers increase in the less elevated provinces; and, in the low lands of Guatemala, a recent traveller appears to have seen flocks of splendid Macaws. Others, of the most brilliant plumage, spread over the whole of Brazil, and even extend to latitudes south of Paraguay. The common green and yellow fronted Parrots seen in this country are all brought from Tropical America, and pass by the general name of Amazonian Parrots. The grey and red-tailed species are nearly the only ones found on the opposite shores of the African continent, a striking instance of the total dissimilarity

890

BLUE-WINGED PARROT.

between the zoological productions of the two regions. The little blue-winged or Passerine Parrot of Brazil (*fig. 890.*) is the smallest of its race; it flies in large flocks, and is not bigger than a sparrow. The abundance of this tribe in the New World is in a great measure explained by this continent being so well clothed with forests and fruit-bearing trees, upon which the whole of the Parrot family depend for food. On the other hand, the chief characteristic of Africa is its bare, sandy soil, and hence the fruit-eating birds of that continent are comparatively few.

5524. *The Toucans* occupy a prominent station in the Ornithology of South America, and extend from Mexico to the southern extremity of Brazil: they are omnivorous birds,

891

RED-BILLED TOUCAN.

feeding both upon animal and vegetable matter. Their enormous bills are nevertheless very light, and, being vascular within, admit a great development being given to the organs of smell. By this power, they discover the nests and eggs of other birds, which they are continually plundering. The Red-billed Toucan (*fig. 891.*) is one of the largest species, having the body black and the throat of a creamy whiteness. The Trogons, the Jacamas, the Hermit Birds (*Monassa* Vieil.), and the Puff-backs (*Tamatia* Cuv.), are all confined to this continent, and feed upon the hosts of insects which always accompany an exuberant vegetation. While these birds are appropriated to winged insects, the Woodpeckers and large Scansorial Creepers (*Dendrocolaptes* Ill.) climb the trunks of trees, and devour those tribes which lurk in the crevices or beneath the bark. Both are particularly abundant, and the latter occur in no other part of the world.

5525. *Among the frugivorous tribes*, we must notice the numerous and beautiful family of Tanagers (*Tanagrinae* Sw.), as peculiar to America: some few species are among the summer visitors of the Northern States, but the chief metropolis of the family is in the equinoctial latitudes, where the vast tracts of table-lands, thinly but universally clothed with low trees and shrubs, supply those small berries and fruits upon which they feed. In the more lofty woods, bordering on the coast, the traveller meets with groves of trees, thickly hung with the long purse-shaped nests of the *Icterinae* or Hang-nest Orioles (*fig. 892.*) they form a striking feature in Brazilian scenery, and are woven with great skill by different species, variously ornamented with plumage of a black and golden colour. These birds are chiefly found in the hottest latitudes, although three species are distributed in the United States: like the Tanagers, they live both upon insects and fruits. The Warblers (*Sylvicola* Sw.), so abundant in the United States, appear almost excluded from latitudes south of

Mexico. The Stonechats and Wagtails are likewise unknown; the first being supplied by the Ground-peckers (*Opethiorhynchus* Tem.), and the latter by the Water-chats (*Fluvicolinae* Sw.).

892

ORIOLE NESTS.

the forests, and that they are sometimes seen perched upon the topmost branches of the loftiest trees, uttering a loud and strange noise, on the rising and setting of the sun.

5527. The genuine fruit-eaters, however, form one of the most beautiful groups in tropical ornithology. There are many species, mostly of the size of a thrush, but variegated with the richest shades of azure, purple, and crimson: they are solitary and silent, and must be sought for far from the abodes of men. Others, called Manakins (*Piprinae* Sw.), are much smaller than sparrows, and live in little flocks in the damp woods, feeding only upon soft berries. Several are conspicuous for their beautiful crimson crests, while one, the Puff-throated Manakin (*Pipra Manacus* L.) (fig. 894.), is remarkable for the feathers on the throat being lengthened like a beard.

893

UMBRELLA CHATTERER.

numerous smaller races of Buzzards, Kites, and Falcons, totally different from those of Europe and Africa.

5529. The gallinaceous birds of Tropical America materially differ from those of the north. A magnificent species of Turkey is peculiar to the forests of Honduras; while, towards the equinoctial line, we find the Curassow Birds, Penelopes, Guans, and other large-sized genera, which might, no doubt, be domesticated by the natives. Grouse, Bustards, or Pheasants are not known, and Partridges are very scarce; but the Tinamou occur in great variety. Several of the species exceed the largest dunghill fowl, and the flesh of all is most delicious eating; their tails are so short that they appear to have none.

894

PUFF-THROATED MANAKIN.

5530. The water birds are few, from the absence of large lakes, and the partiality of these tribes to more temperate regions. The marshes are frequented by Jacanas, or Spur-winged Water-hens (fig. 895.), several sorts of Tiger-bitterns, and a few ducks, of species not known in the Northern States. The lakes of Mexico, however, appear to be profusely stocked with Waterfowl, comprising many of those common species so abundant in Europe and Northern America. But we must no longer dwell upon this charming portion of American Zoology, the investigation of which occupied two of the happiest years of our life.

895

SPUR-WINGED WATER-HEN.

5531. To enumerate even the tribes of splendid insects, which render the Entomology of Tropical America far superior to that of any region in the world, would, in this slight sketch, be impossible. As this continent exhibits a more varied and dense vegetation than any other, so are its insect productions more numerous and brilliant, particularly in those tribes which, like the Butterflies and Moths, derive their food from leaves and flowers. The Diamond Beetle (*Curculio*

imperialis L.) (fig. 896.) is one of the most splendid of insects; and, before Brazil was

896

DIAMOND BEETLE.

accessible to European travellers, was so rare as to be sold at a high price. Carnivorous insects, and also such as feed upon dead animal matter, are very thinly dispersed. Ants are the universal removers of all such offensive substances as are too small for the food of Vultures; and the diminutive size of these little agents is amply compensated by the inconceivable myriads of their numbers. The Cochineal is nearly the only insect which has been turned to great commercial account. The Honey Bee of Europe is unknown, but there are several wild species of this family whose honey combs are formed in trees, and much sought after by the natives.

5532. Of domestic animals the list is scanty; the Horse and Mule, originally brought by the Spaniards from the old continent, are the most universally used in the new, where they have multiplied prodigiously. The immense numbers of wild oxen in the plains of Buenos Ayres are well known: these also are of European descent. Nor does Southern America produce any native animal of equal size, the largest being the Tapirs, while the Lama and three or four kindred species are principally confined to the Andes of Peru and Chile.

5533. The genera and sub-genera of quadrupeds more peculiar to the New World are these:—

<i>Monkeys.</i> Ateles Geoff. Lagothrix Humb. Mycetes Ill. Cebus Cav. Callithrix Ill. Aotu Ill. Pithecia Ill. Hapale Ill.	<i>Bats.</i> Phyllostoma Cav. Vampyrus Spiz Glossophaga Geoff. --	--	--	--	---	---

5535. The number of ornithological groups, which thus belong exclusively to the American continent, appears greater than those of any other geographic division of the globe; but it is proper to remark, that very many appear to be sub-genera, besides those which have been actually reduced to that station (marked *): on the other hand, there are several genera, defined by us in another work (*North. Zool.* vol. ii.) that are here omitted for want of space.

SECT. III. Historical Geography.

5536. The history of America, prior to its discovery by Europeans, can be the subject of little more than conjecture. It appeared long a mystery how this continent, separated from the Old World by oceans of such vast breadth, should have been found peopled from one extremity to the other. The difficulty has vanished, however, since the modern discovery, that, at its north-western extremity, it is separated from Asia only by a narrow strait, and connected by chains of islands; and even the imperfect traditions that have been collected seem to confirm that it was in this channel that the tide of migration flowed. It is barely possible, that some vessels may have been driven by stress of weather across the Atlantic; and it has even been supposed that a country, in which the Norwegians from Iceland formed a settlement, was part of America; but, after examining the details upon this last subject, we consider the inference extremely doubtful.

5537. The discovery by Europeans forms the real commencement, for us, of American history. This naval achievement, the most splendid in modern times, was performed not by the power of any of the great nations, but by one high-minded individual, with difficulty collecting the scanty means requisite. In 1492, Christopher Columbus, sailing in search of a shorter passage to the East Indies, landed at San Salvador, one of the Bahamas, and,

sailing onwards, discovered the greater islands of Hispaniola and Cuba. His next voyage, in the following year, enabled him to discover others of the West Indian group; and his third, in 1498, brought him in view of the continent of America, at the mouth of the Orinoco. Meantime, in 1497-8, John and Sebastian Cabot, employed by Henry VII. of England, not only discovered Newfoundland, but navigated along a considerable extent of the coast of North America. Cortereal, a Portuguese nobleman, in 1501 discovered the mouth of the St. Lawrence, and sailed along the coast of Labrador, as far, seemingly, as the entrance of Hudson's Bay. In 1500, Alvarez Cabral, when sailing to India, came unexpectedly in view of the coast of Brazil. Vesputio and Ojeda had by this time explored nearly the entire circuit of the shores of the Gulf of Mexico. Thus, in ten years after Columbus had set foot on American ground, nearly the whole of the vast length of that continent from north to south had been traced by European navigators. In twenty years more, the South Sea had been discovered by Balboa; and the conquests of Cortez and Pizarro had made Europeans acquainted with a large portion of the eastern coast. In 1519, the grand and first circumnavigation by Magellan ascertained the southern boundaries of the continent; but its northern limit, and the communication on that side between the Atlantic and the Pacific, though a subject of eager interest, with a view to the hoped-for north-west passage, long defied the most strenuous efforts made by Europeans, and particularly by British navigators; and the discovery was reserved for the present age.

5538. *The conquest and colonisation by Europeans* acted most powerfully on the destiny of both worlds, and particularly of the new one. It was attended, in the first instance, with a series of cruelty and iniquity, of which there is, perhaps, no similar example in history. The natives of the West India islands, where the Spaniards first landed, were entirely exterminated, and there remains scarcely a trace of their existence. The people of Mexico and Peru, though their lot was not quite so dreadful, were exposed to remorseless cruelty, and reduced to degrading bondage. Even in North America, where the settlers were actuated by more just and humane principles, the fierce temper of the natives themselves, with the introduction of pestilential diseases, and of ardent spirits, to which they soon became passionately addicted, has extirpated them almost as completely as a war of extermination. The steps taken for filling up the blank thus occasioned in the population of the New World have been almost as inhuman as those by which it was produced. The unfortunate natives of Africa were in vast numbers purchased, seized, crammed into the holds of slave-ships, and conveyed across the Atlantic; so that the negro population of the New World amounts now to several millions. We are happy, however, to state, that within the last century there has been a mitigation of all the wrongs which America had endured from Europe, and even an anxiety to repair them.

5539. *The emancipation of the European colonists* in the New World from the dominion of, and from all dependence upon, the mother country, is a grand event, which has distinguished the last half century, and given the world a new aspect. It is remarkable that this great movement originated with the British colonies, the best governed of any, and whose grounds of complaint were venial when compared to those which the others could reasonably advance. Their determination, however, joined to the extent of the territory, and the aid of European powers jealous of British ascendancy, enabled them completely to succeed. Their independence was recognised by Britain in 1783, and they have since formed a great and prosperous state, rapidly growing in numbers and wealth. The southern states, subject to Spain and Portugal, had ample grounds of discontent, which fermented in the minds of the people; who, however, inured to the yoke, would have been long, probably, of attempting to shake it off, had not, in 1808, the family of Napoleon usurped the throne of Spain. The colonies, secured by British maritime ascendancy, repelled this claim, and, while they professed allegiance to Ferdinand, declined to acknowledge the provisional government established in the mother country. The Cortes, however, claimed the same supremacy as before; and as they were supported by all the Americans of Spanish origin, a long and desperate struggle was maintained. It issued, however, in the complete independence of all the great states on the continent of America, Spain retaining only her insular possessions. Even Brazil has been separated from Portugal on the condition of being governed by a different branch of the house of Braganza. Thus Europe retains her dominion only over the West India islands, over a large extent of North America still held by Britain, and a smaller one claimed by Russia. All the rest is held by people of European origin, indeed, but who, born and educated in America, consider themselves as entirely belonging to that continent.

SECT. IV. *Political Geography.*

5540. *The political state* of America presents some striking features and contrasts. The native tribes, who still survive, are partly held in subjection by Europeans; but the greater number still wander over their extensive wilds, either in rude independence, or ruled, sometimes very despotically, by their chiefs and caciques. The European colonists, who form now by much the most numerous and important part of the population, were long held in

subjection to the mother countries, the chief of which were Spain and Britain; but the greater part of them, by events which have just been detailed, have now established their independence. These new states have adopted very generally the republican form, to which even Brazil, though professedly a limited monarchy, seems strongly inclined. A third political element is formed by the negroes imported from Africa, and held in a state of the most complete bondage. A numerous body of them, however, in one of the finest West India islands, have emancipated themselves, and become the ruling people; while Britain is preparing to bestow liberty and political rights on that large number by whom her islands are cultivated.

SECT. V. *Productive Industry.*

5541. *Industry and commerce* throughout America exist under very peculiar forms. Few of the native tribes have made any advance beyond the hunting state. Previous to the arrival of Europeans, no animals appear to have been tamed for the use of man, except the lama and vicuna. If among many tribes the females were compelled to practise a species of rude agriculture, many others depended entirely on the spontaneous produce of the soil, — the banana in the tropical countries, roots and berries in the northern districts. If some nations, especially the Peruvians, produce fabrics of considerable value, none of them forms an object of exchange with civilised nations. Their only traffic consists in bartering furs and skins, the products of the chase, for European brandy, arms, and toys.

5542. *The colonies founded by Europeans* in America present a much more flourishing aspect. As they brought with them the arts and industry of civilised life, and found abundance of uncultivated land upon which to employ them, they have made a more rapid progress in wealth and population than almost any other people in ancient or modern times. The want of labourers, however, has impelled them not only to treat with great severity the natives of America, but to open with Africa a cruel trade in slaves, by which many millions of negroes have been dragged from their native country, and doomed to the most severe and degrading toil. The industry of colonial America is almost entirely agricultural, carried on with the view of supplying the markets of Europe with sugar, coffee, cotton, tobacco, and other rich tropical products; in exchange for which, and for the timber, hides, and furs of the northern regions, they receive all the variety of manufactures which the improved industry of Europe so abundantly produces.

SECT. VI. *Civil and Social State.*

5543. *The civil and social*, like the political, *state* of America is strikingly varied, according to the races, belonging to remote quarters of the globe, by whom her territory is peopled. The native tribes, who are still suffered to occupy extensive regions, claimed but not occupied by Europeans, exist generally in the savage state, displaying all its bold and terrible, yet sometimes engaging, characteristics. Even the Indians of Mexico and Peru, being mostly of humble rank, and dwelling in remote villages, display few remains of the degree of civilisation which distinguished those empires.

5544. *The European colonists*, who are now in possession of almost all America, retain generally the manners and habits of the mother country, somewhat modified by their peculiar situation. The absence of any old nobility or other aristocratic distinctions has diffused through them a very general feeling of independence and equality, which has been confirmed by the republican institutions now so generally established. The same cause is represented as rendering the tone of society less refined and polished than in Europe. The people, however, have shown themselves active and enterprising, fully capable of availing themselves of all the advantages which their situation presents. Even the Spanish Americans, who, while under the sway of the mother country, were accused of voluptuous indolence, have shown no want of energy, either in the struggle for independence, or in the internal contests which have since unfortunately arisen.

5545. *The negroes imported from Africa*, and held in oppressive bondage, have scarcely room to display any decided character. They retain the rude habits and superstitious ideas, joined often to warmth of heart and amiable feelings. Even those who have obtained emancipation, being still held as a despised and inferior caste, can scarcely attain that self-respect which is the parent of many of the virtues.

5546. The establishment of these three great races in this country has led to the formation of *numerous mixed classes*, in which the blood and complexion of the European, Indian, and negro are variously compounded. Hence, in the absence of the distinction of ranks, has been founded an aristocracy of colour, in which white holds the first place, and each individual, as his complexion deviates from that standard, sinks in the scale of society. The degrees in which it is departed from have been carefully counted, minute subdivisions formed, and various terms, mulatto, mestizo, zambo, &c., invented to express them. In the course of the recent struggle for independence in the Spanish colonies, more liberal and

5550. *The climate is very severe*, much exceeding what is felt under the same latitude in the old continent. Lower Canada for six and Upper Canada for five months of the year have a mean temperature below the freezing point, and are buried in perpetual snow; yet after that period the sun breaks out with such force, that large crops of the most valuable grain can be raised on the great extent of fertile land of which the territory consists. Upper Canada, from a careful survey made with a view to emigration, has been found particularly valuable; finely watered, clad with immense forests of valuable timber, and containing about ten millions of acres capable of culture. Nova Scotia and New Brunswick are well wooded countries, but less fertile; and though the winters are less severe, the heavy fogs that prevail for a great part of the year are still more disagreeable than the frosts and snows of Canada.

5551. *The surface of this extensive region is not very much varied.* Two chains of hills cross Canada, each parallel to the St. Lawrence, one at the distance of fifteen or twenty miles, including all its most fertile and productive valleys; the other at about 200 miles' distance, forming the boundary of the province. Some chains also cross the more northern regions; but upon the whole they may be considered as a prolongation of the great level of the Missouri, bounded still on the west by the Rocky Mountains, which reach the farthest extremity of the continent.

5552. *The river St. Lawrence is the principal feature of this region, and one of the noblest river channels in the world.* It is difficult to say where it begins. It has been held to issue from Lake Superior, a vast body of water, fed by about fifty streams, of which the St. Louis and Grand Portage Rivers are the principal; but, in fact, the lakes are merely connected by short canals, through which the surplus waters of one are poured into the other. These canals bear the local names of St. Clair, Détroit, Niagara, &c. The last is distinguished by its falls, the most magnificent in the world. From Lake Ontario to Montreal the river is broken by a succession of rocks, cataracts, and rapids, which render navigation very dangerous. It is after passing Montreal that it rolls in full grandeur in a deep continuous channel, conveying large ships and rafts down to Quebec. The navigation is blocked up for half the year by the ice, which even in spring encumbers it for some weeks with floating fragments. The only considerable tributaries are the Ottawa, which traverses a great part of Canada, and the Saguenay, which falls in about a hundred miles below Quebec.

5553. *Lakes, in Canada, are on a greater scale than in any other part of the world; and the united chain forms a vast inland sea of fresh water.* The outermost and largest is Lake Superior, 381 miles in length, and 161 broad. Lake Huron, with a varied outline and numerous islands, is 218 by 180. From its western angle, the long lake of Michigan stretches southward into the United States' territory. From its southern extremity, the winding stream of Détroit connects it with Lake Erie, which is 231 miles by 63. Lastly, the channel of Niagara carries on the chain to Lake Ontario, which, though the smallest, is still vast, being 171 miles by 59½. These lakes are remarkably deep, clear, and transparent: frigates have been built, and a naval war waged, on them; and at present superb steam packets navigate them. Lakes Superior and Huron are about 600 feet above the Atlantic. Their depth is very extraordinary, estimated by Darby in some places at 900 feet. Erie is only about 300 feet above the sea, and its depth not more than 200 feet. On the other side, in the interior from Lake Superior, are several smaller lakes, of which the principal is the Lake of the Woods, whose winding shores are 300 miles in circumference. Farther to the north is Lake Winnipeg, 270 miles from north to south, and from eighty to fifteen in the opposite direction. The name signifies muddy, and is descriptive of its waters. There is a water communication with Lake Superior by the rivers Winnipeg and La Pluie; but in the course of it Major Long found seventy-two portages, in which the canoes must be taken on shore, and dragged over land.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5554. CANADA. — *On the south side of the St. Lawrence, from Gaspé to some miles above Point Levi, opposite Quebec, the whole country presents high mountains, valleys, and forests.* These mountains appear equally as lofty as any of the Alleghany chain, of which range they form a part. The prevailing rocks are granite, greywacke, clay slate, and transition limestone. The lower islands of the St. Lawrence are mere inequalities of the vast body of granite which occasionally protrudes above the level of the river. The Kamouraska Island, and the Penguins, in particular, exhibit this appearance; and in the forest of Kamouraska huge bodies of granite rise into sharp conical hills, one of which is 500 feet high. At St. Roch the post-road leads for more than a mile under a perpendicular ridge of granite, 300 feet high. The city of Quebec is situated on a promontory, on the north-west side of the St. Lawrence, formed by that river and the St. Charles. The extremity of the headland is called Cape Diamond, whose highest point rises 345 feet above the level of

the water. It is composed of grey granite, containing in cavities rock crystals, and a species of dark-coloured clay slate. The north coast of the St. Lawrence, below Quebec, exhibits trap rock, clay slate, and occasionally granite; the latter is considered to prevail in the interior of the country, and particularly as forming the base of the mountains of Labrador, and of the country north of Quebec. Cape Tourment, thirty miles from Quebec, is a round massive mountain of granite 1000 feet high. As we approach Quebec, a reddish or greyish black clay slate appears as the prevailing rock, and it forms the bed of the St. Lawrence to Kingston and Niagara. Boulders of granite, limestone, sandstone, syenite, trap, and marble, occur in the same extensive region. Above the rapids of Richelieu a flat country prevails, until we reach Queenston Heights. The greater part of the soil of the lowlands is apparently alluvial; and twenty to fifty-five feet rise of the waters would nearly cover the whole country between the Alleghanies and the highlands of the north. The exceptions to this general rule are, the Belœil mountain, the summit of which is about 1000 feet high. The mountain is an abrupt termination of a branch of the Green Mountains, and divides the waters of Lake Champlain from the sources of the rivers St. Francis and Tamasca. The mountain to which Montreal owes its name, the rocks of which appear to be principally trap accompanied by limestone, is another exception. Whenever rapids occur, we find the elevation of the country increasing, and limestone generally accompanies the prevailing rocks. The step of country formed by the limestone ridge, which commences at Queenston Heights, and which rests upon a bluish clay slate, is elevated about 350 feet above the shores of Lake Ontario; and the upper country, the base of which is limestone, is generally level, until we approach the high lands between Lake Huron and Lake Michigan. The limestone rocks of the Manitoulin Islands, in Lake Huron, contains similar organic remains (those of mountain limestone) to those that occur so abundantly in the limestone rocks which prevail at the base of the island of Anticosti. Along the north coast of Lake Huron and Lake Superior, granite predominates. Indications of *volcanic eruptions* are said to occur at St. Paul's Bay, and on the mountains north of Quebec. The great earthquake of 1663 is said to have overturned a chain of sandstone mountains 300 miles long, north of the St. Lawrence, and levelled them with the plains.

5555. *Canada* is considered rich in minerals. *Petalite*, a rare mineral, was found by Dr. Lyon near York, in Upper Canada; *beryl* is found at Lake of the Woods; *Labrador felspar*, at Lake Huron; *axinite*, Hawkesbury and Ottawa; *aventurine*, Lake Huron; *amethyst*, Lakes Superior and Huron; *apatite*, or phosphate of lime, Fort Wellington; *arragonite*, Laclina; *strontian*, in magnificent masses, Erie, Ontario; *schorl*, St. Lawrence; *precious and mangesian garnet*, River Moira, Ontario, &c.; *carnelian*, *agate*, *zeolite*, *prehnite*, *fluor spar*, *barytes*, Lake Superior; *brown and green coccolite*, Montreal and Hull, Ottawa; *olivine*, *augite*, Montreal; *grenatite*, Rainy Lake; *anthophyllite*, Fort Wellington; *marbles* and *serpentine* are common on the north shore of Lake Erie, which exhibits immense beds of *gypsum*, the principal of which is in Dumfries, and quarried largely for the purposes of agriculture.

5556. *Ores*. — *Iron*. Seven kinds of iron ore occur in Canada; viz. magnetic iron ore, specular iron ore, and red iron ore, brown iron ore, bog iron ore, sparry iron ore, or carbonate of iron, and iron pyrites. The *magnetic iron ore* has been found abundantly, but only in one place, where it is smelted, viz. in the township of Marmora and Belmont, in Upper Canada. *Specular iron ore*. — The only place where it occurs abundantly is close to the mining establishment at Marmora. *Red iron ore* has been noticed in two or three places, but most abundantly in the vicinity of Henderson's Lake, in the Gannanoqui, where it forms an extensive bed in old red sandstone. *Brown iron ore* occurs, but in small quantity. *Bog iron ore*, which is next in abundance to the magnetic iron ore, is found abundantly both in Upper and Lower Canada, particularly behind the two seigniories of Batiscan and Champlain, in Lower Canada. It is the only extensive deposit of this ore which has yet been worked in Lower Canada, and the furnace at the forges of St. Maurice is entirely supplied by it. *Sparry iron ore* is found in the immediate vicinity of the works of Marmora, where it is worked chiefly as a flux for the furnace. *Iron pyrites*, or sulphuret of iron, is found in many places, particularly abundant on an island on the south shore of Drummond Island. *Graphite*, also known under the names *plumbago*, or *black lead*, which is either pure carbon, or carbon united with a small portion of iron, is found rather abundantly in the township of Houghborough, also at Hull on the Ottawa. *Ores of manganese*, in small quantity, are mentioned by some authors; and *ores of silver* are also reported, but on doubtful authority, to have been met with. Traces of *copper ore* and masses of *native copper* have been found, but hitherto no *native gold* has been discovered in either of the Canadas. *Ores of antimony* are reported to exist in the neighbourhood of St. Paul's Bay, in Lower Canada. *Galena*, or *lead glance*, the common ore of lead, has been found in many places, particularly near Lake Memphremagog, in Lower Canada. *Sulphuret of zinc*, or *zink-blende*, occurs in small quantities; and *cinnabar*, the ore of mercury, although reported to have been met with on the shores of Lakes Erie and Michigan, in the United States, has not been found in the Canadian territories.

5557. NOVA SCOTIA appears to be based on *granite*, although this rock is almost every where covered by other, often more recent, formations, or appears only in boulders on the surface. A *transition slate*, and greywacke, with marine organic remains, and containing beds of *limestone*, and very rich beds of *iron ore*, covers the greater portion of the country: the iron ore is an oxide, sometimes a peroxide, and is often beautifully impressed with organic remains, and sometimes a shell is half moulded in the slate, and the other half adherent to the iron ore, thus proving their contemporaneous formation. The *sandstone* formation is next in extent after the slate. Part of it is said to correspond with the *new red sandstone* and *keuper formations* of other countries; and this part also contains great beds of *gypsum*, from which the gypsum imported into the United States is derived; *grindstones*, which also form an important article of commerce between the two countries, are obtained from the same formation; underneath these are beds of *black bituminous coal*, which are worked, and this valuable mineral is finding its way into the Eastern states, both from the peninsula of Nova Scotia and from the island of Cape Breton, which is separated only by a very narrow strait from the north-eastern mainland. As there is no bituminous coal, in any quantity, hitherto discovered in New England; as the Nova Scotia grindstones, having already a great market in the Atlantic States, will continue to maintain it on account of their excellence and of their being so easily transported by water, notwithstanding the successful introduction of the United States fine-grained mica slate and arenaceous quartz rock for the same purpose; and as the gypsum of Nova Scotia can always be brought to the Atlantic ports cheaper than from the interior of New York and of the Western States; it is therefore probable that these interests will long contribute to a friendly intercourse between the countries. A *trap formation* abounds in Nova Scotia: although nowhere more than three miles in breadth, and often not even one mile, it stretches continuously 130 miles along the south shore of the Bay of Fundy. It rises into stupendous precipices, and exhibits basaltic and greenstone columns, 300 or 400 feet in height, and thus fixes a barrier to the tides. These tides twice in twenty-four hours rise to the height of sixty feet, and, whether ebbing or flowing, rush with great fury along this rocky coast, and into the Bay of Mines and Chignecto Bay and their branches, undermining and tearing away immense masses of rocks, and piling them up along the shores. The minerals embedded in the trap afford a rich harvest to the mineralogist, and probably no known trap district of North America is richer in the beautiful minerals that assist in characterising that formation: thus, among others, the following minerals are mentioned as found in the trap formation: — amethyst, rock crystal, calcedony, agate, chabasie, analcime, laumonite, mesotype, stilbite, calcareous spar, and specular iron ore.

5558. NEW BRUNSWICK. — *The geology* of this province is very imperfectly known. According to Mr. M'Gregor, limestone, greywacke, clay slate, with sandstone, interrupted occasionally by gneiss, trap, and granite, seem to prevail on the southern coast. Among these, however, *limestone* appears to predominate. *Marble* of promising quality abounds at Kennebecasis, and, it is said, also in other parts of the country. *Coal* is plentiful, and iron ore abounds. *Graphite*, or black lead, has been found, also copper and manganese ores. *Gypsum* and *grindstone* are abundant near Chignecto Basin. Along the shores of this province, facing the Gulf of St. Lawrence and Chaleur Bay, sandstone prevails. Grey sandstone and clay slate seem to predominate, as far as Mr. M'Gregor could observe, along the course of the Miramichi; among which granite, mica, quartz, and iron ore occur. *Agates* and *jaspers* are collected in some places. Salt springs also have been observed.

5559. CAPE BRETON. — Mr. M'Gregor says, among the *primitive rocks* granite prevails in the peninsular country south-east of the Bras d'Or; and it probably forms the nucleus of the highlands between this inlet and the Gulf of St. Lawrence. Syenite, trap, mica slate, clay slate, and occasionally quartz, also appear on the Gulf Coast. Primitive trap, syenite, and clay slate show themselves, together with transition limestone, greywacke, gypsum, and coal, generally, in all parts of the island. The class of secondary rocks appears, however, to be the most extensive; and *coal* exists in such abundance, that persons unacquainted with geology consider it the predominating formation in the island. Coal, in a field or fields of vast extent, abounds in the south-eastern division of the island, surrounded by carboniferous limestone, new red sandstone, &c. The quality of this coal is well adapted for common fireplaces. The extent or quality of the coal-fields north of the Bras d'Or have not been ascertained. Gypsum occurs in great plenty along the shores of the Bras d'Or, at the Gut of Canseau, on the Gulf Coast, and in some other parts of the island. Several *salt springs* have been discovered, which vary in strength from six to twelve per cent. of salt. Situated, says Mr. Bouchette, in the centre of the best fisheries of North America, and where coal is abundant, the manufacture of salt promises to become hereafter a most valuable source of wealth to the colony. *Iron ore* abounds every where, in the coal district about Lingan, Sydney, &c. and at Cape North and Aspey Bay.

5560. PRINCE EDWARD ISLAND. — *The soil* of this island is fertile; and there is scarcely a stone on the surface that will impede the progress of the plough. There is no limestone nor gypsum, nor has coal yet been discovered, although indications of its presence have been

noticed. *Red clay*, of good quality for bricks, abounds in all parts of the island; and a strong white clay, fit for the potter, is met with, but not in great quantity. A solitary boulder of granite presents itself occasionally to the traveller. The base of the island is a sandstone, which appears to extend under the bed of Northumberland Strait into the northern part of Nova Scotia, and into the eastern division of New Brunswick, until it is lost in its line of contact with the granite base of the Alleghanies, about the river Nipisighit.

5561. NEWFOUNDLAND. — *The only geognostical information* we have been able to procure in regard to this island is derived from an "*Account of a Journey across the Island of Newfoundland*, by W. E. Cormack, Esq.," published in the 10th volume of the *Edinburgh Philosophical Journal*. This enterprising gentleman, in the beginning of September, 1832, left Smith's Sound, at Random Island, on the east side of the island, accompanied by one Micmac Indian; and, along with two of that tribe, reached St. George's Harbour on the west side of the island in the beginning of November: having thus been the first person to travel across Newfoundland. The first rocks met with were granite and porphyry, these were succeeded by alternations of granite and mica slate, which in their turn were replaced by granite. Granite, syenite, porphyry, mica slate, clay slate, and quartz rock, occur in the district occupied by Melville Lake. In the same district there are several kinds of secondary sandstone, probably belonging to the coal and red sandstone formations. The primitive rocks extend onwards to Gower's Lake. From Gower's Lake, by a series of lakes, to Richardson's Lake, the country is almost entirely composed of primitive rocks; the only indications of secondary formations being in the agate near Gower's Lake, the basalt at Emma's Lake and Jeanette's Lake, and the indication of coal and iron near Stewart's Lake. A serpentine deposit is succeeded by a great tract of granite, gneiss, and quartz, which extends from Jameson's Lake by Bathurst's Lake, Wilson's Lake, King George the Fourth's Lake, to St. George's Harbour, in the Bay of St. George, on the west coast of the island.

5562. *About the centre of the island* there are several ridges of serpentine, which exhibit this rock in all its beautiful and numerous varieties. The finest kinds occur on the shores of Serpentine Lake, and on Serpentine Mountain and Jameson's Mountain.

5563. *The west coast is by far the richest in minerals.* There is coal of good quality in St. George's Bay, about eight miles from the sea coast, up the South Barrasway River. There are several salt springs; one about two miles from the sea coast, up another Barrasway river, some miles north of that where the coal is found; another a few miles still farther north, up what is called Rattling Brook; and a third at Port-à-Port. There is a strong sulphurous spring close to the sea shore, about a mile north of the Barrasway River, where the salt spring first mentioned is found. Gypsum and red ochre abound between these rivers and Flat Bay, at the sea shore; and the former is also found some miles within the country. There is a dark grey coloured marble found at Bay of Islands; but, from report, in no great quantity near the coast. The soil of St. George's Bay is good, and not so rocky as in most parts of the island. Mr. Cormack, in allusion to the names given by him to the mountains and lakes met with in the course of his adventurous expedition, remarks, "I have used the customary privilege of giving names to the lakes and mountains I met with in this hitherto unexplored route, and these are in compliment to distinguished individuals and private friends. The rocks I collected were examined by Professor Jameson."

5564. ANTICOSTI ISLAND is said to be a mass of limestone abounding in organic remains.

5565. MAGDALEN ISLANDS are reported to be more or less deeply covered with a sandy soil, resting upon a sandstone which forms the prevailing or only rock in this insular group.

SUBSECT. 2. Botany.

5566. Under this head it will be convenient to consider in one view North America,

exclusive of Mexico. This portion (chiefly, indeed, to the eastward of the Cordilleras or Rocky Mountains) has been divided into three principal regions. The extreme south, as far as lat. 35° N., is designated the Region of Magnolias (*fig. 898.*); the second, extending to lat. 50°, as that of Asters and Solidagos (*fig. 899.*); and the third as the Region of Saxifrages (*fig. 900.*), stretching to the Arctic Regions. The two former are certainly very characteristic; but the latter is not more distinguished by the prevalence of Saxifrages than are similar latitudes in Europe and

Asia : the genera, indeed, and many of the species, especially in the most northern parts, being very nearly the same in all.

ASTERS AND SOLIDAGOS.

however, can compare, as to the quality of their wood, with the British oak. They vary in height, from two feet to the loftiest timber.

SAXIFRAGES.

the Southern States for its delicious kernel ; *J. sulcata*, the thick-shelled or Bark Hickory ; *J. alba*, the shag bark Hickory ; *J. tomentosa*, Mocker nut, or common Hickory ; *J. amara*, the Bitter nut ; *J. porcina*, Pig nut, whose tough wood is formed into narrow slips and used as brooms ; *J. aquatica*, Water nut, or Bitter nut Hickory ; and, lastly, *J. myristicæformis*, or Nutmeg Hickory.

5570. The Pine Tribe are of acknowledged importance in a commercial point of view ; their timber, especially from the British settlements, being largely exported. Besides those of the United States, of which an ample account may be found in the works of Michaux, we possess, in Canada and Nova Scotia, the *P. Balsamea*, Balm of Gilead Fir, Fir balsam, or American Silver Fir ; the *P. canadensis*, or Hemlock Spruce ; *P. nigra*, Black or Double Spruce, of which spruce beer is so abundantly made ; the *P. rubra* ; the *P. alba*, or White Spruce ; *P. resinosa*, the Pitch Pine ; *P. Banksiana*, the Scrub or Grey Pine ; *P. Strobus*, the Weymouth Pine ; *P. pendula*, the Black Larch ; and *P. microcarpa*, or Red Larch. But of all the known Pines, that which has been recently discovered to the westward of the Rocky Mountains, by Mr. Douglas, is the most remarkable. This most princely of the genus, perhaps the finest specimen of American vegetation, attains the enormous height of from 170 to 220 feet, with a trunk twenty to fifty feet in circumference, and its cones are from twelve to eighteen inches long, measuring ten inches round their thickest part. The trunk is remarkably straight and destitute of branches till within a short space of the top, which forms almost a perfect umbel. The wood is of fine quality, and yields a large portion of resin. Growing trees of this species, that have been partly burned by the natives, to save the trouble of cutting other fuel (a practice to which they are greatly

5567. Among the most important of the vegetable productions of North America must, undoubtedly, rank the forest trees, which originally occupied so vast a portion of the surface of the country a few years ago ; but which now, on account of the enormous demand for timber, and the progress of population, are sensibly diminished, especially in the more inhabited parts of the country. The Oaks are very numerous, and extend from Canada to the extreme southern parts of the United States. None of them,

however, can compare, as to the quality of their wood, with the British oak. They vary in height, from two feet to the loftiest timber. The Live Oak (*Quercus virens*), not found north of Virginia, is perhaps the best of all for ship-building, and is considered one of the most valuable trees in America ; next rank the Laurel Oak (*Q. laurifolia*), the Black Oak or Quercitron (*Q. tinctoria*), especially prized for its bark, the White or Iron Oak (*Q. obtusiloba* and *Q. alba*), found in all parts of the United States, and the Scarlet Oak (*Q. coccinea*), which is a very large tree, and whose foliage, changing in autumn to a bright red, gives the woods a highly picturesque appearance.

5568. The White Elm of Michaux (*Ulmus americana*) is among the most graceful and most majestic of American forest trees. The Red or Slippery Elm (*Ulmus fulva*) delights in a dry situation, as the preceding prefers a moist one.

5569. Of Ashes, eight species are enumerated by Pursh, and ten of Acer, or Maple, including the Negundo, among which the Sugar Maple is well known for its copious saccharine sap, yielding a valuable sugar. The Hickory Tribe afford fruit, as well as timber, which latter is employed for various mechanical and economical purposes. The *Juglans nigra* is called the Black Walnut ; *J. cinerea*, the Bitter nut, Oil nut, and White Walnut ; *J. olivæformis*, the Illinois nut, much prized in

addicted) produce a substance which Mr. Douglas says he is afraid to call sugar, but which greatly resembles it. The tree grows abundantly two degrees south of the Columbia River, in the country inhabited by the Umptqua tribe of Indians. The seeds are gathered by the natives in autumn, pounded, and baked into a sort of cake, which is considered a luxury. The saccharine substance is used in seasoning dishes, in the same way as sugar is in civilised countries.

5571. The Locust Tree (*Robinia Pseudo-Acacia*) (fig. 901.) so ignorantly vaunted by Mr. Cobbett, as suited to the soil and climate of England, and even of Scotland, is, indeed, in its native country, a most valuable as well as beautiful tree.

LOCUST TREE.

5572. The Tulip Tree (*Liriodendron tulipifera*) is one of the noblest denizens of the American forests, attaining a height of eighty feet, clothed with a light green and very peculiarly formed foliage, and bearing flowers as large as, and not inaptly resembling, those of a tulip.

5573. Rhododendrons, Azaleas, and Kalmias, with other shrubs belonging to the same natural family, abound in the swamps of North America, and form, with their evergreen foliage and lovely flowers, some of the chief ornaments of our parterres and pleasure-grounds; and our gardens are indebted to the north-west side of America for the variety of beautiful Pentstemons, Oenotheras, Gillias, and Collomias which have been lately introduced to them, as well as Ribes sanguineum, Eschscholtzia californica, three species of Calochortus, Gaultheria Shallon, and numerous Lupines; almost all the discovery of the indefatigable Douglas.

5574. Two remarkable genera of plants, peculiar to North America, must not pass altogether unnoticed: the one (*Sarracenia*) consisting of six species, and extending from New Orleans to Canada; the other (*Dionæa*) is confined, we believe, to one spot, the vicinity of Wilmington, in North Carolina. The *Sarracenia* (fig. 902.), or Side-saddle

SARRACENIA.

flower, grows in swampy places; its leaves are not flat, like those of most plants, but tubular and enlarged upwards, so as to resemble a pitcher in shape; the mouth of this orifice is sheltered by a lid, like a cap or helmet. These leaves, notwithstanding the wet places of growth of the parent plant, which would not seem to require any reservoir of moisture to supply its wants, are always more than half filled with water. It has not yet been ascertained what are the properties of this fluid, which render it so inviting to insects; but myriads do enter, and die there; for no sooner has an individual entered the mouth of the tube, than he is apparently urged forwards by the rapidity of the descent, and by the circumstance of the neck of the tube being covered with thickly set hairs, all pointing downwards, so that his struggles to return are effectually prevented by the inverted position of these hairs, and fatigue presently makes him drop into the watery abyss below.

5575. The *Dionæa muscipula* (fig. 903.), for there is only one species (or American Fly Trap), possesses a most curious apparatus for entrapping insects. The genus is somewhat allied to our Silene or Catchfly, and bears at the extremity of each of its long green leaves, which lie spreading on the ground, a pair of large, thick, fleshy lobes, united together by their base, and fringed at the margins with a row of long and slender spines. One might fancy that this plant gave the first idea of our rat-trap, and its mode of operating is very nearly the same. No sooner does a fly alight upon the centre between the two lobes, than these suddenly converge, the spines meet and clasp one within another, and the poor insect suffers imprisonment and death. The same effect is produced by touching these lobes with a pin, a straw, or any small object; but this is chiefly observable in fine warm weather; the contractile power being very weak in winter. Sir J. E. Smith is decidedly of opinion that these decaying carcasses are serviceable to the plant by administering a peculiar air to it; and Mr. Knight, a nurseryman,

DIONÆA MUSCIPULA.

near London, found that a growing specimen of *Dionæa*, upon whose leaves he laid fine filaments of raw beef, was much more luxuriant in its growth than an individual not so treated.

5576. With regard to the east side of the British settlements in North America, "the

plants of Upper Canada," says Dr. Richardson, in a letter to us, "extend to the south end of Lake Winnipeg, lat. 50° to 51° , where the Oak, Canada Pine, and several other remarkable vegetables disappear. Then, to the westward of this district lie the plains of the Saskatchewan, extending to the foot of the Rocky Mountains, to Peace River in a northerly direction, and uniting with the Prairie country of the Missouri to the southward. This district being open, with interspersed clumps of wood only, has a peculiar vegetation, containing several of Nuttall's plants, gathered on the Missouri. It is the Buffalo district. The Rocky Mountains yield alpine plants, and the country to the westward of them produces Mr. Douglas's plants, which are also peculiar. A line drawn from the south end of Lake Winnipeg to the Falls of the Saskatchewan, and from thence to the west end of Great Slave Lake, cuts off a portion of country, bounded to the eastward by Hudson's Bay, to the southward by Upper Canada, and to the northward by Chesterfield Inlet and Great Slave Lake. This district is more or less rocky, abounds in lakes and swamps and rivers, and is thickly wooded. There is little variety in its plants, which are nearly those of Labrador, and it is the district which has more peculiarly borne the name of the Hudson's Bay Lands. To the northward of it the Barren Grounds extend to the sea-coast. The vegetation in all the open parts of the Barren Grounds is arctic; but some of the Hudson's Bay plants are found on the banks of rivers where there are collections of alluvial soil, sheltered by high lands. This alluvial soil is so abundant on the Mackenzie River, that many of the Hudson's Bay plants and thick groves of White Spruce grow as far north as lat. $68\frac{1}{2}^{\circ}$. The shores of Behring's Straits are similar in soil and climate to the Barren Grounds, and I should class Newfoundland and Labrador with the island of Anticosti and mouth of the St. Lawrence, along with the Hudson's Bay district."

5577. *An article of food*, extensively used by the Canadian hunters in the arctic and subarctic regions of North America, is afforded by some species of Lichen, all belonging to a

904

TRIPE DE ROCHE.

distinct tribe, indeed, of the Liverworts, and now constituting the genus *Umbilicaria*. It was this which, under the name of *Tripe de Roche* (*fig. 904.*), is described as supporting for many days our enterprising countrymen, Captain Sir John Franklin and Dr. Richardson, and some of their companions, when they were in that country exposed to the most unparalleled hardships and sufferings from a want of every other aliment; while other individuals of the same party perished, incapable of subsisting upon so wretched a diet.

5578. *The most northerly land* belonging to North America that has yet been explored, if we except Greenland, is Melville Island, in lat. 75° , belonging to which Mr. Brown has

905

SAXIFRAGA FLAGELLARIS.

enumerated 130 species, including *Cryptogamiæ*. The whole of the genera and most of the species are such as are common to high northern regions, or the most elevated mountains of the southern ones. Many are found upon the Rocky Mountains, as is the case with that very singular vegetable, the *Saxifraga flagellaris* (*fig. 905.*), whose long runners, radiating from a central plant, like the legs from the body of a spider, induced our sailors to call it the Spider Plant.

5579. *Greenland is not* generally considered as part of America; but this is of no consequence, botanically speaking. Its Flora is very similar, but there is this remarkable peculiarity attached to it, namely, that it contains *Heath* (*Calluna vulgaris*), while no part of America Proper bears one of the genus.

5580. *The most northerly speck of land* that has yet been visited by our arctic navigators (though, perhaps, not strictly belonging to America) is Ross's Islet, a little spot in lat. 81° , and its produce of plants, half a dozen in number, is chiefly Lichens. But beyond this, a vegetation has been found, of a most singular nature as to its place of growth and its nearness to the pole. At first sight it would hardly be recognised for a vegetable at all. But it is formed from a seed or sporule, it imbibes nutriment from external organs, however minute these may be, it is destitute of locomotion, it grows, bears seed, and dies! But what is its place of growth? In lat. 82° , where Captain Parry found it in the greatest abundance, —

"There, where the north congeals his watery mass,
Piles high his snows, and floors his seas with glass," —

there, where, we may say, there is no land, no rocks, no earth, to which it can be attached, does it inhabit the snow itself; and, from the circumstance of many miles of surface and twelve

feet in depth being tinged with it, it has received the name of Red Snow* (*Protococcus nivalis*). It was again collected and brought home by Parry's second expedition, having been observed, not only growing on snow, but attached to stones and mosses, covering them with a thin red gelatinous crust; during the third voyage, this highly interesting plant was found in greater abundance, perhaps, than on any former occasion, and in a situation still more remarkable, for it was on the floes of ice, extending to the utmost limit of their progress, and in such profusion, and so completely embedded in the snow, that distinct red lines were left by the track of the boats or sledges on the surface; thus it vegetates in the most northern regions to which man has yet been able to penetrate, and flourishing most in an element (or rather a state of an element) in which no other vegetable, that we are acquainted with, can exist.

SUBJECT. 3. Zoology.

5581. The geographic range of the quadrupeds belonging to this distant portion of the British dominions has already occupied our attention. It will, therefore, be sufficient to notice a few of those whose furs constitute an important branch of commerce, and administer so greatly to our individual comfort. On this head, the invaluable work of Dr. Richardson (*Northern Zoology*, vol. i.) again supplies us with the latest and best information.

5582. The larger quadrupeds now known in this part of America are the Barren-Ground, the Black, and the Grisly Bears, the Prong-horned Antelope, the American Bison, the Moose Deer, and the Carabou or American Reindeer. The lesser, in which are comprised the greater number of the fur-bearing animals, are the Otter, Racoon, Badger, Ermine, Fisher, Beaver, different species of Marmots and Squirrels, with a great variety of Wolves and Foxes.

5583. The Barren-Ground Bear appears confined to those dreary regions which bear its name, lying to the northward and eastward of Great Slave Lake: it is of a dusky brown, and besides being larger than the black species, has longer soles. It feeds, like the Polar Bear, occasionally upon fish, and during the autumn frequents the sea coast for this purpose in considerable numbers. These bears are much dreaded by the Indians, who carefully avoid burning bones in their hunting encampments, lest the smell should attract them. Dr. Richardson relates an amusing anecdote of an old Indian, who, while seated at the door of his hut, pitched upon the bank of a small stream, was surprised by perceiving a large bear coming to the opposite side, attentively surveying him. "The poor Indian considered himself in great danger, and having no one to assist him but his aged wife, made a speech to the following effect: — 'Oh bear! I never did you any harm; I have always had the highest respect for you and your relations, and never killed any one of them except through necessity. Go away, good bear, and let me alone, and I promise not to molest you.' The bear walked off, and the old man, firmly believing in the efficacy

of his eloquence, favoured us, on his arrival at the fort, with his speech at length." The common Black Bear is a well-known inhabitant of Canada, while the Cinnamon bear of the fur-traders is considered but an accidental variety. The hunting of this species has been well described by Mr. A. Henry. (*Trav.* p. 142.)

906

RACCOON.

5584. The Racoon (*Procyon lotor* Cuv.) (fig. 906.) is frequently seen in menageries; its countenance is fox-like, but its gait bearish. In its wild state it sleeps by day, but prowls during the night after fruit, roots, birds, and insects. At low water it frequents the sea-shore to feed on crabs and oysters, and is fond of dipping its food into water before it eats, hence the specific name of *lotor*; it climbs trees with facility. The fur is used in making hats, and its flesh, when it has been fed on vegetables, is reported good.

5585. The Pine Marten (*Mustela martes*) (fig. 907.) differs not from that of Europe, although certain American races, inhabiting rocky districts, are distinguished by the superior fineness and dark colours of their fur. This is used for trimmings, and will dye so well as to imitate

907

PINE MARTEN.

sables and other more expensive furs; hence it has always been an important article of commerce: upwards of 100,000 skins have long been collected annually in the fur countries. The Pekau, or Fisher (*Mustela canadensis*), is a larger and stronger animal, but its manners are similar; its fur, however, is harsher than that of the Marten, and less valuable: some thousands are annually killed in the Hudson's Bay countries.

5586. The Canada Otter (*Lutra canadensis*) resembles the European species in habits and food, but is perfectly distinct, measuring near five feet long; while the American Wolf, equally confounded with that of the Pyrenees, has now been ascertained, by Dr. Richardson, to be a different species. The Quebec Marmot is a solitary animal, inhabiting under-

* Represented at p. 290. of this work.

ground burrows, yet capable of ascending trees: the Indians take it for food, by pouring water into its retreats; but its fur is of no value.

5587. The Canada Lynx (*Lynx canadensis*) (fig. 908.) is not uncommon in the woody districts, since from 7000 to 9000 skins are annually procured by the Hudson's Bay Company. It is a timid creature, never attacking man, and is incapable of injuring the larger quadrupeds. It lives principally on hares: its gait is not much unlike that of its prey; it proceeds by bounds, straight forward, with the back a little arched, and lighting on all the feet at once; it swims well, but is not swift on land. The Indians eat the flesh, which is white and tender.

908

CANADA LYNX.

the Golden and the White-headed. The Fish Hawk is not uncommon; nor is the booted or rough-legged Falcon (*Buteo lagopus*) so rare a bird as with us; a beautiful specimen (fig. 909.) was brought home by the Arctic expeditions. The Marsh Hawk of Wilson

909

ROUGH-LEGGED FALCON

seems to be also numerous, but whether this is the young of our common hen harrier is yet doubtful. The Grouse are much more abundant in these northern latitudes than in the United States, but they are all very different from the European kinds; nor is their Ptarmigan the same as that of the highlands of Scotland. These supply food to the Great White Owl, which here frequently hunts his quarry during the day. Numerous small migratory birds enliven the short-lived summer; they visit Canada for the purpose of incubation, and then retire southward; but the Canada and the short-billed Jays (*Disornithia canadensis*, and *brachyrynchus*, Sw.) appear stationary, and are peculiar to these regions.

5589. The Waterfowl, and wading tribes, as may be expected, are in immense numbers, and supply excellent food to the provident natives, by whom they are preserved in the snow as winter provision. Among these the Canada Goose is one of the largest and the most numerous. How far these birds extend their migrations northward is not known: they were seen by Captain Phipps on the dreary coast of Spitzbergen, in lat. $80^{\circ} 27'$; and, Wilson remarks, it is highly probable that they pass under the very pole itself, amid the silent desolation of unknown countries, shut out since the creation from the prying eye of man, by everlasting and insuperable barriers of ice. Certain it is, that the breeding-places of these wanderers have never been discovered. After incubation, the approaching rigours of the arctic pole compel them to retreat towards the south. The Indians are well aware of the period they are to be expected, and make such havoc in their ranks, that in favourable years 3000 or 4000 are said to be barreled for future use: the autumnal flight lasts from August to October; and those which are taken at this season, when the frost begins, are preserved in their feathers and left to be frozen for the fresh provisions of the winter stock, the feathers being imported to England. When in good order, this bird weighs from ten to twelve pounds, and each is estimated to yield half a pound of feathers. The Snow Goose (*Anas hyperborea*) is another of these northern wanderers, but its manners are not so well known: it is a common species in Hudson's Bay.

910

CANVASS-BACK DUCK.

5590. The American Widgeon (*Mareca americana* L.) (fig. 911.), called also the Bald-pate, is about the size of the European species, but of a handsomer plumage: it does much injury to the rice plantations in the southern states, and is the constant attendant of the Canvass-back Ducks, thieving from those expert divers the fruits of their industry. The Widgeon, who never dives, watches the Bald-pate ducks are said sometimes to perch on trees: they feed in company, guarded by one.

911

AMERICAN WIDGEON.

5591. The Canvass-back Duck (*Fuligula Valisneria* Wil.) (fig. 910.), is celebrated throughout America for the exquisite delicacy of its flesh; which Wilson describes as rich, juicy, tender, and altogether unrivalled by any other of its tribe: two or three dollars a pair is said to be no uncommon price for these birds on particular occasions. The Canvass-back, in its plumage, very much resembles the English Pochard (*F. ferina*), but is larger; its principal food is the root of a vallisneria, a grass-like plant, which grows at the bottom of the freshwater shoals, at from seven to nine feet deep. In winter, these birds sometimes assemble in such numbers as to cover several acres; but they are very shy, and can only be approached by stratagem.

SECT. III. *Historical Geography.*

5592. *The discovery of this part of America* was effected at a very early period by British skill and enterprise. In 1497 and 1498, very soon after the voyage of Columbus, John and Sebastian Cabot not only explored the coast of what is now the United States, but surveyed the mouth of the St. Lawrence, and sailed even along the coast of Labrador. Some years after, the French navigator, Jacques Cartier, sailed up the St. Lawrence to Montreal, upon which voyage the French founded their claim to Canada; which they did not, however, make good till 1608, when a colony was founded on a great scale, under the pompous title of "New France." The settlements were pushed by that enterprising nation with great activity, and even far into the interior, until they began to enclose those formed by Britain, in New England, so that a collision between these two great rival nations became inevitable. Canada was transferred to Britain by the events of the war 1756-63, and by the glorious combat at Quebec, where Wolfe conquered and fell. By the peace, all this and the other parts of North America were secured to Britain in full dominion. Canada remained to her even amid the great revolution which severed all the southern part of her empire. By a singular contrast, the part of America which was colonised from England, and inhabited by Englishmen, rejected her, while the part colonised by France, and inhabited by Frenchmen, remained firmly attached to her. This was doubtless, in a great measure, a consequence of the very liberal and conciliatory manner in which England treated the conquered province.

SECT. IV. *Political Geography.*

5593. *The constitution of Canada* has been made to embrace many of the benefits conferred by that of the mother country. This boon was given almost unsought, in the year 1783, in reward for the fidelity of the people during the war. From that time, instead of being ruled solely by the governor, who is also commander-in-chief, aided by a council, they received a constitution somewhat similar to that of Great Britain.

5594. *The legislature of Canada* consists of two bodies, the legislative council, composed of fifteen members, elected for life by the governor, and exercising the functions of a House of Lords, though they certainly form a less respectable and independent body. The other is the House of Assembly, corresponding to the British House of Commons, and elected by the nation, upon the moderate freehold qualification of forty shillings. They consist of fifty-two members, are nominated for four years, and sit for three months in the year. There is no exclusion on account of country or religion; so that the French, who form the majority of the nation, predominate also in the assembly; and French is the language usually spoken. For some years considerable discontent has been manifested by this assembly, particularly in regard to the want of an efficient control over the public revenue; but a conciliatory system has of late been adopted towards them.

5595. *The course of justice* in criminal concerns is founded upon the equitable principles of the law of England. The same law was once introduced in regard to civil matters; but it excited such dissatisfaction among the natives that there was no alternative but to restore to them their old French law of property. This is founded on the feudal tenure, often characterised by considerable complexity, which renders it very difficult for the purchaser of an estate to ascertain its titles. There is a singular provision, conferring a moiety of all property upon the wife; so that no man can dispose of it without her consent. The courts are formed somewhat on the model of those of England, though without affording the full benefit of the system of jury trial; and various imperfections are admitted to exist in the administration of justice; but measures to remedy these are in contemplation.

5596. *The revenue of Lower Canada* amounted in 1827 to 93,777*l.* derived almost entirely from customs duties. In 1823, the revenue of Upper Canada was about 25,000*l.* (See papers laid before Finance Committee.) The civil government of both provinces costs nearly 200,000*l.*; and the military and other arrangements connected with the defence of the country may be moderately estimated at half a million or more. They may therefore be regarded as costing Great Britain from 500,000*l.* to 600,000*l.* a year of direct outlay.

5597. *The military and naval force of Canada* consists almost entirely of that part of the British army which circumstances render it expedient to maintain there, and which varies with the circumstances of the country. There is also a numerous militia, who behaved with great intrepidity during the last war. On Lake Ontario, at that period, were built a ship of the line of 102 guns, and two frigates; and two seventy-fours were in frame, but have not been finished since the peace.

SECT. V. *Productive Industry.*

5598. *The natural resources of British America* are more ample than would be inferred from its dreary aspect, and the vast snows under which it is buried. Canada has a very fertile soil, especially in its upper province; and though it be free from snow only during five months, the heat of that period is so intense, as to ripen the more valuable kinds of

grain. The vast uncleared tracts are covered with excellent timber. Nova Scotia and New Brunswick are less fertile, yet they contain much good land, and are well timbered. Newfoundland is not so barren as has sometimes been supposed, and has on its shores the most valuable cod-fishery in the world. Even the immense northern wastes are covered with a profusion of animals noted for their rich and beautiful furs, which form the foundation of an extensive and valuable trade.

5599. *Agriculture*, in this country, is still necessarily conducted on a somewhat rude system; yet the whole of Lower Canada, for more than 400 miles along the banks of the St. Lawrence, presents an extensive chain of farms. "Corn-fields, pasture, and meadow lands, embellished at intervals with clumps of trees, snow-white cottages, neatly adorned churches, alternately present themselves to the eye in the midst of the verdant foliage which shades the banks of that noble river." The meadows of Canada are reckoned superior to those in the more southern parts, possessing a fine close turf, well covered at the roots with clover. The French *habitans* have an extremely imperfect mode of culture; they scarcely scratch the soil deeper than an inch, and adhere with pertinacity to old habits. They have none of the enterprise or emigrating spirit of the republicans, but stick to their paternal fields as long as they will yield a support to themselves and families. They cultivate nearly the same kinds of grain which are grown in England, with a little maize and tobacco. Orchards are not much attended to; but culinary vegetables are raised in tolerable plenty, especially onions, garlic, and leeks. Of animals reared for food, hogs are the most numerous; the sheep and cattle are of small size. Culture in Upper Canada is still in an incipient state, but it is advancing rapidly, in consequence of the influx of British settlers. Government for some time allowed to every settler fifty or even a hundred acres upon payment of fees amounting to about a shilling per acre; but since 1827, the lands have been disposed of by public auction. An officer, entitled the Commissioner of Crown Lands, fixes the extent to be sold in each year, and the upset price, which are announced in the Gazette. No lot is to contain more than 1200 acres, and the purchase-money is to be paid by four instalments, one at the time of sale, the rest at intervals of a year; but purchasers under 200 acres may obtain possession, liable to a redeemable quitrent of 5 per cent., payable annually in advance. If the conditions are not fulfilled, the land is forfeited. Government has, however, at different times, during the distress of the labouring classes in Britain, not only made free grants to large bodies of them, but given aid in conveying them across the Atlantic, and settling them on their allotted portions. By Lord Howick's bill, in 1831, it is provided, in the case of any one willing to emigrate, and who it is apprehended may become a burden on the poor rates, that, on payment of a certain sum out of these rates, he shall be conveyed to the colonies; where he may either employ himself as a labourer, or obtain a small assignment of land, for which, however, after a certain interval, he is expected to pay. Among emigrants possessed of capital, a great proportion have of late made their purchases from the Canada Company. This body, incorporated in 1826, bought from government tracts equal to 2,300,000 acres, for which they engaged to pay the sum of 295,000*l.*, by sixteen annual instalments. These are dispersed through every part of Upper Canada; but the largest portion, amounting to about a million of acres, and extending sixty miles in length, is along the eastern shore of Lake Huron. The Company found towns and villages, form roads, lay out the ground in convenient lots: they have agents on the spot, who afford every information and aid to emigrants; they sell their lands from 7*s.* 6*d.* to 20*s.* an acre, requiring only one fifth of this sum to be paid immediately, the rest by annual instalments, which, it is said, the land can easily produce by cultivation; and the company state that they have on no occasion been under the necessity of resorting to compulsory measures to obtain the payment of arrears. The settler must begin with the laborious task of felling the trees, of erecting a log-house for himself, and a commodious barn for storing the grain. The former may cost 12*l.* and the latter 60*l.* The cost of a stock of farm cattle is reckoned by Mr. Howison at 28*l.*; and that of clearing and sowing an acre, 5*l.* 5*s.* The first year's produce is usually twenty-five bushels of wheat, which may sell at 4*s.* 6*d.* each. The second year's crop will be considerably larger. Wheat, the most valuable crop, is raised very successfully; rye and Indian corn also succeed; but oats and barley do not. The best green crop is the squash or gourd. The management here, as over all America, is very slovenly, when compared with good English farming; but circumstances, perhaps, do not admit of better; and the greatest difficulty is the want of a market. The expense of living, so far as concerns the absolute necessities of life, is very moderate; but wearing apparel and all manufactured goods are double the price at which they sell on the other side of the Atlantic. Servants are very dear, and scarcely to be had at any rate of wages; even those brought from Britain usually strike out an independent career for themselves. A wife, if at all industrious, and a large family, instead of being a burden, are the great source of prosperity on the American lakes.

5600. *Manufactures* form no considerable part of the political economy of Upper Canada; and the policy which will lead Great Britain not to encourage them is, perhaps, fortunate, as they would at present, on any great scale, be decidedly premature.

5601. *The commerce of British America* is an object of much greater importance. The fur trade, the original object for opening an intercourse with this part of the world, was carried on in the first instance chiefly from the shores of Hudson's Bay; but it was there injudiciously placed in the hands of an exclusive company, which greatly diminished its activity. About forty years ago, Mr. M'Tavish, and some other active merchants at Montreal, established what was called the North-west Company, which was opposed for some time by a rival one, under Sir Alexander Mackenzie, but the two at last united. The company then consisted of forty partners, who employed upwards of 3000 clerks, travellers, and Indians. Their agents consist chiefly of tough Scotch Highlanders, who undergo incredible hardships in traversing the vast expanse of these dreary and pathless wastes; but they are enabled to live in splendour at Montreal, and sometimes return with considerable fortunes. The furs are chiefly those of the beaver, which pass for money on the northern lakes; those of the various foxes, black, silver cross, and blue; of the wolverine, the marten, the lynx. Lord Selkirk has laid open all the sins of the North-west agents, which do not appear to have been very few. The medium of exchange was almost exclusively spirits, the excessive use of which had the most ruinous effects, both moral and physical, on the Indians, whom, indeed, it has gone near to exterminate. The eager rivalry of the two companies, operating thus in regions beyond the pale of law, has given birth to many deeds of fraud and violence. Within these few years, however, an union has healed the deadly enmity between them; and, by acting in concert, they have determined, as Captain Franklin affirms, to diminish the issue of spirits, and even to adopt every practicable means for the moral and religious improvement of the Indians. The furs exported from Quebec, on an average of 1830 and 1831, were, 41,225 beaver and otter, valued at 25s. each; 466 bear and buffalo, 20s.; 936 deer, 3s.; 2630 fox, 10s.; 12,400 lynx, cat and marten, 10s.; 39,000 musk-rat, 6d.; 1500 tails of marten, fox, &c., 1s. These, with some smaller articles, are valued at 211,000*l*. It is remarkable that they are cheaper in London than at Montreal; owing, it is said, to the superior skill used by the London manufacturers in getting them up, so as to make a small quantity go a great deal farther.

5602. *The timber trade*, the value of which, thirty years ago, did not exceed 32,000*l*., has now surpassed all others in magnitude. It has been favoured not only by the great demand for ship and house building, but much more by the great difference made in the duty, as compared with that imposed upon Baltic timber; and which, though reduced, is still 2*l*. 5*s*. per load. Britain makes thus a great sacrifice (the wisdom of which has been much questioned), since the timber of Canada is not only loaded with a heavier freight, but is decidedly inferior as to strength and durability. This timber is obtained not from the agricultural districts, but chiefly from the immense forests upon the shores of the great interior lakes. The trees are cut down during the winter, partly by American axemen, who are peculiarly skilful; and the business is attended with great hardship, both from the work itself, and the inclemency of the season. The trees when felled are put together into immense rafts, which cover often acres, and on them are raised small huts, the residence of the woodmen and their families. Ten or twelve square-sails are set up, and the rafts are navigated to Quebec through many dangers, in which nearly a third of them are said to be destroyed. Those which survive are ranged along the river in front of Quebec, forming a line four or five miles in extent, till they are taken down and exported in the shape of timber, deals, and staves. The Canada merchants lately estimated the capital invested in this trade at 1,250,000*l*. It is also carried on to a great extent from Nova Scotia, New Brunswick, and even from Cape Breton. The export to all quarters amounted, in 1831, to 1,877,000 deals and battens; 46,278,000 feet of deals, planks, and boards; 6,925 cords of lathwood; 6783 masts and spars; 25,795 oars; 1,372,000 large, and 7,653,000 small, staves; 14,815,000 shingles; 470,580 tons of fir, oak, &c. timber. The value of these and a few minor articles, is estimated by Mr. Bliss at 1,038,000*l*. sterling.

5603. *Other considerable articles* are pot and pearl ashes, which, in 1831, amounted to 200,300 cwt., value 325,000*l*.; wheat and wheat flour, limited chiefly by the want of demand. In 1831 there were exported 1,341,278 bushels of wheat, value, at 6*s*. 8*d*., 447,092*l*.; flour, 82,406 barrels, at 35*s*., 144,210*l*.; barley, 214,562 bushels, at 3*s*., 32,184*l*.; beef and pork, 15,802 barrels at 60*s*., 47,406*l*.; cattle, 2055 head, 5*l*., 10,275*l*.; vegetables, 369,000 bushels at 1*s*. 6*d*., 27,686*l*.; butter, 157,475 lbs. at 1*s*., 7,873*l*.; biscuits, 7348 cwts. at 17*s*. 6*d*., 6429*l*. These, with some minor articles, amounted to 656,584*l*. For some time, however, the ports of Britain have been shut against foreign grain; and, though some relaxation has been granted with respect to Canada, it seems very doubtful if the free admission which its cultivators demand for their grain will ever be accorded by the British landholders. The value of grain imported from these colonies into Britain amounted in 1825 to 95,000*l*.; and on an average of twenty-five years to 256,000*l*. The shipping employed between Britain and her American colonies was, in 1829, inwards, 1609 ships of 431,124 tons; outwards, 1652 ships of 418,142 tons. The value of the imports into Britain in 1829 was 1,088,622*l*.; of the exports, 2,064,126*l*.

5604. *To the West Indies* the northern states export staves, timber, grain, provisions, and salted fish; receiving in return the well-known produce of these islands. With the United States, Canada holds a great intercourse across Lake Champlain, sending chiefly salt and peltry, taking in return some provisions, timber, and potash; and, clandestinely, tea, tobacco, and other luxuries, which the strict colonial rules would require her to receive from the mother country.

5605. *The fishery* is pursued upon these shores to an extent not surpassed any where else upon the globe. The rich supply of cod on the Newfoundland bank is wholly unparalleled. This bank may be termed a vast submarine mountain, 330 miles in length, and 75 in breadth. The approach to it is announced by flights of penguins, and the shore covered with shells and a profusion of small fish, which serve as food to the vast shoals of cod, which resort to the bank. Although all the nations of Europe have been lading cargoes of them for centuries, no sensible diminution has been felt. The English employ about 40,000 tons of shipping, and 3000 men, in this fishery. In 1814 and 1815, the British exported upwards of 1,200,000 quintals, but the amount has since diminished. In 1831, they exported 889,380 cwt. of fish at 10s., 444,690*l.*; 87,788 barrels of herrings at 20s., 87,788*l.*; 14,068 tuns of oil at 25*l.*, 351,650*l.*; 737,449 seal skins at 1s., 36,872; which, with some minor articles, made up an estimated value of 834,182*l.* The French and Americans are allowed by treaty to share in this trade; and the former, on an average of five years, carry off annually 245,000 quintals, at 1*l.* 1s. per quintal; the latter, in 1831, exported 208,000 quintals, and 76,000 barrels, the value of which was about 425,000*l.*

5606. *The interior communications of Canada* are almost solely by the river St. Lawrence and the lakes, which open a very extensive navigation into the country. It is seriously obstructed, however, at one point, between Montreal and Lake Ontario, where a series of rapids occur, over which only canoes can shoot; and all heavy goods must be landed and reshipped.

5607. *Great exertions have been made to improve by canals* the interior communications of Canada, though the advantage of those made by the government has been a good deal controverted. The chief object has been to obviate the continued series of obstructions to the navigation of the St. Lawrence above Montreal. One canal has been conducted from that city to the village of La Chine, a distance of eight miles, avoiding the formidable cascade, called the Sault St. Louis. Considering the moderate distance, the expense of 130,000*l.* is very large; but the works are said to be admirable, and the canal is of great use. Government then determined to form a grand circuitous communication with Lake Ontario by the Ottawa. The object held forth was, that in the event of war with the United States, military stores might be conveyed from Lower to Upper Canada, without the dangers which would be incurred by the route of the St. Lawrence, the opposite bank of which would be in possession of the enemy. In the prosecution of this plan, the Grenville canal, eight miles long, divided into three sections, was constructed, to avoid certain falls and rapids in the lower navigation of the Ottawa. It is forty-eight feet wide, and five feet deep. The grand operation on this line, however, is the Rideau canal, reaching from the Ottawa to Lake Ontario, near Kingston. It is 135 miles long, connecting together a chain of lakes which admit of steam navigation; and the dimensions are such as to allow vessels from 100 to 125 tons to pass. The estimated expense was 486,000*l.*, which it will have considerably exceeded. It seems much to be regretted, when so much expense was incurred, that it was not employed upon a canal parallel to the St. Lawrence, which, whenever it is accomplished, will, in a commercial view, supersede the Rideau. Estimates have accordingly been formed of two dimensions, according to one of which such a canal would cost 92,000*l.*, and to another, 176,000*l.*; and it is thought the larger scale will prove profitable, and remunerate the undertakers. The enterprise of private individuals has constructed the Welland canal, which, at an expense of 270,000*l.*, has united the lakes of Ontario and Erie. It is forty-two miles long, fifty-two feet broad, and eight feet and a half deep; and the chambers of the locks are of dimensions sufficient for vessels of 125 tons. It is thus much more capacious than the great New York canal, though not nearly of equal length.

SECT. VI. *Civil and Social State.*

5608. *The population of the British North American provinces*, according to the latest enumerations, made mostly between 1827 and 1832, was as follows:—

Lower Canada (1831)	-	-	-	511,917
Upper Canada (1832)	-	-	-	257,814
New Brunswick	-	-	-	72,932
Nova Scotia and Cape Breton	-	-	-	142,548
Prince Edward Island	-	-	-	23,473
Newfoundland	-	-	-	60,088
				1,068,772

It is evident, from Mr. Bouchette's statements, that these enumerations have been by no means complete; and the number must have been greatly augmented by the strong tide of emigration which has flowed from Britain into this quarter of the world. In each of the years 1831 and 1832, the emigrants landed at Quebec have exceeded 50,000, the bulk of whom have proceeded to Upper Canada.

5609. *The people of Lower Canada*, and of the interior of Nova Scotia and New Brunswick, consist almost entirely of French, known under the name of *habitans* (*fig. 912.*). The

912

CANADIAN HABITANS.

stranger who passes into Canada out of the United States is much struck with the change of aspect and address. The visage of the *habitant* is long and thin, his nose prominent, inclining to the aquiline; his eyes small, dark, and lively; his chin sharp; his complexion swarthy and sunburnt, and often darker than that of the Indian. Instead of displaying the hardy bluntness of the American, he is courteous and polite in the extreme. Even carmen and peasants are seen taking off their caps, bowing and scraping to each other as they pass along the streets. In their demeanour they are easy and unembarrassed, like persons that have passed their lives in good company. Indeed, Mr. Lambert observes, that the original settlers consisted partly of the noblesse of France, disbanded officers and soldiers, and other persons accustomed to good society. They have imbibed nothing of that stirring, restless, and adventurous spirit for which the Americans are almost proverbially noted. They are described by Mr. Duncan as "of habits altogether hereditary and monotonous, content to pace along in the footsteps of their forefathers." They also cherish a mortal and almost superstitious antipathy against their republican neighbours, especially the Bostonians; to whose machinations, according to Mr. Hall, they are wont to ascribe fire or any other public calamity which befalls their cities. This feeling, with the mild and liberal treatment which they have experienced, has secured them from all disposition to take part with the United States in any of the recent contests. They enjoy a happy mediocrity of condition, possessing in abundance the necessaries of life, and some of its luxuries. They are a contented, gay, harmless, ignorant, superstitious, gossiping race. They emigrate reluctantly and rarely, adhering to their paternal spot, and dividing it as long as possible among the members of their family.

5610. *In religion*, the *habitans* have always adhered to their original catholic profession. In this the British have fully protected them, continuing to support the establishment, and levying a small land-tax to defray the expense. The Canadian clergy are represented as exemplary in their conduct, diligent in the discharge of their functions, and by no means possessed of that violent spirit of proselytism, which has been often ascribed to them. Catholics are admitted to the house of assembly, and to all offices, and are perfectly loyal. A protestant establishment of the church of England is also supported on a small scale. The church of Rome has 191 churches, 298 other places of worship, called *cures*, or *presbytères*, 20 convents, and 10 colleges. Of the convents, six are large nunneries in the great towns; the others are dispersed over the country, serving chiefly for purposes of female education. The church of England has 39 places of worship; the church of Scotland, four; the Wesleyan methodists, five.

5611. *Canadian literature* affords little room for observation. Of the French inhabitants scarcely any can read, except a few ladies, who employ that attainment chiefly in perusing novels and fashionable poems. The British come out almost solely intent upon making a fortune. Even in the great cities no literary taste prevails. An attempt to establish Lancasterian schools was not successful, being discouraged, as Mr. Duncan alleges, by the heads of the protestant church. As to the fine arts, they appear to be quite in embryo.

5612. *The houses of the Canadians* are constructed of logs slightly smoothed with the axe, laid upon each other, and dovetailed at the corners. The interstices are filled with clay or mud, and the surface whitewashed. The roof is constructed with boards, generally covered with shingles, to which the weather gives the appearance of slate. There is only one story, or ground floor. The Frenchwomen are said to have improved in cleanliness by the example of their English neighbours, having before been accustomed to leave the dust and dirt on their floors unmolested for a twelvemonth, only sprinkling a little water to prevent the dust from rising. They have still much to learn in this particular, and argue against the constant scouring practised by their new neighbours, as injurious to health. The mansions are usually adorned with pictures, or images of the Virgin and the saints, the execution of which bears unequivocal testimony to the low state of the arts.

5613. *The amusements of Canada* are not varied. The French, always fond of dancing and of social parties, gave to the towns the character of being gay and hospitable; but Mr. Lambert says, that, since British residents have multiplied, a spirit of party, a propensity to scandal, and jealousy as to rank, have considerably marred this harmonious disposition. The theatre is in a very low state; but the most national amusement is that of driving over the snow in the clear months during the depth of winter, in a vehicle called a *cariole*, with a sharp bottom, which glides over the snow like a skate (*fig. 913.*).

5614. *The dress of the Canadian habitant* consists of a large dark grey cloth coat or frock, with a hood, which, in wet weather, he draws over his white or red nightcap, like the cowl of a monk. It is tied round with a worsted sash of various colours. He has a waistcoat and trousers of the same cloth, and mocassins or long boots, fitted for making his way through swamps. A jacket and petticoat is the original dress of the females; though they have begun to adopt, at a long interval, the changing fashions of the mother country.

913

CANADIAN CARIOLE.

the standing dish at breakfast, dinner, and supper. During Lent, fish, vegetables, and sour milk supply its place. Knives and forks are accounted superfluous; and, to meat which can be eaten with a spoon, the whole party sit round and help themselves from one general dish. Tea and coffee are only occasional treats. Unfortunately, from its cheering influence, rum is too much in request, and the *habitant* seldom returns from market without rather an undue portion of it. At certain seasons, and especially after Lent, they have their "*jours gras*," in which fifty or a hundred sit down to a table, covered with enormous joints, huge dishes of fruit and fowl, and vast tureens of milk and soup. Dancing concludes the merriment.

5615. *The food of the rural Canadians* is chiefly pork, boiled in pea-soup, which is

SECT. VII. Local Geography.

5616. *In detailing the geography of British America*, we must divide this extensive territory into two portions: — 1. Canada; 2. The countries and islands at the mouth of the St. Lawrence.

5617. (1.) CANADA, the most important and productive of the British American territories, lies along a line of upwards of 800 miles, from the mouth of the St. Lawrence to the extremity of Lake Superior. From the line of the river and lakes Canada stretches towards the north, with a small depth of actual occupation, till it touches on the ill-defined boundary of the Hudson's Bay territory. It is divided into Lower and Upper Canada.

5618. *Lower Canada* extends along the bank of the St. Lawrence up as far as the Lake St. Francis, a little beyond Montreal. Till of late, this was the only part of the country which was settled and peopled to any extent, and to the upper province there was little resort, unless with a view to the fur trade. It is still the most densely occupied, and all the trade must necessarily pass through it. The great body of the French *habitans* are included within it. Lower Canada is divided into four districts: — Quebec, Trois Rivières, Montreal, and Gaspé. We need not here attempt to particularise the subdivisions made in 1792 into twenty-one counties.

5619. *For these four districts* the estimates of Mr. Bouchette, formed, seemingly, with very great care, so as nearly to approach the truth, enable us to present our readers with the following table. Allowance, however, must be made for the increase within the last few years: —

	Quebec.	Trois Rivières.	Montreal.	Gaspé.	Total.
Population	143,761	51,657	268,631	7,777	471,676
Square Miles	125,717	15,811	49,769	7,389	198,686
Acres, Arable	291,403	125,902	580,006	4,887	1,002,198
Acres under Fallow, or Meadow	612,443	244,878	1,081,966	5,100	1,944,387
Wheat, Produce in Bushels	793,872	362,974	1,752,386	12,008	2,931,240
Oats	627,053	317,722	1,379,856	16,898	2,341,529
Barley	123,604	25,841	213,672		363,117
Peas	192,469	81,261	546,783	2,805	823,318
Other Grains	171,000	86,000	596,000	1,500	854,500
Potatoes	1,848,104	606,365	4,121,721	219,820	6,796,510
Horses	39,022	18,822	81,199	1,389	140,432
Oxen	35,498	19,344	88,361	1,539	145,012
Cows	78,797	32,218	147,324	1,676	260,015
Sheep	248,042	93,674	482,810	4,596	829,122
Hogs	86,596	30,228	120,906	4,005	241,735
Looms	4,315	2,073	6,756	99	13,243

5620. *The city of Quebec* (fig. 914.), the capital of Canada, is the chief feature in the district bearing its name. It is singularly situated, half on a plain along the northern bank of the St. Lawrence, the other

914

CITY OF QUEBEC.

half on the top of a steep perpendicular rock, at least 350 feet high, which rises immediately above. These are called the Lower and the Upper Towns. The Upper Town contains the government buildings, the residence of the governor, the military, and the most opulent inhabitants, the best and handsomest streets, and the most

agreeable mansions. The Lower Town is more crowded; its houses are less handsome, and have a gloomy and monotonous aspect; but it is the sole seat of the traffic by which Quebec is enriched. The communication between the two is maintained by a narrow track through a cleft in the rock, called Mountain Street, to which name it fully answers. During the long winters, when this steep track is a sheet of ice, it can be passed only with great caution, by the aid of Shetland hose, iron cramps, and similar expedients. Quebec is by strict statute built of stone, as a security against the dreadful conflagrations which have laid waste the wooden cities of the west. There are three nunneries, containing each from thirty to forty inmates, which number is kept up without difficulty. Two of them devote themselves to education and the care of the sick; so that they are of real use to society. The male orders were not allowed to recruit their numbers, and as they successively died, their funds were appropriated by government, which, from the Jesuits alone, derived an income of 12,000*l.* a year. The cathedral and other public buildings are respectable, without any of them being very remarkable. The life of the inhabitants of Quebec is varied chiefly by the vicissitudes of the season. Towards the end of November, winter sets in, and for several weeks heavy falls of snow, hail, and sleet closely follow each other. The snow often rises to a level with the top of the smaller houses; and it is with the utmost difficulty that the inhabitants can keep open a narrow path between them. Towards the end of December the weather becomes clear, the snow ceases to fall, and its white solid mass covers the entire expanse of the surrounding country. Then is the time for the citizens to sally forth with horse, sledge, and cariole, and drive over the smooth snowy plain, where, as every trace of a path has been obliterated, the route is marked by pine branches, stuck in at short distances, and varying the monotony of the scene. Every precaution against the cold must now be employed, of which buffalo robes, lined with green baize, have been found the most effectual. Thus passes the time till March, when the weather becomes mild, and even hot, and in April the ice of the St. Lawrence breaks with a mighty crash, and floats down for eight or ten days in large masses, bearing along with it fragments of earth and rock from the upper parts of the river. May and June are usually wet; in July and August the inhabitants suffer from the intense heat and tormenting swarms of insects: September is the most agreeable month of the year; but in October the biting frosts of winter begin to be felt.

5621. *Quebec, as a military position*, is excessively strong. The rock on which it stands can be approached only on the western side, where a citadel and a great range of other works render it almost another Gibraltar. Quebec was one of the most brilliant scenes of British glory. Near it, on the plains of Abraham, Wolfe, at the cost of his life, gained the splendid victory which annexed Canada to the British empire. In the beginning of the American war, General Montgomery, in attempting to carry it, was defeated. It is considered as securing the possession of Lower Canada, which, without it, would be untenable.

5622. *The commerce of Quebec* is considerable; as all the vessels from Britain and other foreign quarters stop there and unload their cargoes. The communication with Montreal is carried on by steam packets, of which nine, whose tonnage varied from 600 to 350 tons, were plying in 1829. One of between 700 and 800 tons has been recently built to carry on the intercourse with Halifax.

5623. *The country round Quebec* is broken, wild, wooded, and highly picturesque. About

915

FALL OF MONTMORENCI.

seven miles distant is the Fall of Montmorenci (*fig.* 915.), one of the most striking and beautiful objects in North America. It bears no comparison to Niagara in magnitude and the mass of its waters; but the ample woods with which it is fringed, the broken rocks which surround and intersect its channel, tossing it into a foam resembling snow, render it perhaps a more beautiful scene.

5624. *The town of Trois Rivières* is situated about ninety miles below Quebec, with a free navigation. It had, in 1825, only 2453 inhabitants, and may now contain about 3000. The place is built of indifferent wooden houses. The Indians formerly came to exchange their furs here; but these are now intercepted at Montreal, by the North-west Company. The town has a good natural wharf, but its only trade consists in supplying the district with European and West India goods. There is, however, an iron-work in the neighbourhood, where good stoves are said to be made. The inhabitants are almost entirely French.

5625. *Montreal* is situated immediately above the rapids, at a point where the ample stream of the Ottawa flows into the St. Lawrence. It is the commercial capital of Canada;

and most of the business, even in Quebec, is carried on by branches from the Montreal houses. It derives a great impulse from the transactions of the North-west Company, here established; and it is the centre of the commerce with the United States, carried on by Lake Champlain and the Hudson. Vessels of 600 or 700 tons can, notwithstanding some difficulties, come up to Montreal; its wharf presents a busy scene, — the tall masts of merchantmen from the Thames, the Mersey, and the Clyde, with the steam packets which ply between Quebec and Montreal. These are of large size; one, of 600 tons, in one voyage brought up 1360 emigrants. These steam vessels are also much employed in the conveyance of goods. The island of Montreal is about thirty miles in length, and seven in breadth; it is of alluvial soil, the most fertile in Lower Canada, and also the most highly cultivated. The view over it, of fruitful fields, gay country-houses, and the streams by which it is encircled, is one of the most pleasing that can be imagined. The interior of the town is not so attractive. It is substantially, but gloomily, built of dark grey limestone, with roofs of tin, the only kind, it is said, which can stand the intense cold of winter; while the windows and doors are shut in with massive plates of iron. The streets, though tolerably regular, were inconveniently narrow; but of late several have been formed, extending the whole length of the town, that are commodious and airy. The new cathedral, opened in 1829, is considered one of the handsomest structures in America. It is 255 feet long, 134 broad, 220 feet high in its principal front; and it is capable of containing 10,000 persons. Two Catholic seminaries, the English church, and the general hospital, are also handsome structures. Mr. M'Gill, a citizen of Montreal, left lately a considerable estate, with 10,000*l.* in money, for the foundation of a college, which was opened in 1828. The population amounted in 1825 to 22,357, and is now supposed to have reached 30,000. The district of Montreal extends for some distance south of the St. Lawrence, taking in a corner of Lake Champlain. This tract does not present any remarkable features. The village of La Prairie, on the south bank of the river, is the medium of communication between the two states. A number of townships have been formed along the northern bank of the Ottawa, the part of Lower Canada chiefly resorted to by emigrants. The country is level and fertile, but its progress is much obstructed by the number of old unimproved grants; so that the population does not much exceed 5300.

5626. *The district of Gaspé* remains to complete the description of Lower Canada. It is on the south side of the St. Lawrence, near its mouth, bordering on New Brunswick. It is a country of irregular and sometimes mountainous surface, containing numerous lakes, and watered by several rivers, of which the Restigouche is the principal. The territory is covered with dense forests, inhabited by 7000 or 8000 woodmen and fishermen, and exports some fish, oil, and timber. The cod-fishery employs 1800 men, and produces about 50,000 quintals of fish, and 20,000 barrels of oil; and about 4000 barrels of herrings, and 2000 of salmon are shipped for Quebec. Its capital, New Carlisle, is a mere village of forty or fifty huts.

5627. *Upper Canada* is a vast region, commencing at the Lake St. Francis, a little below Montreal, and extending along the whole chain of the great lakes, to at least the western boundary of Lake Superior. Its general features have already been noticed. Its existence as a country has been very recent. The French, while they held Canada, merely maintained a chain of military posts, to keep in check the savage tribes by whom this region was occupied. It remained a mere district attached to Quebec till 1781, when a number of American loyalists and disbanded soldiers were located upon it, and the name of Upper Canada bestowed. It slowly increased till 1811, when it contained 77,000 inhabitants, and in 1824 had rapidly risen to 151,000, and in 1828 to 188,000. Since that time the tide of emigration to Canada has been very strong, and of the 50,000 who in each of the years 1831 and 1832 landed at Quebec, most proceeded to Upper Canada. The population has thus been augmented till it amounts to the number above stated.

5628. *Upper Canada* is estimated by Mr. Bouchette to contain 141,000 square miles, of which, however, only 33,000 have been laid out into townships. The space thus organised composes a species of triangle, two sides of which are formed by the lakes Ontario, Erie, and Huron, with their connecting channels. This tract, about 570 miles in length, and 50 to 80 in breadth, is one of the most fruitful on the face of the earth, and capable of supporting a most numerous population. It is reckoned to contain 16,800,000 acres, of which about 7,000,000 have been granted to settlers in free and common soccage; 4,800,000 are reserved for the crown and clergy; but part have been sold to the Canada Company; 5,000,000 remain to be disposed of.

5629. *Upper Canada* is divided into eleven districts, the names and population of which, in 1828, were as follow: — Eastern, 18,165; Ottawa, 3732; Johnston, 17,399; Bathurst, 14,516; Midland, 31,293; Newcastle, 13,337; Home, 22,927; Gore, 15,834; Niagara, 20,177; London, 19,813; Western, 8333. In tracing the details of the country, however, we shall follow the line of the great water communications, which form its most prominent feature.

5630. *The rapids* commence at the Lake St. Francis, and continue to the village of La Chine, about ten miles above Montreal. The river is there confined in narrow, rocky, broken channels, through which it dashes with violence, agitated like the ocean in a storm. For nine miles there is a continued succession of rapids, the most formidable of which are

those called the Cascades (*fig. 916.*), where there is a considerable fall or descent; and the

CASCADES OF THE ST. LAWRENCE.

channel, for two or three miles below, is like a raging sea. Previous to the formation of the canal of La Chine, all ordinary vessels stopped at that village, and discharged their cargoes, which were conveyed by land to Montreal. There are several modes, however, in which the enterprising hardihood of man contrived to leap over (*sauter*, as it is called) these formidable perils.

The Durham boats are very long, very shallow, and almost flat-bottomed, carrying sometimes twenty-five tons. They are pushed through the rapids by poles, ten feet long, pointed with iron, which the crews even fix in the channel, and apply their shoulders to; the sides being guarded by thick planks. They are chiefly navigated by United States' men. The bateaux are smaller, also flat-bottomed, draw less water, taper to a point at each end, and are constructed of such materials as will bear a good deal of hard knocking. They are guided by Canadian voyageurs, who know every channel, rock, and breaker; and this is recommended by Mr. Duncan as the safest conveyance. The La Chine canal now enables the navigator to avoid the dangers of this part of the river; but as similar obstructions occur in other portions of its upper course, the use of the vessels above described is still necessary. The timber rafts are also obliged to shoot the rapids.

5631. *The country along the St. Lawrence* from the Rapids to Lake Ontario is covered with immense and ancient forests, which the labours of the emigrants are beginning to clear. The oaks, judging from their appearance, are from 300 to 600 years old. The soil is a deep mould of decayed vegetables, which is injured by its exuberant richness, so that, of several successive crops, each is better than the preceding; and instances are frequent of twenty-one crops having been drawn from it without any need of manure. Mr. Howison complains that the Scottish occupants of the Glengarry and other settlements on this line have not availed themselves to the utmost of these advantages; that each has cleared from thirty to at most seventy acres; and continues to reside in a poor log-house, with only a single apartment. Prescott, called now Fort Wellington, at the end of the upper sloop navigation, is only a village of forty or fifty houses; but from its situation must greatly improve. Twelve miles farther down is Brokeville, a new neat village, with 500 or 600 inhabitants, named in honour of the late General Broke. The Americans have corresponding towns on the opposite bank; and mortifying remarks are made on the stir and bustle which prevails among them, compared with the apathy which reigns on the British side. Then follows a remarkable feature; the expansion of the river into what is called the Lake of the Thousand Isles. The expression was thought to be a vague exaggeration, till the isles were officially surveyed, and found to amount to 1692. A sail through them presents one of the most singular and romantic successions of scenes that can be imagined. The isles are of every size, form, height, and aspect; woody, verdant, rocky; naked, smiling, barren; and present as numerous a succession of bays, inlets, and channels, as occur in all the rest of the continent put together.

5632. *Lake Ontario*, a much grander expanse, follows immediately after the Lake of the Thousand Isles. This inland sea is in some places of such a depth, that a line of 500 fathoms could not reach the bottom. It is subject to violent storms, and the swell is sometimes as heavy as in the Atlantic. It bears the largest ships of the line, and was in 1813 and 1814 the theatre of all the great operations of naval war. The current is distinctly perceptible which bears this vast body of water along to the eastward, at the rate of about half a mile an hour. Large and commodious steam vessels, one of them 740 tons, ply between the British and American sides. The Canadian shore is covered with similar majestic forests, which, when removed, show equally a rich and luxuriant soil.

5633. *Kingston and York*, at the opposite extremities of Lake Ontario, are the two principal towns in Upper Canada, the latter the official capital, but the former the most important place. This distinction it obtained last war, when it became the chief naval depôt. It lies on or near the north-eastern point of the lake, and has a commodious harbour. The plan is elegant and extensive, and, being well though but partially filled up, makes a pretty little town. The population in 1828 was 3528, and has doubtless increased. The little navy raised here during the late war is laid up, and some of the ships are only in frame, but all in a state to be finished and sent out in a short time. York, near the north-west end of the lake, owes its support to its being the seat of government, and of the courts; and to the extensive settlements recently formed to the north and east of it. It consists of one long street, along the lake, with the beginnings of two or three others parallel to it. The

houses, barracks, and government offices are all neatly and regularly built of wood, and whitewashed. The inhabitants have increased to about 4000.

5634. *The Niagara channel*, about forty miles in length, brings into Ontario the waters of Lake Erie and of all the upper country. On this channel occurs an object the most grand and awful in nature, the Falls of Niagara. The accumulated waters flowing from four mighty lakes and all their tributaries, after being for two miles agitated like a sea by rapids, come to a precipitous rock where they pour down their whole mass in one tremendous plunge of 160 feet high (*fig. 917.*). The noise, tumult, and rapidity of this falling sea, the

FALLS OF NIAGARA.

rolling clouds of foam, the vast volumes of vapour which rise into the air, the brilliancy and variety of the tints, and the beautiful rainbows which span the abyss, the lofty banks, and immense woods, which surround this wonderful scene, have been considered by experienced travellers as eclipsing every similar phenomenon. The noise resembles that caused by the discharge of a thousand pieces of ordnance; and it is heard, and the cloud of vapours seen, at the distance of

thirty or forty miles. The fall on the Canadian side is 600 feet wide, of a semicircular form, that on the American side only 350 feet. The one, called the Crescent or Horse-shoe Fall (*fig. 918.*) descends in a mighty sea-green wave, the other, broken by rocks into foam,

THE HORSE-SHOE FALL.

resembles a sheet of molten silver. Bold travellers have ventured down, amid broken rocks, with the certainty of being drenched to the skin, and with some little danger, to the foot of the fall, and even below it. Others, with still bolder daring, venture out in a skiff, and view it in front at the distance of twenty paces; but, though there is here little or no danger, so awful is the scene, that few can summon the requisite courage. There are now excellent inns on both sides of the falls, which are crowded with visitants. On the Niagara frontier are three villages; one, that of Niagara, with about 1500 inhabitants,

situated not at the falls, but at the mouth of Lake Ontario, with a fort facing another on the American side; Queenston, twelve miles below the falls, which suffered severely during the late war, but is recovering; and Chippewa, the same distance above, containing several neat houses, and at the mouth of a river, the banks of which are covered with excellent timber.

5635. *Lake Erie* is a still grander expanse than Ontario, and its waters are equally clear and transparent. The navigation, however, is by no means so commodious. It is shallow, not averaging a depth of more than fifteen or eighteen fathoms, and at the same time liable to violent storms. Long sunken reefs and precipitous rocky banks occasion dangers, greatly increased by thick mists, which often hide from the mariner all view of his course. Scarcely a summer passes in which some vessels are not lost. Steam packets are best calculated for steering through these perils, and they are accordingly employed to a great extent. There is a number of fine wooded islands on Lake Erie. The country along its northern shore is varied, and on the whole exceedingly fine. Near its eastern extremity it receives the Grand or Ouse River, which is navigable for schooners thirty miles up, and for boats considerably higher. The banks are very fertile and finely wooded, and abound in gypsum, which proves an excellent manure. The next district is that called Long Point, forming a promontory projecting into the lake. It is composed of a light sandy soil, covered, not with thick woods, like the rest of Upper Canada, but only with scattered groves and trees, which render it very beautiful, and are an extreme convenience to the settler, who here finds himself released from the herculean task of hewing down enormous forests. To the west of Long Point is the Talbot settlement, formed, in 1802, by Colouel Talbot, a gentleman of birth and fortune, who devoted himself to the formation of this colony; all the arrangements

of which are still left to him. It extends seventy or eighty miles parallel to the lake, with many branches stretching into the interior. Numerous examples are here afforded of persons who arrived in a state of destitution, and who now possess in abundance all the necessities of life. As we proceed westward, the settled tracts become more thinly scattered, and beyond the river Thames commences the tract called the Long Woods, being forty miles of uninterrupted forest, with only one habitation, an inn, placed in the heart of this wild wilderness. At the end of it, the traveller comes to the lower bank of the Thames falling into Detroit River, which, with the small lake of St. Clair, connects Lake Erie with the northern expanse of Lake Huron. This district is a thickly planted old settlement formed by the French Canadians. It is a delightful tract, in which fruits of every kind grow to a perfection unknown in other parts of Canada. In summer, the country presents a forest of blossoms, which exhale the most delicious odours; the climate is mild and agreeable, and the meanest peasant has his orchard and plenty of cider at his table. This class of settlers, however, attached to old customs, do not seem likely to make the same progress as the enterprising European colonists. Amherstburgh, at the head of Lake Erie, is an agreeable little town of 1000 people, the most westerly of any in Canada.

5636. *Lake Huron* is still larger than Lake Erie, and its greatest extent is from north to south, almost in a pyramidal form, with its base towards the north, from the eastern end of which, however, the large bay of Machaladosh branches off. It is crowded with islands, which stretch along the northern coast in close and successive ranges, and, combined with the storms to which this lake, like the others, is subject, render the navigation peculiarly intricate and dangerous. The northern coast of this lake is not at all settled, nor indeed fully explored; it is reported, as compared with the lower lakes, to have an unfruitful soil, and a cold, humid, and tempestuous climate; but the cutting down of the woods, and a careful culture, after the more tempting lands shall have been exhausted, may probably yield more favourable results. Along its eastern shore there is a great extent of very fruitful territory.

5637. *Lake Superior*, the farthest of this great chain, is of still larger extent, being nearly 400 miles in length. Its northern coasts are rugged and winding, formed of precipitous rocks, often penetrated with deep caves. Major Long, who coasted it, says that no scene can be more dreary than its northern shore: nothing appears on its surface but barren rocks and stunted trees; the climate is cold and inhospitable; game very scarce; fish plentiful, but difficult to take. No one attempts to travel by land, unless in winter, when the rivers are frozen. The coast, however, is picturesque, from the clearness of the water, the bold and varied forms of the rocks, and the numerous cascades. Only half a dozen of Chippewa families were met along its whole course. The North-West Company have a post at Michipicoten, where a good deal of business is done. The climate is extremely severe; potatoes and turnips are the only vegetables which can be raised.

5638. *Nova Scotia* is a large peninsula, on the south of the St. Lawrence, and forming, as it were, a fragment detached from the great mass of the territory of the United States. It is bounded on the north by the bay, or rather narrow straits, separating it from Cape Breton and Prince Edward Islands; on the east and south-east, by the Atlantic; on the west, by the Bay of Fundy, which penetrates so deep as to leave only an isthmus, about nine miles broad, connecting it with New Brunswick. It is about 380 miles long, and from 50 to 100 broad, comprising about 16,000 square miles, or upwards of 9,000,000 acres. The land varies much in respect of fertility. The coast facing the Atlantic, presenting a rocky and barren aspect, conveyed the idea, which was long prevalent, that sterility formed the prevailing character of the soil; but when the interior and the banks of the rivers had been explored, this was found to be very far from being generally the case. Bouchette calculates that of the 9,000,000 acres of which it consists, upwards of 2,000,000 are of the very first quality; about three are good, and only the remaining four inferior or bad. The unoccupied lands were at first disposed of by grant, but they are now, as in Canada, sold annually by auction. About 4,000,000 acres are appropriated, leaving 5,000,000 still to be disposed of. The appropriated part is of course the best; still there are many fine tracts in the interior, hitherto unknown, or to which navigable access has newly been opened. The cultivated land was found, in 1828, to amount to 292,000 acres, producing 153,000 bushels of wheat; 449,000 of other grain; 3,358,000 bushels of potatoes; 163,000 tons of hay. The live stock consisted of 13,000 horses, 110,700 horned cattle, 174,000 sheep, and 72,000 hogs. The population of Nova Scotia, by a census taken in 1827, amounted to 123,808, and has doubtless since that time considerably increased. About one fourth of the number are French Acadians, who live very much by themselves, and are a quiet, good sort of people; a fourth from Scotland; 1200 free negroes; 1500 Indians, who, though more and more closely hemmed in, still adhere to their roaming and hunting habits, and look with contempt on those who cannot live without the fantastic luxuries of bread, houses and woven cloth. They have been converted, however, by the French to the Catholic religion; and, when not drunk, make tolerable subjects. The climate of Nova Scotia is not nearly so bad as is

reported. From December to March the country is one sheet of snow; but this, as in all northern regions, is the period of gaiety, even out of doors. The spring is foggy, but the autumn delightful; and the country is never subject to those pestilential diseases which desolate the more southern parts of America. It has even been found favourable to longevity. In 1828, the exports are said to have amounted to 473,861*l.*; in which were employed 1651 ships, 132,767 tons, and 7304 men and boys. The value of the imports in the same year is stated at 847,530*l.*: ships, 1694; tons, 132,174; men and boys, 7342. We cannot, however, guarantee the above values, though given by Mr. Bouchette as official, for it is not likely that the imports should so greatly exceed the exports; nor do they agree with others which he gives elsewhere respecting the port of Halifax. Fish is the chief article of export; that in 1831 from Halifax is stated at 161,000 quintals of dry, and 53,500 pickled. Timber is the chief article of export to Britain. In 1828, it sent 8,800,000 feet of hard wood, pine, and spruce, and about 33,000 tons ditto; with 1320 masts, &c. The exports to the neighbouring states and the West Indies consist of timber, provisions, butter, coal of fine quality, gypsum, and freestone, of which there are large depositories. The General Mining Association of London have lately invested 130,000*l.* in the mines of Nova Scotia. The administration is vested in a governor, council, and house of assembly. The revenue in 1828 amounted to 55,176*l.*, of which 35,000*l.* was from excise, and 18,000*l.* from customs. The expenditure was 59,700*l.*, of which 30,000*l.* was spent on roads, and 3300*l.* on education. There is a college at Windsor, on a very respectable footing, and another, called Dalhousie College, has been built at Halifax, but is not yet in operation; and it is regretted that the money appropriated to this institution should not have been rather employed in making the other more complete. There are also numerous schools, partly supported by government, for the education of the lower ranks. The means of religious instruction are large, though without any regular establishment. There are ten or twelve catholic clergymen; twenty-eight of the church of England; twenty-five presbyterian; twenty-five methodists, and numerous baptists.

5639. *Nova Scotia* may be divided into three grand portions: — 1. The eastern coast, which extends for more than 300 miles along the Atlantic. 2. The coasts of the Gulf of St. Lawrence, or more strictly the narrow straits, on the opposite side of which are the islands of Prince Edward and Cape Breton. 3. The shores of the Bay of Fundy. About the centre of the eastern coast is Halifax, enjoying one of the noblest harbours in the world, originally called Chebucto, on a bay sixteen miles long, which will contain any number of shipping of any size. It was founded in 1749, by General Cornwallis, and has since carried on almost all the trade of the country. During the impulse given by the last war, the population had risen to 12,000, but has since sunk to 9000. The most extensive dock-yard in British America has been formed here. The society consists chiefly of military officers and merchants. There is on this coast a succession of fine harbours, of which twelve are capable of admitting ships of the line. Lunenburg, chief of the German settlements, contains a population amounting to nearly half that of Halifax, with which it plies a brisk trade. Liverpool also carries on a considerable traffic; but Shelburne, which, at the end of the American war, was the largest place in Nova Scotia, has sunk into a mere village. The northern coast has Pictou, from which, and the neighbouring bays on this coast, is shipped the largest quantity of timber and coal. On a river falling into the Bay of Fundy is Annapolis, the original French capital; but, since the transference of the seat of government to Halifax, it has sunk into a very secondary place. The trade of this great bay is now chiefly carried on from Yarmouth at its mouth; the population of which, since 1791, has risen from 1300 to 4500. Gypsum is the principal export.

5640. *Cape Breton* is a large island, separated from Nova Scotia only by narrow and winding channels, called St. George's Gulf and the Gut of Canseau, a great part of which is not more than a mile broad. The island is about 100 miles in length, and 80 in breadth, containing an area of about 2,000,000 acres. It is penetrated by an arm of the sea, called the Bras d'Or, which divides it nearly into two equal portions, and is throughout navigable. The surface is diversified by hills, none of which rise above 1500 feet; and the soil is fully equal to that of the neighbouring countries. The land granted in 1821 amounted to 685,000 acres; and, allowing for hills, swamps, and barrens, there are supposed to be about 500,000 acres still to be disposed of. Only the coasts, including those of the Bras d'Or, have yet been cultivated; and the population in general is in a less improved state than in the other colonies; part of them, according to Mr. M'Gregor, having almost the character of bandits. The climate resembles that of the neighbouring countries in the intensity of the cold in winter and of the heat in summer; but these follow more irregularly, and a fortnight's thaw occurs often in the midst of frost and snow. Yet these variations are not disadvantageous to agriculture, which, however, is still in its infancy, the valuable cod-fishery attracting the chief industry of the people. Cape Breton, therefore, imports wheat flour, though it affords a small surplus of oats and potatoes. The exports, in 1828, consisted of 41,000 quintals of dry, and 18,000 barrels of pickled fish. About fifty vessels, averaging fifty tons each, are annually built. There are coal mines of great value, granted to the late Duke of York, and leased by him to Rundell and Bridge of London, who are beginning to work them. Cape Breton has excellent harbours, and commands, in a great measure, the navigation of the St. Lawrence. Of the population, exceeding 20,000, the most numerous portion consists of Scottish highlanders, and next to them of Acadians. The island was, in 1820, politically united to Nova Scotia, and sends two members to the house of assembly. A revenue of about 5000*l.* is raised by a tax of a shilling a gallon on spirits. Louisburg, which the French carefully fortified, and made one of the principal stations in their "New

France," is now entirely deserted, and Sydney, a village of 500 inhabitants, is all the capital which Cape Breton can boast.

5641. *New Brunswick* is a large country to the north-west of Nova Scotia, from which it is separated by the Bay of Fundy. It has on the east a winding coast along the St. Lawrence, on the north, part of Lower Canada; on the south-west, the territory of the United States. It is estimated to contain 27,700 square miles, or 17,700,000 acres. The western part is diversified by bold eminences, though Mars Hill, the highest, does not exceed 2000 feet. From these heights flow fine rivers, of which St. John's has a course of about 500 miles, for nearly half of which it is navigable. The soil is believed to be generally fertile; and grain, where tried, has prospered; but agriculture has not, on the whole, made such progress as to render New Brunswick independent of foreign supply. This great country is still almost one unbroken magnificent forest; and under the extraordinary encouragement afforded by Britain, almost all the energies of the inhabitants are directed to the timber trade. This trade is conducted by a class of men called *lumberers*, who carry it on during the depth of winter, in the heart of these immense woods, sheltering themselves in log-huts, four or five feet high, with a large fire in the middle, round which they all sleep. In spring, when the ice melts, and all the river channels are filled, they load the timber in vessels, or form it into rafts, during which operations they suffer much from cold and wet. Having brought the produce of their winter's labour down to the ports, they obtain a liberal remuneration, which in the course of a few months is squandered, usually in empty show and reckless indulgence. In the year 1824, the timber trade seemed to be at the height of prosperity. The exports, amounting to 320,000 tons of wood, and including sixty newly built ships, were valued at above 600,000*l*. The merchants obtained advances and drew bills on England, with the view of enlarging their transactions, when they were struck by a terrible blow. The price of timber fell one half, and became scarcely sufficient to defray the expense of conveyance; the bills of the most respectable houses were dishonoured, and many were totally ruined. The country, however, has gradually recovered from this shock; and in 1829 the exports were stated at 346,000*l*., and the imports at 483,000*l*. The revenue, derived chiefly from duties on imports, amounted in 1829 to 34,700*l*., and rose in 1830 to 49,000*l*. The population, by a census in 1824, was 72,900, and is supposed to have now reached 93,000. A "New Brunswick Land Company" has been formed, on the plan of the Canada Company, with a view to promote agricultural settlement, and thus establish the prosperity of the country on a more solid basis than the timber trade. The government is similar to that of Canada.

5642. *The towns* are built almost entirely at the mouths of the rivers, and supported by the trade brought down their streams. The only exception is in Fredericton, the seat of government, which has been established eighty-five miles up the St. John; and that river being still navigable for vessels of fifty tons, makes it the seat of a great inland trade. It is a small town of 1800 inhabitants; rather regularly built of wooden houses, with government offices, several churches, and a college. St. John's, on a fine harbour at the mouth of the river, possesses much greater importance, and contains about 8000 people. It is built on a rugged and rocky spot, which renders the passages, especially between the upper and lower town, steep and inconvenient; but much has been done to remedy this defect. The exports from St. John's, in 1829, amounted to 210,000*l*., being nearly two thirds of the amount from all the other ports. St. Andrew's, at the head of the bay of Passamaquoddy, besides its timber trade, has a considerable fishery, and is supposed to contain about 5000 inhabitants. The river of Miramichi is distinguished by the extensive forests on its banks, whence large shipments of timber are made at the port of that name as well as those of Chatham, Douglas, and Newcastle; yet they are all only villages. This tract of country suffered dreadfully in October, 1825, by one of the most dreadful conflagrations on record. The flames, kindled by accident at several points, were impelled by a violent wind, and fed always with new fuel till they spread over about a hundred miles of territory, involving it in smoke and flame, and reducing to ashes the towns of Douglas and Newcastle. Nearly 200 persons are said to have perished, and more than 2000 to have been reduced to entire destitution. The natural advantages of the country, however, have enabled it to recover with surprising rapidity.

5643. *Prince Edward*, called formerly St. John's, is a fine island, extending to the westward of Cape Breton, and, like it, parallel to the coast of Nova Scotia, from which it is separated, however, by a channel ten or fifteen miles wide. It is about 135 miles long, and 34 broad, but the circuit is very irregular, and deeply indented by bays. The island comprises about 1,400,000 acres; and the surface, compared with that of the surrounding countries, is level, varied only by gentle undulations. Protected, perhaps, by their high lands, it has shorter winters, is exempt from those extremes of heat and cold, and those heavy fogs, which render them often so gloomy. This island, notwithstanding its advantages, was neglected by the French, who bestowed all their attention on Cape Breton, as a naval station. In 1768 it contained only 150 families. It then, however, attracted particular attention, and a number of disbanded troops, particularly Highlanders, were settled upon it. The Duke of Kent, at the end of the century, spent some time there, and made great exertions for its improvement; so that, in honour of him, the name was changed from St. John's to Prince Edward Island. Some years after, Lord Selkirk conducted thither a large colony of Highland emigrants. The population in 1826 had risen to 28,700, and is supposed to have considerably increased. The larger proportion consists of Highlanders, who retain still all their native characteristics; their patriotism, hospitality, and capacity of dispensing with little refinements and comforts. The Acadians rank next in number; and a good many respectable farmers have recently resorted thither from Yorkshire and the low-

lands of Scotland. The attention of the inhabitants, as in the neighbouring countries, has been, perhaps, too much attracted by the fishery and the trade in timber; but, the latter being nearly exhausted, agriculture is now more regarded. The soil is light and easily worked, well calculated for wheat and oats, of which it affords a surplus. The horses and cattle are small, but active and useful, though many of them are allowed to run almost wild. Prince Edward has a constitution similar to that of the other colonies. Its revenue in 1826 amounted to 5400*l*.

5644. *Newfoundland* is a large island, 420 miles long and 300 broad, situated at the mouth of the Gulf of St. Lawrence, and forming the most eastern part of North America. The land is by no means so highly favoured by nature as the parts of British America already described: its aspect is rugged and uninviting; and, instead of those noble forests, with which they are clothed, it presents only stunted trees and shrubs. Some tracts, however, are supposed to be well fitted for pasturage. But the prosperity of Newfoundland has hitherto been derived exclusively from the cod fishery on its shores, the banks there being much more productive than in any other known part of the world. So early was its value discovered, that in 1517, not twenty years after the first voyage, upwards of fifty vessels of different nations were found employed in the fishery. The British soon took the most active part, and formed colonies on the island. Their sovereignty was recognised by the treaty of Utrecht, which reserved, however, to the French the right of fishing on the banks. This was confirmed in 1763, when the small islands of St. Pierre and Miquelon were allowed to them for drying their fish. On the revolt of the New Englanders, Britain endeavoured to exclude them from the fishery; but as they were able to withhold provisions and other articles, without which it could not be carried on, this attempt was not persisted in. The Americans are now allowed to take fish at any three miles from the shore, and to dry them on any of the neighbouring coasts unoccupied by Britain; and with these immunities they carry on a most extensive fishery.

5645. *The British fishery* is chiefly conducted from stages or platforms erected along the shore, from each of which, at the dawn of day, issue forth several boats, having each from two to four men on board, who continue fishing till they have filled their bark, then repair and deposit their cargo on the platform, and set out to seek for another. The fish, before they become marketable, must pass through various hands. Along one table are seated the cut-throat, the header, and the splitter. The first functionary with a knife rips open the fish, nearly severing the head, then hands it to the header, who clears away the head, entrails, and liver, throwing the latter into a cask, to be distilled into oil. The splitter then divides the cod, taking out the back-bone. With such celerity are these operations performed, that ten fish are often split in a minute and a half. The salter then piles them in heaps, with layers of salt between each, in which state they remain for a few days, when they are washed and spread out in the sun to dry. There are three qualities of cod fish: the merchantable, which are the very best; the Madeira, little inferior, for exportation to Spain and Portugal; the West India, an inferior description, which are sent to the islands for the purpose of feeding the negroes.

5646. *Newfoundland, by the census of 1829*, contained 60,000 inhabitants, almost entirely fishermen, scattered over sixty or seventy stations on the eastern and southern shores. The government of this island is admitted, by persons least prone to discontent, to have been very imperfect, justice being long administered by what were called surrogate courts, composed usually of captains and lieutenants of his majesty's navy, who, however well-intentioned and able in their profession, could not be supposed qualified for so delicate a function. The recent substitute of a chief justice and two assistants, who go on circuit, is complained of as very expensive. Newfoundland has never received, like the other colonies, the benefit of a representative system; for the exercise of which its fluctuating and irregular population have been considered unfit. A demand for this privilege, however, has recently arisen, which will probably be soon gratified.

5647. *St. John's*, the only place on the island which can be called a town, is little more than a large fishing station, the whole shore being lined with wharfs and stages. The harbour, formed of lofty perpendicular rocks, is safe, though the entrance requires caution. The place is defended by several fortresses, one of which, Fort Townsend, is the residence of the governor. The houses are ranged irregularly along one long street, with lanes branching from it: they are built mostly of wood. This construction exposed the town, in 1815, to a series of four dreadful conflagrations, in one of which 140 houses, and property to the value of 500,000*l*. are supposed to have been destroyed. The population varies much according to the season of the year; Mr. Bouchette estimates its stationary amount at about 11,000.

CHAP. III.

THE UNITED STATES.

5648. *The United States* of North America possess a territory of vast extent, including the larger part of what is valuable and productive in this part of the continent. They form also by much the greatest and most influential power that exists in the New World.

SECT. I. *General Outline and Aspect.*

5649. *The extent of the United States* has been calculated upon two different principles. They have been viewed as including only the territory actually occupied, peopled, and divided into states which send representatives to the general congress. On the other hand, their dominion has been made to comprehend a still more vast additional region, stretching far to the westward, over which the American Union claims a right, and according to every appearance will actually possess the power to occupy and settle it in proportion as she is enabled to do so by her increasing population.

5650. *The United States territory*, under the first view, is bounded on the south by the Gulf of Mexico; on the east by the Atlantic Ocean; on the north it is separated from Canada by the St. Lawrence, and a line drawn through the centre of the great lakes. Thirty years ago, it had for its western boundary the long chain of the Alleghany mountains, but since that time a constant tide of emigration has poured across them, and has extended the limit to the great line of the river Mississippi; settlements have even been established beyond it. The form of this vast space, Mr. Warden conceives, may be represented by a cone stretching from south-west to north-east, about 1700 miles in length, and 650 in breadth. Its area is calculated at about 1,000,000 square miles, or 640,000,000 acres. Of this, about 51,000,000 are calculated to consist of water, and a large part is also covered by the broad surface of the Alleghany.

5651. *The division*, founded on the probably effective claims of the United States, has the same southern, and also the same northern boundary, which is prolonged in the line of the Red River. But the western boundary is that vast and long chain traversing the whole continent south and north, and known by the name of the Rocky Mountains. Their missions have even passed these mountains, and surveyed and named a portion of the territory between them and the Pacific; but as this tract is separated by so strong a barrier, and is pressed by Mexico on one side and by Russia on the other, future circumstances must determine how far the claim to it can be established. In the mean time, America can have little reason to complain, if, to this her prospective empire, we assign the Rocky Mountains as a provisional boundary. The United States territory, in this larger sense, will have nearly the same length from north to south. But its line from east to west will be fully 2000 miles; and the entire area will be somewhat more than doubled.

5652. *By another division*, founded on natural features, the eastern territory, between the Atlantic and the Alleghany, is distinguished from the western territory between the Alleghany and the Rocky Mountains. The former does not comprise above a fifth part of the whole, and is inferior also in natural fertility. But having been long cultivated and settled, it comprises the greater part of what America yet possesses of population, wealth, and culture. The other has only one characteristic, but certainly a most remarkable, feature, the vastness of its level surface. It embraces the immense basin of the Mississippi and the Missouri, the largest plain in the world except that watered by the Amazons. Its tracts of fertile land, with its great and numerous navigable rivers terminating in one main trunk, open to it prospects, by no means remote, of opulence and populousness, the extent of which it is difficult to calculate.

5653. *The mountains* of this territory consist almost entirely of the two long parallel chains already mentioned, which are more distinguished by their extent than their elevation. The Alleghany, called also the Apalachian or endless mountains, form the original unbroken western boundary of the states. Their average height is from 2000 to 3000 feet, and they seldom exceed 4000 feet, though at the single point of Mount Washington, in New Hampshire, they rise to 6600. This height, too, is above the Atlantic, whence the base gradually rises to 1400 or 1500 feet; so that the apparent elevation is by no means striking. The Alleghanies, however, to the breadth of 110 to 150 miles, extend to three, four, or five successive ridges, divided by deep and fertile valleys. The Rocky Mountains are more vast in every dimension. The loftiest peak yet discovered, which is seen at the distance of 100 miles, and whose summit is covered with perpetual snow, was measured by Major Long, and found to be 8507 feet above the level of the plain, which being calculated at 3000 feet, would give 11,500 above the sea. The average is not, probably, quite half that elevation, or more than double the Alleghanies. The chain is very broad, in some places not less than 300 miles; but it is crossed by deep and fertile valleys, which afford commodious passes.

5654. *The rivers* of the United States form a grand and most important feature. Those in the Eastern states, indeed, rising all from the chain of the Alleghany, at only a moderate distance from the sea, cannot, even by a winding course, attain any great length. Those in the north, however, form deep bays, and from the level nature of the country are navigable to a great height. The Hudson is navigable for vessels of 80 tons 160 miles, and presents, perhaps, the busiest scene of river navigation in the world. The Delaware, forming the bay of that name, the Susquehannah, the Potowmac, and the Roanoke, terminating in Albemarle Sound, all contribute the greatest benefits to navigation. To the

southward the mountains receding into the interior, allow to the Catahouche and the Alabama an extent of about 400 miles before they reach the Gulf of Mexico.

5655. *But the system of rivers in the grand western basin reaching from the Alleghanies to the Rocky Mountains, has only one equal throughout the world in extent, and none in the benefits likely to be derived from it as a medium of commercial intercourse.* The main trunk consists of the Mississippi, which rises in some small lakes about latitude 47° north, and flows almost due south across 18 degrees of latitude, through a course of 2000 miles, to the Gulf of Mexico. About half way, however, from its source it receives the Missouri, a river much greater than itself, and which ought clearly to be considered as the main stream; for our capricious nomenclature cannot alter the relations of nature. The Missouri, from its source to the junction, has a course of 2300 miles; while the distance from its conflux with the Mississippi to the mouth of that river is 1000 miles; so that we have here a continuous river course of about 3300 miles, which may be presumed nearly equal to that of the Amazons, its only rival. The Mississippi, however, from its straight central course, is always considered as the line to which the numerous tributaries on both sides are to be referred. These tributaries, though inferior to itself, rival the greatest streams of the European continent. From the east it receives the Illinois, after a course of 460 miles; the Ohio (1188), with its tributaries, the Wabash, 1028; the Cumberland, or Shawannee, 1118; the Kentucky, 627; the Tennessee, 1131. The extended valleys through which these great rivers flow form, perhaps, the most fertile region of the globe, and already begin to be covered with luxuriant harvests. From the west, above the Missouri, come St. Peter's and Moingona, each 450 miles long, and both navigable. The Missouri itself then enters, after receiving the Keheetsa, or Yellowstone, nearly 2000 miles long; the Platte, also about 2000 miles; the Chayenne, 800; the Kansas, 1500; the Grand River, 600; the Great Osage, the Little Missouri, and the Great Sioux. Below the junction, the Mississippi receives the White River, 700 miles; the Arkansas, 2173; Red River, 1450. The most important circumstance is, that all the rivers of this grand system are navigable almost to their source. The Mississippi itself is navigable to the Falls of St. Anthony, upwards of 1500 miles from its mouth, and vessels of 300 tons can ascend 400 miles. The Mississippi, which is clear in its higher course, after its junction with the Missouri, and still more with the Arkansas and Red River, becomes, according to Mr. Stuart, the most turbid river known, with the widest alluvial bottom, and beyond all comparison the narrowest channel that carries so much water. It is broader above the junction, with only a tenth of the water, than at New Orleans. The navigation is dangerous, not only from the instability of the banks, and the impetuosity of the current, but from the numerous trunks of trees floated down, which, attaching themselves to the bottom, form islands, sometimes above and sometimes below water, to avoid striking on which requires the utmost skill of the navigator. The Missouri is also navigable, though with some impediments, while the Ohio, and generally all the other rivers, are navigable for boats, at least nearly to their source. It has, therefore, been calculated, that there exists in this region an inland navigation of 23,000 miles, having an outlet, by the Mississippi, into the Gulf of Mexico, and by canals, recently formed, to the Hudson and the Atlantic. The entire extent of what is called the basin of this great system of rivers, or of the countries which they water, is estimated by Mr. Darby at 1,099,000 square miles.

5656. *In regard to lakes*, the United States have a share in the greatest lake-chain in the world, that of the Superior, Huron, Erie, and Ontario. These, however, though the boundary line passes through their centre, belong more strictly to Canada, the masters of which possess the navigation of the St. Lawrence, their connecting stream. Michigan, however, 262 miles long, and 55 broad, is entirely included within the United States' territory; but their greatest benefit is derived from Lake Erie, which has been made the central point, uniting their eastern with their western waters.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5657. *This region* presents extensive tracts composed of primitive, transition, secondary, tertiary, and alluvial formations; but hitherto no undoubtedly volcanic rocks have been detected.

5658. (1.) *Primitive rocks.* The primitive formations extend from N. E. to S. W., through nearly the whole territory of the United States. Eastward of the Hudson, the rocks are, with few exceptions, principally primitive, and have the Atlantic for their eastern boundary. The apparent breadth of this primitive tract is much diminished in the middle states; but in the southern states it is again enlarged. From the Hudson to the Tombeckbee, its visible boundary on the south-east, is, with a very few exceptions, a vast alluvial tract. Its north-western boundary, after crossing the parallel of 45° N. lat., runs nearly fifteen to twenty miles east of Lake Champlain, twelve miles east of Middleburg, and a little westward of Bennington in Vermont, twelve to fifteen miles east of Hudson, and twelve miles south-east of Poughkeepsie in New York; it then bends to the south-west, crosses the Hudson, passes near Sparta, and ten or fifteen miles east of Easton on the Delaware, terminating in a point a few miles north of Bethlehem; it again appears fifteen miles west from Trenton in New Jersey, runs about fifteen miles west of Philadelphia, ten miles west of York, and, passing about twenty-two miles west of Washington, joins the Blue ridge, along which it continues to Magothy Gap; and thence passes in a south-westerly direction, till it meets the alluvial deposit near the river Alabama. Primitive rocks also appear westward of Lake Champlain, and have for their general boundaries, Lakes Champlain and George, on the east, the St. Lawrence on the north-west, and a line drawn from the Thousand Islands in the St. Lawrence, passing near the Mohawk, and terminating at Lake George, on the south-west.

5659. *The strata of this primitive region* vary in direction from N. and S. to N. E. and S. W.; they very generally, it is maintained, incline or dip to the S. E. at a greater angle than 45° , and are not unfrequently vertical. Within the limits already assigned to the primitive rocks are found several transition and secondary deposits, of comparatively small extent, resting upon the primitive: thus transition rocks extend from Rhode Island to Boston. They again appear on the S. W. side of the Delaware, and extend to the upper branches of the Yadkin in North Carolina, forming a narrow tract of great length, and varying in breadth from two to fifteen miles. Secondary rocks extend from Newhaven to Northfield in Massachusetts, lying principally on the western side of Connecticut river. They appear again S. W. of the Hudson; at the Delaware their breadth is much diminished; they pass a few miles west of York in Pennsylvania, and, crossing the transition rocks already mentioned near the Potowmac, they terminate a little south-west of the Rappahannock. A coal formation, composed of secondary rocks, is also found a little west of Richmond in Virginia.

5660. *One of the most remarkable circumstances*, says Professor Cleaveland, connected with these primitive rocks, is the *granite ridge*, which forms the boundary between the primitive and the alluvial regions. This granite ridge appears to have been the ancient line of the sea coast in the southern and middle states, and very probably through Connecticut. It commences at least as far south as Georgia; and its general direction is from S. W. to N. E., sometimes varying to almost north and south, or east and west. The Roanoke crosses it near Halifax; James River at Richmond; the Rappahannock at Fredericksburg; the Potowmac at Georgetown; and the Petapsco between ten and fifteen miles from its influx into Chesapeake Bay. It sometimes disappears under the soil; but at the point where it crosses the Susquehanna it rises to a greater height, and is more rugged than usual. At Trenton it meets the Delaware. After crossing York Island, this granite ridge extends along the north shore of Long Island, dips under the passage between that island and Fisher's Island, which it crosses, and, again dipping under the passage between Fisher's Island and the continent, appears once more at Watch Hill Reef, not far below Stonington in Connecticut.

5661. (2.) *Transition rocks.* The greater part of the transition rocks found in the United States, according to Maclure and Cleaveland, lie N. W. of the primitive, and form a long and narrow zone, extending from a little N. E. of the Hudson nearly to the river Alabama. The breadth of the zone is from 20 to 100 miles. The strata generally dip to the

N.W. ; and their inclination, or dip, in most places, is less than 45° . The transition rocks, on their north-western border, are often in contact with secondary rocks, the latter appearing in the valleys, and the former in the surrounding mountains. Among these rocks are found limestone of various colours, greywacke, greywacke slate, flinty slate, and various conglomerates. These rocks are traversed and overlaid by various trap rocks.

5662. (3.) *Secondary rocks.* The great secondary deposit lies north-west of the transition rocks, extending from them to the lakes, and from the Hudson to the westward of the Mississippi. This deposit is equally remarkable both for the extent and uniformity of the formations which it embraces, and which consist of limestone and sandstone in strata often nearly horizontal, and on which rests the great black coal formation. According to Maclure, there is reason to believe that this secondary deposit extends westward of the Mississippi nearly to the foot of the Stony Mountains ; thus presenting an area whose diameter from east to west is about 1500 miles, and from north to south about 1200 miles. He further conjectures that all this extent of secondary rocks was once the bottom of a great lake or sea ; that the waters of the lake have been gradually discharged by the Mississippi, the Hudson, and the St. Lawrence, the only rivers that have completely broken through the mountains which once surrounded this immense basin of water.

5663. (4.) *Tertiary rocks.* Although considerable deposits of this class of rocks are met with, no accurate account of them has been published.

5664. (5.) *Alluvial deposits.* These cover vast tracts of country in the United States ; of these the most considerable is that which is interposed between the Atlantic shore and the Alleghany mountains. The northern extremity of this deposit is at Long Island, all of which appears covered with alluvium, except the margin of the shore at Hurlgate, where primitive strata appear for the distance of four or five miles. On the east and south-east this alluvium is bounded by the Atlantic, and on the south by the Gulf of Mexico to the Mississippi. Its north-western or interior boundary, commencing a little below Newark, runs north of Amboy to the Raritan, and thence passes near Trenton, Philadelphia, Baltimore, Washington, Fredericksburg, Richmond, Petersburg, a little west of Halifax, Smithfield, and Averysborough in North Carolina, and Camden in South Carolina, near Columbia, Augusta on the Savannah, and thence bending to the west, it crosses the Ogeechee, Oakmulgee, Alabama, and Tombeckbee rivers, and reaches the Mississippi near Natchez. The height of this deposit above the level of the sea gradually diminishes in passing from Georgia to New York. From the Mississippi to the Roanoke, the tide does not reach the north-western boundary of this alluvium ; but from the Roanoke to the Delaware, it enters the primitive range. This widely extended deposit has not been minutely examined in many points, and in no one to a very great depth. Through its whole extent there is very little which deserves the name of rock, and in those quarters where rocky strata occur, it has not been proved that these are not tertiary. In Maryland, about fifteen miles south from the *granitic ridge*, or border of the primitive, is a bed of *sandstone*, whose direction is parallel to the ridge. In North Carolina, also, a bed of limestone and shells commences about twenty or thirty miles from the border of the primitive, to which it runs parallel through South Carolina, Georgia, &c. In some points, as in Georgia, is a variety of *buhrstone* ; a fact illustrative of the probable tertiary nature of these various beds of limestone and sandstone. The great mass of this alluvial deposit is composed of sand, gravel, pebbles, and clay, the last of which, either white or variously coloured, sometimes forms extensive beds. These beds of sand, either brown and ferruginous, or white and pure, often appear waved ; and sometimes, especially in their upper part, contain extensive beds of pebbles of quartz. Sometimes also the gravel or sand is converted into a kind of ferruginous conglomerate or sandstone. This deposit also contains numerous and valuable beds of clay ironstone ; and sometimes also iron pyrites. Beds of shells, teeth and bones of sharks, whales, birds, &c., and remains of vegetables, are found in various parts of this alluvial deposit, sometimes at a depth of nearly 100 feet. Beds of marl derived from shells also occur. When this alluvial deposit is composed of fine sand, and without any incumbent soil, very important changes are often produced by the action of wind. Thus, at Cape Henry, in Virginia, hills are formed, and trees buried beneath the sand, which is gradually transported by the wind.

5665. *Gems, and ornamental minerals.* — *Coal.* — *Saline minerals ; — and metals and ores.* — I. *Gems, and ornamental minerals.* The United States are rich in the more precious and beautiful minerals. Of these the following may be noticed ; a complete account being incompatible with our limited space : — 1. *Zircon and hyacinth* are met with in North Carolina, Maryland, Pennsylvania, New Jersey, New York, and Connecticut. — 2. *Opalescent felspar*, or *adularia*, in New York, near Champlain. — 3. *Beryl* : next to Asiatic Russia, the United States is the country that affords the most magnificent masses and crystals of this gem. The following general localities may be mentioned : — Maryland, Pennsylvania, New York, Massachusetts, New Hampshire, Maine. — 4. *Garnet.* The precious garnet is met with in Pennsylvania, and other parts in the United States. — 5. *Chrysoberyl* is met with at Had-

dam, in Connecticut. — 6. *Corundum*. This mineral, which is impure or imperfectly crystallised sapphire, is found in South Carolina and Connecticut; and sapphire in Newton township, Sussex county, New Jersey. — 7. *Tourmaline* of beautiful colours in Massachusetts, Maryland, Pennsylvania, New York, Vermont, Maine. — 8. *Rock crystal*, in Arkansas territory, Virginia, South Carolina, Maryland, Pennsylvania, New York, Vermont, Massachusetts, &c. — 9. *Calcedony*, in Missouri, Indiana, Ohio, Maryland, Pennsylvania, New Jersey, Connecticut, and Massachusetts. — 10. *Opal*, in Pennsylvania. — 11. *Agate and jasper*, in Missouri, Virginia, Maryland, New Jersey, New York, Connecticut, Massachusetts, New Hampshire, and Maine. — 12. *Asbestos and serpentine*, in Maryland, New Jersey, New York, Connecticut, Massachusetts, and Vermont. — 13. *Marbles*. *White marble*, in Maryland, Pennsylvania, New Jersey, New York, Connecticut, Rhode Island, Vermont, Massachusetts, and Maine. *Variegated marble*, in Maryland, Potowmac, Pennsylvania, New York, Connecticut, Vermont, Rhode Island, Massachusetts, and Maine. *Flexible marble*. This is found in Vermont, Rutland county, and in Massachusetts. — 14. *Calcareous spar*. Of this interesting mineral many varieties occur in the different states of the Union. — 15. *Fluor spar*. This beautiful mineral is found in Tennessee, Virginia, Illinois, Maryland, New Jersey, New York, Connecticut, Vermont, Massachusetts, and New Hampshire.

5666. II. *Coal*. There are said to be four coal formations in the United States: — 1. The true glance coal, or anthracite, found in the transition clay slate. 2. Coal destitute of bitumen, usually called anthracite, but differing from the anthracite found in clay slate. It occurs in a slate rock, said to be in America the lowest of the lower secondary series of rocks; and is conjectured to correspond to the great coal formation of Britain. 3. The proper bituminous coal is at Tioga, Lycoming, &c. This coal is contained in a slate rock, within the lowest of the series of upper secondary rocks. 4. The fourth formation is that which includes the brown coal, or lignite, which is found in a very extensive deposit in the state of New Jersey, along the south shore of the Bay of Amboy; also in Maryland and Massachusetts. *Peat*, the newest of the coals, is found in many parts of the United States, particularly in the states of Ohio, New Jersey, New York, and Massachusetts. The coal at present most extensively mined and used for domestic purposes and for the arts is the glance coal, or anthracite. The following are some of the most important localities of United States coal, including glance coal and black bituminous coal, viz.: — Missouri, Tennessee, Kentucky, Indiana, Ohio, Pennsylvania, New Jersey, Connecticut, and Massachusetts.

6567. III. *Saline minerals*. The principal saline minerals of the United States are saltpetre, or nitrate of potash, and common salt, or muriate of soda. — 1. *Saltpetre* occurs in Georgia in a great cavern; one bushel of the earth of which, containing both the nitrates of potash and lime, yields from three to ten pounds weight of pure nitre, which sells at about 16 cents a pound. The nitrate of lime is decomposed by wood-ashes. In Kentucky, limestone caverns abound, and furnish large quantities of nitre. One of these caves is 646 yards in length; its breadth 40 feet, and its average height 10 feet. One bushel of the earth of this cave commonly yields from one to two pounds of nitre. Kentucky also affords native nitre under a very different form, and constituting what is there called *rock ore*, which is, in fact, sandstone richly impregnated with saltpetre. These sandstones rest on limestone, and sometimes present a front from 60 to 100 feet high. When broken into small fragments, and thrown into boiling water, the stone soon falls into sand, one bushel of which, by lixiviation and crystallisation, frequently yields ten pounds, and sometimes more than twenty pounds, of nitre. The nitre obtained from these rocks contains little or no nitrate of lime, and is said to be superior for the manufacture of gunpowder to that extracted from the earths already mentioned. Masses of native nitre nearly pure, and weighing several pounds, are sometimes found in the fissures of these sandstones, or among detached fragments. Indeed, it is said that these masses of native nitre sometimes weigh several hundred pounds. — 2. *Common salt, or muriate of soda*. In the United States, salt springs are numerous in several districts. These springs sometimes flow naturally, but are more frequently formed by sinking wells in those places where this salt is known to exist, as in salt marshes, and in *salt licks*, so named from having formerly been the resort of wild animals to *lick* the clay impregnated with salt. Salt springs and wells occur in the Arkansas territory, Virginia, Kentucky, Illinois, Ohio, Pennsylvania, New York, &c. When Cleaveland published the second edition of his excellent Mineralogy, in 1822, the whole quantity of salt annually extracted from saline springs in the United States exceeded 1,200,000 bushels; and of this the springs of New York furnished more than 700,000 bushels.

5668. IV. *Metals and ores*. — 1. *Native gold*. The principal gold district in the United States is in North Carolina. There the gold occurs in veins traversing granite and primitive greenstone, or, according to some, in talcose slate; and as an ingredient in the alluvial spots of ground in the ranges of the greenstone formation. The gold workings in Carolina are much richer than the alluvial mines in Brazil. According to Mr. Ayres, one mass of gold weighing twenty-eight pounds was met with. In the year 1810, upwards of 1341 ounces of this gold, equal in value to 24,689 dollars, had been received at the mint of the United States. — 2. *Native silver, and ores of silver*. Small quantities of these minerals have

been found in the United States, as in New Jersey, New York, New Hampshire, and Connecticut. — 3. *Ores of mercury*. In the Michigan territory and Ohio, more particularly on the shores of Lakes Michigan, Huron, St. Clair, Detroit River, and Lake Erie to the mouth of Vermilion River. It occurs in the soil in the form of black and red sand, but is usually more abundant in banks of fine ferruginous clay. Near the mouth of Vermont River it is in the form of a very fine red powder, or in grains and small masses, disseminated in clay. It yields by distillation about sixty per cent. of mercury. — 4. *Copper*. Masses and grains of pure or native copper are found in different parts of the United States, as in the Illinois, in the North-west Territory (where, about thirty miles south from Lake Superior, on the west bank of the river Ontonagon, was found a very large mass of native copper, weighing by estimation about 2200 lbs.), Virginia, Maryland, Pennsylvania, New Jersey, and Connecticut. Various *sulphurets of copper*, as yellow, grey, and black, are met with in the Union; in Maryland, Pennsylvania, New York, Connecticut, Massachusetts, and Maine. The *red oxide of copper*, or *red copper ore*, is found in Virginia, Pennsylvania, New Jersey, and Connecticut. The *blue carbonate of copper*, in Pennsylvania and New Jersey; and the *green carbonate of copper*, or *green malachite*, in Maryland, Pennsylvania, New Jersey, and Massachusetts. — 5. *Iron*. *Meteoric iron* has been met with in Louisiana. A remarkable mass, in the possession of Colonel Gibbs, is three feet four inches long, and two feet four inches broad, and weighs fully 3000 lbs. *Iron pyrites*, or *sulphuret of iron*, occurs every where throughout the United States. *Black iron ore*, or *magnetic iron ore*, a very important ore of iron, occurs in Arkansas territory, South Carolina, North Carolina, Pennsylvania, New Jersey, New York, Rhode Island, Maine, Connecticut, Massachusetts, and New Hampshire. *Red iron ore*, or *specular iron ore*, occurs in the same states of the Union as the black iron ore. *Brown iron ore*, or *hydrate*, is also a frequent ore in several of the states. These are the chief ores of iron worked for economical purposes; but to these we may add the *chromate of iron*, which affords chromic acid, a substance which, when united with the oxide of lead, forms chromate of lead, a very beautiful yellow pigment. It occurs generally in serpentine, and is found in Virginia, Maryland, Pennsylvania, New Jersey, New York, and Connecticut. — 6. *Lead*. Nearly all the species of lead ore are found in the United States; but of these the only one of importance in an economical point of view is the *common lead ore*, or *lead glance*, the *sulphuret of lead* of chemists, which is found in Arkansas territory, Missouri, Illinois, Kentucky, Indiana, Ohio, Tennessee, Maryland, Pennsylvania, New York, Connecticut, Vermont, Massachusetts, and Maine. *Black lead*, or *graphite*. This valuable mineral, so important in the arts, is found in Missouri, Virginia, Pennsylvania, New Jersey, New York, Connecticut, Massachusetts, New Hampshire, and Maine. Excellent pencils are manufactured at New York: the graphite, from Bucks county, in Pennsylvania, is reduced to powder, formed into masses by some cement, and then sawed into thin tables, as usual. — 7. *Zinc*. All the ores of this metal are met with in the United States. The *sulphuret of zinc*, or *zinc blende*, occurs in Missouri, Maryland, Pennsylvania, New Jersey, New York, Connecticut, and Massachusetts. The *red oxide of zinc*, one of the most valuable ores of zinc, occurs in the Franklin, Stirling, and Rutger iron mines, and near Sparta, in New Jersey. *Calamine*, which is partly a siliceous oxide of zinc, and partly a carbonate of zinc, is found in lead mines in Pennsylvania. — 8. *Cobalt*. The ores of this metal are of rare occurrence, and hitherto not in such quantity as to be of importance in the arts. — 9. *Manganese*. The *oxide of manganese*, or common ore of manganese, is met with in Arkansas territory, Missouri, Kentucky, Virginia, Pennsylvania, New Jersey, New York, Vermont, Connecticut, and Maine. — 10. *Arsenic*. *Native arsenic* is said to occur at Gayhead, in Martha's Vineyard. *Red sulphuret of arsenic*, on the north-west coast of America, mixed with *yellow sulphuret of arsenic*. — 11. *Bismuth*. *Native bismuth* is found at Huntington in Connecticut; and it is said, also, in small quantities, in Indiana and Ohio. — 12. *Antimony*. *Native antimony* is found at Harwinton in Connecticut, associated with grey ore of antimony. *Grey antimony ore*, or *grey sulphuret of antimony*, is found in Missouri, Virginia, Indiana, Ohio, Connecticut, Massachusetts, and Maine. The red sulphuret of antimony occurs in detached masses in the soil near Leesburg in Virginia. — 13. *Molybdena*. The common ore of molybdena, or the sulphuret of that metal, is found in South Carolina, Virginia, Maryland, Pennsylvania, New York, Connecticut, Massachusetts, and Maine. — 14. *Tellurium*, *Tungsten*, *Nickel*, and *Uranium* are found in small quantities in a few places. — 15. *Titanium*. The beautiful ore named the *ruby* or *red oxide of titanium*, is met with in South Carolina, North Carolina, Virginia, Maryland, Delaware, Pennsylvania, New Jersey, New York, Connecticut, Massachusetts, and Maine. The *ferruginous oxide of titanium*, the *siliceo-calcareous oxide of titanium*, and the *octahedral oxide of titanium*, are also enumerated among the ores met with in the United States.

SUBSECT. 2. Botany.

5669. The Botany of this and the other countries of North America has been described under the head of British America.

SUBSECT. 3. Zoology.

5670. To our zoological remarks on North America in general, little more need here be added. The native quadrupeds, particularly those of a large size, have been progressively diminishing as cultivation has advanced, and have retreated to the vast plains beyond the back settlements. The different sorts of Squirrels, &c. among the smaller races, still appear in considerable numbers, and at certain seasons furnish game for the amateur sportsmen. Many of the quadrupeds enumerated by Dr. Richardson are either dispersed, or occasionally appear, over the remaining portions of North America, more particularly to the westward. The American Bison, or Buffalo, never common in the United States, has gradually retired before the white population. Moose Deer, in like manner, were formerly found as far south as the Ohio, but these also are disappearing in the more cultivated states. Two species of Bear, the Black and the Grisly, still retain possession of their former haunts, while the Raccoon, American Badger, Fisher, Ermine, &c., are among the more common species.

5671. The Black Bear of America (*Ursus americanus* Rich.) (fig. 920.) is a different animal to that called by the same name in Europe. It

AMERICAN BLACK BEAR.

It has a milder disposition, and lives more on vegetables; it is the smaller of the American species, seldom exceeding five feet in length; the fur is long, straight, black, and shining, and when the skin was formerly in great request, a "prime" one was worth from twenty to forty guineas, and even more; at present (1830) the demand is small, from their being little used either as muffs or hammer-cloths, so that the best sell for little more than forty shillings. The favourite food of this species are different berries; in the absence of which it preys upon roots, insects, fish, eggs, and such birds or quadrupeds as it can surprise; but it does not, from choice, touch animal food. Timid in its disposition, it will not face a man unless wounded or its retreat is cut off; but in defence of its young it becomes a dangerous assailant. "I have known," observes Dr. Richardson, "the female boldly to confront her enemy, until she had seen her cubs attain the upper branches of a tree, when she made off. When in pursuit, its pace is said not to be quick; but Dr. Richardson has seen a Black Bear make off with a speed that would have baffled the fleetest runner, and ascend a nearly perpendicular cliff with astonishing facility. This species, when resident in the fur countries, almost invariably hibernates, and about 1000 skins are annually procured by the Hudson's Bay Company, from such as are destroyed in their winter quarters. The Black Bear inhabits every wooded district of North America."

5672. The Grisly Bear (*Ursus ferox* Rich.) is a much more formidable species than the last, though its fur is less valuable. Its

GRISLY BEAR.

strength and ferocity is so great, that the Indian hunters use the greatest precaution in attacking it. When adult, it is reported to attain a weight exceeding 800 pounds, and one has been killed, measuring nine feet from the nose to the tail. Some idea of its strength may be had, from knowing that it has dragged to a considerable distance the carcass of a buffalo weighing about 1000 lbs. The following story, Dr. Richardson observes, is well authenticated: — "A party of voyagers up the Saskatchewan had seated themselves in the twilight by a fire, and were busy in preparing their supper, when a large Grisly Bear sprang over their canoe that was tilted behind them, and, seizing one of the party by the shoulder, carried him off. The rest fled in terror, with the exception of a man named Bourasso; who, grasping his gun, followed the bear as it was retreating leisurely with its prey. He called to his unfortunate comrade that he was afraid of hitting him if he fired at the bear; but the latter entreated him to do so immediately, without hesitation, as the bear was squeezing him to death. On this he took a deliberate aim, and discharged his piece into the body of the bear, which instantly dropt its prey to pursue him: he escaped with difficulty, and the wounded man finally recovered." The cubs of the Grisly Bear can climb trees; but when the animal is full grown, it cannot do so: the hunter may thus escape; but the infuriated animal will sometimes keep watch below, and thus confine its enemy for many hours. This is a carnivorous species, but occasionally eats vegetables. It inhabits the Rocky Mountains and the Eastern Plains; while its southern range is stated to reach Mexico. In 1830 there was a live specimen in the Tower, and two others in the Paris garden.

5673. *The American or red Fox* (*Vulpes fulvus*) (fig. 922.) bears a close resemblance to

922

AMERICAN RED FOX.

the common European Fox; but it has a longer and finer fur, its ears and nose are shorter, and its cheeks rounder. It preys much on the smaller animals of the rat family, but devours all animal food; it hunts chiefly in the night, yet is frequently seen in the daytime. It runs for about 100 yards with great swiftness, but its strength is exhausted in the first burst, and it is soon overtaken by a wolf or a mounted huntsman. The skins of about 8000 are annually imported from the fur countries.

The true European Fox (*Vulpes vulgaris*) is said, by naturalists, to inhabit North America; but Dr. Richardson states it does not exist in the countries north of Canada. It is possibly to this species which Dr. Godman alludes, when he says that reddish foxes are numerous in the middle and southern states, and are every where notorious depredators on the poultry yards.

5674. *The Rats and Mice of Europe*, originally unknown in the New World, have been brought thither by the early European visitors. The Black Rat seems to have multiplied very fast until the introduction of the Brown Rat (*Mus decumanus*) thinned its numbers; and from this cause it has now become as rare as it is in Europe. The Brown Rat first appeared in America in 1775; it is now common in *Lower*, but in 1825 it had not advanced much beyond Kingston in *Upper*, Canada. That these, and the Common Mouse, have been so introduced, there can be no doubt; Dr. Richardson found a dead mouse in a storehouse at York factory, filled with packages from England. Neither of these species, however, have yet been discovered in the fur countries.

5675. *The American Field Mouse* (*Mus leucopus* Rich.) is the natural representative of our European field mouse (*Mus sylvaticus*). No sooner is a fur post established, than this little animal becomes an inmate of the dwelling-houses; whilst the Meadow Mouse (*Arvicola pennsylvanicus*) takes possession of the out-houses and gardens. It has, however, a curious habit not observed in ours. It makes hoards of grain, or little pieces of fat; and what is most singular, these hoards are not formed in the animal's retreats, but generally in a shoe left by the bedside, the pocket of a coat, a nightcap, a bag hung against the wall, or some similar place. "Sometimes," says Dr. Richardson, "we found barley introduced into a drawer, through so small a chink, that it was impossible for the mouse to gain access to its store: the quantity laid up in a night nearly equalling the bulk of a mouse, renders it probable that it was made by the united efforts of several individuals."

5676. *The Birds of the United States* are now rendered as familiar to the European naturalist as are those of his own country, for they have been more ably and more beautifully illustrated than those of any part of the world. The delightful histories of their manners given by Wilson, in the nine volumes of his *American Ornithology*, exceed in eloquence and feeling the happiest efforts of Buffon, while they possess a truth and accuracy, resulting from a personal observation of nature, in which it is well known the great French naturalist was lamentably deficient. The magnificent plates by Audubon, in which every species, however large, is to be represented the size of life, are now in a course of publication in this country; while our ornithological volume of "Northern Zoology" has made known several new species, and elucidated others, overlooked or confounded by preceding writers. The Prince of Musignano (Charles L. Bonaparte) occupies a prominent rank among those who have illustrated the ornithology of America; and to this scientific writer we are indebted for the following general observations, highly important to our present purpose. The noble author, in a small tract recently published, calculates the number of species found in Europe at 410, while those of North America are estimated at only 390: the territories, however, comprehended under the last-named region do not appear to be distinctly stated. The species that have been detected more particularly in the Roman States, amount to 247, while those of the Philadelphian province are 281: these latter are distributed under the following divisions: —

Stationary during the whole year, 31.
Partially stationary, 13.

Summer visitors, 60.
Winter visitors, 71.

Transitory visitors, 55.
Accidental visitors, 51.

5677. *It further appears* that although the species in the Roman States are fewer than those of Philadelphia, the former being 247, the latter 281, still it is asserted that the deficiency is largely recompensed by a very great superiority in the number of individuals; a fact, indeed, which the noble writer has had full opportunities to ascertain, but which we should not have credited on any other authority. He further remarks, that Philadelphia is inferior to Rome in the number of stationary species, and of those which come in the breeding season; while Philadelphia, on the other hand, exhibits a much more numerous list of such winter and northern birds as arrive from the arctic regions during intense cold, and are found in the spring and autumn in the more southern provinces.

923

TURKEY VULTURE.

5678. *Among the rapacious Birds* are several hawks and owls well known in Europe, while others appear restricted to this continent. The Californian Vulture occurs only beyond the Rocky Mountains; but two others, of a black colour, are common throughout the States. One of these (*Cathartes Aura* Ill.) (fig. 923.) goes by the name of the Turkey Vulture, the other is called the Black Vulture. The King of the Vultures (*Cathartes*

Papa) belongs more to South America, but appears occasionally in Florida during summer. The largest Eagle is the white-headed species (*A. leucocephala* Sw.); and the Osprey or Fish Hawk differs not from our British race. The Great Horned Owl is spread over all the regions between Canada and Mexico; but that great northern hunter, the Snowy Owl, seldom wanders, except in severe winters, into the midland states.

5679. To enumerate the many species of summer Birds which annually resort at the breeding season to the United States would far exceed our present limits. Prince Charles Bonaparte calculates the number to be met with in the state of Philadelphia alone at sixty,

VIRGINIAN NIGHTINGALE.

not more than two or three of which are known to inhabit Europe. America is celebrated for its singing birds; for, notwithstanding the alleged superiority of our own, we must concede the palm to that country which gives birth to the true Mocking-Bird (*Orpheus polyglottos* Sw.).

The Wood Thrush, whose notes are so charmingly described by Wilson, represents our Song Thrush; but the Virginian Nightingale (fig. 924.) is more deserving admiration for its rich scarlet plumage than for any pretensions it may be thought to have to the melody of its namesake. So totally distinct, as species, are the most approximating birds of the Old and the New World, that even the Shrikes and the Wrens, long thought to be the same, are now proved to be different. The Wild Turkey is still found in flocks towards the southern states, but has long ago disappeared in the more cultivated districts; we have been told, however, that during winter they are sent by the hunters up the Mississippi, and may be purchased in the markets of New York. The other birds of game are two species of Grouse and one of Partridge. The American Woodcock (fig. 925.) is as big as ours, but has no bands of black on the under plumage; while the Snipes can scarcely be distinguished from those of Europe, except by their tail feathers.

AMERICAN WOODCOCK.

5680. The Fish, Reptiles, Insects, &c., present nothing very remarkable to the general reader, although their elucidation would be highly interesting to the naturalist. The number and variety of fish in the Ohio is particularly great.

UNIO PURPURASCENS.

The rivers and lakes abound with a surprising number of Bivalve shells, exhibiting on their internal surface a lustre nearly equal to the oriental pearl counters and other ornaments made from the Pearl oyster; they do not, however, appear to have been turned to any other account than the making of sleeve buttons. The Purple species (*Unio purpurascens*) (fig. 926.) is the most richly coloured.

5681. The Domestic Animals may be shortly noticed. America is not destitute of indigenous domestic sheep, but the United States have been attentive to preserve and improve the breeds originally imported from England, and Merinos have been introduced at high prices; nevertheless the woollen manufactories have not yet engaged so much of the national attention as with us. On the cattle, our information is but partial: Michaux remarks that the number in Kentucky is very considerable, often forty or fifty at a plantation: they are bought lean, and sent to Virginia to be fattened. Sheep, in the same province, are very few; and of all the domestic animals, Pigs seem to be the most numerous.

SECT. III. Historical Geography.

5682. The discovery of North America closely followed that of the Western Hemisphere in general. It was in 1492 that Columbus first landed in Hispaniola; and the century had not closed, when the two Cabots had explored the whole coast as high as Labrador. The Spaniards, however, were the first who formed a settlement upon it, which was in Florida, in 1513, under Juan de Ponce, and they retained it till 1763, notwithstanding some bloody contests with the natives, and the rival efforts made by the French and English.

5683. It was in Virginia, and under the reign of Elizabeth, that the first effort was made to establish these important colonies. Spain had already drawn all the brilliant prizes; but the active reign of Elizabeth, and the romantic enterprisc of Sir Walter Raleigh, impelled the English towards Virginia, under which name was then vaguely comprehended nearly all the coast now held by the United States. But though Sir Humphry Gilbert and Sir Walter Raleigh made or sent some expeditions thither, there was no final settlement till the reign of James I., when, according to the custom of the age, two companies were formed, having a different sphere attached to each. The first, composed of many persons of rank and officers of distinction, sailed in 1608, and formed a settlement on the

river Powhatan, which falls into the Bay of Potowmac. They were soon involved, as usual, in deadly contest with the natives; Captain Smith, the most efficient leader of the colony, was even taken prisoner and about to be put to death by King Powhatan, when his daughter Pocahontas, with the humanity characteristic of her sex, interceded, and obtained for him life and liberty. The hand of the amiable Pocahontas was afterwards bestowed on a young English officer; and the two nations were placed on an amicable footing. This did not prevent many future contests and vicissitudes; but the colonies were continually increased by new detachments, particularly of young females to serve as wives to the settlers; and, notwithstanding many instances of misgovernment, their numbers rapidly increased.

5684. *New England*, now the most flourishing of the states, was peopled in consequence of religious zeal and the persecutions to which some sects were exposed. Charles I. having determined to impose episcopacy on the English nation, many who were attached to puritan principles became willing to quit their native country rather than to resign the freedom of worship. In 1629, a colony, composed chiefly of Brownists, settled at a place in New England, to which they gave the name of Salem. A succession of settlers followed, comprising many individuals superior in character to those who usually emigrate on such occasions. Hampden and Cromwell, afterwards the two greatest men of their age, had actually embarked, but were detained by a mandate, which government had afterwards ample cause to repent. Unhappily, the new settlers had not learned toleration from their own sufferings; but, differing from each other upon some metaphysical dogmas, the superior party drove out the weaker, and obliged them to form new settlements in Rhode Island, Connecticut, and other parts of New England.

5685. *The other states* were successively founded on various occasions. Maryland owes its establishment to protestant persecution, after the puritan party had gained the ascendancy. In 1632, Lord Baltimore, one of the leading catholic noblemen, obtained for himself and his followers the grant of an extensive tract, which, after Queen Henrietta Maria, he called Maryland. In 1663, soon after the Restoration, a charter was obtained by Earl Granville and several other English noblemen, for the settlement in a more southern territory, which, after the king, was called Carolina, and its capital Charleston. Locke was even employed to draw up the form of the constitution, which did not, however, succeed very well in practice. Carolina was divided, in 1728, into two governments, called North and South Carolina. In 1682, a colony of Quakers was brought over to Pennsylvania by William Penn, a son of Admiral Penn, and a man whose beneficence has obtained for him the veneration of posterity. The wise and humane principles upon which this colony was founded soon rendered it very flourishing. Lastly, Georgia was settled in 1732, by a number of public-spirited individuals, with the view of finding employment for multitudes of the distressed labouring classes. It suffered considerably by dissension until 1752, when it was taken under the immediate care of government, and placed on the same footing with the Carolinas.

5686. *These settlements continued to flourish under the English sway.* The native Indians were driven to a distance; the charters which had been wrested from the states by Charles II. and James II. were restored; and they advanced rapidly in culture and population. The war of 1756-63 was attended with signal triumphs of the British arms, and its issue added Florida and Canada to the empire, which thus comprised in one united mass all settlements of any value formed by Europeans in North America. But the pride of Britain, thus raised to its utmost height, was soon destined to experience a severe humiliation.

5687. *The American revolution*, already prepared by the distance and increasing greatness of these states, arose immediately out of the claim of Britain to impose taxes on them without their own consent. After a series of discussions, Britain refusing wholly to withdraw this claim, the American colonies rose in rebellion; and being favoured by the extent and local difficulties of the country, and finally aided by France, Spain, and Holland, they, in 1783, wrested from Britain a full acknowledgment of their independence. Since that time these colonies have ranked as a separate and republican power, under the title of the United States of North America.

5688. *The settlement of the Western States*, between the Alleghany and the Mississippi, formed a wonderful addition to the power and resources of the American Union. Before the loss of Canada, the French had begun to settle the Ohio; and in 1767, the Americans began their emigrations to Kentucky. That territory ranked as a back settlement to Virginia till 1792, when, in consequence of its growth in wealth and population, it was admitted to the rank of a state; and Congress afterwards passed a resolution, acknowledging as such every settlement which had reached the number of 60,000 souls. On the same grounds were admitted, in 1796, Tennessee; in 1802, Ohio; in 1816, Indiana; in 1817, Alabama; in 1818, Illinois. Michigan and the North-west Territory remain only as governments, anticipating the sure and rapidly advancing period when they may claim to be ranked as states.

5689. *The vast region beyond the Mississippi* drew the attention of the Americans, as soon as their settlements began to press against that river. Here, as the old territory was peopled, an unbounded scope was afforded for fresh emigration and settlements. The purchase of Louisiana in 1804, from Bonaparte, who had taken it from Spain in exchange for a paltry principality in Italy, removed all obstacles to their views. The expeditions of Captains Lewis and Clarke, and that of Major Long, explored this territory as far as the Rocky Mountains, and even to a point on the Pacific; and Europe acquiesced in the whole being laid down as American. Louisiana Proper, already settled by the French and Spaniards, Mississippi, Alabama, and afterwards Missouri, were admitted into the Union as states. All the remainder of this tract is occupied only at a few scattered points, and is kept chiefly as a vast reserve, to be appropriated whenever the territory now in occupation shall be exhausted.

SECT. IV. *Political Geography.*

5690. *The government of the United States* is in form decidedly republican, but of a prudent and temperate nature, such as has hitherto either repressed the evils incident to republicanism, or prevented them from rising to any alarming height. On the first establishment of independence, a strong party, at the head of which were Jefferson and Madison, sought to introduce almost pure democracy; but Washington, Adams, Hamilton, and other statesmen attached to the federal system, succeeded in establishing a government more nearly approaching to the original model of the British constitution; in which the popular branch is checked by a senate and by an executive of considerable strength; and though the democratic party have since come into power, they have not attempted to change a system of which experience has proved the benefits.

5691. *The principle of the American constitution is federal.* There is a general government, which makes war and peace, conducts all negotiations with foreign powers, and carries on every thing connected with the protection and defence of the nation, considered as an united body. At the same time, there are state governments for the regulation of internal and local concerns.

5692. *The state governments* are a sort of miniature of the general government. They have their senate, their house of representatives, their governor, and council, all elected by the people. The elective franchise belongs in general to the whole body of free citizens, with some distinction as to particular states. In New Hampshire, Pennsylvania, Delaware, the Carolinas, and Georgia, it is confined to citizens paying taxes; in Connecticut and Virginia to freeholders; in Massachusetts, New York, and New Jersey, to persons possessing a certain amount of property. There is a revenue of limited amount raised by local taxes, and a militia composed of all able-bodied men from the age of eighteen to forty-five, excepting clergymen, teachers, and some civil functionaries, and also excluding all negroes. There is a supreme court of justices of the peace and other local magistrates, on the principle of the English courts of judicature; and the English laws are preserved, except in a few instances. The formation and maintenance of roads and canals, and the provision for public instruction, belong in general to the state governments.

5693. *The general government, or Congress,* exercises a supreme sway over the whole of America. It has power to impose taxes for national defence, or for all purposes connected with the general welfare of the American people; to borrow money; to regulate foreign commerce; to establish uniform laws of bankruptcy and naturalisation; to coin money, and fix the standard of weights and measures; to declare war; to raise and support an army and navy; to call forth the militia, and provide for organising, arming, and disciplining it; and to carry on all transactions with foreign states.

5694. *The legislative branch* consists of two bodies, the House of Representatives and the Senate. The former are elected every two years by the body of the people, excluding slaves, Indians, and two fifths of the people of colour. There was originally a member for every 40,000 inhabitants, but, that the number may not become too great, the standard has been altered, and is at present 47,700. The senate consists of two members from each state, elected by the legislative bodies of that state. The members continue in office for six years; but one third of their number is changed every two years. Here, as in the British legislature, the concurrence of both houses is necessary before any motion can pass into a law.

5695. *The president* is chosen by the general body of voters, not directly, but by a certain number of electors nominated by them. He continues in office four years, and may be re-elected; but this has not taken place with any except Washington. He is the head of the executive government, and exercises the same functions as the King of Great Britain, except that he cannot make peace or war, and that his nomination to all civil and military offices is not valid till confirmed by two thirds of the senate. Nor does he possess a full veto upon the laws presented to him by congress; but if he disapprove, those laws cannot pass without a concurrence of two thirds of that body. His salary is only 25,000 dollars

(about 5300*l.*), with an official residence ; not sufficient, it is supposed, to defray the expense of the situation, without some private fortune.

5696. *The supreme judicial power* resides in a chief justice, with six associate judges, who having been appointed by the president, with the concurrence of the senate, hold their offices during life or good behaviour. Under this supreme court are seven circuit courts, sitting in different parts of the union ; besides which is the district court, proper to each state, as already mentioned. By a somewhat singular anomaly, the supreme court holds itself independent of the legislature, and, in some respects, superior to it, and has not hesitated to decide contrary to its acts, when it considered them at variance with the fundamental principles of the constitution. The emoluments of the judges are exceedingly moderate ; the chief justice not receiving more than 4000 dollars a year.

5697. *The revenue and taxation of the United States* have been moderate in proportion to the extent and wealth of the republic. Yet their independence commenced under a heavy burden, consequent upon the long and arduous struggle by which it had been achieved. In 1783 the debt was 42,000,000, and in 1791 had increased to 75,000,000 dollars. From that time some efficient measures were taken, and by 1812 it was brought down to 45,000,000 dollars. The war in which the States then rashly engaged against England nearly tripled the sum, which, in 1816, was 123,000,000 dollars. By the 1st of January, 1824, it was again brought down to 90,000,000, and by a steady application since that time of the sinking fund, the debt has been very nearly paid off, and revenue will soon be raised solely to defray the expenses of administration.

5698. *The revenue of the States* amounted in 1830 to 24,844,000 dollars ; of which 21,922,000 were derived from customs, 2,329,000 from lands, 490,000 from dividends on bank stock, 102,000 from other sources. Of this amount, 12,729,000 dollars were employed in providing for the interest and discharge of the public debt, on the extinction of which the taxes may be greatly reduced. By the late tariff, enormous duties were imposed upon imported commodities, especially in a manufactured state, not with a view to revenue, but to gratify commercial jealousies, and prematurely foster a manufacturing interest. But as they have been productive of no good effects, and had nearly caused the dissolution of the union, an act of congress, passed in 1833, provides that in the course of the next ten years they shall be gradually lowered, till they produce only what is necessary to supply the wants of the treasury.

5699. *The military force of the United States* consists almost entirely of militia, which, in point of numbers, sound exceedingly formidable. In 1815, they amounted to 748,000 ; and in 1823 had increased to 993,000. This vast mass, however, is described to be greatly and even ludicrously deficient in discipline and subordination. Yet though, at the commencement of the last war, they were exposed to severe and mortifying reverses, they were able, before its close, in a good measure to redeem their character. The regular force, which in the war of independence never exceeded 27,000, was raised, in 1814, to 63,000 ; but immediately on the conclusion of peace it was reduced to 10,000. It is fixed now at 6188 men, consisting of four regiments of artillery and seven of infantry. The entire expenditure connected with the army amounted in 1830 to 4,767,000 dollars. Economy and political jealousy seem to be the joint causes which induce the states to bring it down so extremely low ; and it must be confessed that America has very little reason to apprehend that any other power will ever dream of attempting to reduce her to subjection.

5700. *The American navy*, though yet on a small scale, acquired considerable reputation during the last war, when the few frigates, of which alone it was composed, could encounter British ships of the line. This, however, was partly owing to the larger size of the American frigates, and to the heavier guns they carried in comparison with the British. Both during the war and since, the Americans have expended considerable sums in enlarging their navy, which lately amounted to seven ships of seventy-four guns, seven of forty-four, three of thirty-six, two of twenty-three, thirteen of eighteen, and some smaller vessels. The force in commission consists of five frigates, eleven sloops of war, and seven schooners. The expenses in 1830 were 3,239,000 dollars. During the war, they started the project of steam frigates ; several of which have been constructed, but they never found occasion to bring them to the test of practical utility. A sum was also voted to Mr. Fulton, to mature his scheme of a submarine torpedo, to blow up hostile squadrons ; but no further proceedings were ordered upon that measure.

SECT. V. *Productive Industry.*

5701. *In regard to industry and wealth*, the United States are already respectable ; but they excite a much deeper interest by their vast and unparalleled resources, by their rapid progress, and by the future magnitude which they are almost sure to attain. Possessing, as we have seen, a greater extent of fertile territory than all Europe united, with such a varied range of navigable communications, and with the arts and habits of an improved society,

there can scarcely be a doubt that, at no very distant period, they will leave every other nation behind them.

5702. *Agriculture*, though the staple pursuit, with so vast a field for its operation, has still much progress to make. The general aspect even of the eastern states, which are the most improved, is that of an unbounded forest. Even in New York, one of the most advanced, not above a fourth is cleared. Land is so plentiful, in proportion to the population and capital, that rent has scarcely begun to have any existence, the farmer being in almost every case proprietor of the spot which he cultivates. Government lands in the western states may be had to any amount at two dollars, or less, an acre, and even the very best seldom bring above six dollars. The implements and processes are rude. The attempts made by British farmers to introduce a more skilful system have been found premature, and must be deferred until a more advanced period.

5703. *The products of land in America* are very various. Timber of different kinds is obtained by the mere process of clearing land for cultivation; and its price scarcely exceeds the cost of transporting it to a market. Maize, an indigenous American grain, is universally cultivated, and, though of an inferior species to wheat, is suited to a greater variety of soils and situations. Wheat is also general, but succeeds best in the middle and western states, and in the uplands of the southern states. In the northern, oats for horses' food, and rye for distillation, are the prevalent kinds of grain. Maryland and Virginia have the grand staple of tobacco, which is raised there on a greater scale than in any other part of the world. In the Carolinas and Georgia, cotton, for which there is so vast a demand in Europe, becomes the prevailing article; and that produced on the coast, called Sea Islands, bears the highest price of any. The moist lands in the same region are employed in the cultivation of rice to a greater amount than in any other country out of Asia. In those districts of Florida and of Louisiana which border on the torrid zone, the sugar-cane is found to flourish, supplying already a great part of the internal consumption. Even from the maple tree, in the northern states, sugar is made to the extent of 9,000,000 pounds. Flax and hemp are raised in considerable quantities, especially in the west. The breeds of horned cattle have been much improved in Pennsylvania and other states, and the merino sheep have been introduced without apparent degeneracy, though not to a very great extent; the Americans having an unlucky prejudice against mutton as an article of food. Wine, silk, hops, are articles of prospective culture, regarding which the friends of America indulge in sanguine anticipations. The entire value of American agricultural produce was estimated, in 1812, at about 105,000,000*l.* sterling, of which more than 5,000,000*l.* was exported. The amount since that time has greatly increased.

5704. *Manufactures* of a high class are not suited to a country in this early stage, which, in general, finds it more advantageous to purchase with its raw produce the fabrics of other nations. The Americans, favoured by high protecting duties and occasional prohibitions, have made considerable efforts to supply themselves; but they have never been able, in any of the finer fabrics, to cope with the skill and machinery of England. The common and bulky articles, however, are now pretty largely produced. In 1810, the total produce of the loom was estimated at 40,000,000 dollars. Of this nearly half consisted of woollen stuffs, made chiefly at home for domestic use, and supposed to employ 50,000 hands. The manufactures of leather were valued at 18,000,000 dollars; of iron above 14,000,000; of gold and silver, 2,500,000. Distilled and fermented liquors were above 16,000,000. Manufactures of wood amounted to 5,500,000 dollars; hats above 4,000,000; cables and cordage the same. The entire value of American manufactures was, in 1810, after an official enquiry, estimated at 127,000,000 dollars. These manufactures existed, almost exclusively, in a few of the long-settled Eastern states. In Pennsylvania they amounted to 32,000,000; Massachusetts, 17,000,000; the rest of New England nearly the same; New York, 14,000,000; Maryland, 17,000,000; Virginia, 11,000,000. Since 1810 the amount has been greatly augmented; but no equally careful investigation has recently been made. The value of woollen manufactures alone, however, was estimated, in 1830, at 40,000,000 dollars, employing 50,000 persons. Cotton weaving, which scarcely existed in 1800, was carried on by 795 mills, and 33,500 looms, producing 230,460,000 yards, and giving employment to 52,000 persons; while the value of the produce amounted to 26,000,000 dollars. Hats were made to the value of 10,500,000 dollars, employing 18,000 persons. Cabinet ware, 10,000,000 dollars, employing 15,000 persons; iron-works, 191,536 tons, value 13,300,000 dollars, men employed 29,000; paper, value 7,000,000 dollars; glass and earthenware, 3,000,000 dollars. The convention assembled at Harrisburg in 1827 made the following estimate of the entire products of American industry:—

	Dollars.
Food and drink	249,000,000
Clothing	202,000,000
Horses' keep	75,000,000
Other agricultural products	20,000,000
Products of the forest	200,000,000

	Dollars.
Earthen fabrics -	60,000,000
Mineral fabrics -	120,000,000
Staples for manufactures -	100,000,000
Fisheries -	40,000,000

5705. The following table, from *M'Culloch's Dictionary of Commerce*, gives a most comprehensive view of the commerce of America, and the countries with which it was carried on, for the year ending 30th September, 1829:—

Countries.	Commerce.				Navigation.			
	Value of Imports.	Value of Exports.			Tonnage.			
		Domestic Produce.	Foreign Produce.	Total.	American.		Foreign.	
					Entered into the U. States.	Departed from U. States.	Entered into the U. States.	Departed from U. States.

The imports in the following year, ending the 30th September, 1830, amounted to 70,876,000 dollars; the exports to 73,849,000; of which 14,387,000 were of foreign produce.

5706. *Commerce* is carried on with very great activity. As a pursuit congenial to the spirit of republicanism, it is considered the most honourable, and the merchants in the great

towns form the only species of aristocracy that exists. Mr. Warden even boasts that business is done more promptly than in any other country; that a vessel will be unladen in a few days, which would require elsewhere as many months; that no vessels are built so expeditiously, or sail so fast. With sloops of sixty or eighty tons, they double Cape Horn, carry on the South Sea whale-fishery, and enter the ports of China. The long suspension of direct intercourse between the European states during the revolutionary war stimulated the commerce of America to a premature activity, and called into existence the carrying trade, usually peculiar to the most advanced stage of industry.

5707. *The exports of America* consist almost entirely of the unmanufactured produce of land, to be either consumed or worked up by foreign states. Grain could be furnished almost to any extent, were it not for the heavy freight with which it must be loaded before reaching Europe. Wheat flour, almost the only form in which it can be transported, was exported in 1827 to the extent of 858,000 barrels, to which was added 505,000 bushels of Indian corn. Cotton, however, has now become greatly the leading article, having risen from 17,000,000 lbs. weight, in 1800, to 322,215,000 in 1832. Tobacco, an old staple, amounted in the same year to 106,000 hogsheads. Rice 120,000 tierces. Naval stores, staves, and timber, to the value of above 2,600,000 dollars. Salted pork, 88,000 hhds.; butter, 1,501,686 lbs.

5708. *The imports* consist of all those various articles of consumption which America does not make or produce within herself; the finer fabrics of wool, which amounted in 1827 to the value of 7,886,000 dollars; cotton, 8,348,000; silk, 8,104,000; flax and hemp, 4,770,000; iron, steel, and brass, 3,170,000; and the luxurious and aromatic products of the East and West Indies: coffee, 37,319,000 lbs.; tea, 10,108,000 lbs.; sugar, 84,902,000 lbs.; spices, &c.; also wines, 3,436,000 gallons; and spirits, 3,718,000 gallons.

5709. *The shipping* of the United States amounted, in 1821, to 1,262,000 tons, of which 619,000 were employed in foreign trade; 588,000 in the coasting trade; and 55,000 in fisheries. In 1831 it had increased to 1,267,846; this apparently slow increase being occasioned by a large number of vessels that had been lost and worn out being included in the accounts for 1821 and several subsequent years. Ship-building is carried on with great activity, the materials being almost every where abundant.

5710. *Fishery* is carried on actively by the northern state of Massachusetts, and by it almost alone. The whale-fishery, in 1830, employed 300 vessels, averaging 340 tons, and its products were 106,800 barrels of spermaceti oil, the same of common whale oil, and 2,500,000 lbs. of spermaceti candles. The fisheries of mackerel, herring, and particularly that of cod on the coasts of Newfoundland, are also very important. The products of the American fishery are annually exported to the value of about 2,000,000 dollars.

5711. *Of the interior water communications*, those bestowed by nature have been already pointed out. No part of the world presents such an extensive river commerce. The vessels of all kinds, plying on the Hudson alone, are said to amount to 2000. Steam vessels, a grand improvement, first introduced in America, amount to 300, of which seventy-eight ply on the great channel of the Mississippi. Neither the states nor private individuals have been inactive in improving the advantages bestowed by nature. They have executed in this department several magnificent undertakings, which have thrown lustre on the American name. The rivers running across the Eastern states have been united at different points, and it is expected that a continued interior line from north to south will be ultimately formed. The most important canal here is that connecting the two grand inlets of the Delaware and the Chesapeake, begun in 1823, and completed in six years, at an expense of 2,000,000 dollars. It is fourteen miles long, sixty feet wide, and ten feet deep. In 1830, there passed through it 5280 vessels. The Delaware and the Hudson are also joined by a canal 108 miles long, completed in 1828. Since the rise of the Western states, however, it became an arduous but important object to form a water communication uniting the two great river systems, that to the east and that to the west of the Alleghany. An insurmountable obstacle seemed to exist in that vast and continuous chain, till the state of New York, after careful surveys, determined on forming a canal from the Hudson at Albany to the Mohawk, which falls into Lake Erie; and this grand work, commenced in 1817, was completed in 1825. It is 363 miles long, 40 feet wide, and 4 feet deep, with 83 locks and 18 aqueducts; it cost above 9,000,000 dollars. It is now the scene of a most busy trade. The number of canal boats, which arrived at and departed from Albany during 1830 was 12,830, carrying more than 100,000 tons of merchandise, besides lumber, wood, &c. The tolls amounted to 954,000 dollars, yielding an ample return even on the large expenditure. An important canal has also been formed, connecting the Hudson with Lake Champlain, and thereby opening a communication with Canada; it is 63 miles long, and cost 875,000 dollars. On the opposite side, the new and flourishing state of Ohio has very nearly — perhaps, now, wholly — completed a canal, which, uniting the Scioto and Sandusky, forms a navigable communication between Cincinnati and Lake Erie. It is 306 miles long, with 11,185 feet of lockage, and executed at less than 10,000 dollars per mile. The same state has also formed a canal 70 miles long, connecting Cincinnati

with the Miami. A still grander undertaking is that of the Chesapeake and Ohio Canal, designed to unite the Potowmac at Washington with the Ohio at Pittsburg. It will be 360 miles long and 60 feet wide, and will require a tunnel four miles in length to convey it through the mountains. It was begun in July, 1828, and has made some progress. Several of the states have also done much to improve their interior communications. New England set the first example; but Pennsylvania has now surpassed all the others, having, either executed or in progress, lines of canal that extend 728 miles. Virginia and the Carolinas, notwithstanding their wealth, have been left behind in this great national improvement; but they are beginning to move. The Dismal Swamp canal connects James's River with Albemarle Sound; and it is expected that a communication will ere long be formed between that river and the Ohio. The next object was to connect Lake Erie with the Ohio.

5712. *The roads* have been much improved since 1800, partly by government, but chiefly by companies associated for that purpose. Considerable difficulties occurred, as they were to be made, not only from the coast to the high tracts in the interior, but across the Alleghany Mountains to the Western states. The entire length of post roads, in 1830, amounted to 115,000 miles. The great advantages to be derived from railways have not escaped the notice of the Americans. In New England, New York, and especially in Pennsylvania, extensive communications of this nature have been formed within the last few years. Maryland has undertaken one far surpassing in magnitude every similar work. It is destined to connect Baltimore with Pittsburg, by a line of upwards of 300 miles, and by which it must cross the range of the Alleghany Mountains. A portion near Baltimore is already completed, and three spacious aqueduct bridges have been constructed.

SECT. VI. *Civil and Social State.*

5713. *The population of the United States*, according to the census of 1830, amounted to 12,856,165; a number not very great absolutely, and even small relatively to the extent of their territory; but astonishing when considered as existing in a region which, 200 years ago, was only a boundless wilderness, peopled by a few scattered bands of savages. But the most interesting circumstance is the rapid increase which has marked, and, according to every appearance, will continue to mark, their progress. Although there has been a constant tide of emigration from the closely peopled European countries, ever since the first settlement of those states, there is no doubt that the growth of this great mass is chiefly owing to the ordinary principle of population, to the means which the human race possesses of multiplying itself, when a check is not presented by the difficulty of subsistence. There are no early enumerations on which much reliance can be placed; but, in 1753, the number was estimated at 1,051,000. A regular decennial census, taken since 1790, gave, at that period, 3,921,000; in 1800, 5,319,000; in 1810, 7,239,000; in 1820, 9,638,000. It is most interesting to consider, as the immensity of unoccupied land leaves full scope for this power of multiplication, how vast the future numbers may be with which this region will be peopled, and which will render it much the greatest state that ever existed in ancient or modern times. It is calculated, upon good grounds, that in a century it will contain 160,000,000; and still, being only half as populous as Britain or France, leave ample scope for future increase. The Americans, should they continue united, would then become the greatest nation in the world; and the most powerful states of Europe would rank as secondary to them.

5714. *National character* is, perhaps, in no country less conspicuous than among the Americans; a people not indigenous, but collected from several of the nations of the old world, and retaining always much of the original stamp. It is modified, however, by national feeling, and by the sentiment which is ever in their thought and mouth, that "they are a nation of freemen." They have not exactly fulfilled the theory of those philosophers who maintained that a republican form was to be the remedy for every human evil, moral and physical. They have their good qualities. They are warmly attached to the glory and interest of their country, and at the same time liberal and hospitable to foreigners. The lower class are superior in intelligence, and even in manners, to those of the same rank in the old world; they all read newspapers, and are capable of discussing the political concerns of their country. There is an absence of the graces and courtesies of the higher European society. Servants, and even children, show scarcely any of that deference which is elsewhere paid to parents and masters. The ceremonious terms Mr. and Mrs. are not, indeed, withheld; but they are rendered cheap by being applied equally to the humblest individuals. Their sturdy independence makes them not scruple to intrude in various ways on a stranger, particularly to gratify that curiosity which, in the country districts, scarcely knows any bounds. It is so annoying, that Dr. Franklin once, on a journey, judged it wise to bear upon his person a label expressing his name, his business, whence he came, and whither he was going. The Americans are pugnacious to a considerable degree. Duelling, unknown to the ancient commonwealths, rages in this modern republic to an extent not now common in Europe. Among classes who do not aspire to this elegant form of contest, the mode of fighting generally practised is rather that of infuriate children or madmen. Gouging, or scooping out the eyes, kicking, and biting, have disgraced the pitched battles of the

common people, at least in Virginia and the other southern states; though with advancing civilisation these practices appear happily going into disuse. Party disputes are carried on with greater violence and more unmeasured abuse than even in England; yet it is observed that, after the dispute is over, good-humour and social intercourse ensue between men of the most opposite parties. Upon the whole, travellers generally state that they have met throughout the union with somewhat uncommon kindness and hospitality; though, even at the inns, they were received rather as the obliged than the obligers, and treated rather as guests than as employers.

5715. *In religion*, the Americans have adopted the novel system of cutting off all connection between church and state. Individuals or classes of believers choose their own instructor, and provide entirely for his support. In the large towns, at least of the northern states, the clergy are sufficiently numerous, and well provided for; but in others, and especially in the remote country districts, there is a great deficiency. This general equality is found to abate religious animosity, without relaxing zeal. Yet there is observed on one side more of open irreligion, and, on the other, more violent excess of fanaticism, than in European states. The latter is particularly conspicuous in the camp meetings, where crowds of several thousands flock to listen to some flaming orator, whose address is accompanied by the congregation with shrieks, screams, and even violent convulsions. It appears, however, by the representations of late travellers, that the extravagances acted at these meetings have been exaggerated; and that, in remote quarters, destitute of regular means of instruction, they have been productive of good. Shakers, jumpers, and other fantastic sects, have sprung up in the remote country districts, and even in the cities.

5716. *Literature*, to be very flourishing, would require, perhaps, a more advanced stage of civilisation than America has yet attained; and even the access, which a common language affords, to all the masterpieces produced in Britain, must operate as a check upon the exercise of original talents. It was not till very recently that America produced any compositions that could take their place among the classic literature of the Old World; but the writings of Washington Irving, distinguished by a style peculiarly polished, with those of Lomond, Cooper, and several others, place her in a fair way of redeeming this reproach. The States show a laudable zeal for the diffusion of knowledge. There are twenty-five colleges, and seventy-four academies, under the patronage of the general legislature; and a national university has been planned. Learned societies have been instituted in the great cities, and have published a few volumes of Transactions. Popular English works, and even the Edinburgh and Quarterly Reviews, are immediately reprinted. They thus obtain a new sphere of distinction, and, soon after their publication, are read on the banks of the Ohio and the Mississippi. If newspapers may be accounted literature, this branch has been carried to an extent which Europe cannot rival. The number, which, in 1810, had been 364, rose in 1828 to 802; and is supposed now to exceed 1000, of which 50 are daily papers. The Americans have been eminent for mechanical inventions, of which the steam vessel, by them first applied, at least, to practical purposes, is a conspicuous example.

5717. *In the fine arts* the Americans have shown a very strong natural genius for painting, though their artists have been obliged to seek for patronage in the Old World. They have given us West and Copley, and, more recently, Leslie and Brockedon. Institutions for the encouragement of the art have been now formed at New York and Philadelphia. American music is not much spoken of. Some edifices at Washington, New York, and Philadelphia are splendid; but built, we believe, upon foreign designs.

5718. *The amusements* in America are in general analogous to those of Europe. The drama is pursued with considerable ardour; and, though no histrionic genius of the first rank has yet sprung up, the best English actors have found an excursion to America advantageous.

5719. *The houses in the large towns* are built of stone or brick, after the European model; but in the country, and generally in all the back settlements, the cheap and easy material of wood is preferred. It is put together often very rudely, of unhewn logs, though the better specimens are of framework, and sometimes on a more extensive scale than the owner can occupy.

SECT. VII. *Local Geography.*

5720. *The division of America is into states*; an appellation which corresponds rather with that of kingdoms and nations than of counties or provinces. Of these states several are equal in extent, and in all the capacities of future greatness, to some of the most important European countries. The number of states amounts at present to twenty-four; and the following table concentrates a view of the most interesting particulars respecting each, showing its extent (according to Darby's *View of the United States*), its population by the census of 1830, the name and population of the principal towns. The letter G, appended to any of these, marks that it is the seat of the state government; a distinction often very different from that of being the largest and most important place.

SUBSECT. 1. *Northern or New England States.*

5721. The first six states, which are well known under the general name of New England, comprise the earliest and most respectably settled, the most improved and most intelligent portion of the Union. It was peopled about the beginning of the seventeenth century by the puritan dissenters, flying from prelatic persecution. Those emigrants entertained some extravagant and fantastic opinions, and did not extend to each other that toleration under the want of which they had suffered; but they were men of high principle, and of steady and regular conduct in common life. The New England states, therefore, rapidly advanced in wealth and population, and took the lead in asserting the independence of America. The cargo of tea thrown into the sea at Boston, and the battle of Lexington, formed the commencement of the great contest which finally severed the colonies from the mother country. The territory, at first designated under the general appellation of New England, has been gradually divided into several provinces, which now rank as states. Massachusetts was first founded on a very considerable scale in 1628; Connecticut, in 1637; and, in 1643, they were combined under the title of the United States of New England. In 1635, a body of antinomians, ejected from Salem, founded Rhode Island, for which they obtained a charter in 1643. Disputes which arose in 1680 caused the separation, from Massachusetts, of the extensive territory of New Hampshire. Vermont was a sort of back settlement, which, having gradually sprung up in the beginning of the eighteenth century, began to claim independence about 1760, and obtained its full recognition in 1790. Maine is a more northern frontier territory, and was long harassed by the incursions of the Indians, and by the wars between the French and English. In 1760, it did not contain above 13,000 inhabitants; but these having increased in 1810 to 228,000, Maine was enabled in 1820 to shake off its dependence on Massachusetts, and to become a separate state.

5722. *Massachusetts* is the oldest of these colonies, the most improved, and that to which the character of New England most decidedly applies. The greater part is level, and the soil composed in most places of fine fertile loam, though sandy along the sea-coast; but the extreme west touches on the great Apalachian border, where the mountains rise to 3500 or

4000 feet, and the domain is covered with extensive woods. Its centre is crossed by the Connecticut River, which, with its fine valley, traverses the whole of New England from north to south. This level tract is cultivated and peopled to a degree almost equal to that of European countries. Wheat, however, is not raised with advantage, being blighted by the severe cold of winter; nor is barley much cultivated. Maize, rye, oats, and beans are the prevailing descriptions of grain. The breed of cattle is good; and salted provisions, and the produce of the dairy, form objects of exportation. The farmers have extensive orchards, from which a great deal of cider is made. The state produces a considerable quantity of iron and some lead. Its progress in manufactures is remarkable, compared with that of most of the other states. Working in metals, wood, and cordage are the chief branches. Bar and wrought iron, anchors, and tools, were produced in 1810 to the value of 886,000 dollars; nails, 670,000 dollars; muskets, 229,000 dollars; cabinet and wood work, 525,000 dollars; spirits, 1,735,000 dollars; cables and cordage, 1,302,000 dollars; straw bonnets, 551,000 dollars; paper, 306,000 dollars; prepared hides and skins, 1,200,000 dollars; shoes and saddlery, 1,900,000 dollars. The entire value in 1810 was estimated at 18,500,000 dollars. Since that time they have greatly increased, and cotton cloth has been added, and has become even the leading branch. In commerce, shipping, and fishery, Massachusetts takes a decided lead of all the states. According to the assertion of Mr. Warden, to which a Briton will, perhaps, demur, her seamen excel those of all the world for boldness, enterprise, and skill. She builds 23,000 tons of shipping, valued at 656,000 dollars. In 1832, the exports amounted to 18,118,000 dollars, the imports to 16,650,000 dollars. The customs, in 1831, amounted to 5,227,000 dollars. Most of the remote foreign trade belonging to the Union is carried on from her ports; and the same may be said of the whale and cod fisheries. She has above 1000 vessels engaged in the cod and mackerel fisheries; and 160, averaging 350 tons each, in the whale-fishery. In 1829, there were brought into her ports 420,000 quintals of cod and other dried fish; 227,000 barrels of mackerel; 76,000 barrels of spermaceti oil; 47,000 barrels of whale oil; and 6000 barrels of cod oil. Peculiar attention is bestowed in Massachusetts on public instruction. Harvard College is the oldest and best institution of that description in the States.

5723. *Boston*, the capital of Massachusetts, of the state of New England, and, till lately, of the whole Union, is built on a peninsula, at the bottom of the Bay of Massachusetts. It is not an elegant town. East Boston, where all the business is carried on, consists of a number of narrow streets, lanes, and alleys, where stores, shops, warehouses, and wharfs are crowded together. They are, however, generally clean and well paved. West Boston contains the residence of the principal citizens, and has several spacious streets, with handsome houses built of red brick. Immediately above this part of the town rises Beacon Hill, commanding an extensive and peculiarly rich view into the interior of the country. Several of the public buildings are very elegant, especially the new state house; though it fails to produce the due effect, by being built of brick. A most superb hotel has lately been erected, on a scale seemingly beyond that of the city. It is seven stories high, and contains 200 apartments. Boston, till the late rapid progress of New York, was the centre of the commerce of the United States. In 1831, it owned 138,174 tons of shipping. The harbour is so spacious as to afford a good depth of water to upwards of 500 vessels; and the entrance being extremely narrow, renders it easily defensible. The wharfs are numerous, and more commodious than any other in America. The largest is 1750 feet long, 104 feet broad, and bordered throughout by a range of spacious warehouses. The market, 536 feet long, possesses the same pre-eminence. The inhabitants, according to Mr. Lambert, are distinguished for their domestic habits, regularity of living, integrity in their dealings, hospitality to strangers, strict piety and devotion, and respect for the moral and social virtues. The severity of manners which they brought from England has been considerably relaxed, and the theatre and other amusements have been introduced. At the same time, a devout attention to religious worship, and the strict observance of the Sabbath, are remarked to a greater degree than in Old England. Unitarian doctrines, however, have obtained a considerable prevalence, produced probably by a reaction from the high anti-nomian tenets which prevailed at the first settlement. Boston is also the head quarters of federalism as opposed to democracy, the former system being generally supported by the northern states, and the latter by the southern. It has also been, in a comparative sense, the Athens of the Union, though New York is now treading close on its footsteps. Franklin, the Adamses, Fisher Ames were its natives, and the *North American Review*, the best in the country, is conducted there. Harvard College, at Cambridge, three miles distant, is well endowed, has numerous professorships, and its library is second only to that of Philadelphia, containing many works of rarity and value. Boston is connected with the continent by particularly large and handsome bridges, one of which is nearly half a mile long.

5724. *Massachusetts has some other towns of consequence.* Salem, the name of which indicates the high religious feelings of its founders, is now a handsome pleasant town, which flourishes by the adventurous trade to the East Indies, in which it chiefly employs its 31,000 tons of shipping, and for the promotion of which it has founded an institution called the East India Marine Society. Plymouth (*fig. 927.*), the oldest town in New England, and even in the States, founded in 1621, by a colony of nonconformists, drives still a considerable trade. Nan-

tucket, on an island of the same name, is the chief seat of the

southern whale-fishery, which it prosecutes with almost unrivalled spirit, having thirty works for the extraction of spermaceti oil. Whales once abounded in its own neighbourhood, but they have now disappeared. Worcester is rather a thriving little inland town. Lowell and Taunton are rising rapidly into importance by the establishment of cotton manufactures. In the former are made from 12,600,000 to 14,000,000 yards; in the latter, nearly 8,000,000 yards.

927

PLYMOUTH, MASSACHUSETTS

cultivation is carried to as high a pitch as in Massachusetts. The farmers are a plain, homely, hospitable race, bearing the English stamp almost unaltered. The morals are very pure; duelling, so common in the other states, is here held in disgrace, and there has scarcely been an instance of a citizen guilty of a capital crime. Public education is most amply provided for; there being no less than 250,000*l.* appropriated to the support of schools. There is scarcely an individual in the state who cannot read and write; and Yale College, in Newhaven, under popular patronage, has attained to considerable note. The rank of capital is disputed by Hartford and Newhaven, agreeable rural towns: the former inland, on the banks of the river Connecticut; the latter a sea-port, and a very early settlement, still carrying on most of the trade of the state. It is neatly and regularly built.

5726. *New Hampshire*, stretching south from Massachusetts, occupies a very great part of the surface of New England. Its territory is the most elevated of any in the states; it is broken into every diversity of surface, and rises in the interior into the high level of the White Mountains, the loftiest peak of which is Mount Washington. Its varied scenery, of mountain, lake, and river, causes it to be often called the Switzerland of America. Its industry is chiefly agricultural, and every product of the soil, suited to a temperate climate, is yielded in the utmost abundance. The chief wealth hitherto has been in its forests; but these are now considerably thinned. The inhabitants are peculiarly active, hardy, and athletic; and the advance of population has been remarkably rapid. Nothing is more common than to see a grandmother at forty, and the mother and daughter are often suckling children at the same time. This state is well watered by the upper part of the Connecticut; and almost the whole course of the Merrimack is through its territory. Although it cannot rival the intellectual character of Massachusetts, yet it has Dartmouth College, an institution on a limited scale, and the legislature has made large provision for diffusing the general elements of education. New Hampshire has a comparatively small extent of coast, on which, however, there is some ship-building, fishery, and trade. The towns are not considerable; but Portsmouth is a neat agreeable sea-port, with an excellent harbour, and 26,000 tons of shipping. The *Washington*, a seventy-four gun ship, was launched here in 1814.

5727. *Vermont* is a long territory, running north and south to the west of New Hampshire, and bounded on the other side by Lake Champlain. That piece of water, 160 miles in length, and 18 in its greatest breadth, is a main barrier of the States on the side of Canada, and its positions of Crown Point and Ticonderoga have been distinguished by some of the most remarkable events in its military history. The centre is traversed by the Green Mountains, from which the country takes its name, which form two parallel ranges, but nowhere rise higher than between 3000 and 4000 feet. They enclose many fertile valleys, and a fine plain is interposed between them and Lake Champlain. Under these advantages, its population between 1790 and 1830 increased from 85,500 to 286,000. The people from Vermont are active, hardy, florid, and robust: in peace, industrious and frugal; in war, peculiarly brave and intrepid. The legislature has not been behind that of the other states in its care for education; a portion of land in every new township being set aside for schools. A portion has also been allotted to the clergy, of whom there are 112; a college, endowed with 33,000 acres, has been established at Middleburg, and another at Burlington. The manufactures of Vermont are of little importance, and the exports consist chiefly of timber and the produce of land; a great proportion of which is sent by way of Lake Champlain to Canada. Montpelier, which ranks as the capital, is only a pleasant village, surpassed by Windsor, Middleburg, and Burlington.

5728. *The great maritime district of Maine*, long held politically attached to Massachusetts, has since 1820 formed an independent state. There are considerable tracts of mountain and swamp; and a great part of the interior has not yet been regularly settled; so that four fifths of its area do not contain more than 1500 families. The rest, however, has received most rapid accessions, having grown from 10,000 in 1750, to 399,000 in 1830. A small colony of Indians is peaceably settled on the Penobscot river, and is increasing. The dense original forest, which composed this territory, is broken only by a narrow plain

along the sea-coast, and agriculture is yet in an imperfect state. The inhabitants, however, carry on a good deal of ship-building, trade, and fishery. The registered tonnage in 1827 amounted to 202,000; of which 6000 were employed in fishery, yielding a produce of 470,000 dollars. Portland, the capital, is a considerable, well-built sea-port, owning, in 1827, 49,000 tons of shipping.

5729. *The state of Rhode Island* occupies a little corner of New England, shooting out between Connecticut and Massachusetts. It was founded by about forty individuals, who, being expelled from Salem on account of antinomian tenets, bought a tract of land from an Indian chief for a pair of spectacles, and founded there a town, to which they gave the name of Providence, and to the whole district that of Rhode Island. Possessing considerable advantages of situation, this territory was soon well peopled. During the revolutionary war, it was long occupied by the English troops, and was somewhat recusant as to entering into the federal union, but at length gave its consent. The soil is rather too light for grain, but yields all the productions of the dairy in great perfection; has an excellent breed of sheep, good pacing horses, and valuable orchards. Unfortunately, it is less advanced in general information than the other parts of New England. The first settlers were deeply imbued with the opinion that a Gospel minister could derive no benefit from human knowledge, and this idea has never been eradicated from the minds of their successors. The law for establishing schools was once repealed, though it is lately re-enacted. The Baptists are now the ruling religious sect. Providence, the capital, is the third town in New England. It is situated at the head of Narraganset Bay, which admits vessels of 900 tons, and carries on a brisk trade, owning 14,000 tons of shipping. Newport, at the mouth of the bay, once the chief town, has, notwithstanding its fine harbour and beautiful situation, been in a great measure supplanted by New Providence.

SUBSECT. 2. *The Middle States.*

5730. *The Middle States* consist of *New York* and *Pennsylvania*, with the smaller ones of *New Jersey* and *Delaware*. These are on the whole the most flourishing of the whole Union. They contain the greatest extent of cultivated land, the largest and most prosperous cities; and if they do not at present equal the intellectual character and active energy of the New England States, they are, in these respects, making rapid progress.

5731. *New York* is one of the most extensive and decidedly the richest and best peopled member of the United States. It stretches far beyond the western boundary of New England, widening continually as it extends to the north and west. A branch of the Alleghany, approaching the sea, runs through its eastern district, but is not of such height as materially to obstruct cultivation. Almost all the rest is level, and composed of a fine loam or friable clay, yielding every kind of produce in perfection. It touches the sea at one point only, prolonged, however, by Long Island, and the fine and secure bay which it forms. But the benefits of inland navigation are conveyed far into the interior by the river Hudson, which admits ships to 120 miles; and vessels of eighty tons 160 miles from its mouth. On the north, where it borders on Canada, the state has another great chain of navigation formed by Lake Champlain, the river St. Lawrence, Lakes Ontario and Erie. These two lines being now joined by the great canal, and connected with the river system of the Mississippi, form an immense circuit of inland navigation, which has its focus, as it were, in the city of New York. The agriculture is now conducted with almost as much skill and care as that of New England; wheat is raised in abundance; that and maize being the principal products. The grasses are luxuriant; fruits are largely cultivated, particularly water melons, and peaches in such quantity that in some places hogs are fed with them. In 1812, the whole value of agricultural produce was computed at 4,500,000*l.* The entire value of lands and houses was reckoned, in 1814, at 60,000,000*l.* sterling. Manufactures are also in a flourishing and growing state, the branches being the same as in New England. The value in 1825 was estimated as follows: cotton goods, 3,000,000 dollars; woollen, 3,000,000, iron, 4,000,000; paper, 500,000; hats, 3,000,000; boots and shoes, 5,000,000; leather, 3,000,000; window glass, 500,000; domestic fabrics, 5,000,000. The salt springs at Onondago produce 700,000 bushels, and the mineral springs at Clifton, Saratoga, and New Lebanon enjoy a greater reputation than any others in the States. The commerce of this state is peculiarly extensive, both by its great port of New York, up the Hudson,

NEW YORK.

and the canal which connects it with Lake Erie, and by Lake Champlain. The shipping in 1827 amounted to 360,500 tons, and the exports in 1828 were valued at 38,719,000 dollars, the imports at 23,834,000.

5732. *The city of New York* (fig. 928.), though not the seat of the principal government, may be considered in many respects as the

capital of the American Union. It is the largest, the most wealthy, the most flourishing, and the gayest of all its cities. It is situated on the Island of Manhattan, at the mouth of the Hudson, looking towards two channels formed by Long Island, one with the coast of Connecticut, called the Sound, or East River, the other with the coast of New Jersey. In these channels, and in the harbour, which admits vessels of 90 guns, the united navies of the world might lie in safety. We have elsewhere shown the great value of the commerce which comes down the Hudson, and which was estimated, even before the completion of the canal to Lake Erie, at 50,000,000 dollars. New York is the greatest commercial emporium in America, and, next to London, the greatest in the world. In its centre almost all the shipping and trade above mentioned as belonging to the state. In 1830, there entered its port 1510 vessels, the tonnage of which was 450,000. The imports in 1827 were valued at 38,700,000 dollars, the exports at 23,800,000. New York is a handsome town. The old part, indeed, where the great stir and business is still carried on, appears confused, crowded, incommodious, and is by no means kept in a desirable state of cleanliness. But there are two streets, called the Broadway, and the Bowery Road, which are long, spacious, and filled with handsome houses and shops. The Broadway is continued for upwards of two miles through the centre and highest part of the city, and contains many handsome houses built of red brick. For a certain space, it consists of private mansions; after these appears a range of shops, which are said to vie in magnificence with those of London. Wood is now prohibited as a building material, on account of the destructive fires which it has occasioned; but many of the old houses still consist of it. New York has handsome public buildings. The city hall is considered to have scarcely a rival in the Union. It is 216 feet long, 105 broad, and 51 high, built mostly of white marble, and in many respects with some taste; yet it manifests in others a certain incongruity and ill-timed economy. While the body of the building is of white marble, the basement is of red freestone, and the dome of painted wood; the windows are too numerous, and the edifice is otherwise frittered into too many minute parts. The same observation applies to many other handsome edifices in this and other American cities. The benevolent institutions of New York are very numerous; and the state prison and penitentiary are constructed on a large scale, supplied with working implements, as conducive to the reform of the criminals. The society in New York is numerous and gay, being composed of a great number of wealthy individuals. The upper class consists of rich merchants, leading professional men, and public functionaries; the second class, of shopkeepers, clerks, and subordinate officers of government. The gentlemen dress in the fashion of London, and the ladies in that of Paris; and it is observed, that, while the manners of Boston are decidedly English, those of New York are considerably tinged by French vivacity. There are two or three colleges and public libraries, though not on any great scale; but literary taste and the desire of information are rapidly spreading, even among the female sex. There are 4000 negroes, of whom 1700 are slaves. New York is not particularly healthy. It has repeatedly been ravaged by the yellow fever; consumption carries off annually a great number; and bad teeth are very prevalent. The extremes of heat and cold, and a luxurious mode of living, appear to be the chief causes of these last maladies.

5732. *The country towns are not numerous in this and the other states, the population being either accumulated in the great maritime cities, or diffused into little agricultural villages and townships. The traveller, however, who ascends the Hudson will find several, to which the busy trade of that river has given birth. The principal is Albany, at first built by the Dutch, in their heavy style, with the gable ends of the houses turned towards the street; but of late it has been greatly extended and improved, and has even, in preference to New York, been made the seat of government. Here the river ceases to be navigable for vessels of any size, and the Erie canal begins, the formation of which has contributed in an extraordinary degree to the prosperity of Albany. Hudson, thirty miles below Albany, and Troy, six miles above it, are both recent towns, which flourish by the same trade. Utica on the Mohawk, where the great canal joins that river, Rochester on the Genesee, where it is connected with Lake Ontario, and Buffalo, where it joins Lake Erie, are rising rapidly into importance. The celebrated forts of Crown Point and Ticonderoga, on the western shore of Lake Champlain, have been allowed to go to ruin. The plain of Saratoga, which the surrender of Burgoyne rendered so proud a scene in American history, is now remarkable for the profusion of mineral springs with which it is covered, and which it is expected will one day render it a scene of crowded resort.*

5733. *Pennsylvania is another of the middle states, and one of the most extensive and important in the Union. It forms nearly a regular parallelogram, to the south and westward of New York. The territory is almost wholly inland, since only at its north-eastern extremity it touches the heads of the Chesapeake and Delaware, and at its north-western the shores of Lake Erie. The Alleghany Mountains, here bending eastward, cross it in an oblique direction. Though a part of their sides is rude and rocky, there are rich valleys interspersed. The coast also consists partly of light and sandy soil; but most of the interior plains are composed of a rich and highly productive loam; so that Pennsylvania ranks, on the whole, among the most fertile of the Eastern states. It was founded, as already noticed, by a colony of Quakers, under the enlightened and benevolent Penn. They have been followed by numerous emigrants of various nations, chiefly Irish and Germans, with some Swedes and Dutch. The Quakers are now greatly outnumbered, not having above 54 out of 330 congregations; but their original influence has*

stamped a sedate, mild, and philanthropic character on the population. Agriculture is in a flourishing state in the eastern and southern districts, and land of good quality, in the counties immediately round Philadelphia, sells at thirty, forty, and even fifty dollars an acre. But the extensive tracts to the west and north are still in process of clearing, and land may be had for four or five dollars, or even less. The pastures are very extensive, and there is an excellent breed of cattle of the true Old English description. Coal exists in remarkable abundance; and in the western part there are extensive salt springs. Manufactures are more flourishing than in any other state of the Union. Those in iron alone were estimated in 1810 at nearly 6,000,000 dollars. The most extensive establishments are those formed at Pittsburg, for the supply of the western territory. The shipping amounted in 1828 to 104,600 tons, the imports to 10,100,000 dollars, the exports to 4,089,000.

5734. *Philadelphia* (fig. 929.), the capital of this state, is one of the greatest and most interesting cities of the

929

PHILADELPHIA.

Union. It occupies an oblong space, enclosed by the confluence of the rivers Delaware and Schuylkill. It was originally laid out on a regular plan, the streets being straight and crossing each other at right angles; and they are well paved, and kept very clean; so that, though not so brilliant and gay, this is a neater and more commodious city than New York. The literary establishments of Philadelphia, which owed their origin to Dr. Franklin, are the most respectable of the

new continent. The library founded by him now comprises from 22,000 to 24,000 volumes of very valuable works. There is a museum containing many interesting curiosities, particularly the entire skeleton of a mammoth. The seminary founded by Franklin as an "academy and charity school," is now called the University of Pennsylvania, and, in medical science especially, has no rival in any of the states. The Academy of Fine Arts possesses an extensive collection of casts, and of ancient and modern paintings, among which is West's celebrated picture of the Healing the Sick in the Temple, which was purchased for 3000 guineas. The American Philosophical Society has made some important contributions to science. Printing is carried on upon a greater scale and more elegantly than in any other transatlantic city. There were, in 1819, fifty-one offices, employing 153 presses, partly in newspapers and partly in reprinting popular British works. One of Sir Walter Scott's novels was, it is said, put in types in the course of a single day. With all these means and appliances, Philadelphia is scarcely so literary a city as either Boston or New York. It is celebrated, however, by its philanthropic exertions. The attempt to mitigate the severity of the penal laws by the penitentiary system has been more diligently attempted here than in Boston or New York. Here, as elsewhere, it has hitherto failed; but a new edifice has lately been constructed on so great a scale as to allow the principle of solitary confinement to be carried into full effect, and thus to give the system a fair trial. The best edifice in Philadelphia is the United States Bank, of white marble, in a style of pure Grecian architecture. The bank of Pennsylvania is also a handsome marble edifice.

5735. *Lancaster and Harrisburg* are rather thriving country towns on the Susquehanna, supported by the trade of that river, and by the richness of the surrounding districts. The population of the former place is half German; and six newspapers are published there; three in English and three in German. Harrisburg, notwithstanding its comparative smallness, is the seat of the legislature. As for Pittsburg, and the adjoining regions belonging to the river system of the Ohio, they appear to us so decidedly connected with the Western territory, that they will be considered more advantageously in connection with it.

5736. *New Jersey* is a long narrow strip between the Delaware and the Atlantic, and rather an appendage to New York than a separate state, which it began to be only in 1680. It is in general very flat, and about a fourth part of it, consisting of loose sand and pebbles, is very unproductive. The hilly tracts, however, afford good pasturage; and even on a great part of the level surface, buck-wheat and other grain is raised with success. The original settlers were Dutch; but the population was successively augmented by emigrants from England and Scotland, Quakers from Philadelphia, and Presbyterians from

New England; so that they form altogether a somewhat motley community. They distinguished themselves by their ardour in the cause of independence: the Jersey militia rendered eminent service in the battles of Trenton and Princeton. New Jersey, on a scale nearly proportioned to its size, has the same manufactures as the great neighbouring states. The shad and oyster fisheries are considerable; but its commerce is carried on almost entirely through the medium of New York. There is nothing which can be called a city; the principal places, Trenton on the Delaware, Burlington and Elizabeth's towns, on or near the Atlantic, being only pleasant country towns. The falls on the little river Pasaic (*fig. 930.*), are distinguished as among the most picturesque objects which the

PASAIC FALLS.

United States present. The effect is produced chiefly by the wild and varied scenery by which they are bordered.

5737. *Delaware* forms a still smaller strip, on the eastern coast of the bay of that name. It is a low territory, in some places sandy, in others marshy, the Cypress Swamp covering nearly 50,000 acres; but there is a great proportion of fine alluvial soil.

It was originally settled by the Swedes, then occupied by the Dutch, then ceded to William Penn, when it became part of Pennsylvania, from which it was separated in 1755, under the title of the Three Counties of Delaware. It produces wheat of fine quality, and has some important manufactures similar to those of Pennsylvania. Dover and Wilmington are two rather flourishing sea-ports, from which a considerable quantity of flour is exported.

SUBJECT. 3. *The Southern States.*

5738. *The Southern States*, so denominated from their situation to the south of those now described, are Maryland, Virginia, the Carolinas, and Georgia. They enjoy several natural advantages over their northern neighbours; particularly a more genial climate, and a soil capable of yielding in abundance rich products, which cannot grow under the bleaker sky of the north. These circumstances have led to the formation of a people essentially distinct from those hitherto described, and almost at variance with them. The Northern American joins with his agricultural pursuits a good deal of manufacture, and a most active commerce; the Southern American is purely agricultural. The one is active and stirring, the other indolent and luxurious; the one cultivates the soil as a farmer, the other as a planter. While in the one slavery is happily almost extinct, the other devolves upon his negroes the greater part of the labour. "The southern planter," says Mr. Lambert, "acquires his wealth not by the sweat of his brow, like the New Englander, but by the labour of his negroes. He lolls at ease in the shady retreat, drinking, smoking, or sleeping, surrounded by his slaves and overseers, who furnish him with the luxuries of life, without the necessity of his leaving the piazza." The northern merchant, on the contrary, is strenuously exerting himself from morning till night, exercising his faculties, expanding his mind, and enlarging his ideas by continual intercourse with people of every nation, and by correspondence with every part of the globe. The slaves are held in the most degraded state; their evidence is not received in a court of justice, and a penalty is imposed on any one teaching them to read. The lash is habitually applied to them; and instances are given by many travellers, and especially by Mr. Stuart, of their being treated with the most shocking barbarity, even by their mistresses. Yet their general treatment must be in some respects tolerable, since, without importation, they double their numbers in thirty years. A barbarous prejudice, also, still excludes the negroes, even when free, from all the privileges and rights of freemen. It must be confessed that the Southern Americans, especially in the sea-ports, are doing a good deal to redeem their character both for activity and for intelligence.

5739. *Maryland*, the most northern of these states, is situated on both sides of the great bay of Chesapeake. It borders on Delaware and Pennsylvania, and, though not extensive, is fertile and agreeable. The sea-coast and a range of mountains in the interior temper, in most places, the extremity of the heat. Though marsh and sand prevail in some quarters, the soil is, on the whole, extremely fertile. The wheat, barley, and potatoes are excellent; and both here and in Virginia tobacco forms the characteristic object of culture. The annual produce is estimated at 19,000 hogsheads. It is stronger than that of Virginia, and more esteemed in the north of Europe. The iron-works are extensive and productive. Considerable exertions have been made to establish manufactures, and the Union Manufacturing Company has a capital of a million of dollars; yet Maryland has not become a manufacturing state.

The commerce consists chiefly in the exportation of its raw produce, being almost all the tobacco grown, a great quantity of wheat flour, and some iron. In 1828 it had 171,000 tons of shipping; the imports and exports amounted each to 4,800,000 dollars. Maryland was first settled by Lord Baltimore with a colony of Roman catholics, whose descendants are still numerous. They introduced a very unusually tolerant spirit, so that the state served as a refuge from the persecution of the puritans in New England; and thus it soon became prosperous. The inhabitants are said to present the most favourable specimen that exists of the Southern Americans. They are distinguished by their agreeable manners, kindness, and hospitality. The labour, however, is devolved entirely upon the negroes. We must also observe, that Maryland is now rivalling New England in zeal for diffusing instruction. Several colleges have been founded, and large sums voted for the support of schools.

5740. *Baltimore* (*fig. 931.*), on a bay near the western head of the Chesapeake, is the

BALTIMORE.

931

largest city of the south, and now yields only to New York and Boston as a commercial emporium. There is no place of which the growth has been more rapid. Mr. Palmer assures us that there are persons so old as to remember when there were only twenty houses in it, and not a vessel belonging to the port. It now contains upwards of 80,000 souls; and the shipping, in 1828, amounted to 106,300 tons. The merchants of Baltimore are active and enterprising, and carry on trade with all quarters of the globe. Their schooners are the best constructed of

any in the world, and are no less fitted for trade than for privateering, in which capacity they made a great figure during the last war. The town is celebrated for the superior excellence of its flour, which seems owing both to the quality of the wheat and to a skilful mode of grinding. The citizens lay claim to peculiar distinction for hospitality, enterprise, and bravery. They recollect, with pride, the repulse given to the British army, and the death of General Ross in the attack of their city; they have erected a monument of brick cased with marble to the memory of Washington, and have reared several very fine churches, particularly the Roman catholic and the Unitarian chapel, the latter of which cost 20,000*l.* Although small vessels can come up to the place, the main harbour is at Fell's Point, about a mile distant, where a separate town has arisen. In 1805, a medical college was founded, and was extended, in 1812, to embrace other branches, under the title of the University of Maryland; but the plan has not hitherto been fully realised. Annapolis, the original and still the official capital, is agreeably situated on a peninsula farther down the Chesapeake; but it is now entirely eclipsed by Baltimore, compared to which it is a mere village.

5741. *Virginia* is the most extensive, the richest, and the most influential of all the

932

ROCK BRIDGE, VIRGINIA

Southern States; the centre of all the agricultural interest, the focus of democratic principles and of negro slavery. It extends far to the westward over the successive ranges of the Alleghany. These ranges, composed chiefly of limestone, are not above 2000 and 3000 feet high; but, being steep and wooded, with majestic rivers forcing their way through them, produce many striking and romantic sites. The most remarkable object is the natural rock bridge (*fig. 932.*), formed by some great convulsion of nature, which appears to have rent a mountain asunder from top to bottom. A fissure has thus been formed, about two miles long, and in some places 300 feet deep, the sides of which are joined at the top by a mass of rock, while they descend so perpendicularly that a plummet might be let fall from the edge of the rock to the bottom of the gulph. The stupendous arch thus formed is 213 feet in height, and spans at top 90 feet. From these mountains several fine rivers, the

James, the Rappahannock, and the Potowmac, descend eastward into the Chesapeake. The country for 100 miles inland is low and swampy, and becomes rugged in approaching the mountains; but though some districts suffer from these causes, Virginia in general is highly favoured as to soil; and her climate, being the most genial of the temperate zone, enables the finer kinds of grain and fruit to come to full maturity. The earliest settlement in all North America was made here by Sir Walter Raleigh, in 1587; and Virginia, named in honour of Elizabeth, was long the appellation by which the whole of this coast was known. The other states were gradually detached from it. Tobacco, wheat, and maize are the staples of Virginia, and afford a large surplus for exportation. Manufactures, notwithstanding some efforts to introduce them, never made any progress. The shipping amounts to 67,000 tons; its imports, in 1829, were valued at 3,783,000 dollars; its exports at 3,787,000. The greatest statesmen of America, Washington, Jefferson, Madison, have been natives of this state; yet much less has been done for the diffusion of knowledge than in almost any other. The legislature of Virginia, however, have of late gone far to redeem their character in this respect. In 1816, they voted 1,000,000 dollars for the support of popular schools; and several colleges, though not on a very large scale, have been recently erected.

5742. *The towns* in a district so decidedly agricultural could not acquire any great importance. Yet the commerce which necessarily results from so large an exportable produce has given rise to several flourishing and increasing ports on James River. Richmond, the capital, is situated considerably up that river, at a point, however, where it is still navigable. About 25,000 hogsheads of tobacco and 200,000 barrels of flour

CAPITOL, RICHMOND, VIRGINIA.

933

are said to be annually exported from it. Its improvement was effected chiefly by New England emigrants, who filled the houses as fast as they could be found. The Capitol at Richmond (*fig. 933.*) is in a commanding situation, and one of the best edifices in the United States; and the place is, in general, new and well built. At the mouth of James River, after it has spread into a little bay, is Norfolk, also thriving, neat, and very commercial. On another branch of the river, Petersburg enjoys a considerable degree of prosperity, manifested by the rapidity with which it was rebuilt, after half of it, in 1816, had been burnt to the ground. Wheeling derives importance from its situation on the route to the Western Territory.

5743. *Columbia*, destined to contain the capital of America, is a small segment, ten miles square, cut off from Virginia and Maryland at their point of junction. It stands nearly in the centre of the Eastern or Atlantic states, their extent to the north and south of it being about equal. It derives importance also from commanding the navigation of the Potowmac, one of the greatest rivers of this region, descending from the heart of the

GREAT FALLS ON THE POTOWMAC.

934

Alleghany. Navigation, however, has been seriously obstructed by the succession of falls which interrupt the course of that river. The great falls (*fig. 934.*), fifty-nine miles above Washington, form one of the grandest scenes which the United States present. The perpendicular descent is seventy-six feet, but the rapids extend for several miles up the river. A stupendous projecting rock covered with cedar affords a spot from which the romantic scenery and the impetuous dashing of the waters may be contemplated. At the close of winter, vast masses of ice, rolling over

the rocks with a hideous noise, present a scene truly sublime. Canals of several miles in length, and cut in several instances through the solid rock, enable vessels to evade these formidable obstructions, and to ascend the river to the height of 219 miles.

5744. *The city of Washington* (*fig. 935.*) has been built by the American government as its own chief seat, and also in the expectation of its becoming the greatest and most splendid metropolis in the New World. The situation is fine, on a somewhat elevated ground, at the angle formed by the two branches of the Potowmac. The plan is represented as almost unrivalled for regularity and beauty, forming a parallelogram of four miles by two and a half. The greater number of streets meet at right angles; but the main avenues cross these diagonally, while the public buildings are placed in situations which it is expected will give them the happiest effect. Unfortunately all this is only prospective: the plan, instead of being carried regularly through, has been taken up at a number of detached points, six houses here and twelve there, so that no order is yet perceptible; and the

city consists only of straggling clusters placed at an inconvenient distance from each other.

WASHINGTON.

The expectation of its deriving greatness from commerce has not yet been fulfilled. In the Capitol (*fig. 936.*), or house for the assembling of Congress, no cost has been spared to produce the utmost possible magnificence. Nine hundred marble columns have been imported, and the talents of four artists have been employed upon it. The British set fire to the edifice during their temporary occupation in the last war, a somewhat barbarous proceeding; to which they added another truly gothic, that of burning the

national library. The official house of the president is also very splendid.

5745. *North and South Carolina, and Georgia*, may be considered together, as partaking

936

THE CAPITOL AT WASHINGTON.

one general character. The extensive space which they occupy fills up the remainder of the old or eastern portion of the Union. The "endless" chain of the Alleghany continues still to form the western boundary; but, in its oblique course receding always farther from the coast, it leaves an interval of nearly 200 miles in breadth.

Through the middle of it there runs a large tract, nearly forty miles broad, of sand hills, which are capable of bearing nothing but the pine tree, and are thence called pine barrens. Along the sea-coast there is a great extent of swamps and morasses, generally unfit for culture, and injurious to the salubrity of the climate. The banks of the rivers, however, and the ranges of the lower hills, where the ground is not absolutely swampy, contain a great extent of the finest soil. Here begins to prevail a class of productions differing from those of Virginia, and partaking more of a tropical character. Wheat is no longer grown with equal success, though maize continues to form the staple food of the lower orders. Rice and cotton are the chief products of all these three states. The former is singularly favoured by the superabundant moisture which prevails in all the low maritime tracts; and Europe derives from Carolina almost all that it consumes of this grain. The cotton, which loves a dry soil, finds in the sandy tracts on the sea-coast and neighbouring islands a most favourable situation. The cotton produced under the name of Sea Islands bears a higher price in the market than that of any other region of the globe. The rapidly increased and now immense market which Europe, and, above all, Britain, afford for this material of its most extensive manufacture, has greatly enriched these states, by whom cotton is found more profitable than any description of grain. There are some domestic manufactures, chiefly of cotton; but, on the whole, this branch of industry ranks lower than even in Virginia. The commerce consists in the exportation of rice and cotton, in exchange for manufactured goods, wines, and the produce of the East and West Indies. The gold mines of North Carolina, discovered only within the last twenty years, have acquired a very considerable importance. The annual produce is now estimated at about a million of dollars. The Carolinians are perceptibly inferior to their countrymen of the other states in respect to education; but colleges are now founded, one in North Carolina, two in South Carolina, and one in Georgia; and sums have been voted for the support of common schools. The Carolinians are courteous and rather polished in their manners; yet they have been accused of leading an idle and dissipated life, of being addicted to spirituous liquors, gambling, horse-racing, cock-fighting, duelling, boxing, and gouging; but Mr. Warden assures us that they are improving in all these particulars.

5746. *Charleston*, the capital of the Carolinas, is agreeably situated at the head of a bay and at the confluence of two small rivers, the Ashley and Cooper. This situation forms an excellent harbour, which enables it to engross almost the whole trade of the country, though it is thirty or forty miles distant from the Santee, its largest river, which traverses nearly its whole extent. Charleston contains a number of good streets and handsome houses, which, at least those that are well situated, bear a very high rent; many being from 300*l.* to 700*l.* a year. They are spacious, furnished with balconies, verandas, and every appurtenance which can render them a cool and pleasant retreat from the scorching rays of the sun.

The place, however, wants some of those accommodations which exist in the industrious cities of the north. The streets are unpaved, unless with brick footpaths; and in windy weather, whirlwinds of dust and sand fill the houses and blind the eyes. Swamps and morasses, which surround the place, are allowed to become the receptacles of stagnant water; and the bodies of dead animals, instead of being buried or burnt, are thrown out to be devoured by birds. These disadvantages must injure the purity of the air, and render Charleston liable to those fevers which have repeatedly proved most destructive to it. All the indifferent and some of the good houses are constructed of wood; but the best are built of a dark-looking brick, and the streets are agreeably shaded by a spreading umbrageous tree, called the Pride of India. The great planters reside in Charleston for a part of the year, and spend their time in profuse jollity and hospitality. There are instances, it is said, of individuals among them possessing 20,000*l.* a year, and many have 4000*l.* or 5000*l.* They readily contract debt, and are slow and uncertain in paying; which renders the situation of men in business very precarious. Intellectual pursuits are comparatively little regarded; there is a library and museum, but both on a small scale.

5747. *Georgia* has for its chief town *Savannah*, built at the mouth of the great river of the same name, which has a long course on the line of the Carolina frontier. The town stands on a sandy cliff, about fifty feet above the river, and, though built much more of wood than of brick, is well laid out for a warm climate, with spacious streets and wide squares. It is, however, unpaved, and the passenger is annoyed by the deep sand into which his foot sinks, and which is blown about him by the wind. There is an agreeable walk or mall along the margin of the height, commanding an extensive view of the river and of the surrounding country, bounded by immense forests. The wharfs and warehouses extend along the river, and form a sort of lower town. The Georgian planters are less opulent than those of Carolina, and have not the same free and generous extravagance; on the contrary, their economy is alleged to be somewhat severe; and yet it is asserted that they manifest the same tardiness in the payment of their debts. They are equally fond of horse-racing and jockeying, and are represented to be on the whole ruder and more addicted to the violent and unfair modes of fighting which disgrace the southern states. *Augusta* is a pleasant town, 236 miles up the river, and not only collects the cotton of a very rich surrounding district, but carries on a trade with the Indians. Three newspapers are published there. *Milledgeville*, a still smaller place, has been made the seat of government. *St. Mary's* is a little town on the frontier of Florida.

5748. *Florida, East and West*, forms the southern boundary of the part of the continent which is occupied by the long line of the United States. *East Florida* is a peninsula of 400 miles in length, stretching southwards and forming the boundary of the Gulf of Mexico. *West Florida* is a long strip, extending along the northern interior of that gulf. Its surface greatly resembles that of the low tracts of Carolina and Georgia, sandy and swampy, covered in some parts with superb tropical forests, and in others capable of good cultivation, particularly of cotton. The European settlements are small, few, and scattered, and much harassed by the neighbouring Indians, who occupy the greatest proportion of the territory. The Floridas belonged to Spain till 1819, when they were ceded by treaty, and have since formed a territory of the Union, though not yet raised to the rank of a state. All the towns of Florida are small. *Tallahassee*, in the interior, has been made the seat of government, and invested with the name of a city, but has as yet nothing more. The largest place in *East Florida* is *St. Augustine* on the Atlantic, with a population of not quite 5000 inhabitants. *Pensacola*, in *West Florida*, is smaller, notwithstanding its excellent harbour.

5749. *Alabama* is a tract which runs up into the interior from *West Florida*, and having been severed from Georgia, was first formed into a territory, and in 1820 became a state. The surface and soil generally resemble those of Georgia, though the upland, being considerably elevated above the sea, is reckoned more healthy than most imperfectly cleared tracts under the same latitude. It is finely watered by the large rivers *Alabama* and *Tombeckbee*, which unite in the *Mobile*. The plantations are becoming tolerably extensive, especially in *Madison county*; but a great part of the region is still occupied by the different tribes of *Creek Indians*, of whom the *Lower Creeks*, or *Muscogeas*, are the most numerous. *Mobile* is advantageously situated at the head of a deep bay of the same name, with an excellent harbour; and though it does not at present contain a population of more than 3000, it will, doubtless, one day attain an importance proportioned to the extensive inland navigation of which it has the command.

SUBJECT. 4. *The Western Territory.*

5750. *The Western Territory* is generally understood to comprehend that extensive region which lies between the Alleghany and the Rocky Mountains. Its extent, position, and general features have been already exhibited. It excites a deep interest, less by its actual condition than by its vast capacities, and by the prospect of the mighty nations with which, at no distant period, it will doubtless be covered. A close and continuous tide of immigration has for

the last thirty years set in from the eastern to the western states. It consists partly of emigrants from Europe, but chiefly of the natives of the eastern states themselves. The Americans are enterprising travellers; they consider every part of the States' territory as their country; and are easily impelled, not by distress and necessity only, but by any feasible prospect of advantage, to migrate from one to another of its most distant quarters. "Old America," says Birkbeck, "seems to be breaking up, and moving to the westward. He who crosses the Alleghany is seldom out of view of family groupes, conveying in light waggons, drawn by two horses, their children, provisions, and the whole of their movables. Thirteen or fourteen of these passed daily through Pittsburg down the Ohio." The number of above 3,000,000, to which the western population now amounts, and which has been formed solely by this process, sufficiently attests its great extent. The object of the emigrant is to become a proprietor and cultivator of part of that immense unoccupied territory, which the States' government sells at the low rate of two dollars an acre. In the land offices a division is formed into townships of six miles square, and this is divided, by perpendicular lines crossing each other, into quarter sections of 160 acres, and each lot being numbered, there is no room for litigation or controversy. The emigrant chooses his lot, pays a quarter in advance, and the other instalments at the end of two, three, or four years. In case of failure, he forfeits the purchase; but considerable indulgence is shown in this particular.

5751. *The situation and prospects of the emigrant* have been variously estimated. His beginning is very hard. He must construct a house of logs, with difficulty rendered secure from wind and rain. He has to fell huge trees, drag them together, and burn them. He has then to penetrate with the plough the yet unbroken ground, and to wait a considerable time before any produce arises. All this he must do by the labour of his own hands and those of his family; for there are no servants to be hired, no one coming into the woods to officiate in that capacity. Even after the land is made to yield its produce, he has very little means of converting it into money, either to replace his advances, to procure foreign luxuries, or to enrich himself. Mr. Birkbeck, after five or six years' residence, had only as many dollars as he had pounds when he left England. The only mode of making money is by purchasing large lots of land, and selling them in retail; but even this has been found a losing concern, in consequence of the late depreciation of property in both continents. Many of the tracts are also unhealthy, and even fatal, in consequence of the swamps and the inundations to which many of the townships are exposed from an injudicious choice of site. In short, a late traveller, who seems candid, declares, that any one who had any prospect of making a decent livelihood in England would be a fool to remove to the Illinois. But for a class which belongs to that of the labourer, or is little removed above it, there is a certain prospect of procuring, in abundance, the necessaries of life, and securing them even to the largest family. There is the pride and independence of landed property to tempt the emigrant, and the prospect of a gradual and constant improvement of his condition.

5752. *Forest and prairie* are the two grand features which mark the surface of this western wilderness. Forests predominate in all that tract which is nearest to the eastern states, and immediately beneath the Alleghany. They consist of lofty primeval trees, which rise often to an amazing height. In the rich tracts, they sometimes exhibit a grand assemblage of gigantic objects, which carry the imagination back to other times, before the foot of a white man had touched the American shore. The white oaks are seen rearing their magnificent stems without a branch to the height of seventy or eighty feet, terminating in full luxuriant heads. The roads are formed by merely cutting down one tree after another, and thus opening so much space as will allow a horse or light waggon to pass. To travel through these mighty woods is at first grand and imposing; but it soon produces an impression of confinement and gloomy monotony. "To travel day after day, among trees of a hundred feet high, without a glimpse of the surrounding country, is absolutely oppressive. The effect must be the same on the solitary settler, whose visible horizon extends no farther than the tops of the trees which bound his plantation; perhaps 500 yards. Upwards he sees the sun, and sky, and stars; but around him an eternal forest, from which he can never hope to emerge." These trees, as already observed, present a most serious obstacle to cultivation. The prairies exhibit quite a different scene. They consist of endless meadows, without a tree or even a shrub, and in which the grass rises to the height of four, six, or even eight feet. It is in approaching the Mississippi, that they begin to appear. The grand prairie reaches from Lake Michigan, nearly to the Ohio, about 300 miles in length, and twenty-five to thirty in breadth. The region west of the Mississippi consists almost entirely of one boundless prairie, reaching even to Mexico. The Indians, and sometimes the Europeans, set fire to these prairies, when the flame spreads with tremendous rapidity, and is said to present one of the grandest and most terrible spectacles in nature. The flame rushes through the long grass with a noise like thunder; dense clouds of smoke arise; and the sky itself appears almost on fire. Travellers then crossing the prairie are in serious danger, which they can only escape by themselves setting fire to the grass round them, and

taking shelter in the burnt part, where the approaching flame must expire for want of fuel. Nothing can be more melancholy than the aspect of a burnt prairie, presenting a uniform black surface, like a vast plain of charcoal. These conflagrations are said to be by no means injurious to the soil, unless in so far as they damage some of the bordering enclosures. A prejudice at one time prevailed against the prairies as not fit for cultivation; but this has been found erroneous; and they are the more in request, as it is a most important object to save the labour of clearing away the wood.

5753. *The character of the infant society* in this western region, as in the rest of the states, does not present the same marked features as one composed of simple and native elements. The people are an aggregate from the various nations of the New and Old Worlds, who bring their native habits, and some of whom come expressly to indulge peculiarities which are checked by the order of European society. However otherwise varying in external appearance, they are soon formed to one complexion, from which every tint of beautiful bloom disappears, giving place to a pale yellow. This, Mr. Birkbeck imputes to what he calls the incarceration of a thorough woodland life, where the dark and crowded air is deprived of some portion of its vital principle. Buried in the depth of a boundless forest, the breeze of health never reaches them; they are tall and pale, like vegetables that grow in a vault, pining for light. Thrown together into this vast solitude, they are cordial, friendly, and hospitable; and all the families within many miles are well known to each other. This good disposition is much impaired by a violently litigious spirit, fostered by a set of half-bred pettifogging attorneys; and which often places one half of a village at open enmity with the other. Indolence is observed to be a prevailing fault; the settlers boast of it as a privilege of freedom, and it is fostered by abundance of the necessities of life, and by the absence of any refined or intellectual tastes to rouse the mind from listless inaction.

5754. *The backwoodsmen, divided into the classes of squatters and hunters*, form a peculiar society, beyond the regular pale of settlement. The squatters are those who established themselves upon unoccupied lands, not only without any regular right, but for some time without specific pursuit or object. When, however, the states began to dispose of these lands in a regular manner, the squatters, who could produce no title-deeds, and were unwilling to purchase any, were warned to move farther to the westward, which they did not unwillingly, as the new settlers were ready to give them a good price for their buildings and stock. They form thus a sort of irregular pioneers, in advance of all the settlements. Beyond them are the hunters, who never cultivate, and refuse all occupation except the chase of the bear, the buffalo, and the raccoon, and the bringing down birds with their rifle; unless when they take excursions of 1000 miles to trade with the Indians. They live in rude cabins of unhewn logs, with large intervals between each, through which the smoke escapes; their only furniture is timber cut into a rude resemblance of beds, tables, and chairs; their only covering the skin of the bear and the buffalo. A bad name has been given to them as perilous neighbours; their habits are, in fact, half Indian; and some desperate outlaws, having found shelter in these outer confines of the civilised world, have committed depredations with impunity. But as a body, they have been found by recent travellers to be hearty, honest, and hospitable; in short, persons from whom no danger was to be apprehended.

5755. *Kentucky and Tennessee*, the first settled and most fully peopled of the western states, are prolongations westward of Virginia and North Carolina. They reach from the Alleghany to the Mississippi, and border southwards upon Georgia and Alabama. They are nobly watered by the Tennessee and the Cumberland, which fall into the Ohio, and by the Ohio itself, which forms the northern boundary of Kentucky. The soil almost throughout the whole extent is particularly rich; and Indian corn, rye, and oats grow there in greater abundance and excellence than in any part of the Eastern Union. Wheat of fine quality, hemp, and tobacco are the chief objects of culture in Kentucky; in Tennessee they are in a great measure supplanted by cotton. Cattle and hogs are bred in great numbers. The difficulty of importation has led to manufactures on a greater scale than might be expected; and Kentucky alone employs 24,000 looms. The deep stain of the slave trade has been transferred from Virginia; and in 1830, Kentucky contained 165,000 slaves, and Tennessee 142,000. This gives the people habits of indolence, and a disdain of homely occupations, very unsuitable to the circumstances of such a state. Yet the Kentuckians are on the whole well spoken of. They are said to be high-spirited, frank, and hospitable, full of patriotism and ardour in the cause of liberty. In point of intelligence, they approach nearer to the people of the northern than of the southern states. The taste for reading is general; there are four or five colleges, numerous academies, and a school almost in every township. The people live in rude plenty, eating meat three times a day; are fond of dancing, and rather too fond of gaming. Their commerce, which is limited, is carried on either over the rugged roads of the Alleghany, or down the Ohio and Mississippi; a line of 2500 miles, which even in a steam vessel it requires about twelve days to ascend, and nine to descend. Lexington, the ancient capital, is still the most genteel

residence, and contains a college, increasing in reputation, though rather deficient in discipline. The seat of government is now transferred to Frankfort, a small neat town on the Kentucky. But the most flourishing place is Louisville, advantageously situated on the Ohio, immediately beneath the great rapids which interrupt the navigation of that river. The navigation on the western rivers has been prodigiously improved by the introduction of steam vessels, of which, according to Mr. Stuart, there are now 300 or 400 constantly plying upon them. The voyage from New Orleans to Louisville, which once occupied ninety-five days, is now performed in eleven or twelve, and the passage money is only 8*l*.

5756. *The noble and rapidly advancing state of Ohio* is situated on the northward of Kentucky. The river from which it derives its name, though reckoned only a fourth rate in the Western World, is as large as the Danube, and it receives four great tributaries, all, like itself, of safe and easy navigation. It flows in a clear and beautiful stream, and, according to Mr. Stuart, has, with its tributaries, 5000 miles navigable for boats. The only obstruction formed by the rapids above Louisville will be remedied by a canal now in progress. The soil is perhaps the most luxuriantly fertile on the face of the earth. Instances have been known of 4500 bushels of grain having been reaped from eighty acres. It produces in perfection wheat, rye, and particularly maize; in some parts tobacco and cotton; and the trials of silk and wine are promising. Here, as in Kentucky, there are considerable iron and cotton manufactures. The commerce is obstructed by the same causes as in Kentucky; but when the communication with Lake Erie is opened, there will be a continuous navigation to the Hudson and the Atlantic.

5757. *Several large towns* have arisen in this fertile region. Pittsburg, as already observed, should be considered as belonging to the territory for whose supply its manufactures are carried on. Pittsburg has been called the Birmingham of America. This pompous term caused disappointment to Mr. Birkbeck, who saw in it little analogy to its European prototype; but, for a new country in the New World, its flourishing state is very creditable. The situation, at the point where the Alleghany and Monongahela unite in forming the Ohio, is most favourable for the trade of the Western Territory. Iron-works, the material of which, including coal, the neighbourhood amply affords; glass-houses, flour mills, render it a busy scene. Cincinnati is situated considerably farther down the Ohio, and is the real capital, though at its south-western extremity. This city, sprung up in a few years amid so vast a desert, presents already ranges of commodious well-finished brick houses, spacious and busy markets, substantial public buildings, thousands of prosperous well-dressed industrious inhabitants, houses and boats building, streets levelling and paving, crowds of country people constantly coming and going. The place, though somewhat too close to the river, is well built, on a regular plan, only part of which, however, has yet been filled up. It carries on a most extensive trade up and down the Ohio, by the Mississippi, along the Ohio canal, which here joins the river, and also by the Miami canal. Columbus, pleasantly situated on the Scioto, though the seat of government, is as yet of small comparative importance. Zanesville, Lancaster, and Chillicothe are advancing towns, in convenient but unhealthy situations; for, according to Mr. Birkbeck, gain is the alpha and omega of the founders of American towns.

5758. *Indiana*, an outer region to Ohio, is the resort of those who wish to have choice of land at moderate rates. It is therefore the main receptacle for new settlers, of whom many are from Scotland. The indispensable labour of clearing, and the vicinity of the backwoodsmen, are the chief inconveniences. Yet it has advanced with astonishing rapidity, the population between 1810 and 1830 having increased from 24,000 to 341,000. Still its towns, Indianapolis, recently made the capital, Vincennes, early founded by the French, Corydon, Madison, are all only rising villages. The most remarkable place is Harmony, on the Wabash, long occupied by a body of sectaries, under the sole spiritual guidance of one Rapp, who not only instructed them, but directed their industry and received all its proceeds. A strict rule of celibacy, seemingly very ill suited to this part of the world, was imposed upon them. Some years ago, he removed to Economy in Pennsylvania, having sold his establishment to Mr. Owen, who attempted to realise there his peculiar views of society, but without success; and he has since abandoned the place.

5759. *Illinois* is still an outer tract to Indiana, separated from it by the Wabash, and extending to the Mississippi. The river from which its name is derived has a steam navigation of 400 miles, and receives the Kaskaskia, which has between 300 and 400. Its whole boatable navigation is estimated at 4000 miles, and a canal is in contemplation to unite the Illinois with Lake Michigan. Mr. Stuart, who recently traversed this state, describes it as one of the finest countries in the world; two thirds of it being composed of beautiful and fertile prairies finely diversified with wood. The population has tripled within the last ten years. It possesses lead mines of extraordinary richness, which, in 1830, yielded 8,323,000 lbs. Vandalia ranks as the capital, but Shawnee Town is rather a larger village. Albion and Princeton are rising into some importance.

5760. *Michigan* and the *North-west Territory* are yet in their infancy. They extend along the lakes Huron, Ontario, and Michigan, which last forms the boundary. The climate is

colder than in those last described, but the soil is in many places very fertile, and the vast command of lake and river navigation must one day raise it to great importance. At present, the only settlements in Michigan are in the vicinity of Detroit, a pretty considerable village, and once a strong military post. The north-west is yet almost wholly occupied by the various tribes of Indians, with a few settlements formed by the French when they were masters of Canada. The north-west extremity of this state is very elevated, and contains a chain of smaller lakes, from one of which issues the Mississippi, while from another the Red River flows northward to Lake Winnipeg.

5761. *The state of Mississippi*, on the lower part of that great river, remains still to be described, before we pass to the western side. It has obtained a bad reputation from the aspect of its coast, which is merely a tract of barren sand, bearing nothing but pines; while, higher up, the land is swampy and subject to inundation. But in the interior, between the Mississippi and the Yazoo, there is a tract which has been described as the garden of America. It is covered with large herds of cattle, which are not even housed; and maize and cotton are cultivated with advantage, but chiefly by slaves. Natchez, an unhealthy station, Jackson, the seat of government, and Washington, about 300 miles up the river, carry on all the trade of the state, which does not, however, render them very considerable.

5762. *Louisiana* is the only other state east of the Mississippi. It comprehends the delta of that river, about 200 miles in length, and 100 in breadth, the whole of which space is intersected by numberless branches of the Mississippi and of the Red River, which comes from the frontier of Mexico. These streams, between the months of March and June, are swelled by floods coming down from the Ohio and other northern waters, and are then liable to inundation. To avert this calamity, there has been formed a great work — a *levée*, or mound of earth, from four to six feet high, parallel to the margin of the stream, which is thus confined within salutary bounds. Sometimes, however, in high floods, the waters burst the *levée*, when they rush with indescribable velocity, like a cataract, foaming and carrying every thing before them. The country is laid desolate, and all hands must hasten to the spot to repair the breach. Indeed, whenever the river is high, all its borders are kept in a state of constant alarm. By a survey made in 1828, it appeared that 5,000,000 acres in this state are rendered unproductive by inundation. There is, however, a great extent of fertile alluvial lands, on which large herds of cattle are fed, and good crops raised of sugar, rice, and cotton. The capital invested in sugar plantations is stated at 45,000,000 dollars. Wheat and maize it has been found more advantageous to import from the higher country.

5763. *New Orleans* is situated on the main branch of the Mississippi, about 100 miles above its mouth. It has rapidly risen to be one of the principal ports of the United States, and its increase must be progressive, since it is the only outlet for the immense mass of commodities brought down from the Western Territory. The population has rapidly risen from 10,000 to 46,000, which it had attained in 1830. The imports amounted, in 1829, to 6,857,000 dollars, the exports to 12,386,000; but it has only 51,000 tons of shipping, the trade being chiefly carried on by vessels from other quarters. The town, which was only of wood, has been much improved, and built, in a great measure, of brick, yet it contains no very elegant public buildings: five newspapers have been set up, and a college founded. The Catholics, who originally composed the entire population, are now a minority: the new settlers are aggregated from various parts of the Union and of Europe, and are said to be somewhat irregular in their habits. The climate is extremely unhealthy, and many of the merchants make it a mere temporary residence, with the view of raising a fortune.

5764. *The Missouri territory* is the name given to all that immense range which extends from the Mississippi to the Rocky Mountains. The state of occupation is singular, almost the whole being as yet in the undisputed possession of the Indians, while the States rank it always as an integral part of their territories. They maintain their right against all European or civilised states; and they expect to purchase from the Indians the whole territory in proportion as it is wanted. A certain quantity of arms, provisions, and brandy has always been found sufficient to procure the peaceable cession of any desired tract. The Indians do not know very well what they are doing, when for such trifles they sell so mighty a birth-right. At the same time, so incalculable are the benefits to the human race from the transference of this interior world to civilised possessors, that it would be great pedantry to criticise so peaceable a mode of effecting that salutary change.

5765. *The Missouri country* consists of a succession of great valleys formed by mighty rivers rising in the Rocky Mountains, flowing eastward to the Mississippi and the Missouri. Beginning from the south, the first in order is the Red River, which rises in Mexico, and, after a course of 1450 miles, falls into the Mississippi, about 240 miles above New Orleans; being navigable about 1000 miles, though with some obstructions in the dry season. This river brings down a vast mass of alluvial matter, from the colour produced by which it derives its name. Next, the Arkansas, by a parallel line of 2173 miles, falls in about 500 miles higher up; being navigable for boats 1981 miles. Twenty-two miles higher, the Mississippi receives the White River, after a course of 700 miles, 600 of which are navigable. The next grand

feature is the junction of the Missouri, which thenceforth receives all the streams descending from the western boundary. First, the Grand Osage falls in after a winding course of upwards of 1000 miles through very fine country. Next, the Kansas, a still larger stream, said to be navigable for more than 300 leagues. Higher up, enters the La Platte (Spanish La Plata), after running 2000 miles. The Running Water, the White River, and the Chayenne, though each 600 or 700 miles in length, are scarcely worth mention; but even in approaching to its mountain origin, the Missouri receives an immense river, the Keheetsa, or Yellowstone, which flows nearly 2000 miles through the valleys and along the base of the Rocky Mountains, and has been navigated 837 miles up. On the other side, in the interval between these two mighty streams, the Grand River, the Sioux, and the Jaque River flow into the Missouri, the Des Moines and St. Peter's River into the Mississippi. We omit a host of smaller streams and tributaries.

5766. *The soil of this immense tract* is various, and not so uniformly fine as that of the country between the Mississippi and the Alleghany. The general character is prairie, and in many parts there is not wood sufficient to supply a settlement; but this defect, in due time, could be supplied by floating down timber from the forests which extend along the Rocky Mountains. On the Missouri, above the Osage, there is said to be 30,000 square miles, equal to Kentucky. Beyond the Osage is a vast space, which appeared to Mr. Brown the finest country he had ever seen, except that it is somewhat deficient in wood and water. The banks of the Arkansas are in many parts stony and barren; but those of the White River are very favourably mentioned. There are in this tract two extensive deserts. One lies between the American and Spanish territory, and is of great extent, reaching along the whole eastern bank of the Mexican river Del Norte, 200 to 500 miles in breadth, and from the Gulf of Mexico to the Missouri. It is extremely saline, and abounds with marine exuviae. Two thirds of the springs are as salt as the sea; and in every direction through its small craggy mountains, large quantities of rock salt can be dug. The Red and Arkansas rivers, flowing through this plain, are extremely salt. The other desert is a feature unique in America, an extensive surface of moving sands, extending between the Platte and the Missouri, and resembling in character those of the African Sahara.

5767. This district, notwithstanding its remote situation, has been rapidly settled; and the *state of Missouri*, formed in 1820, is daily increasing. It extends along the banks of the river of that name, about 200 miles west from the Mississippi. The soil is fertile, and agriculture labours under no disadvantage except the want of timber and stone for fences. There is a large district peculiarly abounding in lead, from which, in 1831, about 6,500,000 lbs. were extracted. The command of the navigation of the Mississippi gives it high importance and some trade is also carried on with the Indian tribes.

5768. *The settlements on this territory* are as yet few and small, and formed rather with a view to trade with the Indians than to cultivation. St. Louis, founded by the French in 1764, in a very fertile territory below the junction of the Missouri with the Mississippi, is the chief place of outfit for the Indian traders. Immediately above the junction is St. Charles, also considerable. Descending the river, we find the small villages of Carondelah, St. Ferdinand, and St. Andrew's; Herculanum, where boats are built; St. Génévieve, a larger village, where the inhabitants have a field of 700 acres, which they cultivate in common, and to which a considerable quantity of lead is brought from mines in the interior; New Bourbon; New Madrid. Jefferson, selected as the seat of government, is as yet in its infancy.

5769. *Arkansas* is a territory formed of the region extending along that river, and reaching to the Rocky Mountains, and even to the frontier of Mexico. This tract is ill explored and very thinly inhabited. Along the lower course of the river, the soil is swampy and the climate unhealthy; but in the upper and western tracts an improvement takes place, and great part of the surface is covered with luxuriant herbage. Cotton is the chief article of culture, with which are combined wheat and maize. Little Rock, the capital, is, as yet, scarcely entitled to the appellation even of a village.

5770. *The Indians*, who as yet occupy the vast region to the west of the Missouri, retain still unaltered all the features of the savage character. They procure food almost solely by hunting; and to surprise a hostile tribe, to massacre them with every exercise of savage cruelty, and to carry off their scalps as trophies, is their highest ambition. Their domestic behaviour, however, is orderly and peaceable; and, whether from fear or friendship, they seldom kill or rob a white man, even when an opportunity offers. Yet, although the Americans boast of mild and equitable proceedings towards them, and they cannot resist the temptations offered to them to part with their territory, a deep jealousy appears to be felt, since, during the last war, they almost unanimously took part with the English. Considerable attempts have been made to train them to the habits of civilised society; and in some places, where they are entirely locked in by European settlements, they have become fixed, and have even multiplied; but elsewhere, the moment that any impulse was given to war and hunting, they have instantly thrown up every other pursuit, and reverted to all their original habits. The Sioux are the most powerful and unbroken of these tribes: their

numbers are estimated by Lewis and Clarke at 6000, of whom 2550 are warriors; but they are branded as the vilest miscreants of the savage race, and the pirates of the Missouri. Other powerful tribes are, the Black Feet Indians, 5000; Kite Indians, a most fierce and savage race, 3000; Crow Indians, 3560; Dog Indians, 1250; Pierced Nose Indians, 1400; Big-bellied Indians, 2000; three tribes of Osage Indians, 4000. The whole number enumerated by Lewis and Clarke, and Major Pike, is about 70,000; and supposing the actual number to be double, this is almost nothing compared to the immensity of the limits over which they wander.

CHAP. IV.

NORTHERLY REGIONS OF AMERICA.

5771. The regions now described, occupied by Europeans, or the descendants of Europeans, comprehend scarcely a half of the surface of North America; there remains a vast expanse held still, almost undisturbed, by its native tribes. Three powers, indeed, Britain, Russia, and the United States, have by admitted claim or treaty partitioned the whole territory among them. It is, however, neither possessed by them nor even known, unless in the lines crossed by hunting or exploratory expeditions; and in one direction by a few stations, at vast distances, called *houses*, erected by the fur companies, and slightly fortified, so as to be impregnable by the scanty bands of savages who traverse this region. The demarcation is traced, therefore, not by the features of nature, which are unknown, but by mechanical lines, traced on a map, according to the degrees of latitude and longitude. This arrangement appears to be premature. It seems enough if civilised nations rank as their own the countries of which they have actual possession, not those of which they have only a remote and prospective occupation.

SECT. I. General Outline and Aspect.

5772. This portion of America is of very irregular form, and some of its limits are exceedingly vague. On the south it may be stated to be bounded by Lower and Upper Canada, and by the United States, particularly that district called the North-west Territory. To the west, a large portion of it, extending southwards, called by the Americans Columbia, or Oregon, is bounded on the east by the Rocky Mountains, and on the south by the Mexican territory. All the other boundaries are maritime, and are, on the east, the Atlantic, broken into numerous and deep bays; on the north, the Arctic Ocean, ranging in a varying line between the 70th and 74th degrees of latitude; on the west, the Pacific, forming a very winding line of coast diversified by numerous islands. This region may, therefore, range from 60° to 168° of west longitude; making, in this latitude, a length of about 4000 miles; while the general breadth may be considered as lying between 50° and 70° of latitude, and amounting to about 1600 miles.

5773. The general features of this vast region are so little varied, and also so imperfectly known, that they may be described in few words, and cannot afford room for the usual subdivisions. A very large proportion is bleak, and chilled beneath the influence of an arctic sky. Even extensive tracts, endowed with great natural fertility, are destitute of culture, and covered with pine forests. The only commodity fitted for trade consists in the skins and furs of the numerous animals by which it is tenanted; and these, being destined to

defend against the rigour of an arctic climate, are exceedingly rich and valuable. To obtain them is the chief motive which has impelled Europeans to traverse the expanse of these boundless and dreary wilds. The native inhabitants are thinly scattered, and are all in the savage state, the rudest under which human society can exist. Some display all the ferocity incident to that character; while others are comparatively mild and peaceable. They are divided into two distinct races; those whom we call Indians (*fig. 937.*), and whose various tribes occupy the whole interior of the continent; and Esquimaux, who are found tenanted all the shores of the Arctic Ocean.

937

INDIAN AND HIS SQUAW.

5774. The greatest mountains in North America traverse the western part of this region. The continuous chain of the Rocky Mountains forms the eastern boundary of the district claimed by the United States. Branches from these, probably extending north-west from them, shoot up into the lofty peaks of Mount Elias and Fairweather, which overhang the

Pacific. But the principal chain, so far as our imperfect information goes, takes a north-easterly direction, and runs parallel, first to the Mackenzie River, and then to the Arctic Ocean, where our recent discoverers have given to different portions of it the names of Richardson, Buckland, Romanzoff, &c. The eastern part of the tract is almost entirely level, and forms a continuation of that great plain, which, including the basin of the Mississippi, reaches from the Gulf of Mexico to the Northern Ocean.

5775. *Rivers and other waters* abound in a region which, even in its most level tracts, is covered with extensive forests, and subject to little evaporation. The most southerly part of the great eastern plain includes the sources of the Mississippi, and of those numerous streams which form Lake Superior and ultimately the St. Lawrence. In another direction, the two Saskatchewan, flowing from the eastern side of the Rocky range, unite and fall into Lake Winnipeg. From the same quarter the Unigjah, or Peace River, united to the Athabasca, and passing through Slave Lake, forms the Mackenzie River, whose course from its remotest head cannot be estimated at less than 2000 miles. Farther to the east the Arctic Ocean receives the less ample stream of the Coppermine River. Hudson's Bay forms the receptacle of the considerable streams of the Missinippi or Churchill, the Nelson, and Hill rivers. In the west, the Columbia, descending from the Rocky Mountains, and receiving the tributary of the Sapho, or Lewis, falls into the Pacific, after a rugged and broken course of about 1100 miles.

5776. *Lakes* also are largely produced by the copious waters collected on the dead level of the great eastern plain. The spacious expanse of the Winnipeg borders immediately upon Upper Canada. Northwards along the line of Mackenzie River are the Athabasca or Athapescow, the Slave and the Great Bear lakes, all of large dimensions. Numerous smaller bodies of water are spread over this district, particularly in the newly discovered territory of *Boothia*. These lakes, however, in the heart of an arctic region, frozen for half the year, and almost always encumbered with floating ice, confer few benefits on the surrounding country, and present serious obstructions to the traveller.

SECT. II. Natural Geography.

SUBJECT. 1. Geology.

Of the *Geology* of these most northern regions of America, a general idea will be conveyed by the following details:—

5777. I. *The Rocky Mountains, and the Mackenzie River, from Great Bear Lake, in N. lat. 65° to the Northern Ocean.*—The Rocky Mountain range is principally composed of primitive rocks, which support an extensive deposit of secondary formation. The sea coasts, from them towards the Mackenzie, are shallow, and skirted with islands, sometimes bounded by a gravelly beach, at other times with high banks of sandstone or cliffs of limestone. Greenstone, sandstone, and limestone occur in pebbles on the shore. On the sea coast, *west of the Mackenzie River*, Captain Franklin collected greywacke, clay slate, limestone, Lydian stone, quartz, potstone, and rock crystal. *Brown coal*, clay ironstone, *pitch coal*, and limestone were seen on the shores opposite the Rocky Mountains; and westward, towards Icy Cape, were noticed greywacke slate traversed by veins of quartz and iron pyrites. On Flaxman's

Island, N. lat. $70^{\circ} 11'$, W. long. $145^{\circ} 50'$, were seen greenish clay slate, brought down by the rivulets and torrents from the Rocky Mountains. From the east end of Lake Superior, slightly converging towards the Rocky Mountains, to the east side of Great Bear Lake, there is a range of primitive rocks but little elevated above the surrounding country. For 700 miles, beginning in N. lat. 50° , between these two ranges, the space is occupied principally by horizontal strata of limestone as far as 60° north. The shores of Great Bear Lake are of primitive rocks, sometimes rising into hills of 800 or 1000 feet. Masses of rock and gravel, apparently derived from the hills, consisting of quartz rock, granite, and gneiss, are found on the surface and in the valleys. The north shore of Bear Lake is formed of boulders of limestone. Fort Franklin stands on a bay of the west coast, and the bottom of the bay and the beach are strewn with boulders of granite, syenite, porphyry, greenstone, amygdaloid, porphyritic pitchstone, dolomite, limestone with corallines, grey and red sandstone. The soil in the vicinity of Fort Franklin is sandy or gravelly, covering a bluish plastic clay, which is firmly frozen during the greater part of the year. Narrow ridges of limestone rise in the country west and north of Fort Franklin, which is otherwise level as far as the eye can reach.

5778. *Bear Lake River.* Grey sandstone forms the banks of the river. Salt springs, yielding excellent common salt, fall into the river a little below the rapid, at that point where the Rocky Mountains first appear in the distance. The strata on the sides of the rapid are sandstone. Brown coal, with impressions of fern, occur on the banks; also ammonites in a reddish iron-shot sandstone. The Bear Lake River flows into the Mackenzie through banks of a greyish black limestone, traversed by veins of white calcareous spar. The upper beds are calcareous conglomerate, associated with limestone impregnated with mineral oil, also bituminous shale. Sulphurous springs and streams of mineral oil are seen issuing from the lower limestone strata on the banks of the Mackenzie, when the waters are low.

5779. *Mackenzie River.* The banks of the river, at its junction with Bear Lake River, are composed of different brown coal, alternating with pipe clay, potters' clay, &c. The beds of coal take fire on being exposed to the atmosphere. The pipe clay is used by the natives for food when provisions are scarce. It is not unpleasant to the taste, and it is said "to have sustained life for a considerable time. The traders use it for whitening their houses. It is associated with a rock resembling bituminous shale on the shores of the Frozen Sea." Deposits of brown coal occur near the Rocky Mountains, along their eastern edge, in a narrow strip of marshy, boggy, uneven ground; and again on a branch of Peace River, and on the Saskatchewan in N. lat. 52° , and on Garry's Island, near the mouth of the Mackenzie. On the banks of the Mackenzie, below Bear Lake River, are steep cliffs, and in many places underneath are rocks of limestone. Salt springs are said to occur in connection with this formation. The Rocky Mountains appear at no great distance from the Mackenzie. At the rapids in that river, where limestone ridges traverse the country forty miles below the first rapid, the sides of the river rise into mural precipices of limestone, weathered into columns and castellated towers. At this remarkable rapid, called by the natives the Ramparts, the river is narrowed to 300 yards, with 50 fathoms depth of water, and the defile is three miles in length. The banks rise on each side of this vast chasm from 80 to 100 feet above the level of the river. The rocks of the Ramparts are of granular foliated limestone, coloured with mineral oil; and, accompanying the river through this rent, many varieties of limestone occur. Below the Ramparts the river expands to a breadth of two miles, and its banks slope away to a moderate height. In N. lat. 66° , mural cliffs of sandstone or quartz rock, 160 feet high, repose on horizontally stratified limestone, containing chain coral. Forty miles below the sandstone cliffs, marl slate occurs, forming the banks of the river, which again contracting, gives to this reach, for twenty miles, the name of the Narrows. On emerging from the Narrows, the Mackenzie forms a number of deltas, through which it falls into the sea. The Rocky Mountains form the western boundary of the lowlands of the deltas, and the Reindeer Hills a parallel boundary on the east side. Limestone occurs in conical hills, but a loose sandstone predominates. These hills gradually diminish in height, and the eastern branch of the river runs round this northern limit in N. lat. 69° . White spruce grows as far as 68° , where it disappears. The country thence becomes a frozen morass, onward, north of the hills, seldom thawing more than six or eight inches from the surface.

5780. *Alluvial Islands.* — The space occupied by the various reaches of the Mackenzie, between the Rocky Mountains and the Reindeer Hills, is ninety miles in length, and from forty to fifty in breadth. The river forms this tract into islands, by the numerous channels through which it winds its way to the sea. The islands are most of them flooded in spring, but annual accumulations of drift-wood and sand have raised some parts above the reach of the annual inundations, and as far north as lat. 68° the highest parts are clothed in summer with dwarf willows and white spruce. Sandy shoals skirt the coast, and the whole line from Cape Bathurst in W. long. 127° , as far west as the Sacred Islands in W. long. 137° , presents a similar outline and structure. The sea coast, east from the Mackenzie for

many miles, are low, with occasionally gently swelling sand hills. The beaches and capes are covered with boulders of limestone, sandstone, and syenite. Some of the promontories consist of bluish slate clay, reddish slate clay, with interspersed crystals of selenite, and exhibits the aluminous mineral called *Rock Butter*.

5781. *Sea coast east of the Mackenzie.*—At Parry's Peninsula, still on the edge of the sea, limestone begins. The beaches are covered with limestone boulders, and on the steep banks it appears in weather-worn columns, while in other sections it appears in horizontal strata; and fragments of chert, dolomite, and *greenstone*, are scattered over its surface. Vegetation is very scanty, and over large tracts there is not even the vestige of a lichen.

5782. *Sea coast. Cape Lyon to the Coppermine River.*—Slate clay traversed by and covered with trap rocks form hills rising to a height of 700 or 800 feet above the sea, and appearing on the coast in the form of lofty precipices. Eastward the line of coast becomes lower, red quartz sandstone occurs, and Gothic arches of limestone form striking objects. Naked barren ridges of iron-shot *greenstone* cross the country at Point De Witt Clinton, and the upper soil consists of magnesian limestone, gravel, and bluish clay. From this district to the mouth of the Coppermine River, limestone is the prevailing rock, accompanied by sandstone, *greenstone*, and porphyry, with various disseminated minerals. Vegetation ceases before reaching this line of coast, which is between 69° and 70° N. A patch of moss, or a clump of dwarf willows in crevices, or under the shelter of decaying drift-wood, occasionally appear; but with these very rare exceptions, no trace of verdure or herbage is seen.

5783. II. *From Slave Lake to the Arctic Ocean by the Coppermine River.*—Granite rocks occur east of the Slave River, where it joins Slave Lake, and the same rock forms the Reindeer Islands. The same formation continues to Carp Lake, producing on its hills and valleys spruce firs, *Banksiana*, and aspen. On Point Lake, in lat. 65° N., the prevailing rocks are greywacke, and clay slate, with magnetic *greenstone*. In the sheltered valleys spruce firs are seen, but farther east, where gneiss crosses the river, there is no wood. In lat. 66° N., high peaks of red granite and syenite, and large beds of *greenstone*, are said to pass through and overlay quartz rocks. In the beds of the torrents intersecting the plains are found fragments of red-coloured, granular foliated, limestone, red sandstone, quartz rock, and trap containing *prehnite*. The Copper Mountains consist chiefly of trap rocks, resting upon and traversing red sandstone and limestone. Small masses of native copper occur disseminated through the trap rocks. In the valleys are found native copper, green malachite, copper glance, and *prehnite*. North of the Copper Mountains trap hills occur. The intermediate country consists of a deep sandy soil, and some of the eminences are clothed with grass, but the ridges are destitute of vegetation. On the west banks of the river red granite extends from the Copper Mountains to the sea, where it forms mural precipices on the coast. The main shore, for sixty miles east of the Coppermine River, is a low shelving gravelly beach. Eastward of the beach trap rocks re-appear, and form an exceedingly sterile and rocky coast. The islands near this coast abound in cliffs of *greenstone* and claystone porphyry. The whole country is barren, one ridge of rocks rising above another, with stony valleys between, without a trace of vegetation. Granite occasionally rises up into acute and craggy peaks 1500 feet high, alternating with low naked ranges of gneiss. In one instance a vein of sulphuret of lead or *galena* was found enclosed in the gneiss, which is often intersected by veins of trap and porphyry. Continuing east, red sandstone, with bluish grey slate, appear. Amygdaloid, enclosing agates, occurs in Barry's Island. On the coast gneiss re-appears at short distances, with occasional lofty peaks of granite. According to Dr. Richardson, a red sandstone, which he conjectures may be the new red sandstone of authors, prevails on the Arctic sea-coast, from the mouth of the Coppermine River, in W. long. 116° eastward, to Cape Turnagain, which is in W. long. 109° , N. lat. 69° . The gneiss formation is next in extent, and runs parallel, within the red sandstone, extending from the sea to Fort Enterprise, in lat. 65° N., presenting the true "*Barren Ground*." The general direction of the strata just mentioned is N.W. and S.E., and the mean angle of inclination 45° . Granite, syenite, gneiss, mica slate, clay slate, occurs throughout this, with their usual geognostical relations. Gneiss is the most extensively distributed, *always attended with a scanty vegetation, and generally the most desolate sterility*. The masses which occur on the summit of the hills on the Barren Grounds are generally of granite, derived from the subjacent rocks. Extensive alluvial deposits occurred on the line of the first journey performed by Franklin, such as lakes filled up by deposits from rivers, and the debris of mountains washed down by torrents, besides alluvial peninsulas formed by the action of the sea.

5784. III. *Melville Island, Port Bowen, and the coasts of Prince Regent's Inlet.*—Winter Harbour, in Melville Island, is the most western point ever navigated in the Polar Sea from the eastern entrance. It is in N. lat. $74^{\circ} 26'$, and W. long. $113^{\circ} 46'$. The length of Melville Island is 130 miles from E.N.E. to S.S.W., breadth forty or fifty miles. Sandstone of the coal formation, with casts and impressions of plants, resembling those found in the coalfields of Britain, form the principal mass of the island.

5785. *Port Bowen and the coasts of Prince Regent's Inlet.*—Secondary limestone, by some considered as identical with mountain limestone, forms both sides of Prince Regent's Inlet.

It is every where deposited in horizontal strata. It contains embedded masses of chert, and organic remains of various kinds. On the hills, and on the surface of a red coloured limestone, were found masses of *fibrous brown iron ore*, and also *brown coal*. On the west side of Prince Regent's Inlet thick beds of *gypsum* extend thirty miles through the country, associated with a limestone which, when near the gypsum, abounds in organic remains. All the gypsums are of a white colour, and of these the foliated, fibrous, and granular are met with, but not the compact.

5786. *Alluvial deposits*. — Alluvial marl deposits, from the snow waters passing through and over the limestone strata in the summer, occur on the shores and in the valleys, and fragments of limestone are scattered in different directions by the same agency; but the limestone hills in many parts, and the country generally, were more or less covered with boulders of primitive rocks. Some of these were upwards of fifty tons in weight. They abound near the sea-coast, gradually diminishing in size and number, and at the distance of fourteen or sixteen miles from the sea, they are comparatively small and seldom. The nearest known fixed primitive rocks were upwards of 100 miles distant from these remarkable boulders.

5787. IV. *Islands and countries bordering on Hudson's Bay*. — The lands bordering on Hudson's Bay, and the islands which it encloses, are generally hilly, and are usually disposed in ranges, but are not very lofty, the average being about 800 feet, and the highest summits not exceeding 1500 feet above the level of the sea. The valleys are narrow and rugged, and the cliffs often display mural fronts of more than 100 feet in height. Wherever the shores are low, flats and shoals extend far out, making a shallow sea; but where the coast is rocky and steep, the sea is proportionably deep. The country is covered with snow and ice the greater part of the year. The upper soil varies from two or three inches to one foot in depth, beneath which the ground is frozen like the most solid rock. In the summer, a few plants appear in the fissures of the rocks, in sheltered places. The general aspect of the country indicates the prevalence of primitive rocks, but no volcanic rocks have hitherto been met with. The islands and countries bordering on Hudson's Bay, between lat. 60° and 69° N., and long. 65° and 125° W., are composed of primitive, transition, secondary, and alluvial rocks.

5788. *Primitive rocks*. — These are, granite, gneiss, mica slate, clay slate, chlorite slate, eurite porphyry, hornblende rock, hornblende slate, primitive greenstone, serpentine, and primitive limestone. Several interesting minerals occur in these rocks, such as *garnet*, *zircon*, *rock crystal*, *beryl*, *coccolite*, *asbestos*, *graphite*, *magnetic iron ore*, *magnetic pyrites*, *chromate of iron*, &c.

5789. *Transition rocks*. — These are, quartz rocks in many various forms, greywacke, greywacke slate, transition clay slate, and flinty slate.

5790. *Secondary rocks*. — 1. Limestone enclosing corals, trilobites, orthoceratites, and many fossil shells. 2. Bituminous shale, an indication of the coal formation. 3. Secondary greenstone, sometimes containing titanitic iron ore, sometimes iron-shot and porphyritic, and at others crossed by veins of calcareous spar.

5791. *Alluvial deposits*. — But few alluvial deposits are mentioned as occurring in those parts of the arctic regions that border on Hudson's Bay. The most striking objects are the boulders spread over some of the islands. Whole limestone islands are covered with blocks of granite, gneiss, and quartz, both in rounded masses and in angular forms.

SUBJECT. 2. Botany.

5792. The *Botany* of these regions has been already noticed, under the head of British America.

SUBJECT. 3. Zoology.

5793. The *Zoological features*, in regard to the ferine inhabitants of these wild and uncivilised tracts, have been sufficiently dwelt upon in our introductory remarks. We shall, therefore, merely notice, more in detail, a few of the most interesting quadrupeds already mentioned.

5794. The *Polar or Sea Bear* is precisely the same as that of Arctic Europe; but Dr. Richardson considers its size to have been much exaggerated by the older voyagers: it never exceeds nine feet in length and four and a half in height. Many interesting and even distressing anecdotes are upon record, attesting its amazing strength and dreadful ferocity. The principal residence of this formidable animal is on fields of ice, with which he is frequently driven to a great distance from land; but he not only swims with rapidity, but is capable of making long springs in the water. This species, being able to procure its food in the depth of even an arctic winter, has not the necessity to hibernate; its pace, at full speed, is a kind of shuffle, as quick as the sharp gallop of a horse.

939

MUSK OX.

5795. The *Musk Ox* (*Bos moschatus*) (fig. 939.) derives its name from its flesh, when in a lean state, smelling strongly of that substance. It is truly an arctic animal, the districts which it inhabits being the proper lands of the Esquimaux. Grass at one season, and lichens at another, supply its only food. In size, the Musk Ox

scarcely equals that of the small Highland cattle: the carcase, when cleaned, not weighing more than 3 cwt. Notwithstanding the shortness of its legs, it runs fast, climbing hills and rocks with great ease: they assemble in herds of from twenty to thirty, and flee at the sight of man; the bulls, however, are very irascible, and when wounded will attack the hunter, and endanger his life.

5796. *The Wild Goat and Sheep of the Rocky Mountains* deserve a brief notice; particularly as the two animals have been much confused in the accounts of travellers.

ROCKY MOUNTAIN GOAT.

The first (*Capra americana* Rich.) (fig. 940.) is as big as our domestic sheep: its fleece hanging down on the sides like that of the Merino breed; the hair is long and straight, coarser than that of the sheep, but finer than that of the common goat. It inhabits the most lofty peaks of the Rocky Mountains, and probably extends from 40° to 65° lat. The fine wool which it produces grows principally on the back and hips, and is intermixed with long coarse hair.

5797. *The Rocky Mountain Sheep* (*Ovis montana* Rich.) (fig. 941.) was seen by the first Californian missionaries so far back as 1697; but its true nature or history was only known of late years. It is much larger than any domestic sheep: the horns of the ram are immense. The hair is like that of the rein-deer; at first short, fine, and flexible; but as winter advances, it becomes coarser dry, and brittle, though it feels soft; it is then so close as to become erect. The Rocky Mountain Sheep inhabit the lofty chain of mountains from which their name is derived, from its northern termination in lat. 68° to about lat. 40°. They collect in flocks from three to thirty, the young rams and the females herding together, while the old rams form separate flocks. Mr. Drummond mentions that the horns of the old rams attain a size so enormous, that they effectually prevent the animal from feeding upon level ground.

5798. Among the other larger game is the Bison, the Wapiti the Moose, and seven other species or varieties of Deer, four different Hares, and several other smaller quadrupeds, which our confined limits will not permit us to notice.

ROCKY MOUNTAIN SHEEP.

5799. *The Ornithology* assimilates in many respects to that of Arctic Europe, as most of the aquatic birds found in one country are common also in the other. The land birds, however, are almost entirely different, while nearly all the grouse of the New World are exclusively confined to these northern latitudes. Having treated this subject more at large in another work (*North. Zool.* vol. ii.), we deem it right to record the fate of one of the most interesting collections of ornithology ever sent to this country. These collections, made by the late botanical travellers in California, and sent by them to the Horticultural Society, after having been suffered to remain studiously concealed from the eye of science, during the influence of a late officer of that society, are now no longer in existence: want of care in their preservation, with indolence, or inability to turn them to a useful purpose, has, unfortunately for science, furnished a practical illustration of an old fable. The moths were more industrious: for the boxes, upon being opened, on the return of the collectors, exhibited only dust and half-devoured feathers.

5800. *The Grouse of the northern regions of America* constitute the most peculiar feature in their ornithology; the species are more numerous than those of Europe, from which also they are totally distinct. The largest is the *Centrocercus urophasianus* Sw. or Cock of the plains (fig. 942.): a noble bird, fully equal to the *T. urogallus*, and distinguished by a long, cuneated tail, the feathers of which are narrow and pointed; the male is distinguished by two naked spaces nearly in front of the breast, which, when inflated can only be compared to the bust of a female figure. It inhabits the extensive plains near the sources of the Missouri. Another species, the *Tetrao obscurus*, or Richardson's Grouse, is of the same size, and bears some resemblance to the Black Cock of England.

COCK OF THE PLAINS.

5801. *The Water Birds* comprise, in all probability, nearly the whole of those European species which have been detected in America, with some few others hitherto undescribed. Among these may be named the following Ducks, as being contained in the collections of Dr. Richardson:—

<i>Anas canadensis</i> L. Canadian Goose.	<i>Boschas discors</i> Sw. Blue-winged Teal.	<i>Fuligula rufitorques</i> Bon. Tufted Duck.
<i>Anas clypeata</i> L. Shoveller Duck.	<i>Boschas crecca</i> Sw. Green-winged Teal.	<i>Clangula vulgaris</i> Leach. Golden-eye Duck.
<i>Boschas domestica</i> Sw. Mallard Duck.	<i>Oidemia perspicillata</i> Sw. Black, or Surf.	<i>Clangula albeola</i> Leach. Buffel-headed Duck.
<i>Dafila caudacuta</i> Leach. Pintail Duck.	<i>Anas nigra</i> . Scoter Duck.	<i>Clangula histrionica</i> Leach. Harlequin Duck.
<i>Marica americana</i> Steph. Am. Widgeon.	<i>Fuligula rubida</i> Bon. Ruddy Duck.	<i>Harelda glacialis</i> Leach. Long-tailed Duck.
<i>Marica obscura</i> Steph. Dusky Duck.	<i>Fuligula marila</i> Bon. Scaup Duck.	<i>Fuligula ferina</i> Steph. Red-headed Duck.

5802. *The most remarkable of the Land Birds* is the Great Californian Vulture (*Vultur californianus*) (fig. 943.), which seems confined, according to the observations of Mr. D. Douglas, to the woody districts of that country. They build in the most secret and impenetrable parts of the pine forests, invariably selecting the loftiest trees overhanging the deepest precipices. It measures from four feet to four feet and a half long, and the quills are so large as to be used by the hunters as tubes for tobacco pipes. Their food is carrion, or dead fish; for in no instance will they attack any living animal, unless it be wounded and unable to walk. In searching for prey, they soar to a great altitude, and on discovering a wounded deer, or other animal, they follow its track until it sinks. Although only one bird may be first in possession, it is soon surrounded by great numbers, who all fall upon the carcase and devour it to a skeleton within an hour, even though it be a horse or a stag: their voracity, in short, is almost insatiable.

SECT. III. *Local Geography.*

5803. Of a country so extensive and so imperfectly known it would, as already observed, be impossible to give a *detailed account*, arranged under the ordinary general heads. It will, therefore, be necessary to describe the several parts successively, as in the local sections. We shall describe it provisionally according to the nations by whom each territory is claimed, as this division coincides in some measure with that formed by nature. The British territory includes all the eastern part of the region, extending at one point as far as the opposite coast; while the Russians claim the north-west, and the Americans the south-west parts of the territory.

SUBSECT. 1. *Territory claimed by Britain.*

5804. *The most eastern part of this territory* is Labrador, a vast region extending about 700 miles in each direction, and included between the Atlantic and the spacious inland sea called Hudson's Bay. It has all the characteristics of an arctic territory; is filled with small frozen lakes, and covered with extensive forests of fir, birch, and pine. Numerous rivers, the early course of which is unknown, discharge themselves into the sea, forming excellent harbours, if there were any trade to conduct. The coast is diversified with almost innumerable islands, tenanted by numerous flights of waterfowl. The coast along Hudson's Bay is called the East Main, and the climate there is peculiarly severe. The inhabitants are of two classes: the Esquimaux, who occupy all the coasts, and share the industrious and peaceable character of their race; and the mountaineers, probably Indians, of a ruder and fiercer character: and between these two races bloody contests are waged. No settlements have been formed on these dreary shores with a view either to commerce or cultivation. It is only the ardent zeal of missionary teachers, particularly the Moravians, which has induced them to form several settlements; particularly at Nain, where they have assembled a few of the rude natives, teaching them at once the doctrines of Christianity and the first elements of social life.

5805. *Numerous islands*, single or in groups, diversify the interior of *Hudson's Bay*, and particularly the long strait which leads into it. These are chiefly Southampton and Mansfield Island in the northern part of the bay itself, the former very large; Mill, Salisbury, Nottingham, Charles, and the Savage Islands in the straits; Marble Island, off the western coast; Apomisco, North and South Bear, and many smaller islands at the southern extremity. These islands, like the adjacent shores, are inhabited by different tribes of Esquimaux, many of whom are described by navigators as fierce and rapacious.

5806. *The western coast of Hudson's Bay* chiefly deserves attention, since upon it nearly all the English settlements are situated. The principal of these is York Fort, a few miles up Hayes or Hill River, and in the close vicinity of which Nelson River also discharges itself into the gulf. York Fort is built on a spot so watery and swampy, that in summer, when the snow has completely melted, the inhabitants have no walk unless upon a platform laid between their house and the pier. The place forms a large square, one part of which consists of the habitations, the other of the stores for merchandise. The Hudson's Bay Company have also to the north Fort Churchill, on the great river Churchill, or Missinippi; and to the south, at the extremity of James's Bay, Albany Fort on the western, and East Main Fort on the eastern or Labrador side. The trade of these forts consists entirely in the collection of furs, in search of which their agents are sent in every direction, almost to the Arctic Ocean on one side, and the Pacific on the other. This ground has, indeed, been disputed, with somewhat superior activity, by the North-west Company, from Montreal; but by Captain Franklin's statement a junction appears to have been lately formed between these two rival bodies. The furs exported in 1832 amounted to 4328 skins of the beaver and otter; 3451 of the bear and buffalo; 6822 of the fox and fisher; 45,453 of the fur

cat and marten; 7686 of the minx; 331,192 of the musk rat; 236 of the racoon; 1718 of the wolverine badger; 5938 of the wolf; value about 110,000*l*.

5807. *The country to the south-west from Hudson's Bay*, and bounded on the north by Canada, is commonly called New South Wales. It is a watery and swampy region, yet it contains many fertile spots, under a climate which by no means precludes luxuriant vegetation; so that, when Canada is fully colonised, it is very probable that the range of settlement may be extended to this district. It contains the large lakes of Deer and Wollaston, and the small ones of Methye, Buffalo, and Isle à la Crosse; on the last three of which there are stations, to which the traders ascend in canoes. On Albany River, also, there are Osnaburg House, Gloucester House, and Henley.

5808. *Lake Winnipeg, with the region to the west*, whose waters flow into it, forms an extensive division of native America. This lake, to which the old travellers gave the name of Assiniboin, is of a winding form, about 280 miles long, and from 80 to 15 broad. It receives numerous and large streams from almost every point of the compass, and enjoys thus a remarkable extent of canoe navigation. One shore exhibits variegated hills with wide and fertile prairies; the other, a grand but desolate scene of naked rock. From the north, it receives the Winnipeg river, whose falls, or rather cataracts, have a peculiarly wild and sublime character, from the rapidity and immense volume of the waters, the various forms of the cascades, and the dark granite and primitive rocks through which they dash. The upper part of this river expands into the Lake of the Woods, about 300 miles in circumference. The scenery is very wild and romantic, the shores being bordered by precipices crowned with dense foliage, and the surface studded with countless islands. The country is, however, so bleak and rugged as to afford no support, and only a solitary bear or moose deer, or a half-starved family of savages, is occasionally met with.

5809. *The country west and south-west of the Winnipeg* consists of an extensive plain, in many places fertile, yet still almost exclusively occupied by wild animals and savages. Large rivers flow through it, the two Saskatchewan, the Assiniboin, and the Red River, which rises nearly in the same quarter as the Mississippi. On these rivers the North-west Company have a considerable number of trading houses, of which the principal are Cumberland, Chesterfield, and Marlborough. In a fertile territory, with a fine climate, along the Red River, Lord Selkirk formed settlements, to which he gave the names of Pembina and Fort Douglas. He purchased from the Hudson's Bay Company a territory of 116,000 acres, and transported thither a colony of various nations, chiefly Dutch and German. The soil has been found very productive; but the great distance from a market, being 2800 miles from New Orleans, and 1900 from Buffalo, must long prevent it from rising to great importance. It has suffered severely from contests with the Indians, fomented by the jealousy of the North-west Company. Moreover, in consequence of the recent settlement of the boundary line with the United States, half of it has been included within their territory.

5810. *The regions extending to the north of those now described, and bounded by the Arctic Ocean*, are scarcely known, unless in the lines traced by the recent expeditions of discovery; yet from these we can form a tolerably correct idea of their general outline. The northern boundaries of Hudson's Bay were fully ascertained by the second expedition of Captain Parry. That expanse appears more properly a sea, having a communication not with the Atlantic only, but with the Arctic Ocean, by the Strait of the Fury and Hecla. The north-eastern extremity of America forms here what is called Melville Peninsula, the eastern coast of which is washed by the Fox Channel, the part of Hudson's Bay that extends north from Southampton Island. That island is separated from the continent by a long narrow channel called, since Middleton's time, the Frozen Strait, which is crowded and the navigation encumbered by a labyrinth of islets. The climate is exceedingly rigorous, beyond what might be expected in a latitude under 70°. The seas are covered with an unbroken sheet of ice, unless for three or four months of summer, during which time also icy fragments are tossing about, and the bays and straits are still encumbered with them. From the accumulation of these in the Strait of the Fury and Hecla, the attempt repeatedly made by Captain Parry to penetrate into the Arctic Ocean was completely baffled. When spring melts the snows, the country is traversed by impetuous streams and torrents. One considerable river, called the Barrow, descends in a most magnificent fall amid finely broken rocks, about ninety feet perpendicular. Yet the ground here and in other quarters is covered, during the short summer, with a rich vegetation. Almost the only land animals which endure the rigour of winter are the fox, the wolf, and the musk ox; the deer take their flight into milder climates. The shores, however, are crowded with that huge amphibious animal the walrus, in herds often of 200 or 300. Only a few scattered families of Esquimaux wander along the shores and islands, passing often over the ice from one to the other. They are on the whole peaceable and friendly, and display no small degree of industry, and even ingenuity, in providing for their wants, and fencing against the rigour of the climate. Their food consists entirely of wild animals whom they have snared or taken, and in these operations they display both art and courage. When they have thus laid in a stock of provisions, they indulge most enormously, bringing on themselves the

distresses of repletion, soon followed by those of famine. The skins of captured animals, particularly deer, skilfully fitted to the shape, afford rich and warm clothing sufficient to defend them against the extreme cold. Their summer habitations are tents framed of the skins of deer, with the bones of large animals serving as posts; but the winter houses are most singularly constructed without any other material except snow. This substance, when duly hardened by the first cold of winter, is cut into slabs, which are put together so skilfully as to form structures of a conical shape, that remain durable till melted by the heat of the following summer. Each apartment is accommodated with a lamp fed with the blubber of the walrus or seal; and which serves at once for light, heat, and cookery. It preserves immediately around it a temperature of 38° ; but on the bench round the wall, where the inmates sit and sleep, it does not exceed 23° : and they are preserved from the cold only by large quantities of clothing.

5811. *Captain Ross*, in his late gallant and adventurous voyage, has explored a large extent of the northern coast of America, and found it distinguished by several remarkable and important features. This coast, commencing at the south-western point of Melville Peninsula, nearly opposite to the Frozen Strait, extends north-west to about lat. 68° N. and long. 93° W. Here it narrows into an isthmus, not more than fifteen miles broad, two thirds of which space is occupied by a chain of freshwater lakes. The land then extends on each side, enclosing two spacious gulfs, called the East and West Seas. It then continues to stretch northward, till it forms a very extensive peninsula, reaching not less than 300 miles in each direction. The eastern coast, partly discovered by Captain Parry in his third voyage, has been completely surveyed by Captain Ross. It is much broken by deep inlets and rocky islands, encumbered with ice, and of dangerous navigation; but its south-eastern coast contains three secure harbours, Felix, Victory, and Sheriff's. The northern coast was seen by Captain Parry in his first voyage, without his landing upon it; and about 80 miles of the north-western coast were explored by Commander Ross: but the north-western boundaries are yet unknown. The country, as far north as 72° , is inhabited, and Captain Ross had communication with a very interesting tribe of natives, who had never before seen any European. This peninsula, with the isthmus and the territory along the newly-explored coast, were named by the discoverer *Boothia*, after the individual who had chiefly enabled him to equip the expedition. Commander Ross also sailed westward along the American coast to lon. 99° W., lat. 70° N., where he was only 150 miles from the nearest known point of Cape Turnagain.

5812. *Another line of discovery was traced by Hearne*, under a commission by the Hudson's Bay Company, from Fort Churchill to the mouth of the Coppermine River. It consisted of an extensive plain diversified by a chain of comparatively small lakes, to which he gave the names of Cossed, Snowbird, Pike, Peshew, and Cogead. The natives are of Indian race, much ruder than the Esquimaux, with whom they wage a most cruel warfare. They subsist solely by hunting, and proceed on the usual system of savages, devouring an enormous quantity of food when it is abundant, and thus exposing themselves to intervals of cruel famine. The severest labour, and especially that of carrying heavy burdens on their long journeys, is devolved on the wives, who are supplied also with very scanty fare. As they are thus a source of wealth, the husband anxiously increases the number, and this he attains by exertions of bodily strength, for whoever can overcome another in wrestling, may at once seize on his wife; and stout wrestlers thus sometimes accumulate five or six. At the end of the long northern plain is a ridge of stony mountains of difficult ascent, beyond which is the considerable stream of the Coppermine River flowing into the Northern Ocean. The mine, however, from which it takes its name having probably been exhausted, affords now only a very scanty supply of the metal.

5813. *Captain Franklin afterwards*, by another route, descended the Coppermine River, and explored *above six degrees of the coast to the eastward*. His career terminated at Cape Turnagain, about 150 miles westward of the farthest point explored by Commander Ross. That nearest the river is well covered with vegetation; but all the rest exhibits the most dreary and inhospitable aspect, being composed only of a series of trap rocks which cover with their debris the intervening valleys. It is broken into deep gulfs, to the principal of which were given the names of Coronation, Bathurst, and Melville. Along the coast, with a narrow channel intervening, extend a range of rocky and barren islands, the principal of which, after eminent British characters, were named Berens, Moore, Lawford, Home, Jameson, Goulburn, Elliot, and Cockburn. The whole country, for a considerable distance inland, as was fatally experienced by Captain Franklin, is of the most dreary character, affording support only to a few arctic animals, and nothing which can serve as human food, except a species of lichen called *tripe de roche*, which yields only a scanty and miserable nutriment.

5814. *Farther to the west, a chain of large lakes*, receiving numerous rivers, reaches in an oblique line from the Winnipeg to the Northern Ocean. The first is the Athabasca, Athapescow, or Lake of the Hills; an elongated body of water, reaching from west to east, 200 miles in length by 16 or 18 in breadth. Its northern shores consist of lofty primitive rock, while the opposite bank is mostly either alluvial or sandy. The country between Lakes Winnipeg and Chepewyan is occupied by the Cree or Knistineaux Indians, a tribe now reduced to about 500, who wander over a region of about 20,000 square miles. The influence of the English

has put an end to internal war; but it has introduced a habit, perhaps more baneful, the inordinate use of spirits. For this they exchange all the furs which they are able to collect; and whenever they have thus obtained a quantity of rum, a scene of continued intoxication ensues, till it is consumed. The purchaser, however, still manifests the thoughtless generosity of the savage character, by sharing it liberally with his companions, only assuming, while he deals it out, an air of superiority, and indulging in extravagant boasts: this people continue also, unless under strong temptation, tolerably honest. The females are by no means so hardly treated as among the more easterly tribes: though not admitted to eat with their lords, they are only subjected to the ordinary labours of their sex. Their conduct, however, is not always blameless, and their frailties are only punished by a hearty beating; while the numerous race of half breeds prove an extensive irregular connection with Europeans. They have a singularly complex mythology, and are much imposed upon by an artful race of conjurers. The Stone Indians, who inhabit towards the southern shore of the Athabasca, are a taller and a handsomer race, of a bolder and fiercer character. They maintain the original creed, that all animals, being created for the use of man, ought to be equally shared among all; and this creed they take every opportunity of enforcing. The European traders, whose views are very different, are thus often brought into serious collision with their rude neighbours. It is remarkable that on this level plain the people are subject to goitres, the scourge of alpine regions; a circumstance which favours the belief that this cruel malady is caused by calcareous impregnations, which abound in many of the rivulets. On the south-eastern extremity of this lake the Hudson's Bay Company have erected Fort Chepewyan, so named from the Indians who inhabit the neighbouring country. It serves as a receptacle for the furs which are collected in considerable quantity from this race; who are not supposed to exceed 240 in number. Their appearance is singular, with broad faces and projecting cheek-bones; they are persevering incorrigible beggars, yet tolerably honest, and so deeply imbued with national pride, that, while they give to other nations their proper names, they call themselves, by way of eminence, "the people." *Great Slave Lake* and *Great Bear Lake* form the termination of this vast northern chain. The former being 250 miles long by an average breadth of 50, is the largest of all the northern lakes, and only surpassed in America by Lakes Superior and Huron. Its northern shore is skirted by well-wooded hills, rising gently from the margin of the water; and above which some rocky peaks appear. Fort Resolution has been erected on its southern, and Fort Providence on a deep bay of its northern shore. The Unigjah or Peace River, having received the Athabasca soon after it issues from the lake of that name, flows into Slave Lake. Thence it emerges under the name of Mackenzie River, and pursues a broad and majestic course to the Arctic Ocean, which it reaches in about 69° north lat. Great Bear Lake is not upon but to the east of it, and connected by the channel of Great Bear Lake River. Bear Lake may be about 200 miles in each direction, but it is of so irregular a form, and so deeply indented by large peninsulas, that it does not cover nearly the same surface as Slave Lake. Lying between 65° and 67°, it has an entirely changed aspect and climate; and displays all the rigours of an arctic region. The ground is clothed only with stunted firs, and traversed by numerous herds of rein-deer. The Copper, the Hare, and the Dog-ribbed Indians are the tribes by whom this quarter is frequented. On the whole, they much resemble the Chepewyans, but are of a more amiable and friendly disposition. Their humanity and faithful attachment were experienced by the recent travellers on occasions of extreme distress. Fort Franklin on Great Bear Lake, and Fort Enterprise on Point Lake, which lies to the eastward, have acquired celebrity as places of preparation and of refuge before and after the perilous voyages performed along the shores of the Polar Sea.

5815. *The coast of the Arctic Ocean* which bounds America, after being unknown for so many ages, has been recently explored for the space of 35 degree of longitude westward from the mouth of the Coppermine River. The first portion, surveyed by Dr. Richardson, extends between that and the Mackenzie River, and comprises 20 degrees. This coast stretches in a comparatively uniform line from east to west, broken only by two deep bays, to which were given the names of Liverpool and Franklin; while towards its eastern extremity there extends, parallel to the coast, a long line of insular territory, which was called Wollaston Land. The shore for a great extent is bordered by bold and rugged, though not lofty cliffs, one of which is singularly perforated, while elsewhere a range appeared constantly on fire. This last phenomenon is produced by the structure of the rocks, consisting of bituminous alum shale, the sulphur contained in which has a chemical action producing a constant ignition, whence arises the formation of the chemical salt called alum, of which this may be considered as a great natural manufactory. Along the coast are Esquimaux villages in considerable numbers; and they are, on the whole, better constructed, and show a greater progress in the arts of life, than is usual among this people. When the surprise occasioned by the appearance of strangers was over, they began to traffic with eagerness; but they generally showed a disposition to obtain goods if possible by theft rather than by purchase. Captain Franklin, indeed, at the mouth of the Mackenzie was attacked by a numerous party with such fury, that his whole equipment had very nearly fallen into their hands.

5816. *The coast westward of the Mackenzie River* extends also in an almost direct line, declining gradually to the northwards. It is broken only by two not very deep bays, called Beaufort and Camden, and diversified by a number of small islands. Navigation, however, is rendered gloomy and difficult by the masses of ice, either floating or fixed, which, even in the depth of summer, encumber every part of the coast. The effect is increased by the deep and dense fogs in which the atmosphere is very generally involved. They are supposed to arise from the copious vapours exhaled by the heat of the sun, and prevented from dispersing by the mountain range which closely borders the coast. This range consists of the termination of the Rocky Mountains, which, after so long a course across the continent from south to north, take now a westerly direction, and fall into the Arctic Ocean. The explorers gave to successive parts of it the names of the Buckland Chain, the British Chain, and to one which occurred after passing the Russian frontier the name of Count Romanzoff, as an eminent patron of discovery. They do not, however, rise into those steep and lofty cliffs which form the western boundary of the United States. Mount Conybeare, a conspicuous peak, was found to be only 800 feet high; and though the British Chain was more elevated, there seems no room to think that it much exceeds 2000 feet. The small bands of Esquimaux met here by Captain Franklin required to be cautiously dealt with, though they showed a peculiar ignorance in regard to every thing European. Taking

hold of the English coats, they asked of what animal these were the skins; they fastened fish-hooks and awls as ornaments to the nose, and stuck needles, with the same view, into various parts of their persons. Farther west, however, the natives were found to be possessed of beads and knives, not of British manufacture; which had, it was stated, been brought by Esquimaux from the westward, and received by them from *kabloonas*, or white men; these are, with great probability, conjectured to be the Russians. In fact, the expedition had come within the limits of that territory which had, by treaty, been assigned as Russian.

SUBJECT. 2. *Territories claimed by Russia.*

5817. *By a convention* concluded in 1825, the 146th degree of longitude was fixed as the limit between British and *Russian America*. This line passed through regions then equally unknown to both nations; and the partial exploration of the Russian portion has since been made not by Russia but by Britain. The expedition of Captain Franklin passed this limit by about nine degrees; in consideration of which, he assigned the name of Count Romanzoff to a part of the Rocky chain. Thence an unknown interval of nine degrees occurs, terminating at Point Barrow; and the discovery from thence to the western limit of America at Behring's Strait has been made almost exclusively, first by Cook, and more recently by Beechey. The boat sent by this last navigator reached Point Barrow, in 71° , the most northerly point of America yet discovered or believed to exist. The cold was here so intense, that the boat was frozen in before the end of August, and it was necessary to cut through a quarter of a mile of ice, in order to liberate her. The tribe of Esquimaux here are peaceable and friendly; but at Cape Smyth, to the westward, they are daring and thievish. The point which Captain Cook had named Icy Cape, and where his progress had been arrested, was found by Captain Beechey quite free from ice; it was low and filled with large lakes, so near the sea that a boat could easily be dragged over into them. The coast, in proceeding south-westward, forms Cape Lisburn, composed of low hills of rounded sandstone, and Cape Beaufort, presenting cliffs of rugged limestone and flint. The natives here were good-humoured and friendly. About Point Hope and Cape Thomson, the coast is occupied by a tribe of Esquimaux, diminutive and extremely poor, yet merry and hospitable. The rocks composing Cape Mulgrave were found not to face the sea, as Cook had supposed, in viewing them at a distance, but to be somewhat inland, and the interval filled, as in other parts of the coast, by numerous small lakes. The natives are taller than the other Esquimaux, but appeared never before the arrival of Captain Beechey to have seen Europeans: this was evident from the alarm which they showed on seeing a gun discharged and a bird fall. They were extremely courteous, presenting to the English, as dainties, the entrails of a seal and coagulated blood, which they were much disappointed to find not at all relished. Kotzebue's Sound, so named from the Russian navigator who discovered it, is a spacious expanse, which excited at first much interest, from the hope of its affording a passage eastward across the continent; but careful examination soon proved it to be an enclosed gulf. The natives on being approached raised at first loud cries of alarm and distrust; yet were not long of meeting the friendly advances of the Russians. They showed themselves initiated into the mysteries of smoking, which they had learned from the Tchutchi, but had never seen a pair of scissors, which were passed with wonder from hand to hand, and applied successively to the head of each of the party. The Esquimaux, in short, were found here, as in most other places, an ugly, broad-faced, dirty, but merry and good-humoured race, not devoid of curiosity and intelligence.

5818. *The shore continues low, flat, and well peopled, till its westerly direction terminates at Cape Prince of Wales, a lofty peaked hill, forming the western limit of America, and which is separated by Behring's Strait, fifty-two miles broad, from the Eastern Cape of Asia, a bold mountainous promontory, covered with snow in the midst of summer.* The navigator who sails through the middle of the strait can distinctly view at once these grand boundaries of the two continents. Beyond Cape Prince of Wales, the American coast stretches south by east in an almost continued line, broken only by the deep inlets of Norton Sound and Bristol Bay. It then shoots out into the long narrow promontory of Alaska, which reaches westward almost as far as Cape Prince of Wales, beyond which the coast bends very rapidly to the eastward. This region, which has been very imperfectly explored, is diversified by hills of moderate elevation, interspersed by valleys, which in summer display a rich verdure. It is occupied by the Tchutchi and by tribes called the Kitegnes and the Konaigues. The Russians have a small fort, called Alexandrovskaja, in the interior of Bristol Bay. The peninsula of Alashka is traversed by two lofty mountains, one of which is volcanic. Near the American coast, and considered till lately as forming part of it, is Nunivak, a considerable island; while westward from Norton Sound, and belonging rather to Asia, is the larger one called St. Lawrence, or Clerke. Both are inhabited, but only by native tribes. In the Sea of Behring are three smaller islands, St. Paul, St. George, and Sea Otter, on the first two of which the Russians have formed fishing establishments. Even in the centre of the strait are found three islets, called, by Beechey, Ratmanoff, Krusenstern,

and Fairway, the last on account of the safe passage afforded between it and the American coast.

5819. *The Aleutian Islands* form a long and numerous group, extending from the peninsula westward to Kamtschatka. They appear to be a continuation of the lofty volcanic ranges which traverse these opposite regions of the two continents. From almost every island, steep and lofty peaks arise; and from many, volcanic fire is discharged. In 1795, an island was thrown up by an eruption from beneath the sea, which continued to increase, till in 1807 it measured twenty miles in circuit. The rugged surface of these islands is ill fitted for culture, yet the interior valleys display considerable richness of vegetation. But the subsistence of the inhabitants and the importance of the settlements depend entirely on the vast shoals of fish and of amphibious animals with which the surrounding seas are replenished. The flesh of the seal affords the chief supply of food; while the skins of the sea otter form the most valuable articles of commerce. These islands are inhabited by a remarkable race, sharing, in some degree, the features and aspect of the Mongols and Esquimaux. Considered as savages, they are mild in their manners and deportment, and display a considerable degree of industry and ingenuity. They dwell in large subterranean mansions (*fig. 944.*) or rather villages, partitioned into numerous

944

SUBTERRANEAN MANSION.

apartments, and containing from 50 to 100, or even 150, inhabitants. These abodes, covered with turf, are almost on a level with the surrounding country, from which they are scarcely to be distinguished; so that when two of Captain Meares's officers were walking over a field, the ground suddenly sank beneath them, and they found themselves, to the surprise and alarm of both parties, in the midst of a numerous family busied in various domestic occupations. The Russians, who have completely established themselves in these islands, are charged by Krusenstern with much cruelty and oppression. They divide these islands into four groups:—1. The Aleutians properly so called, of which the largest and most populous is Attou; but Behring, though uninhabited, is the most extensive, and is noted for the death of the celebrated navigator of that name, who was obliged to winter there. Copper Island contains a supply of that metal, from which little or no benefit has yet been derived. 2. The Andreanousky Islands, Tanaga, Kanaga, Atchy, &c., remarkable for the many volcanoes which they contain. 3. Rat's Islands, a small group, of which Kiska is the principal. 4. The Fox Islands, the most populous and important of the groups. The chief are Oonashka and Oonimak, in which last the Russians have a small garrison and a naval depôt.

5820. *From the peninsula of Alashka, the wide range of coast claimed by Russia* stretches west by south about 30° of longitude and 10° of latitude, till it touches on that which has been assigned to America. This extended shore bears in general a bold and awful aspect; bordered with mountainous steeps covered with dense primeval forests, and wholly uncultivated. Mounts St. Elias and Fairweather are respectively 17,000 and 15,000 feet high, and form the most elevated peaks in the northern part of America. Yet, though the spade or the hoe is nowhere employed upon this savage soil, it yields spontaneously a profusion of delicate berries, and the neighbouring seas swarm with huge fish, whose coarse oleaginous substance is suited to the palates of the rude inhabitants, while their skins supply at once warm and beautiful clothing. It is by no means, therefore, a desert coast, but is bordered by populous villages, the inhabitants of which have made a certain progress, if not in civilisation, at least in the arts.

5821. This coast is broken in a remarkable degree by *bays, deep sounds, and long islands* connected, by narrow channels, with the continent and with each other. At the north-west extremity is the Island of Kodiak, about sixty miles long, which with the smaller one of Atognak is separated from the continent by the Straits of Cheligoff. The natives are robust, active, and well skilled in all the arts connected with fishery. Their boats, almost entirely covered with leather, display great ingenuity in their construction. The Russians long made the port of St. Paul in this island the chief seat of their trade with north-western America; and, finding the natives extremely serviceable, have removed great numbers of them to the settlements formed along the coast.

5822. To the west of Kodiak is a *long inlet, which receives the name of Cook*, by whom it was explored, and a little beyond is Prince William's Sound, the head of which, almost touching that of the inlet, encloses a large peninsula. The inhabitants of this and the neighbouring districts are a peculiar race (*figs. 945, 946.*), square, stout, with large heads, broad flat faces, and hooked noses. They are clothed in long frocks or robes of the skins

of sea and land animals, usually with the hair outwards; and they have their noses and

945

MAN OF PRINCE WILLIAM'S SOUND.

946

WOMAN OF PRINCE WILLIAM'S SOUND.

upper lips perforated, and uncouth ornaments stuck into them. The sound is described by Vancouver as containing numerous harbours, but all rendered more or less unsafe by concealed rocks or shoals. The Russians have Roda, a small factory on the western side of Cook's Inlet, and Fort Alexander, a larger one at its head, within the peninsula.

5823. *The coast from Prince William's Sound* extends in an

almost continued line south-east, with only the small opening of Admiralty Bay. It is, however, very bold and lofty, distinguished by the colossal peaks of Elias and Fairweather. The Russians have here a considerable factory, called Yakouat.

5824. At the termination of this territory commences a numerous archipelago of large islands extending in front of the coast. To the principal ones have been given the names of George III., Prince of Wales, Duke of York, and Admiralty. Each of these islands has smaller ones near it, sometimes considered as forming with it a separate group or archipelago. Through the labyrinth of winding channels formed by these numerous islands, Vancouver made a most laborious search, in hopes of finding among them the long sought-for passage into Hudson's Bay or the Atlantic; but he finally ascertained that it was not to be looked for in this quarter of America. The Russians, on George III.'s Isle, which they call Baranoff, have erected New Archangel, which they make the capital of all their settlements in America. It is only, however, a large village of about 1000 inhabitants; and not only the private houses, but the fortifications and public buildings, are constructed entirely of wood, though neat and well kept. The management of the trade at this and the other posts has been injudiciously vested by the Russian government in an exclusive company resident at Irkutsk. The grand object of their trade is to collect the skins of the sea otter for the market of Canton, where they are in very extensive demand. Previous to 1780, a single skin was known to bring from 50 to 100 piastres. The activity, however, with which the trade was soon after prosecuted, brought so large a supply, that in 1790, the price had fallen to 15 piastres, and it has since been constantly on the decline. Chabelski, a Russian traveller, quoted by M. Balbi, estimates the annual value of the furs drawn by Russia from her North American possessions at 40,000*l*. It may be observed, that only the coast here is held as belonging to Russia; the interior territory, under the titles of New Norfolk and New Cornwall, has been adjudged to Britain, by whom, however, it is scarcely at all known or occupied.

5825. In connection with the other Russian settlements, we may mention *Bodega*, on the coast of New California, some miles north of San Francisco. Though this coast belongs indisputably to Mexico, yet that government seems not to have obstructed Russia in placing this station upon its unoccupied boundary; and though it be small, and destitute of a good harbour, it affords the means of carrying on a considerable trade with California.

SUBJECT. 3. *Territory claimed by the United States.*

5826. *The region extending westward from the Rocky Mountains to the Pacific*, and lying between 42° and 49° of north latitude, has by discovery and treaty been assigned to the United States. Besides the great eastern boundary, an intermediate range crosses it from south to north, supposed by Mr. Darby to be a prolongation of the Californian mountains. Its surface is thus very rugged; to compensate for which, the climate, as often happens on the western coasts of continents, is about 7° milder than the eastern states under the same latitude. The leading geographical feature in this territory is the river Columbia. It rises amid the most rugged steeps of the Rocky Mountains, in about latitude 54° , and after a north-north-west course of above 1000 miles, falls into the Northern Pacific in about lat. 46° . In this progress it receives from the right bank, first, Clarke's River, after a course of 500 miles; then Lewis River, which, having flowed already 800 miles, has a claim to be considered as the principal stream; lastly, from the south, the Multnomah, the extent of whose course is yet undetermined. In crossing the secondary mountain chain, this stream forms several violent cataracts, and passes through long narrows, in which the current rolls with furious agitation.

5827. *The tribes inhabiting the coast near the mouth of the Columbia*, of which the principal are the Clatsops, the Chinooks, and the Chillamuks, exist in a very rude state of society. They do not cultivate the ground, but derive their subsistence solely from hunting and from fishing, which they practise with considerable dexterity in boats: these, though composed only of a single tree, will contain thirty or even fifty persons. The skins and furs which

they collect are exchanged with European vessels for bad guns, copper kettles, knives, tobacco, and, above all, white and blue beads, which form their most valued ornaments. These articles afford materials for a trade with the upper nations, whom they meet once a year at the falls of the Columbia. These tribes, however rude, studiously seek to embellish their persons, but in a most fantastic and preposterous manner, by keeping the forehead compressed in infancy with an instrument which, if successful, causes a straight line to run from the crown of the head to the top of the nose. With this form, and with a thick coating of grease and filth, the Clatsop young female becomes one of the most hideous objects in existence. Yet when adorned with bears' claws, copper bracelets, white and blue beads, she is regarded as an object of attraction; and it is painful to add, that the men carry on the most unblushing traffic with their wives and daughters, whom they offer as the medium of trade, the return for presents and services. This dishonourable practice prevails generally to the west of the Rocky Mountains, as well as the flattening of the forehead, from which the other tribes give them the name of Flatheads.

5828. *The coast northward from the Columbia*, like that still farther north, is faced by numerous islands, the principal of which, called by the joint names of Quadra and Vancouver, is about 150 miles long. This coast, like that of the continent, is lofty, crowned with immense woods, and the rocky shores are beaten by the waves of the Pacific with a fury through which whole forests are torn up by the roots, and extended along the shore. The ground is wholly uncultivated; but it yields spontaneously an abundance of the most delicious berries, onions, and other roots. The chief supplies, however, are derived from the ocean, which abounds in an extraordinary degree with fish of every size and species. The smaller kinds serving for food are taken in abundance by merely passing through the water a long rake with pointed teeth: this work is left to the lower ranks; while the chiefs undertake the nobler task of combating the whale, the sea lion, and the otter, whose skins supply them with rich and beautiful robes. Each tribe inhabits a particular cove, or island, and is ruled by a chief, who maintains a very considerable degree of savage pomp. Wicananish was found by Meares occupying a house or palace, consisting of a huge square apartment, in which his whole household, of 800 persons, sat, ate, and slept. The door-posts and the rafters were supported by gigantic wooden images rudely carved and painted, and the whole apartment was studiously adorned with festoons of human skulls. The royal family occupied a raised platform at one end, on which were placed the chests of treasure and other valuable effects. Their repasts consisted of enormous quantities of blubber, fish oil, and fish soup. The people (*figs. 947. and 948.*) have the usual American features, with com-

plexions tolerably fair; but these they studiously disfigure by stripes of red ochre and streams of fish oil, mingled sometimes with a species of glittering black sand. Some of the tribes display extreme ferocity, and on the whole they are suspected of cannibalism, human heads and hands being both displayed as trophies and offered for sale. Yet, when a friendly intercourse was once established, their manners were found peculiarly mild, courteous, and engaging. The subjects of one chief were estimated at 13,000; of another, at 10,000: so that the population of the whole coast must be very considerable.

CHAP. V.

MEXICO.

5829. *Mexico* is an extensive and noble territory, forming the greater part of that vast tract of land which connects together Northern and Southern America. Originally a native empire, afterwards the principal of the Spanish viceroyalties, it is now a great independent republic. It has sometimes been considered as extending to the Isthmus of Panama, which was, in some degree, under the jurisdiction of the viceroy of Mexico; but as Guatemala, to the southward of Mexico Proper, was always a separate intendency, and has now erected itself into an independent republic, it seems fairly to claim a short separate notice.

SECT. I. *General Outline and Aspect.*

5830. *The outline of Mexico* is so vague and irregular that its general dimensions of length and breadth are not easily determined. The southern extremity is at the head of the bay of Tehuantepec, where the two coasts approximate to within about 125 miles of

each other, and then, diverging, form the large peninsula of Yucatan. Thence the coast continues in a long oblique line from south-west to north-east, till it reaches Cape St. Francisco in 38° N. latitude, where is the farthest settlement that has been formed by the Spaniards, though their claim extends to Cape Mendocino, in lat. 42° . The length, even if measured in a line due north, would give 22° , or 1540 miles; but in the oblique direction it would be much greater, probably 2200 or 2300 miles. The breadth varies exceedingly. At the main centre of the empire, from Acapulco to Vera Cruz, Humboldt, after careful measurements, reckons it at $4^{\circ} 16' 7''$, or very nearly 300 miles. In the rude regions to the north, it is more than triple, at least if we adhere to the old boundary of the Rio Salinas, prolonged, we suppose, by the upper course of the Red River. The United States, however, contend that the Rio del Norte, winding in conformity with the line of the Rocky Mountains, would present a much neater and more precise boundary; but the Mexicans have not yet opened their eyes to the beauty of an arrangement which would deprive them of 23,000 square miles of territory. Humboldt computes the whole surface of Mexico at 948,000 square miles, of which under the temperate zone are 688,000, and under the torrid zone 260,000. This last division includes all the ancient empire of Montezuma, with all that part of Mexico that has hitherto been valuable or productive; indeed, all that is considered as strictly Mexico.

5831. *The surface of Mexico* is elevated, composing part of that vast ridge which runs along the whole continent of America parallel to the Pacific, and which in the south is called the Andes or Cordilleras, and in the north the Rocky Mountains. In the middle part the chain presents a broad table-land, from 6000 to 8000 feet in height, thus equalling Mont St. Bernard, and others of the most remarkable summits of the old continent. This table-land is not, as in Quito and other parts of South America, an interval between opposite ridges, but is the very highest part of the ridge itself. In the course of it, indeed, detached mountains occur, of which the summits rise into the regions of perpetual snow, on a level almost with the mightiest of the Andes. Such are the volcanic peak

ORIZANA.

of Orizaba (*fig. 950.*), Popocatepetl, (*fig. 951.*), and Toluca. But these are merely insulated heights or chains, running in a different direction from the general ridge, and presenting few interruptions to that continuous level, as smooth almost as the ocean, which extends, for upwards of 1500 miles, from one extremity of Mexico to the other.

5832. *The fertility of this vast table plain varies with its elevation. The summit is absolutely devoid of vegetation, not from the severity of the*

climate, which belongs only to the temperate zone, but from the absence of moisture, occasioned, as Humboldt conceives, by the force with which the rays of the sun strike on this open plain, the absence of trees, and the porous nature of the rocks, which causes the water to filtrate down to the lower regions. On this high arid plain, muriate of soda and other saline substances exist in extraordinary abundance, and give to it a resemblance to Thibet and the saline steppes of central Asia. Yet a great part of New Spain must rank with the most fertile regions of the earth. As soon as it begins

POPOCATEPETL.

to slope down towards the sea, it becomes exposed to humid winds and frequent fogs; and a vegetation of uncommon strength and beauty is nourished by these aqueous vapours. The descent, suddenly becoming rapid, terminates in the narrow plain along the sea-coast, a tract in which the richest tropical productions spring up with a luxuriance scarcely to be paralleled. Yet while the climate is thus prolific of vegetation in the finest and most gigantic forms, it is almost fatal to animal life; two consequences which, according to Humboldt, are in this climate almost inseparable. The Spaniards, terrified by the pestilential air, have made this plain only a passage to the higher districts, where even the native Indians chose rather to support themselves by laborious cultivation, than to descend into the plains, where every luxury of life is poured forth in ample and spontaneous profusion. The slope by which the table-land descends to the Mexican coast is so steep that, till the road very recently constructed, no species of carriage was able to ascend. Between the western coast and the table-land intervene four long and steep ridges, which are difficult to traverse. Hence the conveyance of goods to the city of Mexico, and from one ocean to the other, had been effected solely on the backs of mules. Another great commercial disadvantage of Mexico is, that its eastern coast, against which the trade-winds are continually driving an accumulation of sand, are destitute of a single harbour; for this name, according to Humboldt, cannot be given to that most dangerous of all anchorages, which is found at Vera Cruz. The western coast, indeed, has, in Acapulco and San Blas, two of the most magnificent ports in the world; but the coast, exposed to the entire breadth of the Pacific, is, for several months of the year, rendered unapproachable by tempests.

5833. *The rivers of New Spain* are not important. The Rio del Norte, indeed, may have a course of 1400 miles, and that of the Rio Colorado, on the west, may be about half that length; but these streams, flowing along the foot of rugged mountains, and through desert and savage tracts, are at present of no commercial value. The rivers of tropical Mexico are mere torrents, which rush down from its table-land, and, from the structure of the country, reach the sea after a short course. They pour down remarkable waterfalls, among which that of Regla (*fig. 952.*), broken by volcanic rocks, and fringed with noble trees, forms one of the most picturesque spots in the world.

CASCADE OF REGLA.

5834. *The lakes of Mexico* are very numerous, and appear to be the remains of others, of vast extent, which formerly covered a much larger proportion of this lofty plain. The valley of Mexico is covered with small lakes, which occupy nearly a fourth of its surface; but the only one on a very great scale is that of Chapala, in New Galicia, which Humboldt estimates to contain an area of about 1300 square miles.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

5835. *In the Old World*, granite, gneiss, mica slate, and clay slate often form the central ridges of the mountain chains; but in the Cordilleras of America these rocks seldom appear at the surface, being covered by masses of porphyry, greenstone, amygdaloid, basalt, obsidian, and other rocks of the same class. The coast of Acapulco is composed of granite;

and as we ascend towards the table-land of Mexico, we see it rise through the porphyry for the last time between Zumpango and Sopilote. Farther to the east, in the province of Oaxaca, granite and gneiss occur in the extensive elevated plains, traversed by veins of quartz containing gold. The geognostical relations of the secondary sandstone, limestone, and gypsum, met with in Mexico, are very imperfectly understood.

5836. *Mexican Volcanoes.* — In Mexico appears to commence the great chain of volcanic mountains, which extends with little interruption from lat. 24° N. to lat. 2° S. The most northern volcanic rocks in this country occur near the town of Durango, in lat. 24° , long. 104° ; but no active volcanoes are met with until we reach the parallel of the city of Mexico; and here, nearly in the same line, five occur, so placed that they appear derived from a fissure traversing Mexico from W. to E., in a direction at right angles to that of the great mountain chain, which, extending from N. W. to S. E., forms the great table-land of Mexico. The most eastern of these, that of Tuxtla, is situated a few miles west of Vera Cruz. It had a considerable eruption in 1793, the ashes of which were carried as far as Perote, a distance of 57 leagues. In the same province, but farther to the west, occur the volcano Orizaba, the height of which is 17,000 feet, and the peak of Popocatepetl, 880 feet higher, the loftiest mountain in New Spain. The latter is continually burning, though for several centuries it has ejected from its crater only smoke and ashes. On the western side of the city of Mexico are the volcanoes of Jorullo and Colima. The height of the latter is estimated at about 9000 feet. It frequently throws up smoke and ashes, but has not been known to eject lava. The volcano of Jorullo, situated between Colima and the city of Mexico, is much more recent than the others; for it is known to have made its appearance so late as the year 1759. In the month of June, of that year, according to Humboldt, a subterranean noise was heard in the district of Jorullo. Hollow sounds of the most frightful nature were accompanied by frequent earthquakes, which succeeded each other for from fifty to sixty days, to the great consternation of the inhabitants of the district. From the beginning of September every thing seemed to announce the complete re-establishment of tranquillity, when, in the night of the 28th and 29th, the horrible subterranean noise recommenced. The affrighted Indians fled to the mountains. *A tract of ground, from three to four square miles in extent, rose up in the shape of a bladder.* The boundaries of this convulsion are still distinguishable from the fractured strata. The *malpays* or volcanic ground near its edges is only thirty-nine feet above the old level of the plain, called *Las Playas de Jorullo*; but the convexity of the ground thus thrown up increases progressively towards the centre to a height of 524 feet. Those who witnessed this great event from the mountains assert, that flames were seen to issue forth for an extent of more than half a league, that fragments of burning rocks were thrown vast heights, and that through a dense cloud of ashes lighted up by volcanic fire, the softened surface of the earth was seen to swell like an agitated sea. The rivers Cuitimba and San Pedro precipitated themselves into the burning chasms. Eruptions of mud, and especially strata of clay, enveloping balls of decomposed basalt in concentrical layers, appear to indicate that subterranean water had no small share in producing this striking phenomenon. Thousands of small cones, from six to ten feet in height, called by the natives *hornitos* (furnaces) issued forth from the *malpays*, having still a temperature of 212° Fahr. Each small cone is a *fumarole*, from which a thick vapour ascends to the height of from twenty to thirty feet. In many of them a subterranean noise is heard, which appears to announce the proximity of a fluid in ebullition. In the midst of the furnaces, six large masses, elevated, from 300 to 1600 feet each, above the former level of the plain, sprang up from a chasm, which ranges from N. N. E. to S. S. W. The most elevated of these enormous masses is the great volcano of Jorullo. It is continually burning, and has thrown up from its north side an immense quantity of scorified and basaltic lavas, containing fragments of primitive rocks. These great eruptions of the central volcano continued till the month of February, 1760; since which period they have become less frequent.

5837. *The five active volcanoes* just noticed appear to be connected by a chain of intermediate ones running in a parallel direction, and exhibiting evident indications of a similar origin. Thus, Orizaba is connected with Popocatepetl by the Cofre de Perote, and with Jorullo by the extinct volcano of Mexico, called Iztaccihuatl; and the geognostical structure of them and all those high mountains that rise above the table-land of Mexico on the same parallel appears to be the same, being composed of trachyte, from apertures in which the existing volcanoes act.

5838. *The same law* prevails in the provinces of Guatemala and Nicaragua, which lie between Mexico and the Isthmus of Darien; but the volcanoes here, instead of being placed nearly at right angles to the chain of the Cordilleras, run parallel to it. In these provinces no less than twenty-one active volcanoes are enumerated, all of them contained between 10° and 15° N. lat. Those which have been most lately in a state of eruption are Los Fuegos of Guatemala, Isalco, Momotombo, Talica, and Bombacho.

5839. *Ores, &c.* — Tin ore, which occurs so abundantly in some districts in the Old World, appears but sparingly in Mexico. The mines of Comanja, which are situated in

syenite, afford veins of silver ore; and the most copious mines in America, those of Guanaxuato, are situated in a vein of silver, which intersects a primitive clay slate, passing into talc slate. Many of the Mexican porphyries are rich in gold and silver. These rocks are characterised by the general presence of hornblende and the absence of quartz; and of the felspars, the ryakolite, or glassy felspar, is the most frequent. The rich gold mine of Villalpando, near Guanaxuato, traverses a porphyry, the basis of which is allied to phonolite, and in which hornblende is very rare. The veins of Zuriapan traverse porphyries, having a basis of greenstone, which rock, as is frequently the case, contains many interesting minerals, such as mesotype, stilbite, tremolite, asbestos, green garnet, fluor spar, chrysoprase, fire opal, sulphur, carbonate and chromate of lead, and orpiment. The rich silver mines of Real del Monte, Pachuca, and Moran are situated in porphyry.

5840. *The transition rocks* of Mexico which most abound in ores are limestone and greywacke; the transition limestone affords ores of silver at Real del Cardonal, Xacala, and Lomo del Toro, to the north of Zuriapan; and rich silver mines are situated in the rocks of the greywacke group.

5841. *The secondary deposits* most prolific in ores are those of the limestone series: thus we are told that the silver mines of the Real de Catorce, as well as those of El Doctor and Xaschi, near Zuriapan, traverse what Humboldt describes under the name of alpine limestone. In that and the formation named by the same author Jura limestone are situated the famous silver mines of Tasco and Tehuilotepic, in the intendency of Mexico.

5842. *The mean produce* of the mines of New Spain, including the northern part of New Biscay and those of Oaxaca, is estimated at about 1,541,015 troy pounds of silver, — a quantity equal to two thirds of what is annually raised from the whole globe, and ten times as much as is furnished by all the mines in Europe. On the other hand, Humboldt remarks, the produce of the Mexican mines in gold is not much greater than those of Hungary and Transylvania; amounting, in ordinary years, only to 4315 troy pounds.

5843. *The silver* obtained from the Mexican mines is extracted from different ores. Most of it is obtained from silver glance, or sulphuret of silver, arsenical grey silver ore, horn ore or muriate of silver, black silver ore, and red silver ore. Native silver is useless in the northern districts. In Mexico there are about 500 towns or principal places, which afford silver. These 500 places comprehend together about 3000 mines, and there are between 4000 and 5000 veins and other repositories of silver.

5844. *Copper, iron, lead, and mercury* are also procured in Mexico, but in small quantities, although there appears to be no deficiency of the ores of any of these metals.

SUBSECT. 2. Botany.

5845. *Mexico naturally connects the vegetation* of North and of South America, though it has a greater similarity with the latter in its climate and productions; but the mountains are not so lofty, the great chain of the Cordilleras being twice interrupted within its limits. The northern Cordillera at Nicaragua exhibits the first indication of depression, but again rears itself for a time in the province of Veragua, and is there crowned with a very fine plain, called the Table. In the eastern part of the province, it breaks into detached mountains of considerable height, and of the most abrupt and rugged formation; thence, proceeding still to the eastward, innumerable sugar-loaf hills appear, not above 300 or 400 feet high, with their bases surrounded by plains and savannahs; and, finally, about Chagres on the one hand, and Chorrera on the other, these also disappear for a few miles, and the country becomes almost uninterruptedly low and flat. Presently, however, the sugar-loaf mountains again thicken, and, becoming connected, form a small cordillera, running from about opposite Porto Bello to the Bay of Mandingo; where is the second break. The land then continues low through the province of Darien and Choco, and is most abundant in rivers; those on the north side tending to the Gulf of Uraba or Darien, and those on the south to that of St. Miguel: beyond which point the cordillera again raises itself on an extended scale and enters South America. The vegetation of the isthmus is very luxuriant, the fruits and vegetables like those of other similar intertropical countries. The grain cultivated is Rice and Indian Corn. The Sugar Cane is grown, but not extensively. Coffee and Cocoa are raised for domestic consumption. The Caoutchouc tree, Milk tree (*Palo de Vaca*), and Vanilla plant abound in the woods. The charcoal made from many of the trees is considered excellent for smelting; and, as such, is exported to Peru, and is in much request there. Some of them yield very rich and brilliant dyes, used by the Indians, but not yet in commerce. The barks of others are medicinal, or abound in tannin. Ink is made both from gall-nuts and a bush called Alsifax, resembling the Caper. Many valuable resins are extracted from different trees; particularly one, distilled from the bark of a tree called the Palo Santo, or holy tree, which is highly fragrant, and used both as a remedy for disorders and to burn as incense. The *Styrax officinalis* of Linnæus is very abundant, the gum extracted from it selling at two dollars the pound. With the gum flowing from the Caoutchouc tree, while yet liquid, the inhabitants manufacture a sort of water-proof cloth, on the same principle as in this country; but which, thus prepared, is

more uniform, and never cracks. In the vigour and varieties of its woods, the isthmus challenges competition with any part of the world, according to Mr. Lloyd; who, in the *Transactions of the Geographical Society of London*, enumerates no less than ninety-seven kinds, of which he has communicated specimens to that institution.

5846. *The Mexican empire*, or New Spain, which extends from lat. 16° to lat. 37° , presents, by reason of its geographical position, all the modifications of climate which we should find in passing from the Senegal river to Spain, or from the coasts of Malabar to Bucharía. This variation of climate is increased by the geological structure of the country, and by the mass and extraordinary form of the mountains of Mexico. Upon the summit and slope of the Cordillera the temperature differs according to the elevation; and it is not the solitary peaks alone, whose summits, near the limit of perpetual snow, are covered with firs and oaks; whole provinces produce spontaneously alpine plants; and the agriculturist, dwelling in the torrid zone, loses all his hopes of harvest from the effect of frost or the abundance of snow. From this order of things, it may easily be imagined that, in so mountainous and extensive a country as Mexico, there is an immense variety of indigenous productions, and scarcely a plant exists on the globe which cannot be cultivated in some part of New Spain.*

5847. No better idea, perhaps, of the general aspect of the vegetation in a much frequented portion of the empire can be conveyed than by the journal of a German botanist, Schiede, very recently published in the *Linnaea*, to which we must beg to refer our readers for a description of the country between Jalapa and Mexico.

5848. In *New Spain* the people not only obtain an agreeable drink from the saccharine substance of Maize, Manioc, Banana, and the pulp of some Mimosas; but they also cultivate a species of the Pine Apple family (*Agave americana*) in order to convert its juice into a spirituous fluid. Wide tracts of country present nothing but fields of Maguey, whose long, sharp, and thorny leaves contrast strangely with the glossy and tender texture of the foliage of Bananas. It is not till after eight years that this plant shows signs of flowering, and affords the "honey" (as it is called) which is used for making Pulque. The interior is cut out, and the hollow continues for two or three months to afford daily a large quantity of sap, amounting, sometimes, to the enormous quantity of 15 quartillos, or 375 cubic inches, daily, for four or five months. This is the more astonishing, as the Agave plantations are always situated in the most arid spots, where hardly any soil covers the rocks. The culture of the Agave possesses many advantages over Maize, Wheat, or Potatoes, as the plant is not affected by the drought, frost, or hail which so often prevail on the high parts of the Mexican Cordillera. The stalk perishes after flowering, and an immense number of suckers spring up in its place. The man who plants 30,000 or 40,000 stems of Maguey is sure of leaving his family rich, though it requires patience and courage to persevere in a culture which will not be profitable in less than fifteen years. In good soil, the Agave sends up its flowering stem in five years; in a poor soil, not sooner than in twenty. The "honey" or juice of the Agave is a very pleasant subacid; and ferments readily, owing to the saccharine and mucilaginous properties that it contains. The smell, however, of the liquor that is obtained, is most putrid and disgusting, but those Europeans who have overcome their dislike to it, prefer Pulque to every other drink. The Indians consider it to be stomachic, strengthening, and nutritious, and speak in rapture of the excellence of that which is made at Tlocotitlan, where the peculiar soil gives a remarkable flavour to the beverage, and where there are plantations of Agave that annually yield more than 40,000 livres of rental. The Maguey was not only the Vine but the Papyrus and the Hemp of the ancient Mexicans, who painted their hieroglyphics on paper made of the fibres of its leaves. A thread called *pita*, which has the advantage of never twisting, is still used that is prepared from it, and its thorns serve, like those of the Cactus, for pins and nails. A highly intoxicating spirit is also extracted from the Maguey. Vanilla, of which we have already made mention, abounds in Mexico;

though the natives take no pains to cultivate so valuable a plant.

5849. *The Cactus coccinellifer* (fig. 953.), which nourishes the valuable Cochineal Insect, is a native of Mexico, and was cultivated for the sake of the precious dye which the insect affords, long before the conquest of that country, the plantations being called Nopaleros. From the district of Oaxaca alone the amount exported has been estimated at above

CACTUS COCCINELLIFER.

* Humboldt's *Hist. de la Nouvelle Espagne*.

500,000*l.* sterling, and the annual consumption of cochineal in Great Britain only is about 750 bags, or 150,000 lbs., worth 275,000*l.*; "a vast amount," as the authors of the *Introduction to Entomology* well observe, "for so small a creature, and well calculated to show us the absurdity of despising any animals on account of their minuteness." The plant bears much resemblance to the Cactus *Opuntia*, or Prickly Pear, and is easily cultivated in dry rocky spots: the Cochineal Insect is, in general appearance, not very dissimilar to the Meal Bug of our gardens, and equally covered with a white powdery substance. The male insects, which are comparatively few in number, are winged: when the females are with young, they are placed on different Cactus plants, which is called sowing them. Here they increase rapidly in size and numbers, and, four months after, the harvest commences; when the insects are brushed off with a squirrel's or deer's tail, by the women, who sit for hours under one Nopal plant, and kill them, sometimes by immersion in boiling water, sometimes by exposure to the sun, or in the vapour baths of the Mexicans. By the latter method, the powdery substance is preserved, which increases the value of the insects in commerce.

5850. *Atlixco*, in Mexico, is justly celebrated for the abundance and excellence of the chirimoya (*Anona cherimolia*) which it produces. This is cultivated in many of the hotter parts of South America, and justly ranks as one of the best fruits of the country.

5851. The *Cheirostemon*, or Hand Plant (*fig. 954.*), was discovered by Humboldt, in 1801, forming immense forests in the province of Guatemala, in New Spain. From time immemorial, a single individual of this tree had been cultivated in the gardens of Tztapalapan, where it was said to have been planted by Montezuma before the conquest of Peru; and the Indians attached a religious veneration to it, believing that not another specimen existed or would exist in the world. This taste for horticulture still prevails among the Mexicans, who delight in dressing with garlands the stands where they vend vegetables or pulque, and arrange nosegays of freshly gathered flowers among the Peaches, Pine Apples, and Sapotillas which they display.*

HAND PLANT.

5852. The true Jalap (*Purga de Xalapa*), that well-known and potent medicine, is the root, not, as is sometimes supposed, of *Mirabilis Jalapa*, but of the *Convolvulus Jalapa*, a climbing plant which grows, at a height of 1300 or 1400 mètres, in many parts of

Mexico, delighting in cool shady situations, among woods and on the slope of the mountains. It is singular that it is likewise found in the hot province of Vera Cruz, in sandy arid spots, near the level of the sea, and that M. Michaux should also have met with it in Florida. The annual consumption of Jalap in Europe has been stated at 7500 quintals, an amount which Humboldt thinks must be considerably over-stated. Its price at Xalapa, when the largest quantity is obtained, is from 120 to 130 francs the quintal of about 100 lbs.

5853. The *Dahlias*, those universal favourites, whose many-coloured blossoms give such splendour to our parterres at a season when the approach of winter renders them doubly valuable, as well as many other semi-hardy plants, are natives of the cool and hilly parts of Mexico.

SUBSECT. 3. Zoology.

5854. The Zoology of these interesting regions has only of late been partially made known to modern science; for, notwithstanding the munificent liberality of the court of Spain in sending Hernandez for the express purpose of investigating the animal productions of the New World, the result of his mission was unattended either by commercial or scientific advantages. Vague and trivial notices, accompanied only by barbarous Indian names, rendered the works of Hernandez nearly unintelligible even to the European naturalists of that age, and the author and his book have long since passed into oblivion. The political events of the last few years have now opened the natural riches of Mexico to the researches and the enterprise of Europeans. And although the zoological gleanings hitherto made on the table-land have been very local, and comparatively scanty, they are sufficient to give some general idea of the probable nature of the whole, at least so far as concerns the geographic distribution of the ornithology; the only department in which we possess, as yet, any collections. To this, consequently, we must from necessity restrict our notice; since the others, slightly mentioned in the narratives of the old travellers, cannot be recognised or named by the moderns. There is, as we have already observed, sufficient reason to believe that the union of the southern and northern American Fauna takes place on that high table isthmus which geographically divides the two most prominent divisions of the New World; and this idea will receive some confirmation by the following details.

* Humboldt and Bonpland, *Voyage et Essai sur la Nouvelle Espagne*, vol. i. p. iii. page 98.

5855. The following Birds are common both to Mexico and the United States: —

Buteo borealis. Northern Buzzard.
Circus americanus. American Harrier.
Accipiter pennsylvanicus Sw. Pennsylvanian Hawk.
Strix virginiana L. Virginian Horned Owl.

KING-BIRD.

Tyrannus intrepidus Vieil. King-bird. (fig. 955.)
Tyrannula saya Sw. Say's Tyrant.
Merula migratoria Sw. Red-breasted Thrush.
Orpheus polyglottus Sw. Mocking Thrush.
Sialia wilsoni Sw. Wilson's Bluebird.
Seiurus aurocapillus Sw. Golden-crowned Tit.
Seiurus aquaticus Sw. Water Tit.
Trichas personatus Sw. Maryland Yellow-throat.
Sylvicola americana Sw. Blue-backed Warbler.
Sylvicola blackburnia Sw. Blackburnian Warbler.
Sylvicola aestiva Sw. Yellow Warbler.
Sylvicola flavicollis Sw. Yellow-throated Warbler.
Sylvicola coronata Sw. Yellow-crowned Warbler.
Vermivora solitaria Sw. Worm-eating Warbler.

Setophaga ruticilla Sw. Redstart Warbler.
Alauda cornuta Wilson. Shore Lark.
Fringilla socialis Wils. Social Sparrow.
Pyrrhula frontalis Bon. Bullfinch Linnet.
Dolichonyx oryzivorus Sw. Rice Bird.
Vireo olivacea ? Bon. Red-eyed Warbler.
Agelaius phoeniceus Sw. Red-winged Starling.
Molothrus pecoris Sw. Cowbird.
Sturnella ludoviciana Sw. Crescent Starling.
Xanthornus baltimore C. Baltimore Hangnest.
Dendrocopus varius Sw. Varied Woodpecker.
Guirac ludoviciana Sw. Rose-breasted Grosbeak.
Guirac caerulea Sw. Blue Grosbeak.
Mniotilta varia Vieil. Black and White Creeper.
Sitta carolinensis L. Carolina Nuthatch.
Alcedo americana L. Great American Kingfisher.

5856. The above species are mostly migratory, visiting the United States to breed, and returning southward. It does not appear, however, that they pass beyond the Mexican Gulf; since not one, out of the whole thirty-five, has yet been discovered on the Terra Firma.

5857. The next list comprises those birds which we were the first to describe as new species, peculiar to Mexico. (*Phil. Mag.*, June, 1827.) They are unknown in the United States, nor have they yet been detected on the main land of South America: —

Hirundo thalassinus Sw. Sea-green Swallow.
Tyrannula affinis Sw. Mexican Pewee Tyrant.
Tyrannula obscura Sw. Obscure Tyrant.
Tyrannula barbirostris Sw. Bearded Tyrant.
Tyrannula nigricans Sw. Blackish Tyrant.
Tyrannula musica Sw. Musical Tyrant.
Tyrannula ornata Sw. sp. nov. Crested Tyrant.

5858. The third list exhibits such few species as have been likewise observed on the Terra Firma, but are unknown to inhabit the north of America: —

Aquila destructor Daud. Destroying Eagle.
Polyborus brasiliensis Vieil. Brazilian Caracara.
Buteo pterocles Sw. Long-winged Buzzard.
Circus rutilans Sw. Chestnut Harrier.

Tyrannula coronata Sw. Round-crested Flycatcher.
Tyrannula cayensis Sw. Cayenne Flycatcher.
Tyrannus griseus Vieil. Grey Tyrant.
Saurophagus sulphuratus Sw. Bentivi Tyrant.

Icterus dominicensis Daud. Domingo Hangnest.
Macrocerus militaris Sw. Military Mackaw.
Trochilus melanotis Sw. Black-eared Humming-bird.

5859. It results from this enumeration, that of 113 species of land birds, hitherto ascertained, by us, to be natives of Mexico, 68 appear altogether peculiar to that country, 11 are also natives of South America, and 34 of North America. These facts, so important in illustrating the great principles of animal distribution, are in themselves so valuable, that we could not withhold them from the scientific reader. It will, however, be unnecessary to enter on similar details regarding the water birds; as of twelve species of the Duck family, sent from the lakes of Real del Monte, not one possessed any novelty, the whole belonging to those species distributed over North America.

5860. Among the Wading Birds are two most beautiful species of Tiger Bitterns, hitherto unknown to naturalists, and which, in fact, we have not yet regularly described. One, the *Tigrisoma lineata*, or Lineated Bittern (fig. 956.), is entirely waved with fine fulvous lines; the other, *T. mexicana*, has these lines enlarged into broader bands, while the chin, and part

of the throat, is naked (*fig. 957.*). The American Bittern, which here represents that of Europe, is also a common bird, and, from its smaller size, it is called *Butor minor* (*fig. 958.*).

LINEATED BITTERN.

MEXICAN BITTERN.

AMERICAN BITTERN.

5861. *The Quadrupeds, Insects, &c.* are too little known, to permit any satisfactory account being given of them. The only quadrupeds brought home by Mr. Bullock were a new Lynx, the Canadian Porcupine, two small Monkeys, and a small Tiger Cat. Deer and Antelopes, of some unknown species, are found on the table-land, while the Bison, according to Mr. Ward's admirable account of Mexico, is stated to visit Texas in great herds.

SECT. III. *Historical Geography.*

5862. *Before the arrival of the Spaniards,* Mexico formed the most powerful and populous, and, with one doubtful exception, the most civilised empire of any in the western world.

959

MEXICAN CALENDAR.

Estalla and some other writers have argued, that Mexico contains at present a greater number of people than at any former period; but the numerous ruined cities traced by Humboldt convinced that traveller of the contrary, at least as to the space comprised under the empire of Montezuma. The plan, too, of ancient Mexico, recently found by Mr. Bullock, shows it to have been greater than the modern city. This empire also had attained in several respects to no inconsiderable height of civilisation. The Mexicans had a calendar, of which a representation is here given (*fig. 959.*), more accurate than that of the Greeks and Romans: they built large cities, lofty and regular pyramids; they smelted metals, and cut the hardest stone; and they recorded events by paintings of a peculiar character, which were little inferior to the hieroglyphics of Egypt. Two speci-

mens of these ancient paintings are here exhibited (*fig. 960.*). There existed a regular gradation of ranks in the empire, and the exorbitant power and pride of the nobles was contrasted with the almost enslaved state of the body of the people. The independent republics of Tlascala and Cholula afforded indications of a certain advance in political science, alloyed, however, by the most fierce and dreadful barbarism. Human sacrifices offered in vast numbers, and with the most ferocious rites, assimilate their character to that of savages in their rudest state. A recent examination of the hieroglyphical tables of the Mexicans has exhibited a view of the revolutions of the empire, and has shown them to be caused by the successive inroads of migratory nations from the North. The first was that of the Toultecs, in 648, and the last of the Aztecs, in 1196. Enquiry has in vain been made after any northern people who could have brought into Mexico any tincture of civilisation; and we have ourselves no doubt that whatever civilisation there was, originated within the empire itself, though the rude conquerors might, as is usual in such

cases, adopt the arts and institutions of the conquered people, still retaining deep traces of their own original barbarism.

5863. *The dominion of the Spaniards over Mexico* was acquired by Cortez at the head of

960

MEXICAN HIEROGLYPHICS.

a band of daring adventurers, whom the possession of fire-arms and the terror produced by them rendered invincible. After a resistance not without some glory, the Aztec empire was overthrown, and Mexico, with Peru, became the brightest gems in the Spanish crown. There appears no doubt that a great part of the nation, including most of the nobility and priesthood, perished at the time of the conquest; but considerable numbers still survived, and continued to live in separate villages, with a local jurisdiction. Although the country was in all respects ill governed, yet the hopes of immense wealth attracted a number of Spanish emigrants, who gradually multiplied in a country abounding with the necessaries of life. Even the Indians, whom the Spaniards at last sought to protect, increased their numbers in the course of the last century, and from the intercourse between the two races a very numerous mixed tribe originated.

5864. *The spirit of revolution and independence*, which was gradually diffused in the mildly governed English colonies, did not, for some time, reach those under the Spanish sway. The habits of implicit submission, and the ignorance which accompanied it, prevented all but a few daring spirits from forming even the idea of emancipation. Yet a root of discontent was deeply lodged. The Creoles, or Spaniards born in America, were now the most numerous race, and were always increasingly preponderant. But the Spanish government, from a short-sighted policy, placed all its confidence, and vested all political power, in a small body of Spaniards sent out from Europe. The discontents of the proscribed Creoles, however, might long have fermented without explosion, had not their ties with Europe been broken by Napoleon's invasion of Spain. The principle of loyalty itself led them indignantly to repel this usurpation, and to frame a provisional government for themselves; and having once tasted the sweets of independence, they were unwilling to recognise either the local authorities established in Spain, or the supremacy of the king himself. The contest was long, bloody, and desperate; for most of the intelligence, and all the military skill and discipline, were at first on the side of the native Spaniards; but, after many vicissitudes and many dangers, both internal and external, the Mexicans succeeded in forming a constitution, nearly on the model of that of the United States. Some disturbances, however, still continue to agitate it.

SECT. IV. *Political Geography.*

5865. The Mexicans, on effecting their emancipation from the yoke of Spain, formed themselves into a *federal republic*, divided into nineteen states, each of which has its local government, while the general congress provides for the foreign relations and general interests of the confederacy. These states are Mexico, Queretaro, Guanajuato, Mechoacan, Xalisco, Zacatecas, Sonora and Cinaloa, Chihuahua, Durango, Cohahuila and Texas, New Leon, Tamaulipas, San Luis Potosi, Vera Cruz, Puebla, Oaxaca, Chiapa, Tabasco, Yucatan, Old and New California, New Mexico, Tlascala, and Colima. The members of the house of representatives are elected for two years, and there is one for every 80,000 inhabitants. The member must possess landed property of the value of 8000 dollars, or derive from some trade or profession an income of 1000 dollars a year. The senate and president are chosen by the state legislatures. This constitution has, unfortunately, not been sufficient to prevent civil dissensions, and even an appeal to the sword.

5866. *The army*, according to Mr. Ward, amounted, in 1827, to 58,955; of whom 32,161 were under arms. They were divided into twelve regiments of infantry, twelve of cavalry, and three brigades of artillery. The navy consisted of one ship of the line, two frigates, four brigs, and some smaller vessels. The army cost 9,069,000 dollars, and the navy, 1,309,000; amounts which the finances of the country were ill able to defray.

5867. *The revenue*, which, in 1808, was estimated at 20,000,000 dollars, had in 1825, through the civil wars, and the abolition of unpopular taxes without the substitution of others, fallen to 9,375,000, being all that was to meet an expenditure of 18,000,000, and the interest of the debt. The state, amid its distresses, had obtained loans from British capitalists, but with little benefit to either party. In 1823, there was procured from the house of Goldschmidt a loan of 3,200,000*l.*, but this being at a discount of fifty per cent. and a large sum being charged for agency, the amount paid into the Mexican coffers was only 1,180,000*l.* A loan of the same extent obtained next year from the house of Barclay was reduced by the same causes to 1,370,000*l.*, of which the lenders were able to make good only 1,078,000*l.*

SECT. V. *Productive Industry.*

5868. *As an agricultural country*, Mexico has been celebrated for the vast variety of productions which can be raised, according to the different degrees of elevation of its great tabular mass of territory. It is divided into warm lands, temperate lands, and cold lands. The warm lands, however, though capable of yielding in profusion all the productions of the torrid zone, are subject to so deadly a pestilence, that even the natives preferred to inhabit a poorer soil on the higher grounds; and Europeans, except the few fixed by commercial avidity, pass through it in trembling haste, as if death pursued them. The cold lands, again, are nearly devoid of vegetation, exhibiting on a few scattered spots the plants of the north. It is only on the "temperate lands," that the real and effective vegetation exists; and there the finest plants of the most genial temperate climates are produced in higher perfection than in most other parts of the known world. The Mexican wheat excels that of all other countries, both in quality and abundance, provided that by nature or art it have been supplied during growth with sufficient moisture. Such is the aridity of the soil, that artificial irrigation is usually necessary. Maize, or Indian corn, the proper grain of America, is still more generally cultivated, and forms the standing food of the people. Its harvests are equally profuse. Barley and rye (seldom oats), grow on the colder grounds, the first forming the chief food of horses. Farther down grows the banana, which, though the proper food of the torrid zone, grows so high, that Humboldt calculates 50,000 square miles may be fit for it. Of all vegetables it yields the greatest proportion of aliment with the least culture. It bears fruit in ten months after planting, and then requires only to have the stalks cut, that new shoots may spring from them, and to be dug and dressed round the roots. The amount of nutritive substance yielded by it, is to that of wheat, as 133 to 1, and to that of potatoes, as 44 to 1. The manioc root, under the same climate, can be made to produce abundance of palatable and wholesome farina. The Mexicans set much value also on the maguey, which is extensively cultivated, and yields annually about 150 quarts of a sweet juice, easily convertible into *pulque*, the favourite fermented liquor of the people. The most remarkable failure is that of the potato, which, though growing both in North and South America, had not reached Mexico at the time of the conquest, and is still rare and of inferior quality. Sugar, coffee, and cotton are all produced of excellent quality, but only for internal use; and cocoa, though an universal beverage, is procured by importation. Cochineal is almost the only article collected extensively for export. The culture is laborious, and has diminished of late, but the price has not increased, substitutes being employed. There is also indigo, but it is inferior to that of Guatemala. Vanilla, the flavouring material of the chocolate, is obtained in the forests of Oaxaca and Vera Cruz, and exported to the amount of 8000*l.* or 10,000*l.* value annually.

5869. *The mines*, however, are the grand objects which have connected the idea of unbounded wealth and romantic splendour with the name of Mexico. Gold and silver, by a natural illusion, have always shone in the eyes of mankind with a lustre beyond that of any other metal. Peru, indeed, offers gold in greater abundance; but Mexico, since the first discovery, has produced more silver than all the rest of the world united. The silver ore of Mexico is far from rich; it seldom yields more than three or four ounces to the quintal of earth, while that of Saxony yields ten or even fifteen ounces. It is situated also very deep in the ground. The quantity, however, is in many cases immense, obtained with comparatively little difficulty; for, instead of being, as usual, placed in the heart of dreary and almost inaccessible deserts, the mines occupy the very best situations of the great table plain, are surrounded with brilliant vegetation, and with all the means of comfortable subsistence. There are 3000 mines in Mexico; most of them, however, are now unproductive, and even ruinous: but adventurers have been encouraged to begin, and to persevere while a particle of their capital remained, by the enormous profits which have, in a few instances, been realised. The most remarkable was that of the Valenciana mine, undertaken by Obregon.

a poor man, who, by begging and borrowing, contrived to carry on a fruitless excavation during eleven years, till he came at length upon the great vein, which for more than thirty years yielded above 500,000*l.* annually. The mine of Pavellon, in the district of Sombrerete, yielded 800,000*l.* in six months; but its product has been by no means so steady. The purification of the metal is effected either by smelting or by amalgamation with mercury. The latter mode is considered the most eligible, especially since the forests have been thinned by the quantity already consumed in the smelting process. 16,000 quintals of mercury are required for the mines of Mexico; a quantity difficult to procure, especially while the Spanish government monopolised and retailed it at an enormous price. The produce of the mines continued increasing till the commencement of the late revolution. From 1750 to 1759, the average appeared to be 16,566,000 piastres; from 1771 to 1803, it was 19,688,000; but in the first years of the present century, the duties levied implied an amount of 22,000,000; and, allowing for contraband, the total might probably be 25,000,000, or 5,500,000*l.* sterling. During the dreadful convulsions of the late revolution, the amount was greatly reduced, the water having in many instances been allowed to rush in, the machinery destroyed, and the workmen dispersed. The silver coined in the mint of Mexico, which, in 1810, amounted to the value of 17,950,000 dollars, had fallen in 1825 to 3,651,000. The mine of Guanaxuato yielded, in 1810, 511,000 marks of silver; in 1825, only 100,000. Extraordinary efforts have lately been made by British capitalists to restore and extend the produce of these mines. During the period of excited speculation in 1825, numerous companies were undertaken for this purpose; and their shares sold for some time at advancing premiums. The following is a statement of the six now in active operation, with an estimate of the funds which they have invested in this undertaking:—Real del Monte, 500,000*l.*; United Mexican, 1,200,000*l.*; Anglo-Mexican, 1,000,000*l.*; Bolanos, 150,000*l.*; Halpuyahua, 180,000*l.*; Catorce, 60,000*l.* There were also two American and one German, but on a smaller scale. The English companies began their operations with the greatest spirit; it was soon found, however, that an enormous expense must be incurred before the smallest return could be hoped for. Every thing was to be erected anew—horse whips, magazines, stamps, crushing mills, and washing vats; hundreds of horses and mules were to be purchased; roads to be made; establishments to be formed for the process of amalgamation. These expenses have absorbed the subscribed capital of the companies, and the produce has not yet answered expectation, though the vein of Vela Grande in Zacatecas has yielded 3,000,000 dollars to the Bolanos Company. The value of the Mexican gold does not exceed 7000 marks, or about 200,000*l.* sterling annually. The mint of Mexico is a prodigious establishment, in which all the processes are carried on with the greatest activity, though not, as Mr. Bullock conceives, with that elegance of design which might be desired. It is capable of stamping 100,000 dollars within the hour. So rapid an operation is seldom required; yet there have passed through it probably upwards of 3,000,000,000 dollars.

5870. *Manufactures in Mexico are, and must long continue, in a very rude state.* A strong prejudice exists among the natives against manual labour: in consequence of which, it is chiefly confined to criminals, or persons compelled by debt to engage in it. These workmen are immured as in a prison: and high walls, double doors, barred windows, together with the severe corporal punishments often inflicted on the inmates, make these places resemble an ill-conducted gaol. There are, however, considerable fabrics of coarse red earthenware, which is used in all the operations of cookery; also manufactures of coarse woollens and cottons. The amount of these, in good times, was reckoned at 1,500,000; but declined during the troubles. Working in gold and silver has, as might be expected, been a favourite occupation. Services of plate, worth 6000*l.* or 8000*l.*, have been manufactured at Mexico, which, for elegance and fine workmanship, may rival the best of the kind in Europe. Glass has also made great progress. The coaches of Mexico have long been celebrated both for good construction and beauty, it being the particular ambition of all who possibly can, to have their coach.

5871. *The commerce of Mexico does not correspond with its great fame for wealth.* The exports of the precious metals form the principal article; next to this is cochineal; to which may be added, sugar, flour, indigo, provisions, vanilla, sarsaparilla, jalap, logwood, and pimento. The exports at Vera Cruz in 1824, amounted to 12,082,000 dollars, of which 7,437,000 were for European and other foreign ports; 4,360,000 for American ports; and 284,000 for other Mexican ports. The imports, consisting chiefly of manufactured goods, wine, brandy, and metals, were from Europe 1,468,000; America, 3,022,000, other Mexican ports, 202,000. Under the Spanish regime, Vera Cruz and Acapulco had a monopoly of the trade; but since the revolution, a considerable amount has centered in other ports, of which the chief are, in the northern part of the Gulf, Tampico, and Soto la Marina; Campeachy and Tabasco in the south; San Blas and Mazatlan on the western coast; and Guaymas in the Gulf of California. The value of exports from Britain to Mexico in 1829 was 302,000*l.*

5872. *The roads of Mexico are tolerable, so far as they extend along the level surface of*

the high table-land. But the steep declivities from thence to the maritime plain along both seas, were long impassable for a carriage of any description. Before the late revolution, however, the merchants of Mexico had undertaken a most magnificent highway, so judiciously adapted to the declivities, that loaded waggons could ascend from Vera Cruz upwards to Mexico, and thence down to Acapulco. This public work was interrupted by the late revolution, and was found by recent travellers in an unfinished and neglected state; but it can scarcely be doubted that the new government will soon avail themselves of the means they now possess, to complete so important an undertaking.

SECT. VI. *Civil and Social State.*

5873. *The population of Mexico*, which had previously been estimated on the most vague conjecture, has been computed by Humboldt with extraordinary care. He copied from the archives of the viceroy a statement containing the results of an enumeration made in 1793, by which the number was rated at 4,483,529. This census was taken, however, in opposition to those popular apprehensions and prejudices with which such an enumeration is always viewed; and the real amount might be at least a sixth more, or 5,200,000. After carefully comparing the numbers of births and deaths, and observing the progress of agriculture, the increased amount of duties on consumption, and the many new houses every where building, he considers that the population of 1808 might be safely estimated at 6,500,000. It has since been rated at 10,000,000, but seemingly too high, considering that, by the war, not only a multitude of the inhabitants has perished, but that many of the sources of industry have ceased to be productive. The best authorities seem to reckon the present population at about 8,000,000.

5874. *The classes of society* are singularly varied, and are characterised by distinctions more striking than those observable in other countries. They are four, more distinct and almost more alien to each other than if they were separate people, actuated by the strongest sentiments of national rivalry. Those classes are, native Spaniards; Spaniards born in America; the mixed castes; and the Indians.

5875. *The native Spaniards*, called *Chapetones*, did not exceed 70,000 or 80,000, and the greater number of these have now been expelled; but, prior to the late revolution, the court of Madrid, either through jealousy of the Americans, or through personal interest, bestowed exclusively upon them every office in its colonies. They deputed themselves as beings of a decidedly superior order to the Creole Spaniards, who, they openly asserted, were an effeminate and ignorant race, incapable of any elevated and liberal occupation. They are now fallen from their high estate. They are stripped of all their honours and dignities; many of them reduced to extreme poverty, and allowed only to exist under strict surveillance by a government to whom they are objects of perpetual jealousy. Captain Hall considers them, notwithstanding the deadly error which caused their ruin, as not undeserving of sympathy. They are better informed, more industrious, and more highly bred than the natives, and in all respects, except on the national question, more liberal. As merchants they were active, enterprising, and honourable; and towards strangers courteous and obliging. It could never, certainly, be expected, that they should not resist to the utmost a revolution which deprived them of their station in society, and reduced them to a depressed and subordinate condition.

5876. *The Creoles*, or Americans, as they prefer to call themselves, even when they were depressed beneath the preponderance of the Europeans, formed a privileged class in comparison with other natives. They are fond of splendour, and delight to ride on horses richly caparisoned (*fig. 961.*). Many of them, descended from the first conquerors, or enriched by speculation in the mines, enjoy fortunes almost more than princely. Forty or fifty thousand pounds a year is not an uncommon income, even for families who do not possess mines. The Conde de la Valenciana has repeatedly drawn from his mine 250,000*l.* in one year. The Conde de la Regla, from the profits of another, presented to the king two ships of the line constructed of cedar. These immense fortunes, however, are often dissipated in ulterior mining speculations, to which the owners are tempted by one successful adventure, and in which they often squander all that they have gained. An ostentatious mode of living, a rage for gaming, and an ill-arranged domestic economy, are also causes which involve the richest families in embarrassment, and prevent any accumulation of capital. The entire

MEXICAN GENTLEMEN.

number of those denominated whites in Mexico, is about 1,200,000, of whom all except the small number of Europeans above mentioned are Creoles. The charge of ignorance is generally advanced against this class; and, notwithstanding some decided exceptions, and a peculiar aptitude, which most of them are said to display in learning the principles of science, cannot be wholly denied. The causes, however, which have produced this mental

degradation, are now at an end; and though beneficial changes are not to be effected by magic, there can be no doubt that the permanent advantage of a free government will enable the Mexicans to take the station for which nature has destined them.

5877. *The Indians* (figs. 962. and 963.), descendants of the original possessors of Mexico, still survive, to the supposed amount of 2,500,000, and are, consequently, twice as nume-

962

MEXICAN INDIANS.

rous as the white race. They bear the general features of those aborigines who have been found in all parts of North and South America. They have the same swarthy or copper colour, the flat and smooth hair, small beard, squat body, long eye, with the corner curving up towards the temples, prominent cheek-bones, thick lips, and an expression of gentleness in the mouth, strongly contrasted with a gloomy and severe look. Their hair is coarse, but smooth, and so glossy as to appear in a constant state of humidity. They share with the rest of their countrymen, and with most races of very swarthy complexion, an exemption from almost every species of deformity. Humboldt never saw a hunch-backed Indian, and squinting and lameness are very rare. They escape the goitre, even in districts where it is prevalent. None of the causes which

have been assigned for this exemption in nomadic nations can apply to a laborious agricultural race like the Mexican Indians; and therefore this immunity must depend on

963

MEXICAN INDIANS.

something peculiar in their structure. It has been supposed that few attain an advanced age; but this is owing to the circumstance that, whatever age a Mexican may attain, he never becomes gray-haired. He leads a very different life, and is exposed to none of the casualties incident to a hunter and a warrior on the banks of the Mississippi. A peaceable cultivator, subsisting constantly on vegetable food, attains often a hundred years of age, and is still green and vigorous. The only circumstance which tends to abridge life is an extravagant use of the inebriating liquor called pulque, especially on occasion of coming to market. The police of Mexico sends round tumbrils to collect the drunkards, like so many dead bodies, after which they are punished by being obliged to work chained in the streets for several days. The Spanish government adopted a singular policy in regard to the Indians, confining them in villages of their own, into which no white was allowed to enter; nor

were they admitted into any place inhabited by whites. Although the Aztec nobles mostly perished in the ruin of their country, yet some still remain, who lay claim to the highest rank among that body, and to whom their countrymen pay profound respect, clearly denoting the importance of their ancestry. They are usually invested with the government of the villages, and are accused of exercising their power in an oppressive manner, with little regard to the ties which unite them to their countrymen. The Indians pay a tribute, or capitation tax, varying at different times and places from one pound to four shillings and two-pence; an impost which, from its nature, must be degrading, though we cannot think, with the worthy bishop of Mechoacan, that it would be any improvement to substitute the alcavala. A few of them have amassed considerable wealth, amounting even to 30,000*l.* or 40,000*l.*; but in general they labour under severe poverty. They appear to be gifted with a clear apprehension, a natural logic, and a capacity of cool and even subtle reasoning, but to be destitute of any warmth of imagination or glow of sentiment. Yet the love of flowers, for which they have been remarkable since the time of Cortes, seems to indicate a taste for the beautiful. In the public market of the capital, the Mexican surrounds himself with an entrenchment of verdure, and the ground around him is embellished with festoons of flowers, which are daily renewed. They evince also a great attachment to the arts of painting and carving, and imitate with great facility any models which are presented to them. A peculiar apathy marks the deportment of the Mexican Indian. He is grave, gloomy, and silent; he loves to throw a mysterious air over the most indifferent actions, but is often seen to pass at once from a state of seemingly profound repose, to one of violent and unrestrained agitation. Their want of present instruction is ascribed to the extinction of the Aztec priesthood and all their monuments, for which nothing was substituted by the Spanish ecclesiastics.

5878. *The mixed castes* form a very numerous part of the population of Mexico, being estimated even by Humboldt at 2,400,000. They are either mulattoes, descended from mixture of the white with the negro; or mestizoes, from mixture with the Indian. The latter, in consequence of the happily small number of negroes introduced into Mexico,

compose seven eighths of its mixed population. To be white is in Mexico a badge of rank, and almost a title of nobility. When a Mexican considers himself slighted by another, he asks, "Am I not as white as yourself?" From a refinement of vanity, the inhabitants of the colonies have enriched their language with terms for the finest shades, which result from the degeneration of the primitive colour. The union of a mestizo, or mulatto, with a white, produces what is called a quarteron; and the union of a quarteron with a white produces a quinteron; after which, the next generation is accounted white. It is said that the Indians can distinguish, even in the dark, the different races, by the odour peculiar to their cutaneous transpiration. Indians often come before courts of law to clear themselves from the charge of impure mixtures; and, when possessed of influence, obtain verdicts which are not always conformable to the evidence of the senses. When the case is very palpable, however, the law contents itself with declaring, "that they shall be held as white;" a concession to which considerable value seems to be attached.

5879. *The Catholic religion* was introduced into Mexico at the time of the conquest, with a body of clergy, both secular and regular, who do not possess the exorbitant wealth which has been ascribed to them. The archbishop of Mexico, and the eight bishops under him, have not among them more than 120,000*l.* a year. Neither is the number of clergy greater than corresponds to the extent and population of the country. They do not exceed 10,000; or, including every person connected with the church, 13,000 or 14,000. A number of the lower clergy, especially in the Indian villages, are excessively poor, their income not exceeding 25*l.* a year. The influence and revenue of the church also have considerably diminished during the revolution. In 1827, according to Mr. Ward, seven bishoprics and seventy-nine cathedral benefices were vacant; in 156 colleges and convents of Mexico, only 280 individuals had taken the vows during five years; and only 92 were serving in noviciate. The alms collected in all the convents of Mexico amounted, in 1826, to only 204,000 dollars. The churches, however, in Mexico, Puebla, and other large cities, are of surpassing splendour; and the blaze of gold, silver, and ornaments, surpasses what is displayed in the richest shrines of Europe. Bigotry, among the body of the people, prevails nearly to the same extent as in Spain; and the new legislators have not attempted to grant toleration to any other religion than the Roman Catholic; yet many of the best informed are supposed to be secretly tinctured even with the sceptical opinions of the modern French school. The Indians have been what the Spaniards call converted to the Christian faith; but the change has evidently been not a change of creed, but a commutation of one ceremony for another, and in some cases their ancient ceremonies are retained. Humboldt seems to suppose that they merely considered the Spanish gods to have vanquished their gods, and thence to have become entitled to their homage. They even persuaded themselves, and, it is said, were assured by the Spaniards, that the emblem of the third person of the Trinity was identical with the sacred Mexican eagle. Be this as it may, the Mexicans display an extraordinary ardour in adorning the churches with pictures and statues, and in collecting and grouping flowers, fruits, and every thing which can increase the splendour of religious festivals. But their favourite form of worship is dancing round the altar, and with astonishment it is perceived, that these dances are the same with which their ancestors celebrated the immolation of human victims to the dreadful god of war. The warrior departs, attired in the full costume of the days of Montezuma; he meets another; fights, vanquishes, and drags him by the hair before the emperor. The spectator almost expects to see the blood begin to flow. When Mr. Bullock was modelling the great Mexican idol, the natives gazed intently, and some of them were heard to observe, that, after the cordial manner in which they had adopted the Spanish gods, they might have been allowed to retain a few of their own.

5880. *The sciences* have not yet shone very bright in this part of the western hemisphere. Few governments, however, have expended more in the promotion of physical science than that of Spain in America. It sent three botanical expeditions into Mexico and other parts of its transatlantic territory, which cost upwards of 80,000*l.* Geometry and astronomy have made considerable progress in Mexico. Humboldt names three individuals, Velasquez, Gama, and Alzate, who might have held a respectable rank in Europe. A botanical garden and collections of minerals were formed in Mexico on a great scale. The school of mines produced great advantages to the country, and the pupils were initiated even in the highest branches of mathematics. These lights, according to the most recent accounts, had suffered a temporary eclipse, in consequence of the long revolution; but the new government is endeavouring to revive them by measures which can scarcely fail of ultimate success.

5881. *The fine arts* were also promoted with great zeal by the old government, which, at an expense of 8000*l.*, transported to Mexico, across the rocky passes of the Cordilleras, a collection of casts of the finest antique statues. The Academy of the Fine Arts possessed an income of 5000*l.* a year, chiefly supplied by government, and the benefit of its exertions was seen in the beauty of the public edifices which adorned the capital.

5882. *The amusements* are chiefly those of Old Spain; bull-fights, and religious pro-

cessions. The theatre is still far inferior to that of the mother country. The dress of the ladies is usually black; but on holidays they wear very showy and brilliant stuffs, without much regard to the richness of the material. The *attire* of the gentlemen, especially on horseback, is exceedingly splendid; embroidered breeches of coloured leather, adorned with silver buttons and silver lace; over their short calico jacket is thrown a rich velvet cloak, often embroidered with gold. The *houses* of the wealthy exhibit similar splendour. They are usually three stories high, and the fronts painted white, crimson, or light green; sometimes covered with glazed porcelain. The finest apartments are lofty and spacious, situated on the first floor, which is ascended by a magnificent staircase. The house is built round an interior court, filled with trees and flowers. The roof is flat, and is made strong, to resist rain; it is adorned with plants and flowers, which in fine weather make it an agreeable resort.

SECT. VII. *Local Geography.*

5883. *Mexico*, in 1776, was divided by the Spanish government into twelve intendencies. This division, made with a view to its interior administration, has been abolished; but as it coincides with the natural features of the country, it may serve for our present purpose to exhibit the details of the Mexican territory. The following table is drawn up from the data of Humboldt. The population here stated, being founded upon the census of 1793, is below the present amount; but it will show the relative proportion between the different parts of the territory.

Provinces.	Square Miles.	Population in 1793.	Provinces.	Square Miles.	Population in 1793.
Mexico - -	5,927	1,511,800	Vera Cruz - -	4,141	156,000
Puebla - -	2,696	813,300	San Luis Potosi - -	27,821	334,900
Guanaxuato - -	911	517,300	Durango - -	16,873	159,700
Valladolid - -	3,446	376,400	Sonora - -	19,143	121,400
Guadalajara - -	9,612	630,500	New Mexico - -	5,709	40,200
Zacatecas - -	2,225	153,300	Old California - -	7,295	9,000
Oaxaca - -	4,447	534,800	New California - -	2,125	15,600
Merida - -	5,977	465,800			

5884. *There is another and more ancient division*, which is still regarded by the inhabitants. This is into — 1. The kingdom of Mexico, comprising the first seven intendencies, and all the most rich and valuable portions of the state. 2. The kingdom of New Galicia, comprehending the intendencies of Guadalajara and Zacatecas; a somewhat ruder tract, but containing some important cities and havens. The outer and ruder regions were arranged under the respective heads of Leon, New Santander, Texas, Cohahuila, New Biscay, Sonora, New Mexico, the two Californias.

5885. *The intendency of Mexico* consists of what is called the Valley of Mexico, a fine and splendid region, variegated by extensive lakes, and surrounded by some of the loftiest volcanic peaks of the new world. Its circumference is about 200 miles, and it forms the very centre of the great table-land of Anahuac, elevated from 6000 to 8000 feet above the level of the sea. In the centre of this valley stands the city of Mexico (*fig. 964.*); the ancient

964

MEXICO.

Mexico, or Tenochtitlan, having been built in the middle of a lake, and connected with the continent by extensive causeways or dikes. The new Mexico is three miles from the Lake of Tezcuco, and nearly six from that of Chalco; yet Humboldt considers it certain, from the remains of the ancient *teocalli*, or temples, that it occupies the identical position of the former city, and that a great part of the waters of the valley have been dried up. Mexico was long considered the largest city of America; but it is now surpassed by New York, perhaps even by Rio Janeiro. Some estimates have raised its population to 200,000; but it may, on good grounds, be fixed at from 120,000 to 140,000. It is beyond dispute the most splendid. "Mexico is undoubtedly one of the finest cities built by Europeans in either hemisphere, with the exception of St. Petersburg, Berlin, and Philadelphia, and some

quarters of Westminster: there does not exist a city of the same extent which can be compared to the capital of New Spain, for the uniform level of the ground on which it stands, for the regularity and breadth of the streets, and the extent of the squares and public places. The architecture is generally of a very pure style, and there are even edifices of a very beautiful structure." The palace of the late viceroys, the cathedral, built in what is termed the Gothic style, several of the convents, and some private palaces, reared upon plans furnished by the pupils of the Academy of the Fine Arts, are of great extent and magnificence; yet, upon the whole, it is rather the arrangement, regularity, and general effect of the city, which render it so striking. Nothing, in particular, can be more enchanting than the view of the city and valley from the surrounding heights. The eye sweeps over a vast extent of cultivated fields, to the very base of the colossal mountains, covered with perpetual snow. The city appears as if washed by the waters of the Lake of Tezcucó, which, surrounded by villages and hamlets, resembles the most beautiful of the Swiss lakes, and the rich cultivation of the vicinity forms a striking contrast with the naked mountains. Among these rise the famous volcano Popocatepetl and the mountain of Iztaccihuatl, of which the first, an enormous cone, burns occasionally, throwing up smoke and ashes, in the midst of eternal snows. The police of the city is excellent; most of the streets are handsomely paved, lighted, and cleansed. The annual consumption in Mexico has been computed at 16,300 beeves; 279,000 sheep; 50,000 hogs; 1,600,000 fowls, including ducks and turkeys; 205,000 pigeons and partridges. The markets are remarkably well supplied with animal and vegetable productions, brought by crowds of canoes along the Lake of Chalco, and the canal leading to it. These canoes are often guided by females, who at the same time are weaving cotton in their simple portable looms, or plucking fowls, and throwing the feathers into the water. Most of the flowers and roots have been raised in *chinampas*, or floating gardens, an invention peculiar to the new world. They consist of rafts formed of reeds, roots, and bushes, and covered with black saline mould, which, being irrigated by the water of the lake, becomes exceedingly fertile. It is a great disadvantage to Mexico, however, that it stands nearly on a level with the surrounding lake; which, in seasons of heavy rains, overwhelm it with destructive inundations. The construction of a *desague*, or canal, to carry off the waters of the Lake of Zumpango, and of the principal river by which it is fed, has, since 1629, prevented any very desolating flood. The *desague*, though not conducted with skill and judgment, cost 1,040,000*l.*, and is one of the most stupendous hydraulic works ever executed. Were it filled with water, the largest vessels of war might pass by it through the range of mountains which bound the plain of Mexico. The alarms, however, have been frequent, and cannot well cease, while the level of that lake is twenty feet above that of the great square of Mexico.

5886. *Acapulco*, on the east coast, has been celebrated in an extraordinary degree as almost the centre of the wealth of America; the port whence the rich Spanish galleons took their departure to spread the wealth of the western over the eastern hemisphere. It is one of the most magnificent harbours in the world, seeming as if it were excavated by art out of a vast circuit of granite rocks, which shut out all view of the sea. To Captain Hall and his companions, it appeared the very beau ideal of a sea-port. Yet while Vera Cruz, with its wretched anchorage amid sand-banks, annually received from 400 to 500 vessels, that of Acapulco scarcely received ten, even in the time of the Manilla galleon, the discontinuance of which reduced it to a state of insignificance. It is said, however, of late to have considerably revived, and its customs, after falling so low as 10,000 dollars, had risen, in 1826, to 400,000.

5887. *Other places of great interest* exist in the intendency and valley of Mexico. Queretaro is a considerable and fine city, containing many handsome edifices, both public and private, with somewhat flourishing cotton manufactures. Of 35,000 inhabitants, 11,600 are Indian. The surrounding valley is particularly fertile and beautiful. Tezcucó is now only a mass of ruins, but these are peculiarly grand. The foundations and remains of temples, fortresses, palaces, and other extensive buildings, attest a period when it must have been one of the greatest cities of America, capital of the kingdom of Acolhuacan; still later it was the seat of literature and art, the Athens of America. The palace of the former tributary king could not be viewed without forming an elevated idea of the ancient Mexican architecture. It must have covered several acres, is raised on several sloping terraces, and of materials at once durable and beautiful. All round Tezcucó are seen raised mounds of brick, mixed with aqueducts, ruins of buildings of enormous strength, and many large square structures nearly entire. Here the blind zeal of the first bishop collected and committed to the flames all the monuments of Aztec history and literature. Near Otumba, once large and flourishing, but now little more than a village, are the pyramids of Teotihuacan, the two principal of which appear to be temples dedicated to the sun and moon: the highest of them has been recently estimated by Mr. Glennie at 221 feet. A flight of steps leads to the top, where an altar appears anciently to have been placed. It is surrounded by numerous pyramids, about thirty feet high, arranged in broad and regular streets, all terminating in the great pyramid (*fig. 965.*).

5888. *The intendency of Puebla* stretches nearly across

PYRAMIDS OF TEOTIHUACAN.

the continent, and over the high table-land. It has few mines, but contains an extensive table plain, 6000 feet high, eminently fertile in wheat, maize, and fruit. This was the seat of republican Mexico. Tlascala and Cholula, the two cities which bade defiance to the power of Montezuma, are usually included within its limits. It contains also Popocatepetl, the loftiest mountain in Mexico, exceeding by 2000 feet the highest

in Europe. The volcano has for several centuries thrown up only smoke and ashes.

5889. *Puebla de los Angeles* (fig. 966.) is a handsome and large city. It is entirely Spanish, having been founded since the conquest. The streets are straight, broad, and cross each other at right angles, dividing the whole into spacious squares. They are well paved, and have broad foot-paths. The houses are large and lofty, the walls often covered with paintings, while the roof is ornamented with glazed tiles. In the splendour of the churches and the richness of their endowments,

PUEBLA DE LOS ANGELES.

Puebla, according to Mr. Bullock, must take the first rank in the Christian world. The cathedral is a vast pile, with little external ornament: but the interior is rich beyond description. The high altar, finely designed by an Italian artist, is composed of the most beautiful marble and precious stones that could be found in New Spain: its numerous and lofty columns, with plinths and capitals of burnished gold, the crowd of statues and other ornaments, have an unequalled effect. In manufactures it takes the lead of other Mexican cities: those of woollen have declined, but those of earthenware and glass are still flourishing. Humboldt reckons the population at 67,800; Bullock, thirty years later, at 90,000.

5890. *Cholula*, the ancient capital of a great independent republic, has declined into a town, containing, according to Humboldt, 16,000, according to Bullock, 6000, souls. The pyramid of Cholula (fig. 967.) is the work of art which, next to the pyramids of Egypt, approaches nearest in magnitude and vastness to those of nature. It is not nearly so high as the Great Pyramid, being only 172 feet; but the length is nearly double; 1335 feet, instead of 728. It is four times as long as the third pyramid, or that of Mycerinus, and somewhat higher. A section having been made through

PYRAMID OF CHOLULA.

it to form the road to Mexico, it was found to be composed of brick, and displayed an interior chamber, built of stone, and containing two skeletons, some idols of basalt, and a number of vases curiously varnished and painted. On the platform at the top has been erected a chapel, where mass is daily celebrated, and whence a noble view is obtained over the fine plain of Mexico and its boundary mountains. Tlascala, once the powerful rival of Mexico, is now no more than a large village; its ancient monuments, if any exist, remain unexplored.

5891. *The intendency of Vera Cruz* occupies the sea-coast belonging to the two now described, and also a tract of land considerably farther south. It extends inland from the level of the Gulf of Mexico to that of the great central table-land. In a day's journey the inhabitants may ascend from regions of the most suffocating heat to those of eternal snow; and, according to Humboldt, naturalists in this wonderful country may traverse, even in a few hours, the whole range of the vegetable kingdom. The aspect of the oak first relieves the traveller, by showing him that he is beyond the dreaded dominion of the yellow fever; and soon after he is cheered by the view of fields of wheat. Pines then begin to mingle with the oaks, and at a little higher elevation, these and other resinous plants alone cover the rocks, whose summits penetrate into the regions of eternal snow. This intendency is capable of yielding in abundance the most precious productions; and within a recent

period, sugar, tobacco, and cotton, all of excellent quality, have been raised to a much greater extent: but the horror with which the climate is viewed both by Europeans and Indians is such, that the greater part of it remains a complete desert, where often, for many leagues, there are only to be seen two or three huts, with herds of cattle, half wild, straying round them.

5892. *Vera Cruz* (fig. 968.), in which centres almost all the trade of Mexico, is well and

VERA CRUZ.

handsomely built of the submarine material called madrepora, which is also made into lime; and its red and white cupolas, towers, and battlements have a splendid effect when seen from the water. The streets also are kept extremely neat and clean; yet Mr. Bullock considers it the most disagreeable of all places of residence. This arises not merely

from the pestilence which taints the air; the surrounding country is covered with sand blown into hillocks, which, reflecting the rays of the sun, render the heat more oppressive. There is not a garden or a mill now within many miles of it; and the only water which can be drunk is that which falls from the clouds. The markets are bad for every article except fish, of which many beautiful species are here caught. The place appears to have sensibly declined since the dissolution of the ties which connected Mexico with the mother country. Humboldt reckons a population of 16,000; but Bullock, though he admits it might hold even more, does not estimate the actual number at more than 7000. The castle of San Juan de Ulloa, the last hold of Spain in the New World, and which commands the entrance of the port, is of immense strength, though it seems impossible to believe that 8,000,000*l.* sterling could have been expended upon the structure.

5893. *The only other important place is Xalapa*, a very handsome town, commodiously situated, being 4000 feet above the sea. The neighbouring country is finely wooded, and particularly remarkable for the medical article jalap, which received its name from the city. This intendency contains also two stupendous mountains, Orizaba, the second in Mexico as to height, and that called the Cofre de Perote, which is still more than 1000 feet higher than the Peak of Teneriffe.

5894. *Valladolid* is an extensive intendency, situated to the north and west of that of Mexico, on the summit and western declivity of the table-land. It includes the ancient kingdom of Mechoacan, as it is still called in the country, which was independent of Montezuma, and of which the capital, Tzintzoutzlan, still exists, though reduced to little more than a village. Mechoacan, unless in the unhealthy tract along the coast, enjoys a fine and temperate climate, is intersected with hills and charming valleys, and presents the appearance, unusual in the torrid zone, of extensive and well-watered meadows. This territory has been marked by some phenomena of the most striking nature. On the 29th of September, 1759, from the centre of a thousand small burning cones, was thrown up the volcano of Jorullo (fig. 969.), a mountain of scorice and ashes, 1700 feet high. In an extensive plain,

VOLCANO AT JORULLO.

covered with the most beautiful vegetation, deep subterraneous noises, accompanied by frequent earthquakes, continued for the space of fifty or sixty days. On the night of the 28th of September, the sounds recommenced with such fury, that all the inhabitants fled from the district. A large tract of ground was seen to rise up and swell like an inflated bladder, and spectators reported that, throughout this space, flames were seen to issue forth, and fragments of burning rocks were thrown up to

prodigious heights; and that, through a thick cloud of ashes illumined by the volcanic fire, the softened surface of the earth appeared to heave like an agitated sea. The plain is still covered with numerous small cones, sending forth from their crevices a vapour, the heat of which often rises to 95°. From among these rise six large hills, of which the highest is Jorullo, still burning, and throwing up immense quantities of scorified and basaltic lava. The only large town in the intendency is Valladolid, delightfully situated, 6300 feet above the sea, where snow sometimes falls. There are several mines, but none of first-rate magnitude.

5895. *Guanaxuato*, also part of the ancient Mechoacan, is the smallest but most populous of all the intendencies. It owes its fame to the great mine of Valenciana, discovered late in

the last century, round which rose one of the most splendid cities in the New World. Between 1766 and 1803, this mine yielded silver to the amount of 165,000,000 piastres. Since that time it has suffered a severe deterioration from the effects of the revolutionary contest, and has declined also in consequence of the greater depth of the workings, and the increased difficulty of clearing off the water. The population, which, by Humboldt, was estimated at 41,000 within the city, and 29,600 in the surrounding mines, was not found, in 1822, to exceed in all 35,000. Zelaya is another considerable and well-built town in this district.

5896. *Guadalajara* is an extensive intendency, which has the important advantage of being traversed throughout its extent by the river of Santiago, the largest in Mexico. It appears that within the last thirty years very important advantage has been taken of this circumstance; that industry has made rapid progress, and an active commercial spirit prevails. The capital, which, in 1798, Humboldt estimated to contain 19,500, had risen in 1809, according to Mr. Jacob's report, in the *Encyclopædia Britannica*, to 40,000; and at present Poinsett assigns to it 70,000. Tepic, which Humboldt calls a small place, was found by Captain Hall to be considerable and flourishing. San Blas, its sea-port town, is perched on the top of a cliff, near the mouth of the river, and has a very fine harbour; but during a certain season of the year, it is extremely unhealthy, though not in so deadly a degree as Vera Cruz; and at that time the rain falls in such torrents that no roof can exclude it, and it is impossible without danger to go out into the streets. At the commencement of this season, therefore, a general migration takes place; and the population is reduced in a few days from 3000 to 150, at which it remains stationary until the return of the dry season. The mountain of Colima, in this intendency, 9000 feet high, throws out ashes and smoke, and forms the western extremity of the volcanic chain which traverses Mexico.

5897. *Zacatecas*, north and east of Guadalajara, in the inland centre of Mexico, is an arid rocky plain, strongly impregnated with carbonate of soda, and suffering under the inclemency of the climate. It derives its wealth and distinction solely from mines, of which the most important in Mexico, next to that of Guanaxuato, are here situated. The mine of Pavellon, in Sombrerete, has already been mentioned as having yielded in a given time a greater produce than any other mine known to exist. Zacatecas, the capital, is reckoned by Humboldt to contain 33,000 inhabitants.

5898. *Oaxaca*, for we must return southwards, in order to complete the picture of the central provinces of Mexico, is a fine intendency, situated near the borders of Guatemala. The beauty and salubrity of the climate, the fertility of the soil, and the richness and variety of its productions, render it one of the most delightful countries in the world. These advantages were appreciated at an early period, when it became the seat of an advanced civilisation; and two ancient kingdoms, Misteca and Tzapoteca, were established. Their ancient greatness is attested by monuments, not of such astonishing magnitude as those of the Aztec empire, but superior in elegance and skill. The palace, or rather the royal tombs, of Mitla (*fig. 970.*), are decorated with ornaments similar to those which are admired in the

THE ROYAL TOMBS OF MITLA.

Etruscan vases. Paintings also, representing warlike trophies and sacrifices, have been found in the ruins. Oaxaca has no mines of any importance, and has, therefore, attracted less attention than the more northern parts of the table-land, though in every other respect inferior to it. Oaxaca the capital, called Antequera at the time of the conquest, is a flourishing place; in 1792 it had 24,000 inhabitants, but it suffered severely during the revolution. Tehuantepec, its only

port, is not a good one; but it is of considerable value as a channel by which the indigo of Guatemala is conveyed to Europe.

5899. *The intendency of Merida* is much better known under the appellation of the peninsula of Yucatan, of which it consists, and which with Oaxaca forms the southern and eastern extremity of Mexico. It is a vast plain, only intersected by a chain of mountains, which do not rise above 4000 feet. It is thus excessively hot; yet, from its extreme dryness, it is by no means so unhealthy as most of the low lands under this burning zone. The heat is too great for the ripening of European grain, and the only articles which it yields for subsistence are maize and roots. This was the first part of Mexico in which the

Spaniards landed, and, though it be less improved than the interior, they found, to their surprise, indications that civilisation was in a more advanced state here than in the islands: stone houses, pyramidal temples, enclosed fields, and a clothed and civilised people. Having no mines, however, it owes its commercial importance solely to its valuable product, logwood, which the English, excluded from almost every other part of Spanish America, were allowed, by treaty, to cut in the bays of Campeachy and Honduras.

5900. *Chiapa*, under which we may include Vera Paz, formed the most northerly district of Guatemala; but the greater part of it, on a late occasion, separated itself from Guatemala, and united with Mexico. The soil is fertile, and capable of yielding in profusion tropical fruits and grain. Though low, yet it is free from damp, and not unhealthy. It seems difficult, therefore, to understand how this country, which the Spaniards found populous and flourishing, should have since been converted almost into a desert. Although the cocoa of Soconusco and its neighbouring district of Suchiltepec be accounted the best in the world, that favourite Spanish beverage is not raised in quantity sufficient to become of commercial importance. Chiapa of the Spaniards, called also Ciudad Real, though ranking as the capital, is now only a small place of 4000 inhabitants. Chiapa of the Indians is larger, and carries on a considerable trade. There are several other large villages, chiefly Indian. Near Palenque, the most northern of these, Don Antonio del Rio lately traced the remains of a great ancient city. Fourteen large buildings, called by the natives the Stone Houses, remain nearly entire; and for three or four leagues either way the fragments of the other fallen buildings are seen extending along the mountain. They are of a rude and massive construction, well calculated for durability; and the principal apartments are adorned with numerous figures in relief, representing human beings of strange form, and variously habited and adorned.

5901. *The northern intendencies* of Durango and Sonora form, as it were, the transition from the fertile and cultivated tracts to the rude outer districts of Mexico. The great table-land slopes gradually downward, the capital of Durango being not more than 4000 feet above the sea. These two intendencies, the first of which is better known under the name of New Biscay, are as extensive as Great Britain and France put together; yet their population does not exceed 280,000. There are some valuable mines in the southern border; but in general the Spaniards exist only in scattered settlements over a vast extent of country. They have to contend with a tribe of ferocious Indians, called the Cumanikes, who have tamed the wild horses of the country, and ride them with the utmost agility; while, like the Kamtschadales, they employ dogs as beasts of burden. They scour the country, destroy the villages, kill all the adult prisoners, and preserve the children for slaves. The spirit of vengeance and inveterate hatred generated during this long struggle has placed nearly an insurmountable barrier between the Indians and the whites, which almost totally precludes the hope of improving these savage hordes. Meantime the people of New Biscay, procuring their subsistence by hard labour, and constantly on the alert to defend themselves against these formidable inroads, have exhibited an extraordinary development both of physical and intellectual energy; and it has even been remarked that they are the best scholars. The towns are larger than might be expected, owing to the necessity of union for mutual defence. There are a considerable number, whose population varies from 5000 to 12,000.

5902. *San Luis de Potosi* is an extensive intendency, stretching north and east along the Gulf of Mexico, and better known by the names of its provinces, Leon, New Santander, Cohahuila, and Texas. In the districts adjoining to Zacatecas are the rich mines of Catorce and several others. But the greater part of the region is uncultivated, marshy, indented by deep lagoons, in which, however, no good harbour has yet been discovered. We have already mentioned the scheme formed by the United States to adopt the boundary of the Rio del Norte, which would sever from Mexico the greater part of this intendency. At present, however, the nearest settlements on each side are separated by 200 miles of marsh and desert; and before the time comes when a public coach shall run between Washington and Mexico, some amicable adjustment will doubtless be effected.

5903. *New Mexico*, which has been dignified with the title of empire, is only an infant settlement, formed on the Rio del Norte, in a fertile territory, but having a climate remarkably cold, considering the latitude. It is separated from New Biscay by a vast, arid, and perilous desert. The settlers have a still harder conflict to maintain with the Indians, a few of whom, however, have attained a certain degree of civilisation. A great number of sheep are reared, of which about 30,000 are sent to the southward; and there are some mines of valuable copper. Santa Fé, the capital, is supposed by Humboldt to contain 3500 inhabitants.

5904. *California* is a long peninsula in the Pacific, parallel to the continent, from which it is separated by its deep gulf. The Spaniards long viewed it as an El Dorado, or country of wealth, their hopes being fed by some pearls found on its shores; but a close examination has dispelled those visions. California enjoys the most beautiful sky in the world; constantly serene, blue, and cloudless; or if any clouds for a moment appear, they display the most brilliant tints. But the soil is sandy and arid like the shores of Provence, and only a few favoured spots present a trace of vegetation. Nowhere can be found a finer abode for the astronomer, or a worse for the cultivator. There are about 7000 or 8000 Spaniards and converted Indians, and 4000 savages; and it is not supposed that the population can ever be very much greater.

5905. *New California* is the name given by the Spaniards to a range of settlements formed by them on the western coast, extending northward from Old California. It is

one of the most favoured spots on the globe as to soil and climate. All the varieties of grain and fruit peculiar to the best European regions grow in the highest perfection; the vine and the olive have been more successfully reared than in any other part of the New World. The establishments are chiefly formed by missionaries, who have succeeded in inducing a great number of the Indians to quit their wandering life, and apply themselves to cultivation. According to Captain Beechey, there are twenty-one establishments, containing about 7000 converts. They are kindly treated, well clothed and fed; but they are prevented from leaving the settlement, and the surplus of their labour belongs to the missionaries. The produce consists of hides and tallow, which are purchased by the merchants of the small port of Monterey.

CHAP. VI.

GUATEMALA.

5906. *Guatemala*, or *Guatimala*, notwithstanding its small comparative extent, has been recognised as one of the new states into which the western world is to be divided. It has even, in virtue of its position, assumed the pompous title of *Central America*; but this the world does not seem to have yet conceded.

SECT. I. *General Outline and Aspect.*

5907. *Guatemala* is bounded on the south-east by the province of Veragua, now belonging to the republic of Colombia, on the north and north-east by the provinces of Chiapa, Tabasco, Yucatan, and the Atlantic, or the Sea of the Antilles, and on the south and south-west by the Pacific Ocean. It forms a sort of extended isthmus, reaching from north-west to south-east, between 8° and 17° N. lat., and 8° and 96° W. long. Measured by an oblique line from one extremity to the other, it may be 1050 miles in length; but the breadth, from sea to sea, nowhere exceeds 500, and in some places is only 100 miles. The surface has been estimated at 200,500 square miles, which, though it appears small when compared with the immensity of other American states, is nearly double the whole extent of the British Islands.

5908. *The surface of Guatemala* does not display that lofty and rugged character which generally marks the American continent. The chain of the Andes, which raises such a tremendous snowy barrier through the greater part of the continent, sinks in the isthmus of Panamá into a mere rocky dike, connecting North and South America. Near Nicaragua, it seems to become little more than an insensible ridge, sloping down to the shores of the opposite oceans. Proceeding north-west, it soon rises and presents to the Pacific a lofty range, in which Humboldt and Arago have counted twenty-one volcanoes, partly burning and partly extinct. The loftiest, called the volcano of Guatemala, being covered with snow for several months in the year, cannot be much less than 10,000 feet high. Hence Guatemala, though it does not present a continuous table-land, like Mexico, has high mountain valleys, enjoying a cool and agreeable air, and producing the grain and the fruits of the temperate zone. The eastern part, swelling somewhat into the form of a peninsula, and known by the name of Poyais, and the Mosquito shore, consists of a vast and savage forest, beat by the burning rays of the sun, and occupied by rude and unsubdued Indians.

5909. *The waters which descend from the Andes of Guatemala* fall into one or other of the opposite oceans, and do not swell into rivers of any importance; but there is one grand aqueous feature, the Lake of Nicaragua, 150 miles in length, and 60 in breadth, and having almost throughout a depth of ten fathoms. Numerous streams, flowing from different quarters, form this great body of water, which has only one outlet in the river San Juan, which flows from it into the Atlantic. The surface of the lake is diversified and adorned with small islands, in one of which is a volcanic mountain. It communicates by a navigable channel, of 26 miles, with a smaller lake, called the Lake of Leon, which may almost be considered as a branch of it, and is 50 miles long, by 30 broad.

SECT. II. *Natural Geography.*

5910. *There is nothing known*, under this head, by which Guatemala can be distinguished from the bordering countries of Mexico and Colombia.

SECT. III. *Historical and Political Geography.*

5911. *The history of Guatemala*, and the country itself, were less known than any other part of America, till recent events brought them into notice. Yet its records appear, in many respects, worthy of enquiry. The ancient Guatemalans evidently possessed a civilisation derived from and rivalling that of Mexico. The palace of Quiche is said to be comparable in magnificence to that of Mitla. In the depth of forests have been found ancient cities, containing monuments similar in grandeur and ornament to the *teocallis* of Mexico, and on whose walls are found figures and other representations well executed in bas-relief. The Toltecs, who preceded the Aztecs, as rulers who civilised Mexico, appear to have been driven southwards, and to have settled in Guatemala. The resistance to Alvarado, sent in 1523 by Cortez to conquer this country, was vigorous, and even such as to render the issue somewhat doubtful. After the conquest, Guatemala was erected

into an audiencia, with only a slight dependence on the viceroy of Mexico; but as it did not, permanently at least, yield gold and silver, and its produce was chiefly sent by the way of Vera Cruz, it was very little heard of in Europe, till the general crash of the Spanish power. Guatemala then suddenly erected herself into an independent state; and Mexico, which at first made great efforts to retain her as a province, finding her determination immutable, very wisely, and with a tolerably good grace, yielded the point.

SECT. IV. *Productive Industry.*

5912. *The productive qualities of Guatemala* are, if possible, superior even to those of other countries in the fruitful climates of America. Like Mexico, it yields in different regions, and at small distances from each other, all the varieties of fruit and grain peculiar to the tropical and temperate zones. Of fruits, several of the most valuable are produced in the highest perfection. The indigo, which forms so large a part of the commerce of Mexico, is almost entirely Guatemalan. The cocoa of Soconusco is said to be the very finest in the world, though it is cultivated on too small a scale to enter much into the market of Europe. Vanilla, however, the other ingredient of chocolate, is procured to a great extent from this quarter. There are manufactures of cotton and porcelain, some of them fine, but only for internal consumption; and the fabrics in wrought gold and silver are said to possess great merit. As to commerce, Guatemala labours under the disadvantage of not having on either ocean a port capable of receiving large ships; and its commodities have to bear a heavy land-carriage, and a coasting voyage, before they arrive at Vera Cruz.

5913. Guatemala abounds in *mines*, particularly of silver; some of which have been undertaken by an English company, in the expectation of their proving productive; but the result is yet uncertain. In Quetzaltenango is found very fine sulphur, of which the Spaniards availed themselves to renew their supplies of gunpowder at the time of the conquest.

5914. *Canals* are naturally an undertaking beyond the infant resources of Guatemala; but one is in contemplation which, if executed, will be the greatest and most important work of this kind on the globe. This is a canal to connect the Atlantic and Pacific, so as to enable European vessels to reach China and parts of India by an easier and more direct course. The isthmuses of Panamá and Darien, from their very small breadth, naturally claim the first attention; but they have never been surveyed with any care: it is certain that a considerable ridge traverses them, and the supply of water is doubtful. The isthmus of Tehuantepec, and the interval between the rivers Atrato and San Juan, in Chocó, appear to be level; but the distance is too great to admit of more than a canal of small navigation, which would, doubtless, have its use. But the grand oceanic canal, which would cause a revolution in the commercial world, will, probably, be undertaken from the Lake of Nicaragua, navigable for the largest vessels, which communicates with the Atlantic by the broad channel of the San Juan, and is separated from the Pacific by an interval of from sixteen to twenty miles in breadth, through which it seems certain that a good level could be found. To execute, therefore, a canal of the dimensions of the Caledonian, is, even at present, completely within the reach of human skill and resources. It is an undertaking, indeed, which does not belong to the government within whose limits it is placed; and, though the capitalists of Europe would find no difficulty in providing the funds, the political atmosphere of the West is scarcely yet so settled, that they might look forward with full confidence to compensation for the large advances which would be necessary.

SECT. V. *Civil and Social State.*

5915. *The population* cannot be considered as well ascertained. An official census, in 1778, gave 797,000; but this has been shown by Juarros to have been very incomplete. Humboldt, during his stay in Mexico, saw official documents which carried it to 1,200,000; and Torrente and other writers well acquainted with the country are of opinion that it does not fall short of 2,000,000. Humboldt considers at present that he may safely adopt 1,600,000 as nearly the real amount.

5916. *The character of the Guatemalans* does not probably differ materially from that of the other Spanish Americans, though it is praised by Juarros as presenting a favourable specimen; and, perhaps, their obscurity may have shielded them from much of the degrading oppression felt in other quarters. He represents them as docile, humane, courteous, liberal, affable to strangers, and only liable to the charges of pusillanimity and indolence. A considerable patriotic spirit was shown by the institution, in 1795, of a society of Friends of the Kingdom, with the view of promoting agriculture and the arts; but, after having carried on operations with great spirit for five years, they were suppressed in 1800 by an arbitrary mandate of the government. An university was established in 1788, whose pretensions were at first confined to scholastic learning; but mathematics and experimental philosophy have since been introduced. Sculpture is said to be carried to greater excellence in Guatemala than in any other part of the New World.

SECT. VI. *Local Geography.*

5917. *The Spaniards divided Guatemala* first into thirty-two and then into fifteen sections, which they named variously, intendencias, alcaldias, and corregimientos. Torrente enumerates the following provinces: Sonsonate, Soconusco, San Salvador, Solota, Costa Rica, Vera Paz, Honduras, San Leon de Nicaragua, and Quetzaltenango. Humboldt's distribution into bishoprics seems, however, sufficiently minute for the interest yet attached to the local details of this territory. These are, Guatemala, Nicaragua, and Honduras.

5918. *Guatemala Proper* is the central province, comprising the great chain of volcanic mountains, and the slope downwards from them to the sea. It is here that the great variety of climate and productions appears, and that the latter are in the highest perfection. What is strictly called the valley of Guatemala consists properly of nine valleys, of varying elevation, enclosed within the great circuit of volcanic mountains. In the centre of this range of valleys, at an elevation not precisely known, stands the old city of Santiago de Guatemala. It was erected first in 1527, at the foot of an enormous mountain, called the Volcano of Water, and which too soon justified that title; for, a few years afterwards, an aqueous eruption burst forth, of the most formidable character, which overwhelmed the whole city, and buried in its ruins a great part of the inhabitants. Appalled by this disaster, the Spaniards removed the city to another situation in a beautiful and finely watered valley, which yielded in profusion all the necessities and luxuries of life. A very magnificent city, also called Santiago de Guatemala, was here erected, with 38 ecclesiastical structures, of which the cathedral was a sumptuous edifice, richly decorated, and more than 300 feet long. Of the nunneries, that of La Concepcion is said to have been inhabited by 1000 persons. But the site, with all its felicities, had terrible defects. It was liable to dreadful shocks of earthquake and volcanic eruptions, which rendered the existence of its inhabitants constantly insecure and their fate often tragical. Juarros has devoted a portion of his work expressly to a record of the miseries of old Guatemala. In the above succession of calamities severe attacks of pestilence were interspersed. At length, in 1775, the series was consummated by a truly appalling earthquake, the shocks of which, continuing at intervals from June to December, reduced the city nearly to a heap of ruins. The Spanish government, on being advertised of this disaster, sent out instructions to remove to another site; but this, perhaps well-meant, order, being executed in an abrupt and despotic manner, only aggravated at first the miseries of the unfortunate city. New Guatemala was built in the valley of Mixco, in a situation not so fertile and beautiful, but extremely healthy, and exempt from the dreadful calamities of which the old city had been the victim. It was reared in the usual regular manner and with numerous squares; the houses are neat, though low, to mitigate the danger of earthquake; the churches and other public edifices on a

smaller scale, but of very elegant design. The citizens, supposed to amount to 30,000, ply, with very considerable diligence, the trades of weaving, pottery, working in silver, and embroidery, its chief articles of trade are indigo and cocoa. Old Guatemala likewise has risen from its ashes, and a great proportion of its exiles have gradually found their way back to their former abode. Having attained a population of 8000, it was reinvested, not with the privileges of a city, but those of a town.

5919. *Other fine tracts and important cities* are also found in the valleys of Guatemala. Santa Cruz del Quiche represents the once great Ulatlan, capital of the Indian kingdom subverted by Alvarado. Its palace, in magnitude and splendour, appears to have been little inferior to those of Cuzco and Mexico. It contained accommodation not only for the king himself, but for all the princes of the blood-royal and a numerous body guard. As it appears to be in better preservation than any other of the imperial seats of native America, a diligent examination would probably lead to important discoveries. San Salvador, to the south, is the capital of an intendency which contains above 200,000 people, and forms a very rich tract, yielding most of the indigo which is the staple of the kingdom. The capital, in a fine valley, contained, in 1778, a population of 12,000, chiefly employed in the indigo trade. A variety of volcanic movements desolate this province, while they present curious phenomena to the view of the observer. Farther to the south, and still in this central region, are other fertile districts, provided the reader can pronounce their names: Quesaltenango, Totonicapan, and Gueguetenango. These districts are chiefly inhabited by Indians, who are civilised, and carry on several curious and ingenious manufactures.

5920. *Nicaragua* forms the most southern of the three bishoprics. The mighty range of volcanic Andes, which have given so decided a character to central Guatemala, here terminates, and the whole chain is in a manner suspended. The territory is low and moist, rich in all the tropical fruits, but in none which belong to the temperate climes. It has, however, vast savannahs covered with numerous herds of cattle, which are sent even to the market of the capital. But the most prominent object in this province is the lake, and the chief interest excited by it is the projected oceanic canal; both of which have been already mentioned. San Leon de Nicaragua is a place of 7000 or 8000 inhabitants, of whom about 1000 are Spaniards, with a college, which in 1812 was allowed by the Cortes to be converted into an university. The town itself, which, like the lake, is called Grande, is not very large, but occupies an advantageous position on the north-western shore. Mazaya, a village of 6000 inhabitants, almost entirely Indian, is said to be the most trading place in the province, though inconveniently situated at the bottom of a deep rocky dell, almost destitute of water.

5921. *Costa Rica*, a district or province attached to Nicaragua, seems named ironically, being in a state of extreme and deplorable poverty. It has, however, mines of gold and silver, which Alcedo pretends to have been once as productive as those of Potosi; but such a state of things, which seems at any time fabulous, has now, at all events, wholly ceased. Yet the "rich coast" is very capable of yielding the common tropical products; but the inroads of the Buccaneers caused a desertion, from which it has never recovered. Cartago, however, in the heart of the province, has a population of 8000 persons, of whom 600 are, or were, Spaniards; while San José, at a little distance, has a number nearly equal, with a greater proportion of Spaniards.

5922. *The eastern part of the state* consists of the province of Comayagua, better known under the name of Honduras, from the peninsula which separates it from Yucatan. The whole coast is flat, marshy, hot, and extremely unhealthy, though some parts of the interior rise into hilly and temperate tracts. This region is covered with thick forests containing the valuable trees of mahogany and logwood, in regard to which the English have carefully stipulated for a right to settle on the Honduras coast. They are established on the river Balize, navigable for boats 200 miles up the country. The settlement consists of 250 whites; 2266 free coloured; and 2127 slaves. The official value of the imports into Britain, in 1829, was 190,795*l*. The mahogany trees are very thinly scattered, and are cut down by gangs of negroes, preceded by what is called the finder, who mounts the tops of the highest trees, and spies out where a mahogany tree is to be found. The chief expense is in the conveyance to the coast. Turtle is found in abundance along this shore. Gold and silver mines are said to exist here, but none have ever been worked, or even found. The coast of Poyais, into which a body of our countrymen were so fatally seduced, partakes of the general character, but seems still more dreary and uninviting. Comayagua, called also Valladolid, is agreeably situated in the interior; but, though the nominal capital, it has never attained any great importance. Truxillo, and Cape Gracias, on the coast, are more conspicuous places, but now also much decayed.

CHAP. VII.

COLOMBIA.

5923. *Colombia* is the name now given to the extensive territory of an independent state or states, which took the lead among the newly formed republics in what was formerly Spanish America. Recent changes are understood to have subdivided it into three portions, which have assumed the appellations of New Granada, Venezuela, and the Equator; but the bearings of this division are too ill ascertained, and even its permanency too uncertain, to admit of its superseding the general appellation of Colombia.

SECT. I. *General Outline and Aspect.*

5924. *Colombia, in its general outline*, occupies nearly the whole north and north-western part of South America, and comprehends the two governments included by the Spaniards under the names of the viceroyalty of New Granada, and the captaincy-general of the Caraccas. It is bounded on the north by the great gulf of the Atlantic, which is enclosed between its shore and the long chain of the West India islands, commonly called the Caribbean Sea. On this side also a narrow land boundary connects it with Guatemala. On the west it stretches along the boundless expanse of the Pacific. Southward it borders on Peru, separated from it by the Guayaquil and the river of the Amazons. Its interior limits are difficult to fix, being formed by vague lines drawn through immense deserts. For a considerable space, its claims at least extend to the Amazons; yet we know not if Colombia has formed any actual settlement on that mighty stream, which can only be approached by rugged and entangled tracks, such as the most daring traveller alone ventures to tread. Proceeding westward, it encounters the territory which, under the appellation of *Guiana*, or *Guyana*, is claimed by the Portuguese, the French, the English, and the Dutch. These

nations, in fact, have formed settlements on the coast ; and ideal lines have been drawn through the interior, to separate their portions from each other and from that of Colombia. For this last, the extreme boundary of solid and practical settlement appears formed by the Orinoco in its course from west to east. All the rest, under the name of Guiana, is merely an indefinite expanse of river and forest, of which the native Caribs remain in almost undisturbed possession.

5925. *This huge mass of territory forms a species of broad irregular oval, reaching from 12° 25' N. lat. to 6° 15' S. lat., being 18° east and west; from 58° to 81° 30' W. long., making 23½°. This will give dimensions in length of 1620 and in breadth of 1260 English miles. The entire content is calculated by Humboldt at 30,000 square leagues, or about 240,000 square miles.*

5926. *The surface of Colombia*, its mountains and plains, are of the most varied character, and on the most majestic scale, presenting forms and phenomena the most grand and awful that are to be found on the globe. The summits of the Andes have ceased, indeed, to rank as the very loftiest on earth. The Himalayah, the mountain boundary of Hindostan, is not only higher, but presents, perhaps, a grander continuity of unbroken and gigantic steep. But, ascending from the low country by a series of tabular plains and broad valleys,

CHIMBORAZO.

it presents at no single point any very astonishing elevation. It has nothing to resemble those solitary gigantic cones, which, in the Colombian cordillera, shoot up towards the sky, and even under the burning influence of the equator remain buried to a great depth in perpetual snow. Chimborazo (*fig. 972.*), the giant of the west, stands yet unscaled by mortal foot. Humboldt and his companions made extraordinary exertions to reach its summit, and arrived at about 2000 feet from that attained by man. Here they planted their

instruments on a narrow ledge of porphyritic rock, which projected from the vast field of unfathomed snow. A broad impassable chasm prevented their farther advance; besides which, they felt in the extreme all the usual inconveniences of such high situations. They were enveloped in thick fogs, and in an atmosphere of the most piercing cold; they breathed with difficulty, and blood burst from the eyes and lips. The form of the mountain, which is that of a truncated cone, appears every where sublime, but peculiarly so from the coast of the Pacific at nearly 200 miles distance, whence it resembles an enormous semitransparent dome defined by the deep azure of the sky; dim, yet too decided in outline to be mistaken for a cloud. The height was ascertained by Humboldt to be 21,440 feet. Antisana, though only 19,000 feet, is remarkable for having a village on its side at the height of 13,500 feet, once believed the highest inhabited spot on the globe. The French academicians, when they established themselves on the top of Pinchincha, at the height of 15,000 feet, experienced all the rigours of an arctic winter, which sometimes threw them, after the exertion of mounting, into a state of vertigo or insensibility. They were involved in almost constant fogs, and when these cleared, they beheld the clouds spreading a wide and smooth surface beneath them like that of the ocean, and heard the dreadful roarings of the tempest in the valley of Quito.

5927. *The most tremendous volcanoes in the world* are those which burst from this mountain range. Cotopaxi (fig. 973.) is the most formidable in the Andes, and, indeed, on the

973

COTOPAXI.

globe. This mountain is 18,898 feet high, consequently more elevated than Vesuvius would be if placed on the top of Teneriffe. It is the most beautiful of all these colossal summits, presenting the form of a regular and smooth cone, wrapped in a covering of the purest white, which shines in the rays of the sun with dazzling splendour, and detaches itself in the most picturesque manner from the azure vault of heaven. It is seldom that this volcano is wholly silent, and that at night smoke and flame are not seen rising from its summit,

like a beacon flame in the regions above. In the course of the last century, it had five great eruptions, and one in 1803. As the inflamed matter ascends, the perpetual snows, which have covered the summit to an almost unfathomable depth, are melted, and rush down in destructive torrents, when its naked and embrowned head is displayed to the astonished inhabitants of the plain. Then, amid appalling sounds, louder than the loudest roar of artillery, the burning entrails of the earth rush up into the sky, rising often half a mile above the mountain head before they stream down upon the surrounding districts; mountain above mountain is then raised of pumice and lava. It has been averred that Cotopaxi was heard at the distance of 600 miles. Humboldt certainly states, that on the coast of the Pacific, at 140 miles distance, it sounded like thunder, or like the discharge of a continuous battery of cannon. From this and the other South American craters are ejected not only the usual volcanic substances, but torrents of boiling water and mud, often containing great quantities of dead fishes. Sometimes, after successive eruptions, the undermined walls of the mountain fall in, and become a mass of tremendous ruin. Such was the fate of El Attai, which once reared its head above Chimborazo, and of another very lofty volcano, which, in 1698, fell with a similar crash.

5928. *The general range of the Andes*, as it passes through Colombia, is divided in the north into three parallel chains, of which the eastern has between it and the middle chain the plain of Santa Fè de Bogotá, and some others, which constitute the most valuable part of New Granada. Farther south, these chains unite into two, of which the most elevated, comprising all the highest volcanic summits, is on the western side, facing the expanse of the Pacific. Between it and the parallel chain is interposed the table plain of Quito, about twenty miles in breadth, and of the most surpassing richness and beauty. To the east also the Andes throw out a chain, called by Humboldt the shore chain of Venezuela, which runs parallel to the sea along the coast of Caraccas, as far as Cumaná, leaving along the shore a plain rich in the most valuable tropical productions. The surface of all these mountain districts presents a very different aspect from that of the huge broad mass of the table-land of Mexico. Their elevated steep ridges are separated by deep narrow burning valleys, which descend almost to the level of the sea, and the only temperate lands consist of small plains, which hang as it were on their sides. There is thus a more rapid, and as it were precipitous descent from an arctic to a temperate, and then to an equatorial climate. A traveller may quit in the morning the frozen tracts near the mountain summits, and, passing through the pine forests, may successively traverse fields of oats, barley, and wheat, and may walk in the evening amid plantations of sugar-cane and banana. Yet the lower grounds along the rivers are close, swampy, and filled with myriads of tormenting insects; and it is not until he has ascended to almost a mountain height, and feels the breezes blowing from the regions of perpetual snow, that he finds an air which he can breathe, or even ground on which he can tread with safety.

5929. *The Llanos* form another extensive portion of the Colombian territory, commencing where the mountain ranges terminate, and reaching east and south to the Orinoco. They consist of immense flats, covered with magnificent forests and vast savannahs, in which the grass often grows above the human height, covering from view both man and horse. A great extent is inundated by the Orinoco and its large tributaries. The soil is fertile in the extreme; but the unhealthiness of the climate deters settlers who are not urged by extreme necessity.

5930. *Two other groups*, not belonging to the Andes, have been traced by Humboldt. These are, the Sierra de Santa Martha, 18,000 feet high, which mariners, seeing on that coast covered with perpetual snow, never

hesitated to rank as part of the Cordillera; but it is now ascertained to be a single mighty group, entirely surrounded by plain. The other is the Sierra Parimé, to the east and south of the Orinoco, a widely extended heap of mountains, but not very lofty. Both by its elevation and its position on the continent, it assimilates rather to the system of the Alleghany and the mountains of Brazil than to that of the Cordilleras.

5931. Among its rivers, Colombia may rank several, the greatest both of the Old and the New World. She sets one foot, as it were, on the Marañon: but that river, being scarcely accessible, and the country near it occupied only by a few scattered missions from Peru, cannot be considered in any practical sense as Colombian. The same observation may almost apply to its great tributaries, the Napo, the Ica, and the Japura, which descend to it from the Andes of Quito. The secondary but still immense stream of the Orinoco rises in the southern part of the mountains of Parimé, and, winding round them, flows first west, then north, till it takes its final course eastward to the Atlantic. It enters that ocean by a delta of about fifty channels, and after a course of 1380 miles. In an early part of that course, it forms a remarkable communication, by the Cassiquiare, with the Rio Negro, and through it with the Amazons, of which the Rio Negro is the largest northern tributary. From the boundless expanse of the Llanos, the Orinoco receives several mighty rivers that have had their sources in the Andes, — the Guaviare, the Meta, and the Apuré; the last of which, flowing through the plains of Venezuela, and drawing its waters from the coast chain, is alone very important in a commercial view. These shores may in future ages become the magnificent seats of empire, but at present they are overgrown with forests and thickets, peopled only by wandering Caribs, and presenting but a few scattered missions and settlements. The really useful streams are those of smaller dimensions, which, running like long canals between the mountain chains, bring down the products of those high valleys, at present the only cultivated part of Colombia. The Magdalena, the largest and most commodious of these streams, has a course of more than 500 miles between the eastern and middle chain of the Cordilleras, affording to the plain of Santa Fé a communication with the sea. The Cauca runs between the middle and western chain; and, after a course of nearly equal length, joins the Magdalena before it falls into the sea near Carthagena. The Atrato is a smaller stream, between the western chain and the Atlantic. The Magdalena is throughout navigable, though the voyage is rendered painful by the heat and the myriads of insects. The navigation of the Cauca is by no means so good. To the south, the still smaller rivers of Esmeraldas and of Guayaquil afford to the province of Quito an important means of communicating with the Pacific Ocean.

5932. There are scarcely any lakes of importance. We must except, however, that of Maracaybo, which, though it communicates with the sea, yet, unless in strong winds blowing from thence, preserves its waters fresh and unmixed. There are also dispersed throughout the territory various little collections of water on the declivities of hills, and others formed by the expansions of rivers.

SECT. II. Natural Geography.

SUBSECT. 1. Geology.

5933. We have not met with any description illustrative of the *geognostical structure* and composition of this country: but it is well known that Colombia affords considerable quantities of gold, silver, platina, and other metals.

SUBSECT. 2. Botany.

5934. Perhaps nothing is so well calculated to convey a faithful general representation of an American intratropical vegetation as the following sketch, by the celebrated Humboldt, in his "*Tableau Physique des Régions Equinoxiales*, illustrated by a plate of the physical phenomena presented by those regions from the level of the sea to the highest summit of the Andes." We shall here consider the botanical part of it alone; and let us, with that eminent philosopher, suppose ourselves transported into the region where nature has delighted in combining the most majestic forms, grouped in the most striking manner; that country of the Palms and the scitamineous plants, which stretches from the level of the ocean to a height of 513 toises; the land of the Banana (*Musa*), the Heliconia, the Alpinia, and the most odoriferous liliaceous productions. In this burning climate grow the Theophrasta, the Plumiera, Mussænda, Cæsalpinia, Cecropia peltata, the Hymenæa, the Balsam Tree of Tolu, and the Cusparia or Quinine Tree of Carony. On the barren sea shore, beneath the shade of Cocoas, Laurus Persea, and Mimosa Inga, are found the Allionia, the Conocarpus, the Mangrove (*Rhizophora Mangle*), *Convolvulus littoralis* and *brasiliensis*, the *Talinum Avicennia*, *Cactus Pereskia*, and *Sesuvium Portulacastrum*.

5935. Some of the plants of this region possess striking peculiarities and remarkable exceptions to the general laws of vegetation. The South American Palms, like those of the Old World, are unable to endure

CEROXYLON ANDICOLA.

the cold of the high mountains, and disappear at an elevation of 513 toises. One single Palm, from the Andes (*Ceroxylon andicola*) (fig. 974.), presents the extraordinary phenomena of growing equally at a height of from 954 to 1472 toises; its trunk, coated with a waxy substance, attains to a height of 54 mètres (about 160 feet). It has been stated that a Palm grows in the ravines of the Straits of Magellan, lat. 50° S. This is the more striking, as it is impossible to confound a palm tree with any other vegetable, except it be the arborescent Ferns, whose existence there would be equally remarkable. In Europe the Palmetto and Date are not found farther north than 43° 40'. The Scitamineæ, especially the species of Heliconia, cease at a height of 410 toises. Near the summit of the Silla de Caraccas (1103 toises) grew a scitamineous plant, from nine to twelve feet high in such abundance as to render a passage through it difficult: it appeared to Humboldt to be a new and harder kind of Heliconia. *Sesuvium Portulacastrum* vegetates alike on the shores of Cumana and to the east of the city of Mexico, on a plain 1200 toises high, where the soil is impregnated with carbonate and muriate of soda. Indeed, the plants of salt marshes generally seem little affected by difference of temperature.

5936. Above the region of Palms and Scitamineæ is that of the Tree Ferns (fig. 975.) and Cinchonas. The latter possess a much wider range than the ferns, which prefer a temperate climate, and an elevation between 200 and 800 toises, while the Quinine Trees rise to 1487 toises above the level of the sea. The hardiest species are *Cinchona lancifolia* and *C. cordifolia*, the tenderest *C. oblongifolia* and *longiflora*. The famous Quinine Tree of Loxa, which is quite different from the orange Quinine of Santa Fé, grows from 975 to 1280 toises; it differs essentially from *C. glandulifera*, to which it bears most analogy, and has only been hitherto seen near Loxa, and in a small district of Peru. To distinguish it from all other species, and to do away the incorrect appellation of *Cinchona officinalis*, it has been called *C. Condaminea*. Caoutchouc is

the product of several plants, that possess few analogous characters, of *Ficus*, a *Hevea*, a *Lobelia*, a *Castilloa*, and several *Euphorbias*. Camphor also exists in vegetables of different genera, being extracted in Asia from a Laurel, and in Peru from a didynamous shrub found by M. Haenke. The fruit of a *Myrica* and the trunk of a Palm equally yield wax: thus substances, possessing similar chemical properties are

derived from highly dissimilar vegetables; and it is the same with the febrifuge principle of Cinchona, which resides in plants belonging to totally different genera.

5937. The Cusparia of Carony, near Upatu, a magnificent tree, which yields the Angostura Bark, is not a Cinchona, though it be difficult even for a chemist to distinguish between the infusion of Cuspa and that of the orange Quinine from Santa Fé. Upon the sea coast west of Popayan grows a tree possessing the qualities both of Cinchona and Wintera, but differing from either of these genera. The Cusparia of Guiana, the Cuspa of New Andalusia, and the Cascarilla of Atacamez, all vegetate at the level of the sea; and their juices contain a principle analogous to that afforded by the true Cinchonas at an elevation of 1436 toises.

5938. In the temperate region of the Cinchonas grow some Liliaceæ, as Sisyrinchium; the large blue-flowered Melastomæ, the arborescent Passion Flowers, as tall as our European Oaks; Bocconia frutescens, Fuchsias, and most beautiful Alstrœmerias. The Macrocnemum and Lysianthus grow majestically there, and the ground is clothed with Kœlreuteria, and Weissia, and Dicranum, and other evergreen mosses, while the ravines shelter Gunneras, Oxalides, Dorstenias, and a multitude of unknown Arums. Porlira hygrometrica with Hypericum baccatum and cayanense grow higher up. Beyond 1120 toises, the sensitive Mimosas disappear under the influence of the increased cold; at 1330 to 1340 toises, Acæna, Dichondra, Nierembergia, Hydrocotyle, and Alchemilla form a thick turf. This is the region of the Weinmannias and Oaks, of Spermacoce and Vallea stipularis. The Mutisia climbs over the loftiest trees. The Oaks (*Quercus granatensis*) only commence in Equatorial Regions at an elevation of 872 toises; while in Mexico they are found as low as 410 toises. These are the plants which sometimes recall the idea of spring in these regions; they lose all their foliage, and the young verdure of the new leaves mingles most agreeably with the Epidendrums that grow upon their branches. The Cheirostemon, a new genus of Malvaceæ, with a most singularly shaped flower, grows also on the Andes of Peru. For a long time a single individual only was known, near the city of Toluca in Mexico; it seems to be wild in Guatemala; and this famous Hand Plant of Toluca has probably been equally planted by some Rointztequas, whose taste for cultivation, and whose admiration of the beauties of vegetation, are attested by the ruined gardens of Iztapalapan.

5939. Near the Equator, the larger trees are not found beyond 1385 toises; and above the level of the city of Quito they become small and of comparatively stunted growth. At 1796 toises, almost all arborescent vegetation ceases, though shrubs become more abundant: this is the region of the Berberries, the Durantas, and Barnardesias, whose presence marks the vegetation of Pasto and Quito, as that of Santa Fé is indicated by the Polymnia and Tree Thorn-apples. Castillejas, Embothrium, and Clusias are common in this region, with Calceolarias, whose golden yellow blossoms contrast agreeably with the verdure of the grass through which they sprout. Nature has assigned a zone to these plants, which commences at a northern degree of latitude. Higher up, towards the summit of the Cordillera, from 1436 to 1690 toises, is the region of Wintera and Escallonia. The cold and damp climate causes the trunks to become short and to divide into numerous branches, covered with coriaceous and glossy foliage. Some trees of the Orange Quinine and Embothrium are found thus high. The Alstonia, whose dried leaves form a wholesome tea, with a Wintera and Escallonia, form scattered groups, and at their feet grow small Lobelias, Basellas, and Swertia quadricornis. Still higher, at 1796 toises, the arborescent plants disappear; in a narrow valley on the volcano of Pichincha alone is there a group of arborescent Syngenesiæ, with stems 20 to 24 feet high. From 1026 to 2103 toises extends the range of alpine plants; Stæhelinas, Gentians, and the Espeletia fruticosa, whose downy leaves often shelter the poor Indians who are overtaken by night in these desolate spots. The open plain is adorned with Lobelia nana, Sida pichinchensis, Ranunculus Gusmanni, Ribes frigidum, Gentiana quitensis, and many similar plants. The Molinas are the under-shrubs that grow at the greatest elevation on the volcanoes of Purace and Antisana. At an elevation of 2103 toises, the alpine plants give place to the Gramineæ, of which the region extends to 2360 toises. There, Jurava, Stipa, and many new species of Agrostis, Panicum, Avena, and Dactylis cover the soil, which, at a distance, wears the appearance of a golden carpet, called by the inhabitants Pajonal. Snow falls, from time to time, on the region of the Gramineæ. At a height of 2360 toises there are no more flowering plants under the equator. From this limit to that of perpetual snow, Lichens alone clothe the rocks. Some of these indeed appear to vegetate under the snow, for at 2850 toises, near the summit of Chimborazo, the Umbilicaria pustulata (fig. 976. a) and Verrucaria geographica (fig. 976. b), are seen growing on a shelf of rock, and these were the last organised substances adhering to the soil at so great a height which Humboldt and his companions were able to detect.

a, UMBILICARIA PUSTULATA.
b, VERRUCARIA GEOGRAPHICA.

SUBJECT. 3. Zoology.

5940. The Zoology of Colombia offers a vast and almost an unexplored field to the modern naturalist. We know not how it has happened, that, while Brazil has been traversed by learned men, sent from nearly all the European nations, the other regions of South America, in regard to their zoological productions, are as little known at this period as they were when guarded by Spanish jealousy; for Humboldt, in Zoology, did little or nothing. We shall not attempt, therefore, to hide this deficiency by quotations from obsolete works; rather wishing that a confession of unavoidable ignorance may induce those who have the power and the inclination, to direct their attention to this subject. There is one bird, however, of surpassing beauty which we can notice, as having been recently sent from Colombia and Guatemala: this is the Calurus pavoninus Sw., or Peacock Trogon (fig. 977.), so named from the splendid green plumage of the back and the long feathers towards the tail: it is said to be very rare; living only in the deepest and most unfrequented forests; and is much sought for by the natives on account of its superb feathers.

PEACOCK TROGON.

SECT. III. *Historical Geography.*

5941. *The former condition* of all the Colombian states was that of a people much less advanced in civilisation than those of Mexico and Peru. The whole of the vast plains watered by the Orinoco and its tributaries were occupied by the Caribs, a savage and warlike race, whom the Spaniards, probably in too sweeping a manner, branded as ferocious cannibals. In the upper plain of Bogotá, however, amid the heights of the Cordilleras, was found the kingdom of Cundinamarca, which could not indeed rival the arts and splendours of Cuzco and Tenochtitlan, yet had made considerable progress in civilisation. It had temples, altars, and priests; the people cultivated the ground, were decently clothed, and enjoyed security of person and property.

5942. *The Spanish conquest* was effected with more difficulty in this than in other quarters. The first attacks directed against the inhabitants of the plains were repulsed with severe loss. From Peru, however, two daring adventurers, Quesada and Benalcazar, scaled the loftiest Andes, and subdued with little difficulty Quito and Cundinamarca, which, with the whole region of the Cordilleras, were afterwards formed into the viceroyalty of New Granada. The Llaneros, or people of the plains, meanwhile desperately maintained their independence; and the Spaniards soon grew weary of shedding their blood, when no gold was to be the reward. By transporting bands of Germans, and even arming the negroes of the islands, they succeeded in compelling the natives to take refuge among the forests of the interior. This coast was then formed into a government, known at first by the name of Terra Firme, but to which the Spaniards afterwards gave the name of Caraccas, and subjected it to the jurisdiction of a captain-general. New Granada never attained the golden fame of Mexico and Peru; but its fine upper valleys and table-lands became the seat of a considerable agriculture; and a tolerably industrious and numerous population was gradually formed.

5943. *The spirit of independence*, which had been long secretly forming throughout Spanish America, broke out earlier, and with greater force, in Colombia than in any other of its vast regions. Even in 1781, the introduction of the oppressive tax of the *alcavala* gave rise to a revolt, which had for some time a threatening aspect, as the spirit of liberty had been roused by the successful example of the United States of North America. The French revolution excited a considerable ferment, and the "Rights of Man" were even printed at Santa Fé, though soon suppressed. Yet the attempt to which Miranda was instigated by these symptoms proved to be premature. In 1808, the impulse given by the seizure of Ferdinand VII. and the invasion of Spain, acted instantaneously through this part of the continent. Ferdinand was proclaimed indeed, but all the rulers appointed by the mother country were displaced, and a congress, with officers elected by the people, was substituted. The native Spaniards, being fewer in numbers than in Mexico, and having little military force, made at first scarcely any resistance; but the government of the mother country, considering this as the head quarters of insurrection, directed hither their main efforts. They sent successive expeditions under the command of Morillo, one of their ablest generals. Caraccas and Santa Fé were at first recovered, and the Independents were driven to hide themselves amid the rocks of the Andes and the marshes of the Orinoco. They were headed, however, by Bolivar, destined to take his place with Washington among the deliverers of the New World. British troops and officers, after the pacification of Europe, were easily attracted to their standard. After repeated overthrows, and many and dire vicissitudes, the independent cause completely triumphed. In 1821, Morillo consented to an armistice, and returned to Spain. The war was afterwards renewed; but the Spaniards were soon defeated, shut up in Puerto Cabello, and finally compelled to evacuate the whole territory of Colombia, which they never again made any attempt to subjugate.

SECT. IV. *Political Geography.*

5944. *The constitution of Colombia* was formed in a congress assembled at Cúcuta, on the 18th July, 1821. Another had been framed, two years before, at Santo Tomé, but only for the province of Venezuela, which, after some resistance, was obliged to yield its claim to the superior power and population of New Granada. The basis judiciously taken was that of the United States of North America, and the alterations are even such as to give it somewhat less of a democratic character. The legislative power was vested in a congress, consisting of two bodies, the senate and the house of representatives. Every four years the body of the people were appointed to assemble, and choose electors of the canton, who formed a provisional assembly, meeting on the 1st of October. This provisional assembly was to elect both the representatives and the senators, the one for four, and the other for eight years; but one half of the senators were to go out by lot at the end of the fourth year. The right of suffrage was not made universal, as in most of the North American states. The original voter was required to possess the sum of 100 piastres, and after the year 1840 to be able to read and write. The cantonal electors were to possess land to the value of 500 piastres, or an income of 300. The senator or representative must, by this constitution, possess an income of 500 dollars, or be of a learned profession. Besides the power of making laws and decreeing taxes, these houses exercise jointly that of declaring war or making peace. The executive is vested in a president and vice-president, the former of whom must have the qualifications of a senator: he is elected for four, and cannot continue in office for a consecutive period of more than eight years. He has only a very partial negative on the laws passed by the two bodies. He may return a law for re-consideration; but if it again passes by a majority of two thirds of the members, he cannot refuse his consent. Neither he nor any of the ministers are members of the congress. His salary was fixed at 30,000 dollars, and that of the vice-president at 16,000 dollars per annum. The judges are elected by the congress, from lists given by the president; but their duration is appointed, rather too vaguely, to be "as long as their conduct gives satisfaction."

5945. *The finances of Colombia* have not yet been brought into a flourishing state. The nation in general seems to show rather a peculiar aversion to the payment of taxes, and the vast extent of the territory, the difficulty of following defaulters into the woods and among the mountains, contribute, with the inadequate salaries allowed to the collecting officers, to give occasion to a vast contraband. In 1824, a new system was adopted; the *alcavala* was very wisely abolished, unless to the extent of levying 2½ per cent. on sales of imported goods and landed property, and a direct income tax was imposed, as one which could be least easily evaded. The post-office merely pays its expense, but stamps have been found a productive branch of revenue. Colombia is burdened with a debt of 40,000,000 dollars, chiefly borrowed in Britain, and of which she has yet paid no principal and scarcely any interest. In 1826, the finances were in a very unfavourable state, the expenditure being 15,487,719 dollars, and the revenue only 6,196,725, leaving a deficit of 9,290,994 dollars. In 1827, the estimates of expenditure were 8,500,000 dollars; of which 4,300,000 were for the army, 912,000 for the navy, 2,100,000 for interest, and the rest for the internal administration.

5946. *The army of Colombia*, in 1824, consisted of 25,750 infantry, 4300 cavalry, and 2520 artillery. They are ill disciplined and accoutred; have scarcely any thing like a uniform; and their arms are both scanty and imperfect; but they are exceedingly brave, hardened by long warfare, and have vanquished even superior numbers of regular troops. The artillery and engineer departments are the most defective.

5947. *The Colombian navy* is yet in its infancy, and, in 1824, consisted only of six corvettes, seven brigs, and six schooners, manned chiefly by English and French sailors. Even this small force rendered great service in the blockade of Maracaybo, and at one period made itself formidable as a privateering force, extending its ravages even to the coast of European Spain.

5948. *A schism* has recently taken place in the Colombian state, which has been divided into the three separate republics of New Granada, comprising the ancient viceroyalty of that name; the Equator, composed of Quito and the adjoining territories; Venezuela, comprehending the great plain to the east of the Andes, and bordering on the sea. These states have of late made an amicable agreement to separate, dividing among themselves the general debt of Colombia. The interior constitution, we believe, remains the same as that of the united republic.

SECT. V. *Productive Industry.*

5949. *The territory of Colombia* is chiefly distinguished by its vast capacities for improvement, which are developed only in a very imperfect degree. The soil is as various as the states that compose the territory. New Granada, though a mountainous country, is fertile in all kinds of grain and fruit: the woods consist chiefly of cedars, walnut trees, ebony, Muzo and Guiana wood, taray, Brazil, sassafras, cocoa tree, vanilla, tamarind, medlar, sapotas, guavas, palms, cassia; manchineel, whose juice, fruit, and even branches, emit a subtle poison, which causes general inflammation and tumour, only to be cured by olive oil; and another tree, called the *habella de Cartagena*, whose bean is the best antidote known against the bite of vipers and snakes. In the province of Venezuela also are found many precious woods, as the variegated granadillo, resembling tortoiseshell, cedars whose trunks serve as hives for bees, vanillas of superior fragrance, cardamoms, sarsaparilla, indigo, cassia, tamarinds, cinchona; tacamajaco, a noted specific for headach; balsams and oils for the cure of wounds. The province of Guayaquil produces a variety of ship timber, including oak, the strong wood called guachapeli, cedars, also ebony, with a variety of cabinet woods. The provinces of Loxa and Quito are noted for their excellent cinchona. In short, such are the natural resources of this part of South America, that, if its inhabitants were active and industrious, it might become one of the richest and most important countries in the world.

5950. *Agriculture* in this country, beyond any other in Spanish America, or perhaps in the world, is capable of supplying in the utmost variety the richest productions of the vegetable kingdom. That which chiefly distinguishes it is the cocoa, a fruit at once palatable and nutritious, which in the country yields an article of food, and in Europe forms the basis of the chocolate. The cocoa of Caraccas is generally reckoned the best in the world; and next to it that of Guayaquil, so much celebrated by Ulloa. The produce is reckoned by Humboldt at 193,000 fanegas, and the export at 145,000, the value of which exceeds 1,000,000*l.* sterling. The tobacco of Caraccas is much superior to that of Virginia, yielding only to that of Cuba and the Rio Negro. The injudicious system, however, of still making it a government monopoly, checked its growth; but this was to be abolished on the 1st of January, 1834. Quinquina, or Jesuit's bark, one of the most valuable articles in the materia medica, is now the produce almost exclusively of Colombia, being brought either from Loxa by way of Guayaquil, or from the hills of the Upper Magdalena. Coffee, cotton, and sugar find all most favourable soils: coffee, in the table-lands, 1500 to 2000 feet high, of Caraccas and Cumaná; cotton, in the plains of Maracaybo; and sugar in all the warm, low, and moist valleys. Coffee only, however, much exceeds the internal consumption. Indigo was once a very important article, being exported from Caraccas, in the most prosperous times, to the value of 250,000*l.*; but it has much declined, and is produced now only in the plain of Varinas. Wheat and other European grain find favourable situations, especially on the table-lands of Bogotá; but as these have not the extent of those of Mexico, the wheat is neither so good nor so abundant; and Colombia cannot dispense with a large import of American flour. The banana grows in the same spontaneous abundance as in Mexico, and M. Mollien draws from it the most sinister auguries that the Colombians will never submit to any settled or laborious habits; but neither they nor any other people of the New World have yet accepted this fruit as a full substitute for bread. The agriculture of the state appears to be still conducted in that indolent and slovenly manner usual where land is cheap and a market distant. The government has lately sought to promote the clearing of waste lands, by disposing of them at a very low rate, and by setting aside two millions of fanegas for foreigners who may be disposed to settle and bring them under cultivation.

5951. *The mines of New Granada* have been a subject of brilliant and perhaps romantic expectations. Humboldt observes that nothing can be more fallacious than the external appearance of rocks and veins, and that, till regular shafts and galleries have been formed, no certainty can be attained. The only important product as yet is gold, obtained by washing the earth and sand in the provinces of Chocó, Popayan, and Antioquia. Humboldt estimates the product during the last years of tranquillity at 18,000 marks. There are indications of various minerals in different quarters. The silver mines of Marquetores, and those called the mountain mines, and the higher and lower mines in the province of Pamplona, are said by Torrente to be so rich that they generally yield two marks of silver per quintal: there are also mines of copper and lead, others of emeralds, which have given name to the province of Muzo, and the valley of Tunja, noted also for its sapphires and other precious stones, and yielding in some places cinnabar and mercury. In the mountains of Antioquia and Guamoro there are diamonds, though of small size, hyacinths, fine garnets in great abundance, excellent pearls in the Rio Hacha, amethysts in Timasco, turquoises in the districts of Pamplona, Suza, and Anserma. There are also rich mines in the district of Chocó; but some of these were neglected in the more general search for platina. From the year 1800 to 1810 were coined in New Granada 27,350,000 dollars, and from 1810 to 1820, 20,000,000, or 2,000,000 annually; but if the mines were ably managed, the result might be much greater; and it is thought that Chocó alone would yield 2,000,000 dollars a year.

5952. *In Santa Martha* there are mines of gold, silver, and precious stones, and some rich salt-works. The province of Quito yields gold, silver, copper, quicksilver, topazes, amethysts, emeralds, rock crystal, and very fine marble; in Venezuela is found tin, and also rock crystal, with lapis lazuli, not much inferior to the celebrated ultramarine. The copper mines yielded in one year 1500 quintals of excellent quality. Time only can discover whether the rest will pay the expense of working. The salt mine of Zichaquirá, glittering like an immense rock of crystal, yields a revenue of 30,000*l.* a year. It is not the only one; and the mineral finds a ready market in the country. The pearls of Panama and the Rio Hacha, notwithstanding their great name, do not yield more than 20,000*l.* a year.

5953. *Manufacturing industry* can scarcely be said to exist. The leather of Carora, the hammocks of Marquesita Island, and the blankets of Tocuyo, are objects of little importance, even in respect to internal consumption.

5954. *Commerce*, in consequence of the very circumstance last mentioned, has a peculiar activity. From the total want of manufactures, almost the whole population must be clothed in foreign fabrics. In 1831, the exports from Caraccas consisted of 6,268,640 lbs. coffee, 1,791,814 lbs. cocoa, 192,035 lbs. indigo, with hides, sarsaparilla, and sugar. The entire value amounted to 887,099 dollars. The imports amounted to 975,019 dollars; of which cottons, linens, and woollens made up 561,025 dollars; the rest consisted principally of silks, laces, salt beef, and fish. The tariff of duties is moderate. In 1831, there cleared out from La Guayra 90 vessels; burthen, 9470 tons; of these 9 vessels and 909 tons were for England; 28 vessels and 3882 tons for the United States. Trade is understood to be on the whole in a prosperous state. The internal traffic will one day probably be immense, upon the Orinoco, the Apure, the Meta, and by the Cassiquiare, with the Rio Negro and the Amazons; but all the regions watered by these mighty rivers are as yet little better than deserts. The cataracts also of Atures and Maypures prevent navigation from being carried much above the lowest bend of the Orinoco.

978

PASSAGE IN THE CORDILLERAS.

5955. *Roads* can scarcely be said as yet to have any existence. There are only tracks formed by the tread of successive travellers. In many places they lead through the beds of torrents, or through crevices or fissures caused by earthquakes. Sometimes the declivity (*fig. 978.*) is so abrupt that it can be crossed only by a zigzag path cut into steps, which form a staircase as steep as that of one of our steeples. Men, baggage, and merchandise are alike conveyed on the backs of mules, which find their way over these frightful steepes with surprising dexterity; sometimes dropping on their knees, and sliding down the most precipitous hills. A traveller, however, who wishes to escape some of these hardships, may be conveyed in a species of chair placed on the backs of persons, called *silleros*, hired for the purpose, who carry him with surprising comfort and safety. Even in what were called the royal roads, all that has been done is to cut down the trees. War, which usually makes some little compensation for its evils by the formation of fine military roads, has not yet introduced any improvement into those of Colombia. Scattered bodies of partisans without baggage, and with only a few light artillery, could scramble through such openings as the country afforded, and even set a value on the impossibility of transporting through them a regular and equipped army. The exclusive use of mules, without carriages of any description, remarkably increases the expense of conveying goods; yet habit causes

it to be followed even on the plains of Venezuela, where there might be room for waggons as large as those which are driven over the Pampas of Buenos Ayres.

5956. *The bridges*, which are thrown over the torrents of the Andes, and from steep to steep, are of the most fragile and hazardous description. In a few rare instances only stone is employed. In general a few rough planks are laid across, and covered with earth and branches; no fence and no breadth greater than four feet being ever thought necessary. Where the space to be traversed is too great for this contrivance, a bridge of strong cable is constructed, over which the Colombian passes secure, though it rocks beneath him at every step. Sometimes, between distant

979

ROPE BRIDGE.

points, a single rope is stretched across (*fig. 979.*), and a hammock or basket made to run from one end to the other.

SECT. VI. *Civil and Social State.*

5957. *The population of Colombia* cannot be computed with any precision from existing data. The most positive is that formed in 1822, upon the reports made by the deputies of each province to settle the law of elections, according to which the amount was 2,643,000. Humboldt, however, who seems to have directed every possible attention to this subject, does not think there can be fewer than 2,785,000, and is even inclined to believe they may exceed 2,900,000. The estimate of 3,500,000, made by the president in 1820, seems manifestly exaggerated.

5958. *The character of the Colombians* is, probably, much influenced by the sudden transition from a depressing despotism to an extreme degree of liberty. They retain much of the gravity, temperance, and sobriety of the Spaniards, with a share of their pride, suspicious temper, and neglect of cleanliness. A courtesy somewhat stately and studied prevails in their demeanour. It is not easy to gain their confidence; but when that is once obtained, they are extremely friendly and cordial. They are hospitable to foreigners, whom, from national pride, however, they regard with secret jealousy. Though they have shown themselves in many instances capable of the most vigorous exertions, their general procedure is slow and sluggish; and to urge a Colombian to stirring activity is like rousing a man out of a dream. The Colombian unwillingly engages in any speculative occupation, or mercantile transactions on a great scale; he prefers quietly accumulating money by retail trade. It certainly redounds much to his honour that, after a war so long and desultory, the country is not infested by robbers or bandits to any extent; and there is no necessity for having houses secured by bolts or bars. An inordinate propensity to gaming prevails among the men, who spend almost all their leisure in this diversion, and often hazard enormous sums. Between the two sexes in Colombia, as in the mother country, prevails a dull mechanical gallantry, the admirer keeping in close and constant attendance upon his mistress, to whom no one else must speak or almost look; yet this is, perhaps, less frequently accompanied with any thing criminal than a foreigner would be led to suppose.

5959. *The religion* is as yet exclusively the Roman catholic, and its ceremonies are observed with the strictest punctuality. The shrines of Bogotá appear to surpass in magnificence even those of Mexico. The cathedral contains an image of the Virgin, adorned with 1358 diamonds, 1295 emeralds, besides many other precious stones. The other twenty-six churches are all resplendent with gold and jewels. The convents are also numerous, but are happily diminishing. The parish priests rule in the villages with almost absolute sway; but their influence, uniting together the different classes and sexes, is considered on the whole advantageous. Many of the young men who have had more enlarged means of information, have begun to see the absurdities of the Catholic creed; but a general scepticism, rather than any rational system of religion, seems to have taken the place of their ancient superstition.

5960. *The races* are as numerous and as variously crossed as in Mexico; but they are more happily blended and balanced than either there or in the United States. The negro maintains his place in the scale of humanity; and the mulattoes Paez and Padilla have ranked among the foremost of the heroes who achieved the national independence. Humboldt calculates, contrary to the idea of Depons, that there are not many more than 60,000 slaves in the state; and, by the legislative arrangements, the whole number will be free by the year 1840.

5961. *Of the native Indian tribes* within this territory, the Caribbees are the ruling people. No nation in the world is stamped with a deeper brand of ferocity, the very name, converted into *cannibals*, being applied to signify devourers of human flesh. The charge appears to have been greatly exaggerated by the Spaniards, who certainly met with a most fierce resistance, and sought by this allegation to justify the system of enslaving and exterminating the savage tribes. Oppressed by a long series of unequal war, they were considered as nearly extinct, till Humboldt, in his voyages along the Orinoco and its tributaries, ascertained that there must be still about 40,000 of pure and unmixed blood. They are a fine tall race, whose figures, of a reddish copper colour, with their picturesque drapery, resemble antique statues of bronze. They shave great part of the forehead, which gives them somewhat the appearance of monks; they wear only a tuft on the crown. They have dark intelligent eyes, a gravity in their manners, and in their features an expression of severity, and even of sadness. They still retain the pride of a conquering people, who, before the arrival of the Spaniards, had driven before them all the native tribes in this part of the continent. A great proportion of them, however, have now been civilised in a surprising degree by the missionaries, who exercise over them an almost absolute sway. Each holiday they present themselves loaded with offerings of every kind which can be acceptable to the priest; and after divine service, those of both sexes who have been guilty of any offence receive in his presence a sound whipping, which they bear with exemplary patience. Humboldt, though scandalised by this scene in the view of ecclesiastical dignity, conceives that such strict discipline may be necessary to keep these savage natures in check. They cruelly torment their children by imprinting on them the barbarous ornament produced by raising the flesh in long stripes along the legs and thighs. They are free, however, from the equally barbarous practice of flattening the head by compression, which is general among the other tribes

of the Orinoco, the specimens of whose crania, shown in Europe as destitute of forehead, are merely skulls shaped between planks. In this country occur the caste of *albinos*, with white hair, of weakly and delicate constitution, low stature, and very effeminate character: they have large eyes, and are so weak-sighted, that they cannot endure the rays of the sun, though they can see clearly by moonlight.

5962. *The intellectual state of Colombia* is yet very rude. Study, either as an occupation or amusement, is little known among the middle and higher ranks. In all the great cities, indeed, there are universities and colleges, which are even richly endowed; but they are usually attached to monasteries, taught by monks, and have reference only to Catholic theology and obsolete systems of philosophy. In that of Caraccas there were two professors, whose sole function was to prove the immaculate conception of the Virgin. There are, however, men of superior mind, who are making endeavours, which doubtless will ultimately succeed, to elevate in this respect the character of their countrymen. Under their auspices, a museum, a library containing already 7000 volumes, and several Lancasterian schools, have been formed at Bogotá.

5963. *The amusements of Colombia* are chiefly borrowed from the mother country. Dancing is passionately followed in the several forms of the fandango, the bolero, and the Spanish country-dance. Bull and cock fighting are equally favourite sports, and tend to keep alive that ferocity which is the main blemish in the moral character of the Spaniards. Here, as over all South America, they practise what is called the *lasso*, or catching the bull by a noose formed at the end of a long leathern cord, and thrown over him. Under the head of amusement may fairly be ranked the religious ceremonies, and especially processions, in which they certainly outstrip the mother country, both as to splendour and absurdity. Persons representing the leading scripture characters are paraded through the streets, arrayed in the most magnificent robes, and covered with pearls, diamonds, emeralds, and rubies. In the grand procession at Quito, justly characterised by Mr. Stevenson as an ecclesiastical puppet-show, the Holy Virgin appears in the uniform of a general officer, with a gold-laced hat and a red cockade. These festivals are, in fact, accompanied by games and shows, and usually terminate in balls and masquerades.

5964. *The Colombians, especially the females, affect a singular plainness of dress.* They almost universally walk the streets in a large Spanish mantle, a wide cloak of black or light blue, which envelopes the person in such a manner as often to leave nothing visible except the eyes. Their festival and ball dresses, on the other hand, are too gaudy, being covered all over with jewels or tinsel.

5965. *Food* is supplied to the Colombians plentifully and cheaply, especially animal food from the table plains or the Llanos. It is eaten in very great quantity, there being half as many cattle slaughtered in Caraccas as in Paris, though the population is not a twentieth. Fruits are various and delicate. Their festive dinners are rare, but magnificent; the table groans under numberless dishes; yet, though the wines are various, they do not sit long at table, but usually conclude with a ball.

SECT. VII. Local Geography.

5966. *A division* has been formed of Colombia, by the new government, into departments and provinces, which, as it seems sufficiently to correspond both to its natural and civil features, may probably be durable.

5967. *Cundinamarca*, the original name of the Indian kingdom established in this part of America, forms the chief and central department. It corresponds with the viceroyalty of New Granada, recently formed into a separate republic. It consists of ranges of vast mountains sloping down to the banks of the Upper Magdalena, and partly also of the Cauca. It presents in the extreme that abrupt transition between the most opposite soils and climates remarked as peculiar to this part of America; but the most valuable tracts consist of the fine though not very extensive table-lands dispersed along the declivity.

5968. *Santa Fé de Bogotá*, the capital of New Granada, is situated on a table plain 50 miles by 25, and 8000 feet above the level of the sea. This plain, though under the line, has the climate of Britain, and even of Scotland, though without the change of seasons, the perpetual temperature being that of spring or autumn, and the thermometer seldom falling below 47° or rising above 70°. The only alternation is formed by the wet seasons, which are two: the first comprehending March, April, and May; the second September, October, and November; and these, being colder than the others, make two winters and two summers. The surrounding plain is excessively fertile, fine, and fruitful, yielding two crops in the year of the best European grain. It is hemmed in by lofty mountains, rugged precipices, roaring torrents, and frightful abysses. The

city of Santa Fé itself is enclosed in a grand mountain circuit, cliffs of 1000 feet high rising immediately above it. This city was founded in 1538, by Quesada, and rapidly increased: it is now supposed to contain 30,000 inhabitants. Its streets and squares are open and spacious, but the houses are generally heavy and old-fashioned; and even the late palace of the viceroy displays little magnificence. The beauty of the city rests wholly on its ecclesiastical edifices, which consist of twenty-six churches and twelve convents. Many of the former are not only splendid, but built with some taste; and their numerous spires, amid the grandeur of the surrounding scenery, give it a very fine appearance. It contains an university and archiepiscopal see, and carries on a considerable trade in cotton goods, hides, and grain.

5969. *The scenery of the plain of Bogotá* is marked by many striking and picturesque features. Among these are particularly conspicuous the Fall of Tequendama (*fig. 980.*), and the natural bridges of Icononzo. The first is formed by the river Bogotá, as it descends precipitously from its native plain to mingle with the Magdalena. Its mass of waters, previously spread to a considerable breadth, are contracted to forty feet, and dashed down a precipice 650 feet high, into an almost fathomless abyss. The waters, as they beat against the

FALL OF TEQUENDAMA.

rocks beneath, rise up sometimes in columns, sometimes in myriads of fleecy and fantastic shapes, like those formed by fireworks. The immense clouds of rising vapour, when illuminated by the sun, form beautiful rainbows. The plain above the fall is covered with the grain of Europe, while at its foot grow the palms and sugar-cane of the tropic. The bridge of Icononzo (*fig. 981.*) is a natural arch across a chasm 360 feet deep, at the bottom of which flows a rapid torrent, which would have been otherwise impassable. It appears to have been formed by three masses of rock detached from their original position, and thrown together by an earthquake. It is about fifty feet long and forty broad. At one spot, a view is obtained into the abyss beneath. The continual night which reigns there, the birds of darkness whose mournful cries re-echo in the caverns, the gloomy waters which fill the depth of the precipice, the thick foliage of the trees which

partly conceal this scene of mystery, and the darkness which shrouds all these horrors, convey no feeble idea of the empire of death.

5970. *Neyva* is situated above Bogotá, in the highest part of the course of the Magdalena, yet on a plain so much lower as to make it excessively hot; while the waters of the Magdalena, fed from the snowy regions above, are excessively cold. Cocoa is the chief product, which is exported to the extent of 2000 loads, costing thirty piastres each. The Andaquis, a nation of savage Indians, occupy the upper tracts whence the Magdalena rises, and which are accessible only to foot passengers.

981

BRIDGE OF ICONONZO.

5971. *Mariquita* is a province situated below Bogotá, on the western bank of the river, and on the middle range of the Andes, as they slope downward to it. Its table-lands are not extensive, and the city of Mariquita, which stands at a considerable height, has been chiefly supported by mines, which are now abandoned. Honda, immediately on the river, is a town of some importance, being the highest point to which boats can ascend. Here, therefore, the goods are disembarked, and conveyed into the interior, either by slight rafts, or on the backs of mules.

5972. *Antioquia* is a more important province, reaching from the Lower Magdalena to the Cauca, on which it is principally situated. It lies between the middle and western range of the Cordilleras. The first, called here the Quindiu (fig. 982.), separates the valleys of the Magdalena and Cauca. It is very lofty and steep, its highest peak of Tolima being ascertained by Humboldt to be 17,190 feet high, and consequently the most elevated in the northern Andes. It is an uniform ridge, opposing very great obstacles to a passage; but it does not throw up those magnificent cones, which strike the view in the equatorial Andes. The province of Antioquia is nearly in a state of nature. Of the 2200 square leagues which compose it, only 60 are cultivated, 250 are in pasturage, and the rest is covered with thick and entangled forests. Amid its profusion of foliage, indeed,

are found the cinchona, the wax tree, and some valuable dyeing and ornamental woods; but the chief wealth of Antioquia is derived from the auriferous character of its mountains, particularly the Quindiu. Restrepo

reckons the annual value of the gold at 1,200,000 piastres; the products of agriculture at only 338,000 piastres.

982

MOUNTAIN OF QUINDIU.

5973. The department of *Boyaca*, divided into the provinces of Tunja, Socorro, Pamplona, and Casanare, occupies the slopes of the eastern Andes, as they stretch northwards towards the lake and plains of Maracaybo. It presents the same aspect as the regions now described; rugged passes, bleak paramos, sultry valleys, interspersed with cool and fertile table-lands. The province of Tunja is generally bleak and elevated, and its agricultural produce small; but in return it is the most industrious in the whole state, and manufactures a great quantity of coarse cottons, with which it supplies the other provinces. The city of Tunja was the Indian capital of Cundinamarca, and continued,

even under the Spaniards, to be a rich place, till it was superseded by Santa Fé. Socorro is a more fertile and cultivated region. The town is rudely built, but contains 12,000 inhabitants, busily employed in coarse cotton fabrics. Pamplona is a considerable and pleasant town in a lofty situation. Casanare, on the river of the same name, forms the medium by which the provinces on the Magdalena communicate with the Llanos and the coast of Caraccas; under the old régime the influence of the merchants of Carthagena caused it to be shut up, in order to secure their own monopoly of the Santa Fé trade; but as such absurd restrictions will now be abolished, the Casanare may become an important channel of commerce.

5974. The department of the *Cauca* occupies the upper part of the course of that river, with the plain extending to the Pacific. The mountainous part forms the province of Popayan; the plain that of Chocó.

5975. *Popayan* is one of the richest and finest provinces of America. Its plain is more extended and productive than that of Santa Fé, and maintains a superior breed of horses and cattle. Cultivation, however, is indolently carried on, being abandoned chiefly to slaves. The inhabitants look to a more brilliant source of wealth in the gold of which their soil, every where tinged with red and yellow, indicates the presence. In the numerous mines, it is found in earth, from which it is extracted by agitation in water, as in Western Africa. Popayan is a handsome city, built more regularly and elegantly than Santa Fé, and inhabited by many opulent merchants, who have suffered severely by the revolution. Its site, on the river Cauca, is picturesque; the climate delicious, notwithstanding the frequent rains and tempests. It enjoys a considerable trade in European merchandise, which it receives from Carthagena, and distributes to Quito and other neighbouring districts, together with the products of its fertile soil. Above it rises the volcano of Gurose, continually emitting flames, unless when obstructed by the substances thrown out by itself, in which case Indians are employed to clear it, lest the subterranean flame should produce earthquake. From its summit a river descends to Popayan, so impregnated with acid substances, that the Spaniards call it Vinagre. On its banks are the most picturesque, perhaps, of all the falls (fig. 983.) in America, with which Humboldt has made us acquainted. Caly is a clean and well-built town, in a delightful situation; and the inhabitants have attained considerable prosperity by exporting tobacco and other produce of the interior. Lower down the river is Cartago, in a situation which the cold blasts from the snowy mountains would render inclement, were it not sheltered by a ridge of lower hills. The surrounding country contains many valuable mines, and would be most rich in cocoa, coffee, sugar, and all tropical productions, if cultivators and a market could be found.

5976. The district of *Chocó* occupies the plain between the most eastern range of the Cordillera and the Pacific. It is excessively humid and unhealthy. The streams pouring down from the Andes, and the congregated clouds borne in from the great ocean, produce numerous and rapid rivers, and would afford great accommodations to commerce. Unluckily the ground is so wet, that all Chocó may be considered as a vast morass covered with impenetrable forests. It is, likewise, so soft, that the houses can be built only upon

stakes; and even culinary vegetables cannot be grown, unless upon wooden boards artificially elevated. The

983

CASCADE OF VINAGRE.

ground, however, in the few places that are cleared, produces most abundantly, maize, sugar-cane, and banana. But Chocó derives its wealth, as yet, wholly from its mineral treasures. Between the height of 250 and 2000 feet, the earth can scarcely be dug, at any point, without presenting gold, combined with platina, in greater or less quantities. The platina is usually found in the proportion of two pounds to six of gold. The former metal sells for eight or ten dollars a pound; the latter at 200 dollars, bringing in Jamaica 250. The Congress, very injudiciously, continue the old prohibition against its export. The mines have declined greatly during the war, which drew away all the best negroes, and they do not now yield more than twenty quintals of gold, and ten of platina. Captain Cochrane apprehends that the approaching emancipation of the slaves will put an end to the working altogether, and that it will be impossible to bribe free negroes to dig, in a climate which, though not oppressively hot, is damp and extremely unwholesome. Chocó has only large trading villages: Citera, which carries on the commerce of the Atrato, a fine navigable stream flowing northwards into the Gulf of Darien; Novita, that of the San Juan; and Buenaventura, that of the Dagua, both which flow into the Pacific. Buenaventura, with its district, comprising the southern part of Chocó, has lately been formed into a separate province.

5977. *Pasto*, the most southern province of Popayan, bordering to the south on that of Ibarra, abounds in

excellent pastures, to which, probably, it owes its name. The triple chain of the Magdalena cordilleras, and the double chain of those of Quito, here unite into one mass, which is called by Humboldt the knot of the mountains of Los Pastos. The inhabited land is here 10,000 feet above the level of the ocean. It is the Thibet of equinoctial America. In the woods of Pasto grows the tree which yields a resin, called in that country *mopa-mopa*, from which the natives make a very beautiful varnish, of so durable a quality as not to be softened by boiling water or dissolved by acids. In its most northern part rises the volcano of Pasto, the last eruption of which took place in 1727. The district is rich in cattle, and produces also the grain of the temperate climates. Pasto is a considerable town, and the inhabitants manufacture a peculiar species of cabinet-work of considerable elegance. The sea-coast of Pasto consists of the district of Barbacoas, on the river of the same name, and precisely similar to that of Chocó. Provisions cannot be raised on account of the excessive moisture, and must all be brought from the table-land of Pasto on men's shoulders, there being no road by which even a mule can travel; but Barbacoas derives considerable wealth from its *lavaderos* of gold and platina.

5978. *Quito*, whose territory the Congress dignified with the name of the department of "the Equator," and which has now assumed the character of a state bearing that title, forms the finest table plain in all America. It has an average breadth of about thirty miles, enclosed between two parallel ranges of the loftiest Andes. In soil and climate, it possesses a felicity almost approaching to that which fable has ascribed to the golden age. The climate is that of a perpetual spring, at once benign and equal, and even during the four months of rain, the mornings and evenings are clear and beautiful. Vegetation never ceases; the country is called the evergreen Quito; the trees and meadows are crowned with perpetual verdure. The European sees with astonishment the plough and the sickle at once in equal activity; herbs of the same species here fading through age, there beginning to bud; one flower drooping, and its sister unfolding its beauties to the sun. Standing on an eminence, the spectator views the tints of spring, summer, and autumn, all blended. But the feature which renders the view from Quito the most enchanting, perhaps, that the eye ever beheld, is that above this beautiful valley, and resting, as it were, on its verdant hills, there rise all the loftiest volcanic cones of the Andes. From one point of view, eleven may be discovered, clad in perpetual snow. These mountains, particularly Pinchincha (*fig. 984.*), having been chosen by the French academicians for the operations by which they determined the figure of the earth, are considered by Humboldt as the classic land of modern astronomy. They have been made the principle of the division of the department into provinces; the southern being called Chimborazo, the middle Pinchincha, which immediately towers above the city of Quito, and the northern Trubaburu. In this happy vale are found many monuments of the sway of the Incas, who, though they had their main seat of empire at Cuzco, ranked Quito as one of their most valued provinces. The

984

PINCHINCHA.

ruins near Cayambe may be called superb; they form a circle of forty-eight feet in diameter, fifteen feet high, and five feet thick: and though built only of brick and clay, they have resisted the violent rains of the country, and are in a state of perfect preservation. The remains of the palace of Callo (*fig. 985.*) present one of the most perfect examples of the ancient architecture of the Peruvians, which, throughout the vast extent of the empire, are marked by the most striking similarity. It forms a square, each side of which is about 100 feet long; four gates and eight interior apartments may be distinctly traced. The gates resemble those of the Egyptian temples, and the niches, of which there are eighteen in each division, are distributed in a very symmetrical manner. The remains of spacious porphyry palaces are found also at Autun, Canar, and some other places.

5979. The productions of *Quito* are equally various as at Santa Fé, all gradations of climate occurring in a similar proximity; but the most valuable are those of the temperate climates; grain, fruits, and rich pasturage.

5980. *Quito* leaning, as it were, on the side of Pinchincha, more than 9000 feet above the sea, is one of the finest and largest cities in the New World. It has four streets, broad, handsome, and well paved, and three spacious squares, in which the principal convents and dwelling-houses are situated; but the rest, extending up the sides of Pinchincha, are crooked and irregular. The churches and convents are built with great magnificence and even some taste. The most elegant is the college formerly belonging to the Jesuits, finely adorned with Corinthian pillars, and wreaths of flowers executed in stone. The convent of San Francisco is of vast extent and has a massive yet neat façade of the Tuscan order. Quito has two universities, which are numerous attended and carefully conducted; and it is considered comparatively as a sort of American

Athens. The inhabitants are gay, volatile, hospitable, and courteous. Quito is noted for its viands, particularly ices, confectionery, maize, and potato cakes. Vast quantities of cheese are consumed, mixed with pumpkins, gourds, pulse, and other vegetables.

985

HOUSE OF THE INCA AT CALLO.

5981. The districts of *Esmeraldas* and *Tacames* lie between the mountainous part of Quito and the ocean. They are very fertile, yielding cocoa of the very best quality, sugar-cane in abundance, vegetables, fruits, and palms, all excellent, and great variety of timber. The maize is not good, but four crops may be raised in the year. The inhabitants are a mixed race of Negroes and Indians, and call themselves Christians without even observing the ceremonies of the church. Their industry is quite in an infant state. *Esmeraldas* and *Atacames* are merely villages.

5982. The department of *Asuay* derives its name from a knot or mass of lofty mountains on the southern frontier of Quito. It is divided into four provinces; *Cuenca*, *Loxa*, *Jaen*, and *Maynas*. The first two are situated on table-lands of the Cordillera, which are considered by Humboldt as mere prolongations of that of Quito. Like it they are agreeable and fertile, without being either so extremely beautiful, or bordered by such grand and lofty elevations. *Loxa* affords the finest cinchona, and was long supposed to be the only spot which produced that precious medicament in any perfection. The provinces of *Jaen* and *Maynas* are situated on the eastern slope of the Cordillera, and the great *Llanos*, or plains, which extend to and beyond the Amazon. These tracts are rugged, marshy, covered with thick and impenetrable forests. Many parts might yield cocoa, cotton, and tobacco in abundance; but the culture is very partial. There are some missions along the Amazons, the communication with which is maintained only by the Indians on foot, carrying a long knife to cut their way through the underwood.

5983. *Guayaquil* forms one of the most important departments of Colombia, which was for some time held alternately by that state and Peru. It is now divided into two districts, *Guayaquil* and *Manabie*. The country is very fertile, particularly in cocoa, inferior indeed in quality to that of Caraccas; but there has always been a demand to the extent of the quantity produced, which Mr. Stevenson estimates at 600,000 fanegas of three bushels each, and selling sometimes at seven dollars the fanega. There are also large plantations of tobacco; a great amount of timber and salt is exported; and large droves of horned cattle, mules, and horses are driven from the savannahs into the interior. *Guayaquil*, the capital, on the bay of the same name, founded by Pizarro in 1533, contains 20,000 inhabitants, and is one of the most flourishing commercial cities in South America. Its dockyard is particularly extensive. It produced one ship of 700 tons: very commonly vessels of 300 or 400 tons are built there; but it is chiefly noted for schooners of 150 to 200 tons. The houses stand in fine picturesque confusion, along the sides and the top of a hill: they are handsome and commodious; but none of the public edifices are very splendid. The animal food is not of very good quality, but nowhere does there exist a finer fruit market; the plantain is supposed to be more esteemed and eaten than in any other place. *Guayaquil*, like Egypt, has its plagues. The air swarms with mosquitoes and other flies still more tormenting; the ground teems with snakes, centipedes, and other reptiles, whose bite causes fever and inflammation. There is aameleon whose scratch is believed to be mortal, a belief which seems quite chimerical, but which greatly harasses the citizens. The ants cannot be prevented from filling even the dishes: and sometimes, when a tart is cut up, they are seen running off in all directions, leaving the interior a void. Lastly, the shores are crowded with caymans and alligators, whose number cannot, by the utmost exertion, be kept within any tolerable limits. The beauty of the ladies of *Guayaquil* is celebrated throughout all America: they have complexions as fair as any European, with blue eyes and light hair. They have also an agreeable gaiety, joined to a propriety of conduct, which renders the society of this place particularly engaging.

5984. *Venezuela*, the last of the three grand divisions of Colombia, presents itself now under the character of an independent republic. It bears a completely opposite aspect to the two former divisions. While they consist of the declivities and valleys of the loftiest Andes, *Venezuela* forms a plain of immense extent, reaching westward to and beyond the Orinoco. This region is divided into three parts, distinguished by the most marked contrasts both natural and social. The first consists of the forest territory beyond the Orinoco. It exists in an entirely unsubdued and savage state, peopled by the Caribs and other tribes, who roam from place to place, and wage almost continual war with each other. A few only have been formed by the missionaries into *reductions*, and inured to the habits of civilised life. The second part consists of the *Llanos*; boundless plains, where the eye, in the compass of a wide horizon, often does not discover an eminence of six feet high. Like the Pampas of La Plata, they are covered with the most luxuriant pastures, on which, according to Depons, 1,200,000 oxen, 180,000 horses, and 90,000 mules are fed. Some of the great proprietors possess 14,000 head of cattle. The export of the hides of these animals forms one of the principal branches of the commerce of *Venezuela*. The third division, consisting of a coast about 600 miles long, and the territory immediately adjoining to it, includes all that exhibits any degree of culture or civilisation. Here the West India products, and particularly cocoa of superior quality, are cultivated to a considerable extent; and a trade is carried on, which, though interrupted by the revolutionary war and other calamities, is likely, in periods of tranquillity, to be revived and extended.

5985. *Caraccas*, situated considerably to the eastward along this coast, has always been the capital of *Venezuela*, and previous to 1812 was a very large city, containing above 40,000 inhabitants. On the 26th of March it was overthrown by one of the most dreadful earthquakes recorded in either hemisphere. After four in the evening, two successive shocks were felt, during which the ground was in continual undulation, and heaved like a fluid in a state of ebullition. The danger was then thought to be over, when a subterranean noise was heard, like the rolling of loud thunder; it was followed by two shocks, one perpendicular and one undulatory, so tremendous, that in a few seconds the

whole city was in ruins. Several of the loftiest churches fell, burying 3000 or 4000 of the inhabitants, and they were so completely destroyed, that none of the fragments were more than five or six feet above the ground. Nearly 10,000 persons perished on the spot, besides many more who died afterwards, in consequence of wounds and privations. The agitation of the revolutionary contest obstructed the revival of Caraccas, and in 1830 it did not contain above 23,000 inhabitants. The city is finely situated, in a valley between the sea and the lofty mountain of the Silla, whose two peaks rise to the height of nearly 9000 feet. The cathedral is spacious, but massive and heavy. Alta Gracia, its most elegant church, was overthrown by the earthquake. There is an university on a very large scale, though the objects of instruction are somewhat obsolete.

5986. *La Guayra*, about twelve miles from Caraccas, of which it is the port, notwithstanding its unhealthy climate and bad harbour, is the seat of a very considerable trade. Similar disasters have reduced it from a population of 13,000 to scarcely 5000; but it is now reviving. The Colombian Agricultural Association, formed in Britain during the speculative era of 1825, sent out to this place a colony of about 200 Scottish highlanders; but they had been ill selected: a number died, partly through their own misconduct; the rest were conveyed in British vessels to the United States.

5987. *Some considerable cities* occur on the coast to the east of Caraccas. *Cumana* is situated on an extensive and fertile plain on the Lower Orinoco, bounded by a curtain of rude mountains, covered by luxuriant forests. Numerous herds run wild on its savannahs, and in the plain on the coast very fine tobacco is cultivated. It has a very spacious and noble harbour, and the whole gulf of Cariaco, on which it is situated, affords good anchorage. Mules, cattle, and provisions are exported to the West Indies; but there is no longer room for the very large contraband which prevailed when the Spanish Main was generally closed against Britain. The inhabitants, reckoned by Humboldt at 18,000, do not probably now much exceed 10,000. *Cumana* has suffered dreadfully by earthquakes: that of 1766 laid it completely in ruins; hence it contains no lofty or important edifice. *New Barcelona*, to the westward, on an extensive plain over-run by wild cattle, carries on a similar trade, which supports a population of about 5000. The isle of *Cabagua*, on this coast, once famous for a pearl-fishery, is now deserted.

5988. *Still larger cities* occur on the long line of coast which extends westward from Caraccas. *Valencia* flourishes in consequence of the fine interior territory, the trade of which is conducted through it, whence it is supposed to maintain a population of about 15,000. Its port, about ten leagues distant, called *Puerto Cabello*, has an admirable harbour, but is extremely unhealthy. *Coro*, once the capital of Venezuela, having lost that distinction and a great part of its trade, is now much decayed. *Maracaybo*, happily situated at the junction between a bay and a large lake reaching far into the interior, early became a great city. It contains many descendants of the early conquerors, who live in proud indolence: the rest of the inhabitants gain wealth by traffic; and the whole are supposed to be nearly 20,000. *Truxillo*, in a fine country near the head of the lake, early became one of the most flourishing cities in America; but being, in 1678, plundered and reduced to ashes by Gramont the buccaneer, it has recovered only in so far as to be a tolerable country town, though presenting monuments of its former importance. It is almost rivalled by *Merida*, a neat town to the west of it. Returning to the coast, and proceeding westward, we find *Hacha*, only distinguished by the neighbouring pearl-fishery, to which an English company, during the last ten years, sent an annual ship, but, it is said, with little of the expected profit. Farther west is *Santa Marta*, situated in a country pervaded by a detached range of very lofty mountains. It is fortified, and carries on a little trade.

5989. *The department of Carthagena*, on the west of the Magdalena, is chiefly distinguished by its capital of the same name. This city, long considered by the Spaniards as the bulwark of their possessions in America, equally noted for the successful attacks of Drake and the buccaneers, and for the disastrous failure of Vernon in 1741, has lost much of its former importance. The fortifications are considerably decayed, yet it is still the chief arsenal of the state. The packet-boats, which maintain the intercourse with Europe and the United States, sail to and from Carthagena; and it absorbs most of the commerce of the Magdalena and its tributaries: hence it is still supposed to have a population of about 18,000. The buildings have on the whole a gloomy aspect, though there are some handsome churches and convents. *Mompox*, at the junction of the Magdalena and Cauca, derives some importance from this situation. *Tolu*, in a rich vegetable district, is noted for the balsam bearing its name. The vicinity of *Turbaco* is distinguished by the curious phenomenon of the *Volcancitos*, about twenty cones, eighteen to twenty-five feet high, whence issue constant eruptions of gas, sometimes accompanied with water and mud.

5990. *Panama and Porto Bello*, on the opposite sides of the Isthmus of Darien, bore a great name in America, when they were the exclusive channel by which the wealth of Peru was conveyed to the mother country. Now, when both that wealth is diminished, and a great part of it is transported round Cape Horn, their consequence has much declined. Yet *Panama*, on the coast of the Pacific, is still a fortified place, and, though with only a bad roadstead, continues to carry on some trade, and maintains a population of about 10,000. *Porto Bello*, on the opposite coast, whose pestilential climate caused it to share with Carthagena the reputation of being the grave of Europeans, has, in this respect, been lately much improved by the cutting down of some neighbouring forests. Yet, notwithstanding a noble harbour, it is only a large village, unless during the annual fair, which is extremely crowded. *Chagres* has some employment, from its situation midway between these two ports. The project of a canal between *Panama* and *Porto Bello* is for the present given up, but a railway is projected. Near *Cape Blas* is a fishery of pearls and turtle; the former carried on by an English company with little advantage, the latter affording a profitable employment to about 120 individuals. *Santiago*, or *Veragua*, capital of the former province of that name, is a place of some consequence.

5991. *The great plains in the interior of Venezuela* and on the Orinoco, possessing neither manufactures nor commerce, cannot contain cities of any magnitude. Yet *Varinas* was reckoned a neat and handsome place, and, notwithstanding severe losses during the revolutionary war, has still 3000 inhabitants. *Manteral* derives some importance from the commerce of the Apure, on which it is situated. *St. Thomé d'Angostura*, the only city yet founded on the Orinoco, notwithstanding recent losses, is still about equal to *Varinas*, and is the seat of a bishop and a college.

CHAP. VIII.

PERU.

5992. *Peru*, of all the regions south of the Gulf of Mexico, is the most celebrated for wealth and ancient civilisation. Its very name is proverbially used to denote profuse abundance of the most precious metals. Yet the Spaniards, towards the close of the last

century, severed from Peru all the ultra-Andean regions, called Upper Peru, comprising the richest mines and the greatest mass of the native population, and annexed them to the viceroyalty of Buenos Ayres. We cannot but regret, with Humboldt, this attempt "to efface the historical remembrances of nations. The associations," he observes, "of the Indians who inhabit these countries are oftener directed towards Cuzco, the centre of the ancient grandeur of the empire of the Incas, than towards the plains of Buenos Ayres." Besides, we must say, that, in our estimation, the idea of "rich Potosi's mines" was so strictly associated with that of Peru, that we could not willingly see them separated. In fact, the artificial ties formed by the court of Spain were finally dissolved by recent events. Upper Peru, having been liberated by a force from Colombia under Bolivar, has been erected into an independent republic, under the name of *Bolivia*. Buenos Ayres, having in vain endeavoured to effect an union even with the nearer territories of Cordova and Tucumán, will still more vainly seek to comprehend within its limits the domain of Potosí. Under these views, we have determined to consider Upper Peru as Peru, and restore to that country the districts which seem thus naturally to belong to it.

SECT. I. *General Outline and Aspect.*

5993. *The boundaries of Peru* are on the west the Pacific, forming a long line of coast between 4° and 24° of S. lat., which, by its windings and its oblique direction from north-west to south-east, probably exceeds 2000 miles in extent. On the north, the general boundary is the river of the Amazons in its easterly course, which is prolonged to the sea by a line somewhat winding, indented by the Colombian province of Jaen. On the east, Peru is separated from Brazil by lines very vaguely drawn through barbarous regions, which cannot very properly be said to belong either to one or the other. It is carried, generally speaking, parallel to the coast, sloping like it to the south-east, ranging from 68° to 60° long., and extending from 4° to $25^{\circ} 40'$ S. lat. At first, the Tavari, for some space above its junction with the Amazons; afterwards, the upper part of the Madera; lastly, a portion of the upper La Plata; form grand natural limits. To the north, according to our principle of including Upper Peru, the general boundary will be formed by the Pilcomayo, continued to the ocean, by a line drawn from its source across the Andes. Peru will thus be about 1500 miles in length and 700 in breadth. The contents, according to the careful estimate made by Humboldt, will be in square leagues 41,500 for Lower Peru, and 37,020 for Upper Peru; in all, 78,520 leagues, or 936,240 square English miles.

5994. *The surface of this extensive territory* is of the boldest and most varied description. It is crossed, and in a great measure covered, by the Andes, in their greatest extent and loftiest height. Humboldt, who has traced with such care the line of these mountains, finds them separating, about 19° or 20° S. lat., into two parallel chains, which enclose an extended and lofty table-land, including Bolivia, or Upper Peru, and partly filled with the immense lake of Titicaca. Between 14° and 15° these chains unite, and near their junction is situated the ancient capital of Cuzco. It is remarkable that the Andes, which in their course from Cape Horn have hitherto proceeded almost due north, here suddenly change their direction to north-west, and for a short time almost due west; while the coast, as along all this side of South America, follows every winding of the mountain chain, to which it continues always strictly parallel. Around Cuzco is accumulated a vast knot or mass of mountains, about three times the extent of Switzerland. The Cordillera then again separates, and another table-land appears only about half the extent of the former, but extremely elevated, being in some places 10,000 feet high. It then unites in another knot or mass, which contains the rich mines of Pasco, those of Potosi being placed at the opposite extremity of the first table-land. It then opens into three parallel chains, of which the most eastern is only a small lateral branch, bordering on the vast plains called the Pampas del Sacramento. Very high summits occur in the western chain facing the Pacific, and are seen in lofty succession from the cities of the coast. The last is in 8° S. lat., after which there does not occur one for 350 miles. But the mightiest part of the range is that already mentioned as extending over Bolivia, or Upper Peru. It is both the most spacious and the highest of all the branches of the Andes. It contains the stupendous peaks of Sorata and Illimani, the highest in the New World; and which rise, the former to the height of 25,400 and the latter of 24,350 above the level of the sea. It encloses an extensive table-land, scarcely any where less than 12,000 feet high, and peculiarly distinguished for the great altitude at which full cultivation, large towns, and even cities, are situated. In this lofty district also are found the rich mines of Potosi. Between the Andes and the sea extends the plain of Peru, where the chief Spanish settlements have been formed. It is from 50 to 100 miles in breadth, partly covered with branches from the Andes, but towards the sea forming a flat expanse of land, often white with saline incrustations, and absolutely a desert, unless where one of the broad streams, or rather torrents, from the mountains can be directed over it.

5995. *The rivers of Western Peru* can scarcely be ranked as such, being merely torrents, which descend from the Andes, and roll along its narrow plain to the Pacific. The interior, however, is bordered, and partly traversed, by the greatest rivers in the world. The Amazons commences its unrivalled course among the Peruvian Andes. One branch rises from two lakes amid the mountains of Pasco, traverses the whole of the last-mentioned table plain, receiving all the waters of its boundary mountains. After following this course for about 500 miles, it forces its way through rocks and straits across the barrier of the Cordilleras, turns its direction eastward, and reaches that immense plain through which it pursues its course across America to the Atlantic. The greater river Beni rises in the Sierra de Cochabamba, in 18° S. lat., to the north of Oropesa, and rolls along the back of the Andes, draining all their eastern waters, and in 11° S. receives the Apurimac, forming with it the Ucayal, the largest branch of the Amazons. Its entire course is about 1000 miles. On the east, Peru, as already observed, has for its boundary part of the courses of the Madera and the Plata; but these belong more properly to Brazil and Paraguay. On the south the Pilcomayo, after forming its boundary, falls into the Plata, having passed through the richest mineral region in the world.

5996. *Lakes* in South America are not very grand or characteristic features; yet Peru contains one enclosed in its greatest table-land, the Lake of Titicaca, which, though twenty times the size of the Lake of Geneva, cannot come into any competition with the mighty inland seas of Canada.

SECT. II. *Natural Geography.*

SUBJECT. 1. *Geology.*

5997. *The great chain of Peruvian Andes* is divided between 14° and 20° of S. lat., into two longitudinal branches, which are separated from each other by a wide valley, or rather by a *plateau*, the surface of which is elevated 2033 toises above the sea. The northern extremity of this table includes the Lake Titicaca. The western chain separates the bed of the Lake Titicaca and the valley of Desaguadero from the shores of the South Sea, and it presents at least sixteen volcanoes in a state of activity. Its geognostic constitution is essentially volcanic, the volcanic rocks being chiefly trachytes, obsidian and tufas, while the eastern chain consists entirely of mountains of secondary and transition formation, of mica slate, syenite, porphyry, red sandstone, marl containing rock salt, gypsum, and oolitic limestone. From this eastern chain issue a great number of torrents, which empty into the Rio Beni, and which carry down with them auriferous sand. The mines of Peru have been long celebrated, and of these the most valuable are those of gold, silver, and mercury. The gold is obtained at present at Pataz and Huillies in Taoma; and from some veins of quartz traversing primitive rocks. There are besides gold washings on the banks of the Marañon Alto, and on many of the rapid mountain torrents. The quantity of gold coined in the royal mint of Lima between the years 1791 and 1801, amounted to 3450 marks Spanish. In Peru nearly the whole silver is extracted from the great mines of Yauricocha, or Lauricocha (commonly called mines of Pasco, and the *Cerro di Bombon*), and those of Gualgayoc, or Chota, and Huantajaya. The most valuable of these mines are those of Pasco, situated in the high table-land, 13,000 feet above the level of the sea, which afford annually about 2,000,000 dollars. The mines of Chota were discovered in 1771 by a Spaniard; but the Peruvians worked, in the time of the Incas, some silver mines near Micuipampa. Great wealth has been obtained, even at the surface, both in the mountain of Gualgayoc, which rises like a fortified castle in the midst of the plain, and at Fuentestiana, at Cornolache, and at La Pampa de Navar. In this last plain, for more than half a league, wherever the turf has been removed, sulphureted silver has been extracted, and filaments of native silver adhere to the roots of the grasses. Frequently the silver is found in masses, as if melted portions of this metal had been poured upon a very soft clay. All the mines comprehended under the name of mines of Gualgayoc, on the partido of Chota, furnished to the provincial treasury of Truxillo, between the month of April, 1774, and the month of October, 1802, 1,189,456 lbs. troy of silver, or at an average of 44,095 lbs. troy annually. The mines of Huantajaya, surrounded with beds of rock salt, are particularly celebrated on account of the great masses of native silver which they contain; and they furnish annually from 45,942 to 52,505 lbs. troy of silver. The conchoidal horn ore, or muriate of silver, silver glance, lead glance, quartz, calc spar, accompany the native silver. These mines are situated in the partido of Arica, near the small town of Yquique, in a desert destitute of water.

5998. *Cinnabar*, or sulphuret of mercury, the common ore of mercury, occurs in Guanica-Velica, a district of Peru, at no great distance south-west of Lima. It appears that the discovery of this great mercury mine goes back to a very remote period, since the Incas made use of cinnabar in painting themselves. Mercury is found in the environs of the town of Guanica-Velica, in beds and veins. In the great mine of Santa Barbara, the cinnabar is contained in a bed of quartz sandstone of nearly 400 yards in thickness; but the metalliferous mass is not more than 70 yards thick. Besides the cinnabar contained in the sandstone of Santa Barbara, there is also some in this same part of the Cordilleras, in small veins, in alpine limestone. Tin and lead mines are worked at Chayanza and Paryas; there are considerable deposits of copper at Aroa, yet the inhabitants of Peru import that metal from Chili.

5999. *UPPER PERU, OR BOLIVIA.*—This state is interesting from the variety, extent, and value of the minerals it affords. The mountainous regions are principally composed of porphyry, and in the same chain there are volcanic mountains, some of which are in a state of activity. Gold is found in considerable quantity on the mountainous districts, but hitherto it has not been very extensively mined. It occurs associated with antimony, silver, and other minerals, and sometimes in masses of considerable size: the largest mass on record is one which was detached by means of lightning from a mountain near to La Paz, and for which 11,269 dollars were paid. But by far the greater part of the gold procured in Bolivia is obtained by washing the sands of rivers: the most productive of these *cavaderos*, or gold washings, is that of Tipuani. Silver has hitherto been the principal metallic production of Bolivia, and has conferred on it its great celebrity. In the rich mountain of Potosi alone, according to records kept at Potosi, of the *quintas*, or royal duties, from the year 1745 to the year 1800, no less than 823,950,509 dollars were coined during that period; and if to this be added the amount of the preceding years, not included, and that obtained in a clandestine manner, without the payment of the customary dues, not less than 1,647,901,018 dollars have been obtained from this source alone in the space of 255 years. The silver mines of Portugalete, in the province of Chicas, have acquired celebrity on account of the riches as well as the quantity of their ores, which yield from sixty to eighty marks of silver to the *caxon*, while those of Potosi only afford about ten marks from the same quantity of ore. At La Plata, Porco, and Lipes, there are silver mines, especially one in the latter province, celebrated for the purity of its ores, which were formerly in great repute, but since eclipsed by the more important ones of Potosi and of other places. In Carangas there are rich silver mines; and formerly the silver mines of Oruro were very productive.

SUBJECT. 2. *Botany.*

6000. *The country is a complete desert* from Copiapo, along the whole coast of Peru, to the mouth of the Guayaquil river, intersected only by valleys, which are twenty or thirty leagues apart. A few patches of Tillandsiæ and Cacti are almost the only vegetation seen, except for a short time in winter, when bulbous plants of great beauty appear, wherever there is soil for them to fix their roots: but they quickly vanish when the mist disappears, and the sun regains its power.

6001. Though the surrounding country be so cheerless, *the valleys of Peru enjoy a delicious climate*, the cool south breeze moderating, though it hardly obscures, the sun's rays. It is not, however, always favourable to health; intermittent fevers attacking almost all those who reside on the coast of Peru. From the perpetual spring that prevails in the valleys, vegetation is most luxuriant; almost every cultivated plant, from barley

to rice and sugar-cane, coming to perfection, the climate permitting both planting and reaping at every day of the year. The traveller, on entering one of these valleys, is struck by the sudden transition from the sterility of the desert to the bright verdure of the irrigated land: the water channels are, of course, carried near the hills, to ensure more fall of water; and every inch of ground within these limits is covered with luxuriant vegetation; so that hills that are parched and barren beyond these bounds, within them are clothed with a beautiful verdure. Few trees or shrubs remain in these valleys; still, for the purposes of fuel, some are left, as Willow, Manglillo (*Manglilla Jussieu*), and Huarango (an *Acacia*). Among the shrubs that grow near Lima are various species of *Cordia*, *Buddlea*, *Heliotropium*, *Lantana*, *Lycium*, and *Jussieu*. East of the Andes, again, there are considerable forests, an extraordinary difference existing between the eastern and western parts of Peru. Towards the coast, the climate is temperate, the rivers small and few, and the hills bare of wood. Wild animals are very rare: there are few birds, and no noxious reptiles. The country, its climate and productions, appear to belong to the temperate zone. But if we cross the Cordillera, and descend to the east, we find lofty trees, wild animals, and venomous snakes: numberless birds of splendid plumage inhabit the trees, and alligators and tortoises abound in the Marañon and its numerous tributary streams. Here are all the productions of a moist tropical climate; yet the two districts are in the same latitude, only separated by the Cordillera.

POTATO.

6002. Between Lima and Pasco, a distance of about forty-five leagues, many interesting plants occur, especially the bright golden Amancaes (*Narcissus Amancaes* of Ruiz and Pavon), which is almost confined to the neighbourhood of the former place. This is a favourite flower with the inhabitants of Lima, who annually make a promenade to the spot where it most abounds, on St. John's day, and return home decked with its brilliant blossoms. Tillandsiæ, Mutisiæ, Melocacti, Cacti, and Schinus Molle also grow in this district, the latter plant affording a resin which is much valued as an application to bruises. The celebrated Yellow Potato of Peru (*Papas amarillas*) is cultivated at Huaman-tanga. It is deemed superior to every other variety, but is an indifferent bearer, and does not succeed near the coast. This may be considered as the native country of that valuable and widely diffused plant, the Potato (fig. 987.), which is very common about Valparaiso, inhabiting steep rocky places on the cliffs near the sea, and always bearing pure white blossoms free from the purple hue so common in the cultivated varieties. In the immediate neighbourhood of Pasco, that celebrated spot from which so much wealth has issued, few plants are to be found, those which most frequently occur being a few Gentians, *Lupinus nubigenus*, and some Compositæ. The pappus of *Werneria rigida* is used as tinder, and the fruit of *Alstrœmeria dulcis* is eaten by the children.

SUBJECT. 3. Zoology.

6003. The Zoology is as much unknown as that of Colombia: the researches of the accomplished travellers Humboldt and Bonpland, having been more directed to plants than to animals. Our notices must consequently be very brief, and confined to the three most celebrated animals of the Peruvian Andes, the Lama, the Vicugna, and the Condor.

LAMA.

6004. The Lama (*Camelus Glama* L.) (fig. 988.) reminds the spectator of a very small camel, in which genus it has been placed by Linnaeus. It has been supposed by Baron Humboldt, that the wild lamas are only individuals strayed from the domestic breed: but if this is correct, where was the animal originally brought from? The hair is long, soft, and elastic on the body; but close and short on the head and limbs. In manners, the lama is gentle and confiding, without showing much vivacity; its carriage is graceful, and even beautiful, when the pure white of the throat and breast is seen in front. It has not very great strength, but is trained to carry burdens.

great liveliness. The manner of taking this animal so valuable for its fleece, is said to be as follows:—Ropes, to which bunches of feathers have been attached, are first stretched across the mountain passes, near their haunts; the animals are then hunted and driven in these directions. On reaching these barriers, the lamas stop in terror at the fluttering of the feathers, and wait to be slain or noosed by the Indians; unless, indeed, an alpaco (another species, not unlike the lama) happens to be among them. This animal, not so easily intimidated, will immediately leap over, and then the whole herd will instantly follow the example.

CONDOR.

6005. The Vicugna (*Camelus Vicugna* L.) is smaller than the lama, but is celebrated for the superior fineness of its wool. It inhabits the highest points of the southern Andes, and exhibits great liveliness. The manner of taking this animal so valuable for its fleece, is said to be as follows:—Ropes, to which bunches of feathers have been attached, are first stretched across the mountain passes, near their haunts; the animals are then hunted and driven in these directions. On reaching these barriers, the lamas stop in terror at the fluttering of the feathers, and wait to be slain or noosed by the Indians; unless, indeed, an alpaco (another species, not unlike the lama) happens to be among them. This animal, not so easily intimidated, will immediately leap over, and then the whole herd will instantly follow the example.

6006. The history of the Condor (*Vultur gryphus* L.) (fig. 989.) was long enveloped in fable, until the publication of M. Humboldt's researches. It is one of the largest of terrestrial birds; but its size appears much greater, when seen by itself on a rocky peak, than it really is: for, when perched, it does not stand more than three feet high. It is peculiar to the Andes, and seems to prefer the highest points, bordering the limits of perpetual snow. Although they never attack man, yet they exhibit no fear at his approach: their food and habits are very similar to those of the bearded vulture of Europe. Two condors will dart upon a deer, or even a heifer, pursuing and wounding it for a long time, by their beaks and talons, until their victim sinks. They then immediately seize its tongue, and tear out its eyes. In Quito, it is said that the mischief done to cattle, by these formidable birds, is immense: their general food, however, is carrion or dead game. The skin of the condor is so thickly clothed with down and feathers, that it is capable of withstanding musket balls, when not closely fired; and the bird is killed with great difficulty.

SECT. III. Historical Geography.

6007. Peru was one of the two monarchies which, at the invasion of the Spaniards, had attained to a degree of refinement far above that infant and savage state of society in which all the rest of the American continent was plunged. It was also remarkable from the contrast of the character of its civilisation with that

of the Mexicans. Instead of the fierce and lofty spirit, the bloody wars, the uncouth deities, and ferocious rites of that singular people, the Peruvians were united in tranquil subjection to a mild superstition, which represented to them their inca as the child of the sun, that supreme source of light and power, exercising in his name a beneficent sway, to which their unreserved submission was due. However fable may be mixed with truth in the tale of the first descent of Manco Capac and his spouse, from the heights of the Andes, there can be no fable in the story of the greatness of the empire to which their posterity attained. It comprehended not only the vast region we are now describing, but the territory of Quito, which, though united by Spain to New Granada, is covered with monuments of the empire of the Incas. Complete order and obedience were established in this dominion of more than 2000 miles in length. The land was carefully cultivated. As moisture was the chief want, all the rivers were diverted into *aqueas*, or irrigating canals; mountains were formed into terraces to receive them, and walls built to prevent the water from escaping; and thus large tracts were rendered productive, which, under European management, have relapsed into the state of desert. The grand imperial road, extending for 1500 miles, from Cuzco to Quito, though only eighteen feet broad, and not fitted for carriages, which, indeed, did not exist in Peru, was yet rendered a wonderful work by the natural obstacles which had been overcome, and the flying bridges by which a passage had been formed over the deep ravines. Robertson conceived that ancient Peru contained one city only, that of Cuzco, and that all the rest of the population was rural; but this opinion is at variance with the extensive remains observed by recent travellers. The ancient structures of Peru have nothing of that lofty character, to which those of the Mexicans attained. Perhaps they were thus formed for security in a country so subject to earthquakes. The walls, composed of immense blocks of stone, seldom rise to more than twelve feet in height; but they enclose immense spaces of ground, and are divided into an infinity of apartments; inasmuch that one, observed by a late traveller, near Caxamarca, appeared capable of containing 5000 men. To the Mexican paintings and hieroglyphics, there is nothing analogous among the Peruvians, who, however, had their *quipos*, or strings, on which the colours represented the objects, and the knots their number. This contrivance, first used apparently for purposes of calculation, was afterwards employed as a record of events; though it cannot be said to be so effective as the Mexican pictures. Amid the mildness of all their rites and habits, the Peruvians retained one practice marked by the deepest barbarism. On the death of their Inca, or even of any great chief, a number of his vassals, often very considerable, were interred along with him. There were also deposited a portion of his wealth, and many precious and useful articles, destined for his use in the other world. The opening of these *huacas*, or tombs, has often proved a great prize to European adventurers; and in one instance there was found a treasure in gold amounting to no less than 150,000*l*.

6008. *Spain*, through the daring enterprise of a small band of adventurers, whose deeds we willingly decline recounting in detail, acquired, by a *coup de main*, this vast and rich empire. Peru then became the centre of the wealth and power of Spain in South America. An extensive dismemberment, indeed, took place, by the erection of the viceroyalty of Buenos Ayres, and the transference to it of the richest mining districts; yet Lima continued not the less to be the capital of all the southern states.

6009. *The spirit of revolution and independence*, which was kindled with such force by the French usurpation in the mother country, was much less strongly felt in Peru than in the less opulent seats of Spanish power. All the highest functionaries, and the richest merchants, were settled in Lima, and inspired a tone of feeling decidedly favourable to the mother country. So deep was this feeling, that Mr. Stevenson has heard affectionate parents declare, that they could not feel the same attachment to their children as if they had been born in Europe, and that, if they could suspect them of joining the American cause, they would murder them in their beds. Peru, therefore, not only remained for some time firmly attached to the Spanish cause, but made great exertions to suppress the opposite spirit in the neighbouring provinces; accompanied with cruelties which caused a general disgust and indignation, and gradually generated a feeling hostile to it. An external force, therefore, was necessary to give effect to the new system in Lima. It was not till the year 1820, more than ten years after the first revolution, that San Martin sailed with an expedition from Chili, landed at Pisco, and advanced upon Lima, which the viceroy La Serna abandoned to him without resistance. The triumph of the patriots seemed complete. But the misconduct and disunion of their chiefs, and the misfortunes of the army which they sent into Upper Peru, gave an unfavourable turn to affairs, and enabled the Spanish chiefs to regain possession of the capital. Bolivar, however, now came forward, and, having finally achieved the deliverance of Colombia, considered it essential to the general cause of American independence to destroy this last strong-hold of resistance. He marched down upon Lima, and La Serna again gave way: when the war was transferred to the defiles of Upper Peru, the patriot force was compelled to a disastrous retreat, in which it almost entirely mouldered away. La Serna was again master of Lima, which remained for some time in his hands; but Bolivar having called forth all the strength of Colombia, and the royalists being weakened by the defection of Olafleta, he was again obliged to retreat without a struggle. Yet the royalists in Upper Peru had once more rallied, and seemed on the point of regaining the ascendancy, when General Sucre, by a bold and sudden attack, on the 9th December, 1824, gained a complete victory on the plains of Ayacucho: the whole Spanish army surrendered; its chiefs were conveyed to Spain; and the freedom of Upper and Lower Peru was to all appearance finally sealed.

SECT. IV. Political Geography.

6010. *Peru*, in consequence of its liberation, was formed into two separate republics: one, consisting of Lower Peru, considered now as Peru proper; and the other of Upper Peru, or Bolivia. It must be owned, however, that our information respecting the organisation and present state of these republics is very imperfect. Balbi states the revenue of Lower Peru at 1,250,000*l*., its debt somewhat above 6,000,000*l*., and its army at 7500. The revenue of Bolivia is stated at only 460,000*l*., its debt 750,000*l*.

SECT. V. Productive Industry.

6011. *Agriculture* is not the branch on which the wealth of Peru in any great degree rests. The plain on the sea coast is a sandy desert, and the sides of the mountains are steep and broken into ravines; while the parameras or table-lands at the summit of the Cordillera are rendered nearly unfit for cultivation by the extreme cold and the perpetual snow which covers them; so that it is almost solely through the neglected remains of the Indian terraces and irrigating canals that any of the elevated tracts are rendered very productive. Some of the valleys, also, and of the lands along the rivers, are extremely fertile. Maize is the staple grain and chief food of the natives, in the various forms of bread, puddings, porridge, and roasted grain. It is also made into a fermented liquor called *chica*, which is agreeable enough; but, unfortunately for the fastidious taste of Europeans, the Indian women consider it their duty carefully to chew it, as a means of fermentation. Some of the higher grounds are better fitted for barley; but for wheat, Peru is dependent upon the Chilian province of Concepcion. The sugar-cane is cultivated with decided success, though not on a very great scale. Fruits of every climate, from the successive slopes of the Cordillera, are poured down into the markets of Lima. The neighbourhood of Pisco is covered with vines, from the grapes of which are made 150,000 gallons of excellent brandy; but the wine of Peru possesses no merit. Ipecacuanha, balsams, medicinal plants, and valuable dye-woods may also be mentioned.

6012. *Manufactures* are in a still less advanced state. In the mountain districts are made considerable quantities of coarse woollens, blankets, flannels, baize, and particularly *ponchos*, a loose riding cloak, generally worn throughout Spanish America, and sometimes made of great fineness. A few towns on the coast manufacture cottons. Goatskins are made into good cordovan. The Indians execute very fine filigree work

in gold and silver, and their mats and other articles of furniture made from grass and rushes are very much admired. In general, however, the Peruvians look to Europe for a supply of all the finer manufactures.

6013. *The mines* have been the source of the unrivalled wealth of Peru. These are seated in the inmost depth of the Andes, approached only by steep and perilous passes, and in mountains which reach the limit of perpetual snow. The silver mountain of Potosi, in Bolivia or Upper Peru, has no equal in the world. It rises to the height of 16,000 feet, is eighteen miles in circumference, and forms one entire mass of ore. It appears from the city dyed all over with metallic tints, green, orange, yellow, grey, and rose-colour. Though since the conquest upwards of 240,000,000*l.* have been drawn from it, the mountain is still only honey-combed, as it were, at the surface; ore still lies at a somewhat greater depth, and is in some places overflowed with water. Yet it has sunk into such a state of decay, that in the ten years ending 1829, the annual produce is not believed to have exceeded 330,000 dollars. But the present depressed state of the mine is chiefly owing to the late political convulsions, and the exhaustion of all the capital that was formerly employed. These are evils which probably a state of peace will remedy, though no arrangement to that effect has yet been made. A company from Buenos Ayres offered 2,500,000 dollars (500,000*l.* sterling) for the exclusive working; but several English agents coming out in eager competition for the same object, Bolivar sent the proposals to London. They reached that capital at the well-remembered moment of deep depression, and did not obtain even an offer. The Spaniards assert that there are 5000 mines in Potosi; but these mines are only *estacas*, or lots portioned out to individuals, of which, when Mr. Andrews visited the place in 1826, there were not quite 100 at work; yet these few yielded a good profit, and there was no want of labourers: hence he calculates that a capital of 100,000*l.* would yield 18,000*l.*, or, in allowing a third to pay the high salaries expected by the agents, 12,000*l.* This is exclusive of any advantage from the use of machinery, and any improvement in smelting, refining, and other processes, which have hitherto been performed in the rudest manner. The exhaustion of timber will, however, be a serious obstacle; for the reported discovery of a vein of coal is not confirmed by Mr. Andrews. The mines of Pasco are situated at a prodigious height, on the knot where the Andes lock into each other, more than 13,000 feet above the sea. They are chiefly in the mountain of Lauricocha, forming a bed of brown ironstone, about three miles long and one and a half broad; from every ton of which two or three marks of silver are extracted. These mines, before the revolution, yielded annually 131,000 lbs. troy of silver. By that convulsion their working has been entirely suspended. The house of Abadia, by which it was chiefly carried on, has been ruined; and the royalists, in revenge for the part taken by that house, destroyed all the costly machinery: the water, which always occurred at the depth of 400 feet, took full possession of the mine. It would cost now a very large sum to bring it again into a productive state, though it is still believed that the returns in such case would be great. There are mines also at Hualgayas in the province of Truxillo, and Huanlaya in that of Arequipa. All the Peruvian mines, however, are so much declined, that their produce, during the entire period from 1819 to 1829, was under 4,500,000 dollars. The gold mines are found chiefly in the interior district of Tarma, bordering on the Amazon. The metal is partly obtained by the usual process of washing the earth impregnated by auriferous streams; but in some instances the gold is found embedded in veins of quartz rock. The mines of mercury are considered equally precious with those of silver, from its scarcity and its necessity in amalgamation. The discovery, therefore, of the mines of Guanica-Velica was of the greatest importance, and they yielded at one time an immense amount. The mountain, which is nearly 14,000 feet above the sea, being excavated into three successive galleries, and the props not having been made sufficient, a great mass fell in, and crushed the most valuable part of the works. Hence, even before the revolution, the produce had fallen to 15 cwt. The same district abounds with valuable mines of gold and silver, which, however, from the imperfect mode of working, were never very productive.

6014. *Commerce*, during the late crisis, can scarcely be said to have had an existence in Peru; nevertheless we must describe what has been, as likely to exist again, when peace and security revive. The export trade rests almost entirely on gold and silver, with a little bark, cocoa, cotton, and sugar. The value which, before 1739, scarcely exceeded 2,000,000 dollars, had risen between 1785 and 1794 to 6,680,000. The imports consist of all the articles of European manufacture, except those coarse and common fabrics, which are produced in the country itself. Those of Britain obtain a decided preference. Mr. Stevenson remarked with pride, on entering a house in Lima, that almost every thing was English; the brass furniture, the window glass, the dimity hangings, the linen and cotton dresses of the females, the cloth coats of the men, the plates, knives, and forks on the table; even the iron pots and pans in the kitchen. From the peculiar state of society, in which European habits prevail without European industry, the market for foreign goods is here, as in the other American states, much more than in proportion to their wealth and population. Mr. Proctor even heard it calculated by a well-informed person, that Lima, under favourable circumstances, would receive a value not less than 2,000,000*l.* sterling. The most saleable articles are cotton goods of almost every kind; Manchester broad flannels, Irish linens and lawns, fine Scotch cambrics and table linen; silks, crimson damask, and particularly narrow ribands. Thick broadcloth finds a market in the interior. Glass, earthenware, and hardware are also in regular demand. Toys need not be sent, as the gold and gems of the country are preferred. Hats, with leather, and every thing made of it, are so well manufactured in the country, as to render foreign supplies superfluous. The principal imports direct from Peru into Great Britain, in 1831, exclusive of gold and silver, were, Peruvian bark 206,574 lbs., hides 553 cwt., saltpetre 2,586 cwt., goat-skins 10,735, seal do. 4952, cotton wool 57,027 lbs.; but a good deal of Peruvian produce is imported at second

hand from Buenos Ayres and Valparaiso. The real value of the total exports of British produce and manufactures to Peru, during the same year, was 409,000*l*. The principal articles were cottons, woollens, and linens. (See M'Culloch's *Commercial Dictionary*, art. LIMA.)

6015. *The roads in Peru*, as in other parts of South America, consist in general only of the foot tracks of the horses, or more frequently mules, by which they are trod. No carriage is attempted to be driven; but the effeminate traveller sometimes establishes on the back of the mule, a species of box or litter, the motion of which, however, is very unpleasant. It is only in the dreadful steepes of the Andes, that human art has been employed to form a path along the sides of precipices, to cut one through rocks, and even to form them into steepes; but these works, it is probable, were performed by the native Peruvians, and not by their European conquerors.

SECT. VI. *Civil and Social State.*

6016. *The population of Lower Peru*, according to two enumerations made about 1803, amounted to 1,076,000. Of these there were 136,000 Spaniards, 609,000 Indians, 244,000 mestizos, 41,000 free negroes, and 40,000 negro slaves. Humboldt has assumed 1,400,000 as the actual number; perhaps rather hastily; for there cannot, we suspect, under the circumstances of the last twenty years, have been any increase. According to statements obtained by Mr. Brackenridge at Buenos Ayres, Upper Peru, called there the Audiencia of Charcas, contained 1,716,000; of which 510,000 were Europeans and mixed races, 986,000 Indians, and 220,000 not distinguished. We cannot help suspecting this statement to be a little exaggerated, especially as to the first head; but we have no other. Peru, then, will contain in all 2,792,000 inhabitants.

6017. *The character of the Creoles*, or native Spaniards, of Peru, is painted under colours somewhat less flattering than that of the same class in almost any of the other states. The preponderance of the European Spaniards appears to have been more overwhelming than elsewhere. This political degradation, with the general diffusion of wealth and facility of subsistence, seems to have been the chief cause of the enervated state into which the natives of Lima had sunk. The male inhabitants are considered by Mr. Proctor to be almost too insignificant a race to be worthy of mention; destitute of all energy both mental and bodily; so that, notwithstanding the extensive trade, there are not above two or three mercantile houses carried on by native Peruvians; all the rest are conducted by foreigners, many of whom are from Chili and Buenos Ayres. The ladies act a much more conspicuous

FEMALE COSTUME OF LIMA.

part; though not always, we are sorry to say, altogether to their credit. From their earliest years they are led to consider themselves as the objects of admiration and homage, and a system of the most decided coquetry, or at least flirtation, is established. Even Mr. Stevenson, their champion, allows it to be common for the mother to screen her advancing years by making her daughters address her as a sister. Their intrigues are greatly aided by a dress originally intended to mark reserve and seclusion; the *saya*, a light elastic gown fitted close to the frame, being covered with the *manto*, a large loose cloak of black silk gauze, which is wrapped round even the face (*fig. 990.*). Under this disguise, they sally forth, and amuse themselves by addressing their friends without being known by them; mixing with the crowd to view whatever exhibition may be going forward; and, it is too likely, in still more culpable indiscretions. Gaming prevails also among both sexes to a destructive extent; and families are extremely ill managed. Yet the Peruvians are courteous, humane,

hospitable, and generous. In the country, these amiable qualities are combined with equal mirth, but a much greater degree of simplicity.

6018. *The Indians*, or native Peruvians, are still, over all Peru, the most numerous class. They present nothing of that fierce aspect, and that untamed and ferocious character, which render the Caribs, the Brazilians, and the Indians of Canada, so terrible to European settlers. They have small features, little feet, well-turned limbs, sleek, coarse, black hair, and scarcely any beard. Ulloa and Bouguer have represented them as sunk in apathy and insensibility; as beings to whom good and evil fortune, honour or dishonour, life or death, appeared to be all alike. But though a certain tameness of character may have been generated by their former despotism, it appears that the shy, reserved, and gloomy aspect which they present to Europeans has arisen chiefly from the experience of oppression and accumulated wrongs; and when it is often said that no expedient can rouse them from their gross ignorance, Mr. Stevenson triumphantly asks, what expedient has been employed for that purpose? The Indians assuredly live in very miserable huts; and they show a wonderful patience under the greatest privations; yet they do not neglect the means of improving their condition: they are industrious cultivators, and manufacture often very beautiful fabrics from very simple materials. Several of them have distinguished themselves in the pulpit and at the bar; and, when completely at their ease, they are found to talk with even an excess of fluency. Chastity, especially in the married state, is a national virtue; but they are apt to indulge in too deep potations of chicha, their favourite liquor. They have been converted to something which they call Christianity; that is, they celebrate the festivals of the church by drinking enormous quantities of chicha, dancing through the streets to the sound of the pipe, with bells fastened to their legs, and cudgels, which they apply to any who attempt to obstruct their progress; in which devout exercises a whole week is sometimes consumed. They have, in a good measure, wiped off the reproach of cowardice, by late achievements in the cause of Old Spain. Yet they retain the deepest and most mournful recollection of the Inca, and in all the remote districts annually celebrate his death by a sort of rude tragedy, accompanied by the most melting strains of natural music.

6019. *The mixed races* are more numerous than the pure Spaniards, though less so than the Indians. They

consist of the usual multiplied branches from the three original stocks of Europeans, Indians, and Negroes. According to Mr. Stevenson, the mestizo is strong, swarthy, with little beard, laborious, and well disposed; the mulatto is less robust, but is acute, talkative, imaginative, fond of dress and parade. In a public disputation at the university, a mulatto in the gallery will often help the embarrassed student out with his syllogism. The zambo (mulatto and negro) is violent, morose, and stubborn, prone to many vices, and guilty of more robberies and murders than any other class, only excepting the Chinos (negro-Indian), said to be the very worst mixed breed in existence, ugly, lazy, stupid, and cruel.

6020. *The religion*, as in every country over which Spain ever reigned, is exclusively catholic. Lima is the seat of an archbishop, who had for suffragans the bishops of Cuzco, of Panama, two in Chili, and six in the south of Colombia; but this extensive jurisdiction must now be curtailed. There are in Peru 2018 clergy, 2217 monks, and 1361 nuns. Immense wealth has been accumulated by several of the convents from pious donations. Some of the clergy are respectable, but a great proportion of the friars are said to lead very dissolute lives, and to promote rather than check the general licentiousness. Although no toleration is admitted, yet in 1812 the inquisition was abolished. An English traveller then resident saw its dungeons broken open, and their secrets disclosed: racks, pillories, scourges of knotted cord, tormentors of netted wire, with points projecting inward; and gagging instruments formed of human bone. There was a crucifix with a head capable of making a movement, which, being produced by a person from behind, had the appearance of being miraculous.

6021. *Literature* is not in so utterly depressed a state at Lima as in the other cities to the south of the Isthmus of Darien. Besides several colleges, there is a highly endowed university, founded in 1549, on the model of that of Salamanca. The professors do not deliver lectures; but examinations and disputations are maintained with considerable diligence. A number of scholars have been produced, who, in America, are accounted eminent. The *Mercurio Peruano*, a periodical work, carried on before the revolution, contained a good deal of valuable information. The emancipation has, as might be expected, been accompanied with extensive arrangements for diffusing knowledge among the body of the people.

6022. *The amusements* consist of the theatre, which, at Lima, is tolerably conducted; bull-fights, cock-fights, and religious processions; and the rage for public diversions, as already observed, is extreme. In regard to dress, the chief distinction seems to consist in the saya and manto, worn by the ladies, and already described. The favourite dishes are the well-known olla podrida, and the chupe, a mixture of fish, eggs, cheese, potatoes, and onions, eaten by the guests with spoons from a common dish in the middle of the table. The cigar is almost constantly in every one's mouth.

SECT. VII. Local Geography.

6023. *Lima* (figs. 991. and 992.), next to Mexico the most splendid city of Spanish America, is situated about six miles in the interior, from its port of Callao. It is of a form nearly

991

LIMA.

semicircular; two miles long, and one and a half broad; the base being washed by the river Limac. It is surrounded by a wall of brick and clay, twelve feet high, but capable merely of serving for purposes of police. The houses run in straight lines, dividing the city into a multitude of squares of various forms and dimensions. They are built wholly of timber, cane, and unburnt brick, and are seldom more than one, scarcely ever more than two stories high; but those of the rich are surrounded by porticoes or open courts, enclosed by high walls and gates, which being, as well as the interior, painted with figures as large as life, and adorned with wooden pillars, coloured in imitation of stone, make a very gay appearance. The *plaza*, or principal square, is, as in other Spanish cities, surrounded by all the finest edifices. The viceroy's palace, however, is an old plastered and unsightly structure, of a reddish colour, the lowest story of which is strangely occupied by a row of mean shops, above which is a gallery open to the public. The apartments now employed as government offices display some vestiges of decayed magnificence. The cathedral is an elegant building, with a stone front, and two towers of considerable height; and the interior, particularly the great altar, is, or at least was, excessively rich. Close to it is the archbishop's palace, elegant, adorned with green balconies, though with the same bad taste of having little shops, among others, a drinking shop, on the ground floor. There are twenty-five convents in Lima, with churches attached to them; and fifteen nunneries. The convent of San Francisco, with its appendages, is the most extensive, and,

992

LIMA FROM THE SEA.

though not so rich, is more elegant than the cathedral. An immense treasure in the precious metals was contained in these establishments; but during the revolution great part has been abstracted, though the base materials substituted have been carefully gilded over. The population of Lima is reckoned by Cald-

cleugh at 70,000, of whom about 25,000 are Spaniards, 2500 clergy, 15,000 free mulattoes, 15,000 slaves, 7200 mestizos, and 5200 Indians. Mr. Stevenson estimated the number at 87,000, and Mr. Proctor heard it reckoned at above 100,000; but no recent

census has been taken. Callao, communicating with Lima by a very fine road, has an excellent harbour formed by two islands. The forts by which it is defended are handsome and strong; but Callao itself is a mere fishing village, of about 200 huts.

6024. *On the coast to the north of Lima* is Truxillo, a handsome little town, a miniature of Lima, and built in the same gay style. Around it is a very extensive and productive plain; and other tracts, which are now sandy wastes, are proved, by the remains of acequias, and the ruins of large towns, to have been cultivated and peopled in the time of the Incas. By its port of Huanchaco, which has a tolerable roadstead, Truxillo sends the produce of its territory to Lima, and receives British goods in return. On the 29th November, 1820, the Marquis of Torretagüe, governor of Truxillo, proclaimed the independence of that intendency, and thus rendered an essential service to the cause of liberty in Peru. Huachi and Supe are large Indian villages, the houses poorly built of mud; but the inhabitants, an active and hardy race, carry on some fine manufactures of cloth and glass. Sanna is the seat of a considerable trade, and Lambayeque, to the north of Truxillo, is the most thriving place between Lima and Guayaquil. The inhabitants manufacture excellent cordovans of goatskin; cotton cloth, particularly table linen and canvas; soap, which, though much inferior to that of Europe, is preferred in Peru; and sweetmeats made from the fine fruits of the country, which are packed up in chip boxes, and sent all along the coast. Piura, still farther north, is generally accounted the most ancient city in South America, though it is not exactly on the site of the city founded by Pizarro. Its district is noted for the finest breed of mules in Peru, sometimes selling for 250 dollars each; also for a very fine breed of goats, from whose skins they manufacture good cordovans; and they make also some cotton, cloths, though not on so great a scale as at Lambayeque. The houses are built of cane and mud, and the streets, both here and at Truxillo, being unpaved, the passenger walks ankle deep in sand and mud. Payta, celebrated for the successful descent of Anson in 1741, is a commodious and well-frequented sea-port, the most northerly in Peru, and where, consequently, a considerable quantity of goods is landed from Panamá, to be distributed through the country. It being a complete desert of sand, potable water is brought from a distance of twelve miles, and sold at a high price.

6025. *To the south of Lima*, and only four miles distant, is Miraflores, an assemblage of villas surrounded by gardens, formerly the country residence of a number of the grandees of the capital, which the late disturbances have caused to be almost deserted. Four miles farther is Chilca, the Brighton of Lima, to which a great part of the population resorts during four months in the year, for coolness and for sea-bathing. In proceeding southward, the coast becomes very desolate. Pisco, though bearing the name of a city, is, in fact, only a poor village. On islands near it, however, are vast accumulations of the excrement of birds, forming the richest manure that is any where known. The vines in the neighbourhood produce fruit, from which is made a large quantity of good brandy. The intendency of Arequipa fills the space between the ocean and the Andes. It is one of the most fertile provinces in Peru; rich in maize, sugar, and vines, from which an esteemed red wine is made. There are some considerable silver mines, but not to be compared to those on the other side of the mountains. Arequipa is a large city, considerably in the interior, in an agreeable and healthy climate. All the principal houses are substantially built of stone. The river Chile supplies the city with water, and irrigates the surrounding lands. The population has been estimated from 24,000 to 40,000: the first number is the most probable. Arequipa has stood, notwithstanding shocks of earthquakes repeated three or four times in each century. Near it is a great volcano, whence arise clouds of ashes, which reach even to the ocean. Mollendo, its sea-port, is only a village. Arica was originally a port of considerable importance: but since the earthquake of 1605, and the plunder of the place, in 1680, by the pirate Warren, it has been in a great measure deserted, and the population has emigrated to Tacna, which is a thriving town, about thirty miles in the interior, employing extensive droves of mules to carry the merchandise landed at Arica into the provinces beyond the Andes. Moquehua, another interior place, is chiefly noted for the good wine produced in its district.

6026. *The northern interior of Peru*, forming part of the Spanish intendency of Truxillo, consists of the provinces of Huallas, Huamalies, and Conchucos: they occupy various levels in the great interior table-land of the Andes, and are reached by rocky and almost precipitous routes over the western chain. They present that variety of rich and valuable produce, which generally marks the American table-lands. Wheat, barley, cocoa, sugar, are grown in its different stages; fine cinchona is brought from the eastward, though the wasteful mode of collecting it may cause a dread of exhaustion; the fine soft wool of the alpaca and vicuña is collected. There is a great deal of manufacturing industry in these upper districts; the wool is made into ponchos, flannels, serges; the goatskins into cordovans; the tallow into soap. The mines, which were formerly worked to a considerable extent, are now almost all abandoned. Great hospitality prevails; any respectable traveller, on arriving at a town, has only to go to the best house in it, where he is sure to be entertained, usually without charge. Rudeness, however, is ascribed to the inhabitants, especially of Conchucos, and believed to arise from habits formed under the mining system. There are several pretty large towns in this high district, which serve as markets for the produce of the neighbouring country, and channels by which they receive European commodities. These are, Caxatambo, Huaras, and Caxamarca; each of the two last, according to Mr. Stevenson, containing 7000 inhabitants. Caxamarca is, above all, distinguished as having contained a palace of the ancient Incas, and being the spot where Atahualpa, the last of the dynasty, fell by the sword of Pizarro. An Indian family still boasts this high descent, and inhabits the remains of the palace of Atahualpa, and particularly the room in which that unhappy prince was confined, and where is still shown the mark in the wall, up to which he was to fill the apartment with silver. In the neighbourhood are also the remains of a vast mass of building, constructed of ponderous stones, in the Peruvian fashion, and capable of containing 5000 persons.

6027. *The vast plains called the Pampas del Sacramento* extend eastward from the provinces to the great river Beni or Ucaili. They are not naked plains, like the southern pampas, but covered with immense forests. The full occupation by the Indians is only interrupted by missionary settlements, which exist in considerable numbers.

6028. *The district of Tarma* is chiefly distinguished for containing the richest silver mines in Lower Peru, among which those of Pasco take the lead; but the working of them having ceased, from causes already described, the town is fast going to ruin. The town of Tarma contains about 5500 inhabitants, having a considerable manufacture of baize. Jauja, situated in a very fine valley, is also of considerable importance, as commanding the passage of the Andes from the interior to Lima. Guanuco, north of Tarma, is distinguished by Peruvian remains, and still more by containing the infant rivulet, which swells into the stream of the mighty Amazons.

6029. *Guamanga and Guanica-Velica* occupy the more southern valleys of the Andes. The former has many districts very fertile in green pasture, and its capital, of the same name, is a great and very handsome city, built of stone, and adorned with magnificent public places and squares. It has an university of royal foundation, richly endowed, and contains 16,000 inhabitants. Guanica-Velica is bleak and cold, only distinguished for the rich mines of mercury, which once rendered it a flourishing place, but are now so much declined that the population is reduced to 5000.

6030. *Cuzco*, the grand metropolitan seat of the ancient empire of Peru, is situated east of these provinces, and somewhat deep in the interior. It is placed upon a knot of the loftiest Andes, the summits of which are enveloped in eternal snow, but separated by valleys, and even extended plains, rich in pasturage, and in the grain of the temperate climates. The Peruvian fabrics of woollens and of cordovan leather exist still on a more extended scale than in any of the provinces yet mentioned. The imperial city of Cuzco, even in its fallen state, is still handsome, and even splendid. The cathedral is described as a noble pile. The Dominican church has been built from the materials of the ancient temple, on the same site, and the altar has taken place

of the image of that deity. On an eminence are the walls of the fortress of the Incas, raised to a great height, and built of truly astonishing masses of stone. Cuzco is stated by Mr. Jacob to contain 32,000 inhabitants, of whom three fourths are pure Indians, the rest mestizos, with only a small and diminishing proportion of Spaniards. The manufactures are considerable. Cuzco threw off the Spanish yoke earlier than Lima, but the city was soon retaken by the royalists, and remained with them till the final extinction of their power.

6031. *Upper Peru* forms an extensive territory, situated south and somewhat east of Lower Peru, with which it assimilates in aspect and productions. Yet, in 1778, it was separated by the Spanish government, and attached to the viceroyalty of La Plata; while in the course of the late revolution it was severed from La Plata also, and erected into an independent republic, under the name of Bolivia. This is among the least known regions of the globe, yet one which its natural features render peculiarly interesting. It is now ascertained, by the important observations of Mr. Pentland, to contain the loftiest mountain peaks in the New World, yielding in height only to those of the Himalayah. The summit of Sorata was found to be 25,400 feet high; that of Illimani, 24,350; so that Chimborazo, which is only 21,400, must hide its diminished head. The very elevated table plain from which these colossal summits rise appears to have prevented their extraordinary elevation from becoming sensible, till it was determined by barometrical measurement. This table plain, though not the most elevated, seems undoubtedly the most fruitful and populous on the globe. That of Thibet is as lofty, and vegetation ascends as high on the southern slopes of the Himalayah. But while Thibet, in general, presents only wide pastoral expanses, covered with numerous herds of goats, sheep, and oxen, this western table yields copious harvests of rye, maize, barley, and even wheat; it has cities above the region of the clouds; villages which would overtop the white pinnacles of the Jungfrau and the Schreckhorn; cottages as high as the top of Mont Blanc. The following are among the most remarkable heights: — the city of Potosi, 13,350 feet (its mines, 16,060); city of Púno, 12,832; of Oruro, 12,442; of La Paz, 12,194; of Charcas, 9332; of Cochabamba, 8440; cottages at the source of the Ancomarca, 15,721; post-house of Pati, 14,402. Mr. Pentland's observations of longitude, though imperfect, seem to show that the principal stations in this region are farther east, and more in the interior, than our maps represent them, in consequence of which these remarkable summits are not visible from the Pacific.

6032. *The new government* have formed Bolivia into eight departments: — Chuquisaca, La Paz, Oruro, Potosi, Cochabamba, Santa Cruz de la Sierra, Tarija.

6033. *A site has been fixed upon for a capital*, to bear the name of Sucre, the commander whose victory at Ayacucho secured the independence of the state; but as this city is not yet in existence, the interim metropolis is fixed at Charcas, which has been re-invested with the ancient Peruvian name of *Chuquisaca*, and has borne also sometimes that of La Plata, from the silver mines in its vicinity. It is a handsome city, containing about 12,000 inhabitants. Notwithstanding its astonishing elevation, the country round is fertile and smiling. There is an university numerously attended, and a library, said to be one of the best in South America.

6034. *La Paz*, to which M. Balbi, on Mr. Pentland's authority, assigns a population of 40,000, is really the chief city of Bolivia, and surrounded by the most interesting objects in that country. A few miles to the south is the Nevado de Illimani, and at some distance to the north rises that of Sorata, both already described as the highest mountains in the New World. At some distance to the north-west is the great lake of Titicaca, about 150 miles long, and the largest in South America. This lake is a sacred object in the eyes of the Peruvians, since, according to their most sacred traditions, it was on an island in its centre that Manco Capac and his spouse first appeared to give laws and arts to the empire. At the village of Tiahuanacu, near its banks, are the remains of a stupendous palace erected by the ancient Peruvians. The interior courts, 360 feet square, are built of enormous blocks of stone, some of which weigh eighty tons. The great gates are each composed of one single mass. There are also remains of colossal images, but rudely sculptured.

6035. *Potosi enjoys the greatest fame* of any city of this region, but retains, as already observed, few traces of the wealth which gained for it this celebrity. It is probably the most elevated city in the world, being, as stated above, 13,000 feet above the sea, and consequently higher than the Peak of Teneriffe. It is not a well-built town; the streets are narrow and irregular, and most of the houses indifferent. It has, however, a college and a mint. Reports vary greatly both as to its past and present population. The assertion that, in its most flourishing state, it ever contained 160,000, is probably much exaggerated. In its present decline, Mr. Pentland, the latest and perhaps best authority, states, that a census in 1826 found in it not more than 9000 inhabitants.

6036. *There are some other considerable places* in this region. Oruro has not more than 4000 or 5000 inhabitants; but the mines in its vicinity were once important. Cochabamba, in the midst of a fertile though mountainous territory, has been said to contain 30,000 inhabitants. Santa Cruz de la Sierra, situated amid an extensive plain in the eastward, is an ill-built town, with a population of about 9000. Large tracts in this quarter are occupied by the Moxos and Chiquitos, Indian tribes nearly independent, unless so far as the missionaries have reclaimed them from their savage habits. Tarija, a small province to the southward, belonging to the territory of La Plata, has voluntarily united itself with Bolivia. The republic, in their small extent of coast, have only one port, that of Puerto de Lamar, which labours under a deficiency of fresh water; so that they are obliged at present to receive almost all their foreign commodities across the mountains, by way of Arica.

CHAP. IX.

CHILI.

SECT. I. *General Outline and Aspect.*

6037. *Chili*, or *Chilé*, consists of a long narrow band of territory situated between the Andes and the Pacific Ocean. The former, reaching unbroken from the northern to the southern extremity of South America, divides it into two very unequal parts. That on the east

consists of plains of almost boundless extent, those of the Orinoco, Amazon, Plata, and of the Pampas; while the western, varying from 150 to 200 miles, is little more than the slope of the mountains downward to the Pacific. Of this western portion, Chili forms nearly the southern half. Its northern boundary is formed by the desert of Atacama, nearly on the tropic of Capricorn, or about 24° S. Mr. Caldcleugh terminates it on the south by the river Biobío, the frontier of Arauco, a territory whose fierce and warlike tenants always maintained a decided independence; but as they have to the south the important ports of Valdivia and Osorno, we seem justified, by the authority of Humboldt, in extending Chili to the Gulf of Chiloe, comprising the island of that name, in about 44° . We have thus a length of 20° , or 1400 miles. The boundary on the side of Buenos Ayres is formed by a line drawn along the culminant point of the Andes, and through their eternal snows. From this line to the coast of the Pacific must be measured the breadth of Chili, not averaging more than 200 miles. The superficial content is estimated by Humboldt at 14,300 square geometrical leagues, or about 171,600 square miles; from which, however, must be taken off the considerable portion held by the Araucanos.

6038. *The surface of Chili* consists of portions the most strikingly dissimilar, but passing into each other by regular and insensible gradations. Between its mountain and ocean limit is a transition from the frozen to the torrid zone, similar to that which takes place in Mexico and Columbia, though not quite so abrupt. It is remarkable, in a region and range which has excited so much interest, that beyond 8° of S. lat. not a single summit has been measured by any geometrical or physical process. The range of the Chilian Andes seems peculiarly massive and unbroken; and the perpetual snow which covers it to a considerable

993

ANDES OF CHILI.

depth, even at the points chosen as of most easy access, cannot well consist with a height of less than 14,000 or 15,000 feet. From these, according to Molina, three parallel chains descend towards the sea; but it seems more correct to say, that on this extended slope rise many steep eminences and ranges branching in various directions. The foreground of the Chilian landscape consists usually of mountain piled over mountain, and the back-ground of a continuous chain of snowy summits (*fig. 993.*). Yet the sides of the mountains are generally fertile and beautiful; foliage and verdure with rich pastures extend even to the border of the perpetual snow, and many of these upper valleys present such romantic and enchanting scenes, that Chili has been called the garden of South America. It is, however, a heavy misfortune to the Chilians, that the ground is not secure under their feet. Repeated earthquakes have laid their cities in ruins; and from time to time shocks are felt, which even when slight are rendered dreadful by recollection and anticipation.

6039. *There is no river in Chili* deserving the name. Numberless torrents dash down from the steeps of the Cordillera, but with such rapidity that no boat can navigate their channel, and even in their estuaries the stream is too rapid to allow vessels to find in them a

994

LAKE OF ACULEO.

secure harbour. In return, every quarter of the country has the advantage of being at a very short distance from the sea coast.

6040. *Lakes* do not prevail in the Andes, the mountains of the chain being too closely wedged together to admit of their formation. That of Aculeo (*fig. 994.*), twenty

miles south of Santiago, is distinguished by the softness and beauty of its scenery, and is compared by Mrs. Graham to those on the Italian side of the Alps.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

6041. *The central chain of the Cordillera*, we are told, is principally composed of the usual primitive rocks, through which there appear projecting, in many places, rocks of volcanic origin. The declivities on the western side abound in porphyries. At Las Pomas, on the eastern side, is a mountain entirely composed of

pumice and obsidian. Few countries in the world are so continually and violently agitated by earthquakes as Chili: and these agitations occur principally on the eastern foot of the mountain range; seldom on the western. The most remarkable eruption of the Chilian volcanoes was that of Peteroa, on the 3d of December, 1760, when the volcanic matter opened for itself a new crater, and in a mountain in its vicinity a rent several miles in extent was formed. A large portion of the mountain fell into the Lontue, and, having filled its bed, gave rise to a lake, in consequence of the accumulation of the water. Springs of petroleum flow out in various places on the eastern side, and gypsum also occurs abundantly; limestone in Quillota and other places, and coal near the Bay of Concepcion. Fossil shells are found not unfrequently in the Andes, sometimes at an elevation of 9000 to 14,000 feet above the level of the sea. Deposits of clay, partly tertiary, partly recent, enclosing fossil shells, occur in the maritime provinces on the coast of the Pacific. These clays rest upon a brownish sandstone, which extends as far as the cuesta of Valparaiso, consisting of syenite, and forms the northern offset of the three secondary mountain ranges which branch off from the Cordillera by the cuesta of Chacabuco, and form the three ridges intervening between Santiago and Valparaiso. Similar organic remains are found near the mouth of the river Aconcagua, and on this coast farther north. Dr. Gillies informs us, that on making some excavations in this neighbourhood, several human skeletons were found in the clay in a state of good preservation, intermixed with the shells. The ground was too hard to admit of complete skeletons being procured, even although in good preservation. In the valley above Coquimbo, half a mile wide, are parallel roads resembling those of Glen Roy in Scotland, whose formation is connected with the rising of the land in this part of the New World.

6042. *The mineral productions of Chili*, according to Dr. Gillies, are very numerous, and many of them of great value and utility; but its produce in the precious metals has nevertheless been somewhat over-rated. Many of the richest mines cannot be worked under present circumstances. The desert country to the north of Copiapo does not permit the working of the rich mines of gold, silver, and copper at Chuco Cajo, and other parts of that country, as these districts are altogether destitute of water and other necessities of life. In that part of the country there are also rock salt and fine statuary marble. To the north of this, in the province of Atacama, are mines of nitre, which have been recently explored; and the produce of this substance has been conveyed in considerable quantities from the port of Cobigo to Europe. In the country between the Bío Bío and archipelago of Chiloe are numerous and rich mines; but none of them has been worked since the natives recovered possession of that country. The gold mines in the intermediate provinces are at Copiapo, Guasco, Coquimbo, Peteroa, La Ligua, Tiltie, Putuenda Algue, Huilliputugua, and other places. These were formerly worked to a great extent, but have been less attended to than formerly, since the commencement of the revolution. The richest mines of silver are in the provinces of Copiapo, Coquimbo, and Santiago. In these, the silver is generally found combined with sulphur, arsenic, lead, and other mineral substances; but a few years ago, a rich vein of silver was discovered at Coquimbo of great value, the silver being in the metallic form, and very abundant. Unfortunately, however, the hopes of the discoverers were disappointed on finding it to be of a very limited extent. The silver mines of San Pedro Nolasco, on the south side of the river Muypu, are valuable; but although they have been worked of late years by an Englishman, they have not been so productive as to remunerate the proprietor. They are situated near the summit of a very lofty mountain. The ore is extracted with difficulty from the hard rock in which it is contained, and requires to be carried on mules a distance of from twelve to

fifteen miles, to the banks of the river Maypu, where it is reduced by amalgamation. The copper mines are much more numerous and valuable than any of the others, and afford the staple mineral product of Chili. They occur between 24° and 36° S. lat.; but are principally confined to the provinces of Coquimbo and Copiapo. The copper ore is associated with sulphur and arsenic, which are separated by smelting. But it is only such mines as contain ore that yields one half of its weight of pure metal that are worked. About a thousand of these mines were worked in the time of Molina; but since that period, owing to the vicissitudes in the political and commercial condition of the country, the number worked has varied considerably. Of late years, however, owing to the improved commercial practices, this branch of industry has received an increased impulse. The rich and famous copper mine of Payen in the Araucanian country has long been unworked. Mines of quicksilver are stated to exist in Coquimbo, Copiapo, and Limaches. Formerly they were prohibited from being worked, and we do not hear of their having been opened since the restriction was removed. Mines of lead, iron, antimony, and tin are also found in Chili; but none of them are worked so as to be of importance in a commercial view. The secondary range of the Andes, situated on the eastern side of the Cordillera, which now belongs to the Argentine republic, and is called the Uspallata range, is by far the most productive in mineral treasures, and contains the celebrated silver mines of Uspallata and Famatina, besides many others in the same range. In the above tract is the alum mine of Guandacol, where this useful production may be had in great abundance. In it the alum earth is united with soda instead of potassa.

SUBJECT. 2. Botany.

6043. If we consider the eastern side of South America, in nearly the same latitudes as the western, we shall find a very different vegetation, owing to the extensive chain of the Andes, already noticed, which separates the two countries by a vast natural barrier. The Cordilleras gradually decrease in height as we recede from the tropics. In the neighbourhood of Quito, Chimborazo and Pichincha rear their summits to the height of nearly 22,000 feet above the level of the sea: near Santiago de Chili the highest land is 14,000 feet; farther south, at Concepcion, it is still lower; and, at Chiloe, there are few parts of the range exceeding 6000 feet in height. Between Chiloe and the Strait of Magellan, the average altitude may be taken at 3000 feet; but there are some of the mountains that may rise to between 5000 and 6000 feet high.*

6044. One of the most striking features presented on the approach to Chili by the Pacific is afforded by the view of the Andes. "I can conceive nothing," says Mrs. Maria Graham, "more glorious than the sight of the Andes this morning, on drawing near the land at daybreak; starting, as it were, from the ocean itself, their summits of eternal snow shone in all the majesty of light, long before the lower earth was illuminated, when, suddenly, the sun appeared from behind them, and they were lost, and we sailed on for hours, before we descried the land." Of the vegetation of these mountains, little is at present ascertained; and that little, collected principally from specimens gathered by Dr. Gillies, Mr. Cruckshanks, Mr. Macrae, and Mr. Cuming, is more interesting to the botanist than to the general reader. The intermediate country between the Andes and the coast is better known; but, as its vegetation passes insensibly into that of Peru, we shall endeavour to give a sketch of the more remarkable features, by some extracts from a little-known journal of our valued friend, Mr. Cruckshanks, very lately published in the second volume of the *Botanical Miscellany*. Chili, and that part of Peru lying west of the Andes, from their geographical situation and physical structure, offer an interesting field for studying the effect of climate on vegetation. The two countries present a line of coast, extending from 40° S. lat. to within a few degrees of the equator; the great chain of the Andes runs in a direction almost parallel to the coast, and the surface of the intervening country is similar throughout, consisting of ranges of mountains, diminishing in height as they recede from the Cordillera. These mountains, again, are intersected by valleys, varying little from due east and west; thus affording an opportunity of comparing the climate of the coast with that which obtains in the same latitude, varied by different degrees of elevation, from the level of the sea to the verge of perpetual snow.

6045. The chain, or, as it has aptly been called, the great wall of the Andes, exerts a powerful influence on the climate; the great atmospheric current, that, according to the season, flows north or south, and is affected elsewhere by local causes, here being maintained by this elevated barrier in its original direction. The average duration of the rainy season is about five months, from May to October. In the south of Chili, the rains are very heavy and fall frequently during the six or seven months of winter; but in the latitude of Valparaiso, it is seldom wet for more than two successive days, after which there will be fine weather for a week or two, or much longer. At Coquimbo, there is still less rain; and at Copiapo, the most northern part of Chili, the showers are few and light; while on the coast of Peru, rain is almost unknown, a dense mist being all that ever occurs, though this is dignified with the name of the "rainy season" (*tiempo de los aguaceros*), and the ladies of Lima often complain, after a short walk, of the heavy shower they have been exposed to, in what we should consider, in this weeping climate of ours, tolerably fine weather. Still nearer the equator, this mist diminishes, and the sun is rarely obscured. The gradual decrease of atmospheric moisture from the south of Chili to the north of Peru is a striking feature, and produces a remarkable effect on the vegetation. In Valdivia and Concepcion, where the rain is copious, forests of lofty trees abound, and the earth is generally covered with herbaceous plants, and produces large corn crops without artificial irrigation. From Concepcion is derived most of the timber consumed in Chili and Peru, the following being the commonest trees: the Roble (*Fagus obliqua*), Lingui (*Laurus Lingui*), the Queule (*Gomertiga nitida*), Laurel (*Laurelia aromatica*), Canelo (*Drymis chilensis*), Reuli (?), Avellano (*Quadria heterophylla*), and Litri (*Rhus ? caustica*, of Hooker and Arnott in the *Botany of Capt. Beechey's Voyage*). The Araucaria, or Chili Pine (fig. 996.), is almost

CHILI PINE.

confined to the Indian country south of the Biobío; where the natives subsist entirely on its seed, which they harvest and bury in pits for winter use. Its wood is said to be very resinous and close-grained, but brittle; for which reason, probably, it is never exported. Some of the above-named trees are also found in other parts of the country. In the middle provinces, vegetation is less luxuriant, and the woods thin. Trees seldom attain a large size, except in ravines, and many of these are different from those of the south. Those most frequently found on the hills are the Molle, the Boldo (*Boldoa fragrans*), Quillai (*Smegmadermos emarginata*), and Peumo (*Peumos rubra*). The Mayten (*Maytenus chilensis*), Lilen (*Azara serrata*), Litri, and some others, are less common. The Patagua (*Tricuspidaria dependens*), Maqui (*Aristolochia Maqui*), Bellota (*Lucuma valparadensis* of Molina), and Canelo are confined to moist places in the valleys, where many Myrtles are likewise found, of which the Temu and Petra grow to a large size and produce useful timber. When covered with their fragrant white blossoms in early summer, these trees are truly beautiful. The Fuchsiae (fig. 997.) also are confined to moist ground, except *F. lycioides*, which inhabits the driest spots on the hills. In many places, where the soil is too poor or too dry for other trees, the Espino (*Mimosa Cavenia*) grows; the wood of which is heavy, and much valued for fuel. Near the Andes, the Algaroba, a tree of the same family, is common in similar spots; and large tracts of the hills are often covered with *Pourretia coarctata*. It is chiefly in the middle provinces that the Palm of Chili (*Micrococcus*) is found. It is not a common tree, being very

* King, in *Journal of the Royal Geographical Society of London*, loco cit.

on the hills, at the same time that they effectually perform a very useful operation.

6046. In the district of which Valparaiso may be considered the centre, though the surface seems barren, yet pasture abounds during the rains; and near the coast some corn is grown. In the interior, cultivation is confined to the valleys.

6047. The northern provinces have a barren aspect; there are few trees, though plenty of shrubs and beautiful annuals are common in the wet season; but, except in the valleys which are capable of irrigation, there is no culture. The Carbon (*Cordia decandra*) is almost the only tree; its wood is hard and heavy, and used for fuel in smelting copper ore, as are the Talguea and various Cacti, with columnar stems, which grow thirty or forty feet high, and throw out many branches.

SUBSECT. 3. Zoology.

6048. Our information on the Zoology of Chili is very slight: a meagre list of about a dozen birds has been given by one of the modern travellers in this country, but we may consider it as a region unexplored by the professed naturalist. The Lama and Vicugna, two wool-bearing animals of the Andes, have already been described under the head of Peru: to these we may add three other kindred species, called by travellers the Paco, Chilihueque, and Humel, as natives also of Chili. We have just received a fine collection of Chilean birds, which will form the subject of a distinct volume of our *Ornithological Drawings*. Among them are two or three new genera of Larks and Lark-warblers, which were supposed to be unknown in South America.

6049. The most celebrated bird is the Condor; while another, called the Plantcutter (*Phytotoma rara* Gm.), is singular, from the bill being toothed like a saw, and used, like that instrument, to cut down plants, that the bird may feast on the tender leaves. More recently has been discovered in this country a new species of Humming-Bird, near four times the size of any other yet known to naturalists: hence it has received the name of *Trochilus giganteus*, or the Patagonian Humming-Bird. It is only remarkable for its size, since it is without any of those brilliant colours which deck the plumage of its congeners.

SECT. III. Historical Geography.

6050. Chili, when first discovered by the Spaniards, was found in possession of the most active and hardy races of the Indians that people the New World. Almagro, in 1535, penetrated with great difficulty through the mountainous and desert tracts leading to it; but was so disgusted with the hardships and losses which he endured, that, in 1538, he returned to Cuzco. The real founder of Spanish dominion in Chili was Pedro de Valdivia, who, after an obstinate contest of ten years, between 1540 and 1550, subdued the greater part of the country, founded the cities of Valdivia, Concepcion, and Quillota, and established a naval intercourse with Chili. He had then to encounter the warlike Araucanians, with whom the Spaniards sustained that long war, which has been celebrated by Ercilla, the first of the Spanish epic poets. Valdivia was defeated, taken, and put to death by the Araucanian chief, Caupolican; the Araucanians afterwards baffled all attempts to subdue them, and continue to separate the main body of Chili from the southern district of Valdivia.

6051. The dominion of Spain was maintained over Chili, interrupted only by the inroads of the Araucanians. The English made one and the Dutch several attempts to form a settlement; but, not being supported by the natives, they made no lasting impression. Chili, in 1567, was separated from Peru, and placed under a captain-general solely dependent on the king of Spain. It never drew the attention nor rose to the importance of Mexico and Peru; but the produce of its mines, which was considerable, and the many fertile districts which it contained, secured to it a progress in population and wealth, similar to that of the other colonies.

6052. The emancipation of Chili was prepared and produced by the same causes which excited all the other provinces to shake off the Spanish yoke. On the 22d of June, 1810, intelligence was received of the events which had occurred in Europe. The Chilians repelled the demand made by the French government for their submission, and in a few days elected a new governor and a junta of administration. This ostensible act was designed, as in other instances, to keep the sovereign power for Ferdinand VII.; but it was not long ere a general disposition arose to embrace the opportunity of shaking off the oppressive yoke of Spain and the European Spaniards. In April, 1811, a national congress was summoned, and the independence of the country seemed in a favourable train. A force, however, was sent from Peru to re-establish the royal cause, which, being aided by the disunion of the patriot generals, defeated them, though after a brave resistance, and drove them over the Andes towards Mendoza. They were there received and supported by San Martin, governor of that city. That enterprising and remarkable person now took the lead in the revolution of southwestern America. He assembled a considerable force, with which he crossed the Andes, and, being joined by the great body of the Chilians, soon compelled the royal troops to take refuge in the port of Concepcion. The governor of Peru, however, being now determined to make a grand effort, assembled almost all his disposable troops, to the amount of 5000 men, and sent them to reinforce those already in Chili. The patriot force was at first defeated and driven back; but, being rallied by the zeal and abilities of San Martin and O'Higgins, it met the enemy on the plain of Maypó, and gained a complete victory; which finally secured the independence of Chili. San Martin was even encouraged to advance into Peru, the capital of which country he succeeded in occupying; though its liberation, as we have seen, did not then prove to be final. O'Higgins became director of Chili; but, endeavouring to rule by a self-elected senate, he became unpopular, and was obliged to yield to Don Ramon Freire, under whose auspices a general representative congress was called. Chili has ever since formed a republic completely independent of Spain, though not without a good deal of interior agitation.

SECT. IV. Political Geography.

6053. The political system of Chili is as yet in a vacillating and uncertain state. The congress was to be composed of deputies chosen on the principle of direct election, and of one deputy for every 15,000 inhabitants. A considerable disposition seems to prevail for a federal form of government.

6054. The finances are not in the most flourishing condition. According to the statements in Mr. Cald.

cleugh's Appendix, the customs yielded 1,100,000 dollars, and all the other revenues 200,000; making a total of 1,300,000 dollars. The annual expenses of the province of Santiago amounted to 1,026,948 dollars; of Concepcion, 360,000; of Valdivia, 180,000; expenditures caused by the loan, 400,000: in all, 1,966,948 dollars; making the heavy deficit of 666,948 dollars. A loan, the capital of which was 1,000,000*l.* sterling, was raised in London in 1822, at 70 per cent.

6055. *The army*, under the pressure of circumstances, has been supported on a large scale, compared with the population and resources of Chili. That country sent into Peru, in support of the patriotic cause, no less than 7500 troops, who had been well disciplined, and who proved brave and effective. Besides these, about 3000 remained in the country. The militia consists chiefly of cavalry who are ill disciplined, but brave, and admirable riders.

6056. *The navy*, though it distinguished itself under Lord Cochrane, never formed any considerable force, comprising only one ship of sixty guns, two or three of fifty, with some corvettes and gun brigs. Being old ships purchased from Britain, and having been in hard service, they are now considerably decayed, and the present state of the Chilian resources will probably prevent much being done to repair them.

SECT. V. *Productive Industry.*

6057. *Agriculture* is carried on extensively, though with very rude implements, of the same form with those that were introduced 300 years ago. The plough is only a piece of knee timber, shod at one end with a flat plate of iron, into which a long pole is fixed by means of wedges. It proceeds amid the trees, of which only the trunks are cut off. A bundle of fresh branches serves for a harrow, made heavier, if necessary, by stones, or by one or two men placed upon it. The cart is formed of canes and straw-floored and bound with hide, without a single nail or piece of iron. The only pains bestowed upon the land is irrigation, rendered absolutely necessary by the eight months of dry weather in the year; the fields being crossed by canals fed by a stream common to the neighbourhood. Wheat has been hitherto the chief object of agriculture; its quality is fine, though small-grained, and there is a regular demand for it in Peru, Guayaquil, and the other equatorial tracts. Potatoes, in this their native soil, grow in perfection; pumpkins, lettuces, and cabbages are reared with care and success; and fruits, with but very little culture, are produced in profusion and of excellent quality. A good deal of wine is made, though not of the first excellence; the flavour of the best somewhat resembling Malaga. That exquisite vinegar, which derives its name from Chili, is made from the juice of a grape peculiar to the country. The greatest extent of ground, however, is laid out in cattle farms, which are managed with great success. The horses are small, but beautiful, and of fine temper and spirit, so that they are preferred to those of Buenos Ayres. The oxen and mules are equal to any in the world; but, as the latter do not amount to the number required for crossing the Andes, a further supply must be brought from Mendoza. Agriculture, as in Mexico, is much impeded by the enormous grants which were made to individuals at the time of the conquest; yet it is stated, that in many districts fine land may be obtained at the rate of a dollar for two acres.

6058. *The manufactures*, as over all America, consist only of coarse articles made by the country people for domestic use, with the simplest instruments. From Mrs. Graham we learn, that they bring to market ponchos, hats, shoes, coarse shifts, coarse earthenware, and sometimes jars of fine clay.

6059. *Mining* is the branch of industry for which Chili has been most celebrated, but it is not the source of her most substantial wealth. The mines occur in the interior from Coquimbo, in a barren tract in the northern part of the country. The metals are gold, silver, and copper. The latter is by far the most abundant, there being many hundred mines of it; the others are much rarer, and, as they attract more speculators, generally answer much worse: hence, the common saying is, that if a man finds a copper mine, he is sure to gain; if it be silver, he may gain or he may not; but if it be gold, he is sure to lose. In consequence of the great expense of first opening a mine, the discoverers, who are often poor, are usually obliged to have recourse to *habilitadores*, a class of rich individuals resident in the cities, who supply the funds necessary for working the mine, while the owner delivers to them the produce at a fixed rate, calculated to yield them a large profit. Captain Hall estimates the annual average produce of copper at 60,000 quintals, which, in 1821, was worth twelve dollars the quintal; that of silver, 20,000 marks, at eight dollars each; that of gold, trifling, and diminishing. The northern mines are situated in a bleak and barren country; and many of them are in very rugged and inaccessible situations; none so much so as that of San Pedro Nolasco, on a lofty pinnacle of the Andes, where the snow, even in summer, lies from 20 to 120 feet deep, and in the winter its drift is so tremendous that the miners have been buried under it 150 yards from their own house. The southern mines are in a more fertile state; but, on the whole, by the reports of Messrs. Head and Miers, it seems that, for the reasons already stated in respect to the La Plata provinces, there is no prospect of any increase, or of any advantage to compensate the application of English capital. Mrs. Graham conceived the machinery brought out by Mr. Miers to be 100 years in advance of the present state of the country. A very fine vein of coal has been found near Concepcion, which has begun to be shipped from that port for other parts of Chili, and even for Peru.

6060. *Commerce in Chili* labours under great difficulties from its extreme remoteness; since it is separated by about half the circumference of the globe from the civilised countries of Europe, Asia, and even North America. It has, however, a very extended sea-coast; and, to the bold skill of modern navigation, the circuit of the globe is scarcely more arduous than a Mediterranean voyage was 100 years ago. The intercourse between England and Chili is more extensive than that between England and any other country of South America, Brazil excepted. During the year 1831, the real or declared value of the articles of British produce and manufacture exported to Chili amounted to 651,617*l.* Of these, cottons alone amounted to above 450,000*l.*; the other leading articles were linens and woollens. The returns, which consist of bullion, copper, wool, hides, &c. are made partly direct and partly through Buenos Ayres. In 1828, sixty-nine British vessels, of the burden of 13,869 tons, cleared out from Valparaiso. Exclusive of the trade with Europe, the Chilians have also a considerable trade with Peru, to which they export wheat, flour, &c.; they have also, notwithstanding the formidable obstacles opposed by the Andes, a considerable trade with Buenos Ayres.

6061. *Fishing* is neglected by the Chilians, though many fine species are found in their seas. The shell fish are particularly delicate.

6062. *Artificial communications* remain still in a very imperfect state. A good road was lately made from the capital to Valparaiso, but it is not kept in complete repair. The cross roads, as Mrs. Graham describes them, are not such as in England would be considered passable, though she has seen worse in the Apennines.

SECT. VI. *Civil and Social State.*

6063. *The population of Chili* is more involved in doubt than that of any state of South America. Humboldt states, from Spanish authorities, that a census, in 1813, gave 980,000, and that the present amount is probably 1,200,000. More recently, Mr. Caldcleugh and Mr. Miers have estimated it only at about 600,000; but this seems to have been founded on very superficial observation; and the best informed persons, who have penetrated into the interior districts, do not believe it to fall short of 1,500,000.

6064. *The social state of Chili* differs scarcely by a shade from that of the rest of Spanish America. There is the same native courteousness, politeness, kindness of heart, ignorance, extravagant love of diversion, abject superstition, and propensity to quarrelling. This last

passion, which among the lower orders is fed chiefly by a resort to *pulperías*, is alleged by Mr. Proctor to be more prominent than among other Americans, and oftener productive of bloodshed. The ladies often can neither write nor read; but Mrs. Graham and Captain Hall join in praising their natural talents, and the unstudied grace of their manners. Mr. Caldcleugh conceives the general deportment of those in the higher ranks to be almost unexceptionable.

6065. *The Catholic religion* has hitherto reigned in Chili with the same supremacy as in the other states; but under the new system, the convents have been very sensibly thinned, no one being allowed to take the vows under the age of twenty-five; and many of the religious shows and processions have been suppressed; a change not altogether agreeable to the body of the people, whom it has deprived of one of their favourite amusements. The Roman catholic religion continues the exclusive one, though numerous heretics are allowed to live in the country without molestation. The Protestants have even a consecrated burial-place, though not the public exercise of their worship.

6066. *Knowledge* in Chili is beginning to disperse the general ignorance which prevailed. Mr. Caldcleugh is of opinion that, before the revolution, there was not a printing-press in the country. That since established at Santiago has been chiefly employed upon gazettes and political pamphlets. The government once proclaimed the freedom of the press; but as soon as an unfortunate writer, taking them at their word, began to criticise their measures, he was instantly seized and deported to the Isle of Juan Fernandez. The people, however, soon regained the freedom of the press, which they now enjoy in its full extent. The government do not seem to have shown the same zeal as elsewhere for the promotion of knowledge, though they have established Lancasterian schools in the principal towns; that of Santiago containing 400 boys. There is a library of several thousand volumes, formerly belonging to the Jesuits, containing some curious manuscripts respecting the Indians, but otherwise composed chiefly of scholastic divinity. The only fine art cultivated with any ardour by the Chilians is music, their application to which is truly indefatigable: the girls being set down to it almost from infancy, and having constant practice at their evening parties. The importation of piano-fortes is said to be truly immense. They do not play with consummate science, but with considerable feeling and taste,

6067. *The habitations of the lower ranks in Chili* are of the most rude and primitive construction: the walls merely of stakes crossing each other, and fastened with thongs, or hemp twine; the roofs, which must resist the rain, composed of branches plastered with mud and covered with palm leaves. These, on both sides of the Cordillera, are called *ranchos*. The name of houses is assumed, where the walls are built of brick, which is easily formed in almost all the environs of Valparaiso, by merely digging out the clay, watering, treading, and then drying it in the sun. The walls are solid and thick; the apartments spacious, well furnished, and often richly gilded.

SECT. VII. *Local Geography.*

6068. *Chili* has been divided into three provinces: Santiago, the central and metropolitan one; Coquimbo in the north, and Concepcion in the south. This division is sufficiently minute for the details into which we are able to enter; but it may be mentioned, that, in 1824, a new division was formed, and still subsists, into Coquimbo, Alvacagua, Santiago, Colchagua, Astante, Concepcion, Valdivia, and Chiloe.

6069. *Santiago* seems to derive its pre-eminence from its fertile and agreeable territory, particularly in the plain of Maypó, and that which surrounds the capital; from its mines of gold and silver, a more brilliant, though really not so valuable an object as the copper mines of Coquimbo; and from the residence of the government.

6070. *Santiago, the capital*, is situated in a richly wooded plain, at an elevation of 2600 feet above the sea, which renders the climate agreeable and salubrious. Its aspect is irregular and picturesque. The dark tints of the fig and olive, with the lighter hues of the mimosa, mingled with steeples and houses, produce a novel and imposing effect. The houses having in general only one floor, and being surrounded by large gardens, the town appears completely overshadowed with foliage. Each house, in general, stands by itself, and, being strongly barricaded towards the street, forms a little fortress. The streets, however, are regularly laid out; the cathedral, several of the churches, and the director's palace, may be reckoned handsome, though they do not exhibit any thing very splendid in architecture. The river Mapocho runs through the city; but being, like most in this country, dry at one season and swollen to an overwhelming torrent at another, it has been necessary to erect not only a bridge, but a wall to confine the violence of the stream.

6071. *The vicinity of Santiago* presents the most romantic and sublime prospects: on one side over an expanse of plain bounded by the distant ocean, on the other over successive mountain ranges crowned by the awful snowy pinnacles of the Andes. Near the city is a very picturesque waterfall (*fig. 998.*), called the Salto de Agua, or water-leap, which Mrs. Graham compares to Tivoli, though it wants the villa and temple to crown it.

6072. *Valparaiso* (*fig. 999.*), the port of Santiago, and the main seat of Chilean commerce, is situated on a long narrow strip of land bordering a semicircular bay, over which impend on all sides steep cliffs nearly 2000 feet high, and sparingly covered with shrubs

and stunted grass. One street, about three miles long, runs along the sea, and contains

998

SALTO DE AGUA.

the houses of the most opulent citizens; it is prolonged by the Almen-
dral, or Almond Grove, a sort of
detached village, which forms the most
agreeable residence. The lower ranks
are huddled into the quebradas, or
ravines, among the hills behind. None
of the buildings are handsome; even
the governor's house is scarcely toler-
able; but the commercial progress of
the town is marked by the many new
and handsome warehouses erected.
Originally a mere village, it acquired
some importance by becoming the
channel for conducting the intercourse
with Lima, to which all the trade of
Chili was then confined. All the
commerce of the world being now thrown open to it, and numerous settlers attracted from
Europe, it has acquired a population of 14,000 or 15,000, and assumed almost the appearance

999

VALPARAISO.

of an English town. In 1828, sixty-
nine British ships, of 12,746 tons,
entered its harbour. During the
summer, which lasts from November
to March, the bay affords a safe and
pleasant anchorage; but in winter,
especially in June and July, precau-
tions are required against the north
wind, which blows often with peculiar
violence. Quillota is a small but
agreeable town, a little in the interior,
giving name to the province in which
Valparaiso is situated.

6073. *Coquimbo* is the most southern province of Chili; but, instead of assuming a gayer aspect as it approaches the brilliant regions of the tropic, it becomes more and more sterile. At the town of Coquimbo, even the brushwood which covered the hills round Valparaiso disappears, and its place is only supplied by the prickly pear bush, and a scanty sprinkling of wiry grass; while at Guasco, four degrees farther south, there is no longer a trace of vegetation. The greater part of the interior consists of a rock, composed entirely of pieces of broken shells, sometimes covered with a thin soil, but more commonly with a white powder like snow, which proves to be sulphate of soda. It is only on the banks of the streams, that the eye is gratified with verdure, cultivation, and pasturage. Its importance arises solely from its mines, which include both silver and gold; but the most productive and valuable, as already observed, are those of copper. The produce of the mines usually belongs to some capitalist at Santiago, who causes a vessel to call at Coquimbo for the copper, which is to be exchanged, perhaps, for a cargo brought to Valparaiso from Europe or India, and instructs his correspondent at Coquimbo to have a sufficient quantity in readiness. This employment gives some importance to the port of Coquimbo; though the inhabitants, unaccustomed to any varied traffic, retain much native simplicity, kindness, and hospitality. About fifty miles in the interior is Copiapo, in the heart of the mining district, of which it may be considered the capital. This place is subject to the dreadful calamity of being once in about every twenty-three years completely destroyed by earthquake. That of 1819 shook it entirely to pieces; the wrecks of its houses and churches lying scattered in every direction. The walls, though three or four feet thick, of large sun-dried bricks, seem to have toppled down, some inwards, some outwards, like so many castles of cards. The people had all crowded to the great church of La Merced, which they were judiciously advised to leave, and had scarcely quitted it when it fell to the ground, and would have buried the whole population had they remained. The Copiapians, in 1821, rebuilt their fallen city. Copiapo is bounded on the north by the desert of Atacama, which separates Chili from Peru, and is considered as belonging to the latter.

6074. *Concepcion*, the most southern part of Chili, is the most highly endowed with all the real bounties of nature. Its situation, indeed, and the cold rains, render it unfit for tropical produce; but all the grain and fruits of the finest temperate climate are reared in such abundance as to make this the granary and garden of South America. Wheat of excellent quality was the staple, and the southern markets were chiefly supplied from Concepcion; to which may be added barley, maize, pulse, and all kind of vegetables. It yields also a sweet wine, the best in the New World, which Mr. Stevenson reckoned equal to Frontignac, and for which the demand at Lima was almost unlimited. The cattle farms are also numerous and valuable, yielding a large export of jerked beef. The exports, according to Mr. Stevenson, amounted to 2400 tons of wheat, 6000 quintals of jerked beef, 36,000 gallons of wine, with hides, wool, and other minor articles. Concepcion, with four conventual churches, a nunnery, a cathedral in progress, and many handsome houses inhabited by some of the old Spanish nobles, might almost dispute with Santiago the rank of capital of Chili. The houses, like those of Santiago, are mostly of one story, built of mud or sun-dried brick; but here they form regular streets at right angles to each other. The people are peculiarly kind and hospitable, and their gay and festive habits are accompanied with comparatively few irregularities. Such, at least, was Concepcion; such, and more, will it doubtless be again; but the last accounts represent it to have suffered with peculiar severity from the late contest. Alternately occupied by the Spaniards and the patriots, it was rudely treated by both, but especially the former. General Sanchez directed to military objects all the timber destined for the new cathedral, and, on finally abandoning the city in 1819, set fire to a number of the principal houses. When Captain Hall visited it, in 1821, he found it almost desolate. Whole squares had been reduced to rubbish, and the streets were knee-deep in grass and weeds. Of the bishop's palace there remained only the sculptured gateway; many of the houses still standing were uninhabited; and, through the luxuriant vegetation of the climate, were enveloped in a thick mantle of shrubs, creepers, and wildflowers. The churches were all in a ruinous state; of the cathedral, the western aisle had fallen in, and the rest was rapidly crumbling into dust. Besides

the usual conflict of Spanish parties, Chili had been laid waste by the Araucanians, who, led by Benavides, a bold outlawed native of Concepcion, carried on a war of perpetual inroad, similar to that which once raged on the Scottish and English borders, and which, though picturesque and eventful in narrative, was most calamitous to the parties concerned. Talcahuano, the port of Concepcion, is a small town of about 500 inhabitants, on a large bay, with a good and secure anchorage. Its defences have the reputation of being very strong; but during the late war they were neglected; wherefore, being of mud, and incapable of resisting the heavy rains of the country, they are nearly ruined.

6075. *Valdivia*, the most southern province of Chili and of America, comprises a territory of about 130 by 120 miles in extent, watered by three rivers, and containing several plains that are very productive in grain and cattle. There is scarcely any European culture; but the missionaries have, at different points, succeeded in forming the Indians into peaceable and tolerably industrious little communities. Valdivia was founded in 1553, destroyed by the Indians in 1603, and re-established in 1645. It was recruited to a limited degree by convicts sent from other parts of Peru and Chili, and employed in the public works. The town of Valdivia is situated about sixteen miles above its port, which is good, and defended by strong batteries. Its population, which never exceeded 953, was reduced in 1820 to 749. This decrease was occasioned chiefly by the emigration to Osorno, built about forty miles distant, in the middle of the last century, the most southern town in the New World. The capture of the port of Valdivia, in 1819, by Lord Cochrane, with 319 troops, opposed by 1600, was one of the boldest and most brilliant achievements in the American contest.

6076. *Arauco* has been already mentioned as an extensive territory, which interposes itself between the Spanish districts of Concepcion and Valdivia. It extends north and south for about three degrees of latitude, reaching inland to the mountains. This region, celebrated in Spanish story and song, is described by Mr. Stevenson as really one of the finest in South America. The Araucanians, having adopted the rude agriculture of the Spaniards, raise Indian corn in abundance; they grow most admirable potatoes, which are, probably, indigenous; and have a good stock of horses and horned cattle. The whole country is divided into four districts, governed by hereditary rulers, called *toquis*, confederated together for their own benefit and the injury of their neighbours. Particular districts are ruled by subordinate chiefs, also hereditary, called *ulmenes*. When war is declared, the *toquis* elect one of themselves, or even some other chief, who assumes the supreme command. They have appended the European musket to their own original arms of the bow, arrow, and club. When they set forth on an expedition, each individual merely carries a small bag of parched meal, trusting that ere long he will be comfortably quartered on the territory of his enemies. During the Spanish dominion, every new governor of Chili generally endeavoured to distinguish himself by the conquest of Arauco; and having assembled an army, he usually beat them in the field; but he soon found himself obliged, by a continued series of harassing warfare, to sue for peace from a proud race, whom nothing will ever induce to make the first advances. The Araucanians have a religious belief, but without temples, priests, and sacrifices. They have Pillian, the supreme *toqui* or ruler, with many subordinate deities or *ulmenes*, among whom the chief are Meuben, the good genius; Ulencuba, the evil genius; and Epunamun, the god of war. Omens and divinations are also objects of firm belief; and the warrior who would intrepidly face an armed battalion, will shake with terror at the flight of an owl. Witchcraft is in their eyes the most deadly sin, for which numerous unhappy victims are devoted to death. Marriage is always celebrated with a show of violence; for even after the consent is obtained, the bridegroom conceals himself on the road, seizes the bride, carries her to his house, where, perhaps, the parents are waiting to share the nuptial feast. Polygamy prevails among the chiefs, and all the hard work devolves upon the females, who plough, sow, and reap; and each wife must present her husband with a poncho or cloak, which is the chief manufacture of the country: some of these garments are very fine, selling at 150 dollars, though in general they can only be called a coarse rug. The towns of Arauco, Tubul, and Tucapel, are only villages, perched on the top of the most inaccessible rocks, and even these were built by the Spaniards. The abode of the principal cacique was a thatched house with mud walls, sixty feet long, and twenty feet broad, which behind, throughout its whole length, contained a range of sleeping places resembling stalls; and in front a long narrow apartment, in which the family, forty in number, spent the day. Their chief amusements are out of doors; within, they are seen trotting through the room to sounds which resemble the filing of a saw, in uncouth movements imitating the dance. Though resisting all attempts at conquest, they have entered into a treaty with the republican government, and even agreed to a species of political union, though a long interval must elapse before this can be completely effected.

6077. *The large island of Chiloe*, with others surrounding it, which form a species of archipelago, have been formed into the most southerly province of the Chilian republic. They have a rude and rocky aspect, and are as yet thinly inhabited.

6078. *The Island of Juan Fernandez* may be considered as an appendage of Chili. This

little island, of which a view is here exhibited (*fig. 1000.*) is so diversified by lofty hills, streams, and varied vegetation that it has been described as one of the most enchanting spots on the globe. It was early noted as being the solitary residence of Alexander Selkirk, during several years; an event upon which Defoe founded his celebrated narrative of Robinson Crusoe. The island afterwards afforded to Anson the means of recruiting his shattered squadron, after the passage of Cape Horn. A small colony was lately settled

there; but it seems doubtful whether it still subsists.

CHAP. X.

LA PLATA.

6079. *La Plata* is the name given to an extensive region of South America, watered by the great river of that name, and which, under Spanish dominion, formed one of the principal viceroyalties. It had then annexed to it Upper Peru, including the mines of Potosi;

but this country has, by recent events, been severed from it, and forms now an independent republic, under the name of Bolivia. The remaining territory consists chiefly of detached cities, with surrounding cultivated tracts, which form, as it were, oases in a vast expanse of uninhabited plain. Buenos Ayres, the principal city, and commanding the navigation of the river, has endeavoured to form the whole into a republic, of which she herself shall be the capital, or at least the federal head; but there reigns through the different districts a strong provincial spirit, which has hitherto rendered this union imperfect and precarious.

SECT. I. *General Outline and Aspect.*

6080. *La Plata* may, in a very general view, be considered as occupying nearly the whole breadth of America, south from the tropic of Capricorn, leaving only the narrow stripe of Chili on the west, and on the east a section cut out of it by Brazil. On the north, the Pilcomayo, while it runs from west to east, forms the natural boundary from Upper Peru; but after its great bend to the south, the line must be considered as continued eastward, cutting the Rio de La Plata and onwards to the Paraná. On the east, the boundary of Portugal may be considered as fixed by the Paraná and the Uruguay, though the districts immediately west of these streams have not, since the revolution, been actually possessed by Buenos Ayres; and south of the Plata, the Atlantic is the clear boundary. On the south, the Rio Negro terminates the country actually occupied; but, on the principle so generally adopted by different European settlers, of extending their respective claims till they come into collision, we suspect that the Buenos Ayreans stretch their frontier to the Straits of Magellan, or even to Cape Horn. On the west, the uniform boundary is Chili, separated by the lofty summits of the Andes. The contents of this very extensive territory are calculated by Humboldt at 89,750 square geometrical leagues, or about 1,077,000 square English miles. It is thus nearly, though not quite, equal in extent to Colombia, and to the United States east of the Mississippi.

6081. *The surface* of this territory consists of a plain the most extensive and uniform, perhaps, on the face of the earth, bounded only by the eastern slope of the Andes. The Pampas, west from Buenos Ayres, form an uninteresting level of more than 1000 miles across. This plain is divided into three successive portions: the first covered with thick clover and flowering thistles, that rise sometimes to the height of ten or eleven feet; then 450 miles of long grass, without a weed; lastly, a forest of low evergreen trees and shrubs, standing so wide, that a horse can gallop through them. At the end of this ocean plain, the Andes shoot up abruptly their wall of unbroken rock covered with eternal snow, which to the traveller from the east appears to present an impenetrable barrier. The banks of the Plata consist also of immense plains, though not quite so level, nor covered with such varied vegetation.

6082. *Of the rivers*, the chief is that from which the region derives its name and character, and which forms one of the grandest features on the globe, the Rio de la Plata. To Buenos Ayres, which it reaches after a course of nearly 3000 miles, it brings down a body of water thirty miles broad, resembling an arm of the sea; yet completely fresh. The largest vessels can ascend to the vicinity of that port and Monte Video, though the shore is obstructed by rocks and sand-banks. These increase as the stream ascends, and render it impossible for vessels of any magnitude to arrive at Asuncion. From the west the Plata receives the Pilcomayo, the frontier stream of Upper Peru, which passes through the richest mining districts, and the Rio Vermejo; both navigable. On the east it receives the half-Portuguese streams of the Paraná and the Uruguay. Large rivers, the Saladillo, and the Colorado or Desaguadero de Mendoza, run across the Pampas, and are supposed to reach the Atlantic. The latter rises in the Cordillera east of Coquimbo, and has a course of 1000 miles, during which it forms numerous lakes; but it has not yet attained any commercial importance; and another, the Rio Negro, forms the extreme southern boundary of settlement.

6083. *There are several lakes*, as that of Hiera, in the Entre Rios, fully 100 miles in length; some round Mendoza, formed by the streams descending from the Andes; and others farther in the interior; but none of these can be said to correspond in grandeur to the other features of this region.

SECT. II. *Natural Geography.*

SUBSECT. I. *Geology.*

6084. *The whole extent of this province* forms one continuous and unbroken plain of great fertility, and covered with perpetual vegetation. Rocks are rarely seen. Some gypsum occurs near to Buenos Ayres, and limestone is mentioned as occurring in different parts of the country. The stones used in paving the streets or in building are brought from the island of Martin Garcia, at the mouth of the Uruguay, or as ballast from Europe. Many of the lakes to the south of Buenos Ayres are strongly impregnated with salt. Salt occurs in greatest abundance and purity at Las Lagunas de las Salinas, situated in lat 37° S. in a south-west direction from the city, and not far distant from the mountains called La Sierra de la Ventana. At these lakes, when the evaporation has been considerable, salt is procured in great quantities; and to obtain supplies of this substance, considerable numbers of Indians and Creoles visit the place at particular periods; but owing to the distance, and expense of land carriage, little of it reaches Buenos Ayres, as it can be obtained cheaper and of a superior quality from England.

6085. *Patagonia, Straits of Magellan, and Terra del Fuego.* The expedition under Captain King, for the purpose of surveying the Straits of Magellan, left Monte Video on the 19th of November, 1826, and, after putting into Port St. Elena, about lat. 45° S., and remaining for a day or two in the vicinity of Cape Fairweather, continued for ninety days within the Strait; during which time its shores to the east of Cape Froward were surveyed under the superintendence of Captain King himself; while his consort, under our former pupil Captain Stokes, examined the western entrance. The coast at Port St. Elena is described by Captain King as consisting of porphyritic claystone; of which the hills, from 300 to 400 feet high, are entirely composed. On the beach was a conglomerate, apparently of an alluvial character. Cape Fairweather is near the southern extremity of a range of coast, occupying between two and three degrees on the east of Patagonia, composed of horizontal strata of clay, in cliffs from 300 to 400 feet high, and entirely bare of vegetation. Some of the specimens from this quarter, Dr. Fitton, in his report, remarks, consist of a white marl, not unlike certain varieties of the lower chalk; and with these are portions of a greenish sand-rock, much resembling that of the upper green sand formation, and of a clay having many of the properties of fuller's earth. The pebbles on the shore consist of quartz, jasper, and flinty slate, but do not contain any mineral identical with chalk flint. Cape Virgins, at the north-eastern entrance of the Straits of Magellan, consists of clay cliffs, like those of Cape Fairweather; and between these two capes the coast is of the same character. What may be called the eastern branch of the Straits, from Cape Virgins to Cape Froward, though its general course is from N.E. to S.W., varies considerably in width and direction; but from thence to the western entrance the direction is nearly straight, from S.E. to N.W., and the width much more uniform; and one of the principal points already determined by Captain King's survey is, that the fissure forming this portion of the strait is continued in the same direction for about 100 miles towards the S.E. from Cape Froward; through St. Gabriel's Channel, and a deep inlet, discovered by Captain King, and named "Admiralty Sound," which runs nearly fifty miles into the interior of Terra del Fuego. Dr. Fitton remarks that this separation of the land by a narrow rectilinear channel of such great length, appears to be analogous to the division of Scotland, by the chain of lakes on the line of the Caledonian Canal. In proceeding westward from the eastern entrance, the coast gradually changes its character; and primitive rocks appear about Cape Negro, near Elizabeth Island, where mountains of slate rise to the height of from 2000 to 3000 feet. Captain King remarks that the direction of all the ranges, commencing at Port Famine, about thirty miles from Cape Froward, is towards the S.E.; and that all the sounds and openings of the land in Terra del Fuego tend in the same direction: *this being also the direction of the strata*, which dip towards the south. This coincidence in the direction of the mountain ranges is expressed on Captain King's map: and he supposes that a similar structure holds good throughout the western branch of the Strait, from Cape Froward to the entrance on that side.

6086. *Specimens from Freshwater Bay*, about 120 miles from Cape Virgins, on the Patagonian side of the strait, consist of highly crystallised greenstone, and hypersthene rock, resembling those of Scotland; and the pebbles and boulders on the shore are of granite, syenite, quartz, and flinty slate.

6087. *The vicinity of Mount Tarn and Eagle Bay*, about midway between Port Famine and Cape Froward, affords various hornblende rocks; with greywacke, flinty slate, and grey splinty limestone. The slate of Mount Tarn contains traces of organic remains. Specimens from the south side of the eastern branch of the strait consist of micaceous gneiss, found at the entrance of St. Magdalen's Sound, and at Card Point on the south-west of St. Gabriel's Channel. The rocks at Cape Waterfall, near Card Point, are of clay slate; and the shores of Admiralty Sound afford granite, clinkstone, porphyry, and greenish compact felspar. Captain King also mentions his having observed here reddish quartz or sandstone, like that of the *old red sandstone* of Europe; and he remarks, that the soil over this rock is barren, while that above the slate produces luxuriant vegetation; beeches of great size growing there within a few feet of the water side. In general, the hills in this part of Terra del Fuego appear to be slate; they rise to the height of 3000 feet, and are covered with ice and snow. Mount Sarmiento, however, which is more than 5000 feet high, appears, from the shape of its summit, to be *volcanic*; and was called by the navigator, after whom it was named, "The *snowy volcano*."

6088. *Specimens from the western branch of the Straits of Magellan*, collected by Captain Stokes, all consist of primitive rocks. Cape Notch, Cape Tamar, and the Scilly Islands, affording granite; Port Gallant, and Cape Victory, gneiss and mica slate; and Valentine's Bay, clay slate much resembling that of Port Famine. These places are all on the north side of the strait. On the southern side, in Terra del Fuego, Cape Upright affords granite and gneiss; and the latter rock is found also at Tuesday Harbour, and in the neighbourhood of Cape Pillar: the columnar mass, from which that remarkable point was named, is composed of mica slate.

SUBSECT. 2. Botany.

6089. *In a former chapter*, p. 1291-2., some account was given of the botany of the Terra del Fuego and the Straits of Magellan. The eastern coast of Patagonia, from the entrance of the Straits of Magellan to the river Plata, is comparatively low, and a great portion of it occupied by *pampas*, extensive plains, covered with grass, but destitute of trees. This peculiarity of country, indeed, exists upon the most extensive scale in the province of Buenos Ayres: a vast superficies, the whole of which is a plain (interrupted only here and there by a few hills, the highest scarcely 300 feet), extending from the Atlantic Ocean to the foot of the Andes, a space of 720 leagues. Many of the rivers, from the extreme evenness of the surface, are (with the exception of five or six that are received into the Parana or Paraguay) arrested in the plain, without any decided course, and insensibly absorbed, like the rains which fall on the same ground.

6090. "The level surface which so uniformly characterises the whole province of Buenos Ayres affords little scope for variety in its vegetable productions: still the aspect of the country is marked by many striking peculiarities. Different kinds of *clover* and other *leguminous* plants, intermixed with *grasses*, constituting the great mass of the vegetation, give to the country its verdant appearance, and form an inexhaustible source of nutriment, not only to the deer and other wild animals which are so abundant, but to the numerous herds of cattle and horses which may be seen grazing in all directions. The country is naturally destitute of wood, and, with the exception of an occasional natural copse of the Tala shrub, of very inconsiderable height, nothing resembling a tree is to be seen. The Ombu (*Phytolacca dioica*), however, sometimes makes its appearance to diversify the scene, and relieve its monotony. Trees of this kind generally point out to the traveller the site of some habitation, near which they are usually planted; since, from the great rapidity of their growth, they soon become conspicuous at a distance, and afford a grateful shade to the inhabitants, during the hot season of the year. They are otherwise very useless, on account of the spongy nature of the trunk, which is so soft that it has sometimes been used as wadding for artillery, during the wars which prevailed in the country. In the more inhabited districts of the province, and especially in the neighbourhood of the city, numerous plantations are met with of peach trees, which are cultivated for firewood, and form a very profitable investment of land and capital, as they grow with great luxuriance, and may be cut down every four years; so that, by dividing a plantation equally, a fourth part may be felled yearly, which is sure to meet with a ready sale, being the principal fuel used in Buenos Ayres. The fruit, which is produced in great abundance in such plantations, is applied to no useful purpose, except the feeding of pigs and poultry."*

6091. *A very remarkable feature*, occasioned by plants of exotic production, is given to the pampas of Buenos Ayres by two kinds of Thistle, well known in Europe; but principally of the Cardoon (*Cynara Cardunculus*, β. *Hooker*, in *Botanical Magazine*, t. 2862.). The native country of this plant is the south of Europe and north of Africa; but, the seeds having been conveyed to South America, it has escaped into the extensive plain that lies between Buenos Ayres and the Andes, and has given such an extraordinary feature to that

* Dr. Gillies's account of Buenos Ayres, in Napier's edition of the *Encyclopædia Britannica*.

country, as deserves to be recorded in a description of its vegetation. "The great plain or pampas of the Cordillera," says Captain Head, in his "Rough Notes, taken during some rapid Journeys across the Pampas, and among the Andes," "is about 900 miles broad; and the part which I have visited, though in the same latitude, is divided into regions of different climate and produce. On leaving Buenos Ayres, the first of these regions is covered for 180 miles with clover and thistles; the second, which extends for 430 miles, produces long grass; and the third region, which reaches the base of the Cordillera, is a grove of low trees and shrubs. The second and third of these regions have nearly the same appearance throughout the year; for the trees and shrubs are evergreens; and the immense plain of grass only changes its colour from green to brown; but the first region varies with the four seasons of the year, in a most extraordinary manner. In winter, the leaves of the thistles are large and luxuriant, and the whole surface of the country has the rough appearance of a turnip-field. The clover, at this season, is extremely rich and strong; and the sight of the wild cattle, grazing in full liberty in such pasture, is beautiful. In spring, the clover has vanished, the foliage of the thistle has extended across the ground, and the country still looks as if covered with a rough crop of turnips. In less than a month the change is most extraordinary; the whole region becomes a luxuriant wood of enormous thistles, which have suddenly shot up to a height of ten or eleven feet, and are all in full bloom. The road or path is hemmed in on both sides; the view is completely obstructed; not an animal is to be seen: and the stems of the thistles are so close to each other, and so strong, that, independent of the prickles with which they are armed, they form an impenetrable barrier. The sudden growth of these plants is quite astonishing; and though it would be an unusual incident in military history, yet it is really possible that an invading army, unacquainted with the country, might be imprisoned by these thistles, before it had time to escape from them. The summer is not over before the scene undergoes another change; the thistles suddenly lose their sap and verdure; their heads droop, the leaves shrink and fade; the stems become black and dead, and they remain rattling with the breeze one against another, until the violence of the pampero or hurricane levels them with the ground, where they rapidly decompose and disappear; the clover rushes up, and the scene is again verdant." If by any accident the dry stems of the thistles chance to catch fire, the conflagration spreads with such rapidity as to destroy much agricultural produce, and great numbers of cattle and other animals, which are unable to escape. In the neighbourhood of the city, they are cut down in large quantities, and sold for the purpose of heating ovens. The florets of this thistle are in common use in the country for the purpose of coagulating milk, which they effect in the same manner as rennet. A quantity of these florets is tied up in a rag and stirred about in warm milk for a few minutes. This thistle is also eaten as a vegetable; the tender footstalks of the leaves, and the young stems, when boiled and the outer skin removed, have the flavour of artichokes. When the plants of the pampas become too strong, it is customary to set fire to them, which gives a remarkable aspect to the country, as thus described by Azara:—"This operation, which is intended to make the plants send out new and tender shoots, must have the effect of diminishing the number of species; because the seeds are destroyed, and the fire inevitably exterminates some of the more delicate kinds. It is requisite to use precaution in setting the plants on fire, because there is nothing but water or roads that can limit its progress. I have travelled 200 successive leagues, in a southern direction from Buenos Ayres, continuing along the same plain, that had been all burned at one time, and where the grass was beginning to shoot again: and still I did not arrive at the termination. There was certainly no obstacle that could stop the flames. Woods arrest its ravages, because they are so thick and green, that they do not burn; but the edges of them become dry and scorched to such a degree, that the next conflagration finds them an easy prey. This custom destroys whole swarms of insects and reptiles, with immense numbers of the smaller quadrupeds, and even of horses, which have not so much courage as the oxen in forcing their way through the fire."

6092. *Of trees*, Azara observes, that in this singular country, from the River Plata to the Straits of Magellan, there appear to be none, and shrubs even are exceedingly unfrequent. In some places near the frontier are *vixnagas*, a large wild Carrot, and Thistles, which are collected for fuel; but as this is still scarce, the inhabitants burn the bones and fat of animals, and the dung of horses. At Buenos Ayres and even at Monte Video, much of the latter substance is consumed, especially in the ovens; though the peach trees, that are cultivated for this sole object, aid in the supply. A little wood, too, is procured on the banks of streams near the north coast and in the islands of the Paraná and Uruguay. There, too, wood that is fit for making carts, houses, and boats of various sizes, may be obtained; but the major part of this comes from Paraguay and the missions. In the Chaco, there are plenty of trees, growing thick and tufted on the river banks and more thinly in the open country; consisting of Cebile, Espinillo, Quebracho, Algaroba, and various species, which are quite unlike those that are known by the same name in Europe. The fruit of one of the Algarobas (a species of *Acacia*) is a large blackish pod, which, after having been peeled, would be as good as nut-galls for making ink, and perhaps for dyeing. The fruit of another resembles Haricot beans; it is much eaten by the poor, who peel and put it in water, where by fermentation it produces a liquor, called *chica*, of a pleasant taste and possessing inebriating qualities. From the river Plata to the missions, the trees are only seen by the sides of the rivers, and they diminish as the country becomes more peopled. In the Jesuit missions, and as you advance northward, there are extensive woods, not only near water, but wherever the soil is uneven. These are so thick and so full of Ferns, that walking is difficult; and yet the circumstance that seeds cannot vegetate in these situations, because they fall on a soil that is covered with leaves, and are neither affected by wind nor dust, nor capable of reaching the earth, renders it difficult to account for the multiplicity of the trees, whose only mode of increase is by suckers from the root; while the closeness of their stems would rather dispose them to push upwards, than to send out fresh shoots from below.

6093. Azara gives an interesting account of many vegetables of Buenos Ayres, Paraguay, and Paraná; but, unfortunately, without mentioning their scientific names, so that we are too frequently at a loss to know what plant he means. Among them are the following:—"The Curiy, a kind of Pine (*Araucaria brasiliensis*?), grows in large forests not far from the rivers Paraná and Uruguay. It seems to excel the pine of the north, and is equally straight. It is said that it has but one very thick and straight root, and that its wood much resembles the fir; but the leaves are shorter, broader, and lanceolate at the point. The branches issue from the stem in regular and distant stages, they grow horizontally, and are rather slender. The fruit is a round cone, of the size of a child's head, with scales that are not so distinct as those of the common fir, but when ripe they expand and show the central nut, about as large as one's finger. The seeds are very long, and the thickness of the thumb at the biggest end; when roasted, they have a flavour superior to chestnuts. The savage Indians are remarkably fond of them, and make flour and bread of them. The Jesuits have sowed some of these trees in the missions, where they have grown so large that it would be worth the while to cut one of them down, and, floating it to a desirable place, make a trial of it for a mast or a rudder, for I am convinced that it would be applicable to this purpose, as well as for any kind of planks. The seeds of this tree should be tried in Europe, and with this view I brought away a dozen cones; but they, with my other seeds, as well as all my luggage, were taken from me by the Portuguese. I have seen a single individual in a garden at Buenos Ayres, where it grew very well. The Ybaro is another large wild tree. The Jesuits planted a long avenue of it, from their settlement called the Apostles, to the fountain, that the Indian women might, in passing, pull some of the fruit, and use them instead of soap for washing linen. This tree (*Sapindus saponaria*) produces an immense number of round fruits, the kernels of which serve for playthings to the children, and of which they make large rosaries, because they are brown, bright, and glossy. Between these nuts and the outside skin there is a glutinous pulp that may be used for soap, by smearing it upon linen; but it is probable that the quality is not very excellent."

6094. *Though the family of the torch-thistles* (*Cactus* Lin.) have their trunk, joints of the branches, and foliage in the flat form of a batt, and are of all trees or shrubs those whose general proportion and aspect are the least pleasing; "yet," says Azara, "I have seen two individuals which were the finest trees possible. The stem was 20 to 24 feet high as round and as smooth as if it had been turned in a lathe. It was destitute of foliage,

except at the top, where it was terminated by a sphere of branches or leaves of a flat shape. Both the fruit and foliage, though similar to other species of this family, were smaller. I found these two Cacti, in Paraguay, in two different woods of the settlement of Atirã, nearly a league distant from one another; and I was surprised to see them thus solitary among other trees without another of the same species. So that this kind of Cactus, reduced to two individuals, perhaps the last of the sort, will disappear at the death of those which I have just described."

6095. *Reeds*, probably species of Bamboo, attain a great size, as thick as the thigh, and hollow; they are very strong, and are important in making scaffolding and other useful articles. The Jesuits employed these reeds, strengthened with bull-hides outside, to make the guns that they used in the war against the Spanish and Portuguese in 1752. These reeds grow on the banks of the streams, excelling all the trees in height; like others of the same tribe, they spring up in tufts, and it is said that seven years are requisite to bring them to the full size, after which they wither away, the root not sending up any suckers till after two years. There are at least seven kinds of reed in this country, some hollow and some solid, all of which might be advantageously introduced to Europe, where the least useful species (*Arundo Donax*), perhaps, is the only one known.

6096. The famous Paraguay Tea must not be passed over unnoticed; and we must observe that the editor of *Azara's Travels* (M. Walckenaer), has fallen into a strange error in supposing the plant to be the same with the "Culen jaune" of Molina (the *Psoralea glandulosa* Linn.). It is a plant belonging to a widely different family, that of the Holly, and is the *Ilex paraguensis* (fig. 1001.), which grows wild in all the woods,

ILEX PARAGUENSIS.

fringing the rivers and streams which fall into the Uruguay and the Paraná, as well as those whose waters swell the current of the Paraguay from the east, from lat. $24^{\circ} 30'$, northward. Some of these shrubs are as large as a good-sized orange tree; but in those spots where the leaves are regularly gathered, they never become more than bushes, because they are cleared out every two or three years, and the foliage requires that interval of time to arrive at perfection. The plant is evergreen, its stem is as thick as a man's thigh, with a smooth white bark, and boughs that point upwards, as those of the laurel, the whole plant presenting a thick and very branched appearance. The leaf is elliptical, rather broadest towards the end, four or five inches long, and about half as wide; it is thick, glossy, toothed all round, of a deeper green above than below, and the petiole is short and reddish. The flowers grow in bunches of thirty or forty; they have each four divisions and as many pistils placed in the intervals. The seed is very smooth, reddish-violet, and like peppercorns. To bring the Paraguay Tea into a state for use, the leaves are slightly scorched, by drawing the branch itself through fire. Then the leaves are roasted and broken down to a certain size, that they may be packed under strong pressure, the flavour of the recently prepared leaves not being considered agreeable. The use of this herb is general in Paraguay, and even in Chili, Peru, and Quito. The Spaniards have derived the custom from the Indians of Maracaya, and it is now so universally diffused, that the importation, which amounted but to 12,500 quintals in 1726, exceeded 50,000 in 1800. To drink this infusion, it is customary to put a pinch of the leaves into a cup or small calabash, called Maté (from which the name of the plant, Yerva Maté, is derived), full of very warm water, and to drink off the fluid immediately, by imbibing it through a little tube or sucker, pierced with small holes in the lower part, which only allow the passage of the water and keep back the leaves that float on the surface. The same herb serves three times, by macerating it in fresh boiling water. Some drink it with sugar, or a few drops of lemon juice, and it is taken at all hours of the day, the average daily consumption of each inhabitant being an ounce. If not drunk immediately, the infusion turns quite black. One man can easily collect and prepare at least a quintal in the day. The Jesuits planted a great many of these trees round their towns and missions, for the convenience of preparing and exporting the leaf; but their example has been but little followed, nor has the government adopted those provident measures which might ensure the preservation and propagation of this valuable tree. At present, the groves of Paraguay Tea are situated in wild spots, often exposed to the invasion of the uncivilised tribes; these have sometimes murdered the labourers, who are exposed to many hardships and privations. By forming the plantations in inhabited districts, such difficulties would be avoided, the gathering would cost less, from women and children being employed, and the present destructive method of collecting the leaves might be in a measure obviated. The Jesuits were also more careful in the mode of preparing the leaves, from which they removed all the broken bits of wood and pounded them small, thus making three kinds from the same plant. There is, however, but little difference in the flavour, the principal requisite being that the foliage should be thoroughly scorched and roasted, and collected at a suitable time, as damp weather is very injurious to the quality. Thus, without regarding the intermixture of bits of wood, or the size of the leaves, the Paraguay Tea is divided into two classes, the Fuerte and the Electa. The latter, which is the best, is consumed in the provinces of La Plata to the amount of 1,250,000 lbs.; the other goes to Chili, Peru, and Quito. The South Americans ascribe numberless virtues to this plant, which is certainly aperient and diuretic, but perhaps possesses no other good qualities. Like opium, it produces some singular and contrary effects, giving sleep to the restless and spirit to the torpid. Those who have once contracted the habit of taking it, do not find it easy to leave it off, or even to use it in moderation, though, when taken to excess, it brings on similar disorders to those produced by the immoderate use of strong liquors.

6097. Many resins and gums are produced in Paraguay. Among them is the well-known Gum Elastic, Caoutchouc or Indian Rubber, which distils from the *Hevea guianensis*. Though applied to so many purposes in Europe, economical and medicinal, especially in rendering cloth water-proof, in its native country this gum is only used to make balls for children to play with, and to give light at night in the desert. For the latter, they make a round ball of the resin, and, throwing it into water, observe the part that floats upwards, in which they insert a burning match, which lasts a whole night, or till the ball is entirely consumed. When the trunk is pierced, a large quantity of resin soon flows out, which is received on a piece of leather stretched on the ground; it quickly condenses, and may be drawn out in long strips; or, by pressing it together, it forms a compact mass. Another tree, called Nandipa, affords a resin which, mixed with equal parts of Cane Brandy, forms a beautiful varnish. Turpentine and Gum Elemi are the produce of two other trees; and a strong milky glue exudes from a common tree called Curupicay. The Aquaraibay, of which the trunk is sometimes as thick as a man's body, furnishes a much esteemed article, called the Mission Balm. This is procured from its leaves, which are boiled in wine or water till it becomes a syrup, fifty arrobas of leaves producing one of balm. A tribute of 2 lbs. of this balm was paid by all the Indian nations where the tree grows, and transmitted to the king's apothecary at Madrid. In its native country, it is called Curalo Todo (or universal remedy), and considered equally efficacious whether administered internally or externally, in wounds, bruises, colics, catarrhs, diarrhoeas, and stomach or head complaints.

6098. Climbing plants, commonly called Ysipos, are very abundant in the woods: they climb and descend upon the largest trees, passing from one trunk to another, and sometimes entwining them so closely as to form apparently but one and the self-same body. There are also innumerable parasitic air-plants, which spring up and vegetate on the stem and branches of other trees: some are remarkable for the extraordinary form or beauty of their blossoms, and others recommend themselves by their surpassingly delicious odour. At a particular season, the large forest trees are adorned with the yellow orange flowers of some of these species; and it is customary to place them on all the balconies at Buenos Ayres. One kind, called Guenbé, springs up within the hollow trunks of decaying trees. Its stem, of which there are several on each plant, is as thick as one's arm, and from three to five feet long, the leaves two feet in length, and a foot wide, glossy and

deeply cleft. This plant produces a spike like maize, with seeds of a pleasant flavour, and long straight roots, without any knots, that, after having twined several times round the trunk, strike into the earth. These roots are carefully peeled, and their bark, which is deep violet, fine and easily detached, serves to make cables and other cordage employed in navigating the Paraguay, without other preparation than that of drying it after it has been wetted. These ropes are cheap, they are not liable to decay in mud or water, and will stand a strong pull; still they are not so durable as hemp. Friction and bending are apt also to injure them. Our frigates used these ropes with advantage during the latter years of the war.

6099. The plants usually known in the country by the name of Pitas, Cardas, and Caraguatas (*Tillandsia* and *Bromelia*? perhaps *Agave*) grow in great abundance; some as parasites, and some on the ground. They all contain more or less water, which is perfectly clear and fresh, and often serves to quench the traveller's thirst. Two are more remarkable than the others: one of them grows in large quantities on the edges of woods and even in open spots, but does not extend to the river Plata. Its long and thick foliage, like that of the pine-apple, yields a strong fibre, the inside leaves, which precede the development of the fruit, being quite pearly; the small blossoms are followed by fruits, like dates, which, when ripe, are of a fine orange colour and good to eat. The other is called Ybirá: its fruit resembles a pine-apple, but is quite worthless; but from the foliage is manufactured an excellent cordage, called Caraguata. This is used for various purposes, even in preference to hemp, because it neither stretches, nor decays in water. A rope, an inch thick, made of this substance, was compared with an hempen one of the same thickness, and it proved the strongest.

6100. It is reasonable to suppose that on the western extremity of the great plain we have above alluded to, about Mendoza, the vegetation begins to alter, and to partake of that of the mountains, that city being situated at the eastern foot of that vast range. One of its most remarkable features, and that which would be least expected from its extra-tropical latitude, is the number of species of Cactus found in its vicinity. Schouw gives 26° S. lat. as the southern limit of the cactus region. Dr. Gillies, in a morning's ride from Mendoza, has been able to gather twenty-two distinct species of this curious genus, all of which he has introduced to the gardens of Great Britain, and all are growing in one establishment, the Glasgow Botanic Garden.

6101. At Buenos Ayres, wheat yields 16 for 1, at Montevideo 12 for 1; but the grain is not much above the half the size of that of Spain. From S. lat. 40° to the Straits of Magellan, Azara considers the soil to be too salt to yield wheat.

6102. Vines were once more extensively cultivated than at present. In 1692, the city of Asuncion, the capital of Paraguay, supported in its neighbourhood 2,000,000 vine-stocks. Mendoza and San Juan, both situated near the eastern foot of the Cordillera, towards the close of the last century yielded annually to Buenos Ayres and Monte Video, the former 3313 barrels, and the latter 7942 barrels of wine. Tobacco is largely grown, and 15,000 quintals per annum have been exported. Sugar, Mandioca, Indian Corn, Batatas, and other vegetables requiring a warm climate, are, as may be expected, readily cultivated.

SUBSECT. 3. Zoology.

6103. On the Zoology of Paraguay, and of the provinces bordering on the great Rio de la Plata, the only authentic information is to be found in the memoirs of Azara, whose ample accounts of the native animals may be consulted with the greatest advantage. Unfortunately, however, this writer uses only provincial names; so that the scientific naturalist, unless he detects the animal from its description, is quite in the dark as to its generally received name. Most of the quadrupeds and birds are of species common also to southern Brazil. The Puma and Jaguar, among the ferocious animals, have been already mentioned; while the vast inland plains, or pampas, are well known to swarm with wild Oxen and Horses, the descendants of those brought from Europe by the Spaniards. So little, however, do the inhabitants appear to turn the former animals to any other use than making candles of their fat, and traffic of their skins, that milk is a scarce article, Irish salted butter a luxury, and the making of cheese nearly unknown.

6104. The Burrowing Owl, and the Cock-tail Waterchat, are two of the most singular birds of Paraguay.

COCK-TAIL WATERCHAT.

Of the first (*Strix cucularia*), a ridiculous account has been given by a "galloping" traveller. (*Mag. of N. H.* i. 285.) It appears to live in the deserted holes made by a species of Marmot. The evidence of this was clearly presented by the ruinous condition of the burrows tenanted by these birds; while the neat and well-preserved mansions of the marmot show the active care of a skilful and industrious owner. (*Bon. Am. Orn.* i. 71.) These Owls hunt during the noon-day sun, and appear to live in the villages of the marmots, whose deserted habitations they occupy; for there is no evidence that the marmot and the owl habitually live in one burrow.

6105. The Cock-tail Waterchat (*Alecturus alector*) (fig. 1002.) is not much bigger than the Stonechat; the colours are plain, but the highly singular structure of the tail, shaped like that of a cock, renders it very remarkable. It lives on the ground, in open plains, near water; but flies with great celerity. The

males frequently mount vertically in the air, flapping their wings, and moving their tail in an extraordinary way, and then darting down suddenly to the ground from a great height.

SECT. III. Historical Geography.

6106. La Plata had no claim to a place among civilised nations before the discovery of America. The Indians on the banks of the Paraguay, as on those of the other great rivers, were at that time in the lowest stage of savage life.

6107. The Rio de la Plata was discovered by the Spaniards early in the sixteenth century. In 1534, Don Pedro de Mendoza founded the city, and in two years established settlements as high as Asuncion. Thirst for gold was probably the motive for penetrating so quickly and so far into the interior; but no gold rewarded the search. The first importance of Buenos Ayres was derived from a few cattle having strayed into its immense plains, where they multiplied with astonishing rapidity amid the rich pastures, and in later times their hides became a great staple of commerce. Paraguay derived great benefit from the missionary establishments formed there by the Jesuits; where the rude Indians, on a greater scale than in any other part of America, were reclaimed from their savage life, and trained to regular, peaceable, and industrious occupations. The re-establishment of the order may produce political changes of great importance throughout all the republics of South America.

6108. In 1778, Buenos Ayres, hitherto subordinate to Peru, was erected into a viceroyalty, including all the provinces east of the Andes, and thus comprehending Upper Peru, with the mines of Potosi; which rendered it, next to Mexico, the most important division of Spanish America.

6109. The emancipation of Buenos Ayres was in some degree prepared by the British expeditions in 1806 and 1808, which formed one of the least creditable parts in the military history of the last war. But the grand impulse was given, here as elsewhere, by the compulsory abdication of Ferdinand. In May, 1810, Cisneros, the viceroy, after having taken violent measures to support the Spanish authority, was obliged to assemble a junta, and to allow an independent government to be formed, acting in name of Ferdinand VII. After this the country was agitated by many disturbances and vicissitudes. Monte Video still resisted; and when reduced by General Artigas, it was occupied by that person as an independent chief: while the Portuguese, encouraged by this disunion, advanced and seized the town, together with the whole

of the territory called the Banda Oriental. This step, however, was resisted by Buenos Ayres vigorously and successfully, and the government of Brazil was obliged to evacuate this territory, and allow it to be formed into an independent republic. Dr. Francia also contrived to occupy the upper province of Paraguay so firmly as to baffle all attempts to expel him. With these exceptions, and with that of Upper Peru, a general congress of all the provinces of the viceroyalty was held at Tucuman in March, 1816, and adjourned the following year to Buenos Ayres; and a republic was constituted, under the title of "the United Provinces of South America." This union, however, has not been permanent. In February, 1820, the provinces broke off, and each at present has an administration of its own, though negotiations are still pending for an united government.

SECT. IV. *Political Geography.*

6110. *The constitution of Buenos Ayres* is that of a representative republic. The legislative power is exercised by two chambers, the representatives and the senators; the former consisting of forty-one deputies elected by the direct suffrages of the provinces, and renewed by half their number every two years; the senate is formed by two deputies for each province, making thirty in all, who are renewed by one third at a time: they are elected by eleven members of each province. The executive power is exercised by a citizen holding the title of president, elected in the same manner as the senators, and holding his office for five years. He is re-eligible, and his powers are very extensive. He appoints to all offices civil, military, and ecclesiastical, except to archbishoprics and bishoprics, which are nominated in ternaries by the senate. The despatch of business is intrusted to five ministers, responsible for every unconstitutional measure, the president also being liable to impeachment before the senate and house of representatives. The judicial power is exercised as in other South American states; but it is to be observed, that the ministers of the supreme court of justice, as well as the lowest judges, are all nominated by the president.

6111. *The administration of justice* has been placed on a respectable footing, with the exception of trial by jury, for which Mr. Caldeleugh doubts if the state of society be as yet adapted. There are four counsellors, called judges in the first instance, with salaries of 2000 dollars; five judges of the high court, with 2500 dollars; and a council for commercial affairs.

6112. *The military forces* are estimated by a late traveller at 2500 or 3000. Their manœuvres are very simple compared to those of the British troops; and their attire bears rather too great a resemblance to that of the levies of Sir John Falstaff; however, they have of late considerably improved. During the war with Brazil, about 10,000 troops were collected, with a numerous militia.

6113. *The revenue*, during a continued war, and disorganised internal government, necessarily fell into an embarrassed state. It is remarkable, that the old government, notwithstanding the oppressive alcavala, and its fifth on the product of the mines of Potosi, never drew from this viceroyalty more than 700,000 dollars (175,000*l.*). The independent government, under its necessities, was driven to forced loans, which destroyed confidence; and to enormous custom-house imposts, which led to a ruinous contraband. At length, in 1821, fixed and moderate rates were established, being for most articles 15 per cent.; but for sugar, tea, coffee, and maté, or herb of Paraguay, 20 per cent.; wines, liquors, and ornamental furniture 25 per cent. Materials of manufacture and some other favoured articles, are only 5 per cent. There are also small export duties: hides, half a real; other productions, 4 per cent. The produce of these duties in 1822 and 1823 was nearly 2,000,000 dollars; and when added to direct contributions, stamps, and licences, came in the last year to 3,000,000 dollars, or 675,000*l.* The debt, incurred by loans from the never-failing purses of London capitalists, amounts to 4,500,000 dollars, or 1,000,000*l.* sterling. In 1822 and 1823 were paid off 845,000 dollars. Thus the financial state of the republic may, on the whole, be considered as good.

6114. *The provinces*, since the breaking up of the congress in 1819, have remained in a state of separation; though they have assisted Buenos Ayres in her war with Brazil. In general they are loud and rather unreasonable in their complaints against her; but a new congress is projected at Cordova, and it is hoped that an union will at last be effected. In Paraguay, Dr. Francia continues to exercise a most absolute and tyrannical sway over the ignorant natives, for the reports of his death seem to be premature. Monte Video and the Banda Oriental have formed a separate republic, the constitution of which we have yet no means of knowing.

SECT. V. *Productive Industry.*

6115. *The agricultural produce* consists almost entirely in the vast herds of horses and horned cattle which cover those boundless plains, clothed with rich herbage, which constitute the Pampas. The gaucho, or farmer, has no care in rearing or feeding; he has only to throw over them the lasso, or long leathern noose, to kill or drive them into Buenos Ayres, and in the case of horses, to break them, and put a mark on them by which they may be known. Beef can scarcely be said to bear any price, since a cow may be had for twenty shillings, and the hide is worth more than half that sum. Wheat and barley, for which the soil is perfectly adapted, are cultivated in a slovenly way immediately round Buenos Ayres, the grain being threshed by making cattle gallop over it. Notwithstanding the encouragement given to agriculture by the government, there was still a necessity, in 1823, to import 70,000 barrels of American flour. The milk is not made into cheese or butter; and garden vegetables are no object of culture, the gaucho considering them as food fit only for beasts. In this naked and exposed country there is a great want of timber for fuel; the peach tree has been found to grow, and answer the purpose of fuel, better than any other. Paraguay produces its herb, or maté, of which the infusion, like that of tea, is prized over all the most southern countries of America. Quantities of this commodity have been sent down the river to the value of 1,000,000 dollars in the year; but Dr. Francia, of Paraguay, prohibited its exportation.

6116. *The mines of Potosi*, the richest in South America, may now be considered as again attached to Peru. There are, however, scattered along the eastern border of the Cordillera, a number of mines of gold, silver, and copper, from which high expectations were once formed in this country; and it was supposed, that, by the application of British skill, industry, and capital, they might be rendered far more productive than they had ever been. The observations of Captain Head and Mr. Miers have dispelled these hopes. It appears that mining, before the revolution, had been pursued to excess; adventurers being urged at once by the immense profits which had, in a few instances, attended it, and by the cheap rate at which the compulsory labour of the Indians could be obtained. Under this impulse, mines had been worked, which in Cornwall would not be thought worth working. All these poor mines are now deserted, being unable to pay the high rate demanded by free labourers for such severe work, when they are surrounded by the richest unoccupied land, and masters of as many cattle as they can catch. Machinery, supposing it were worth employing, is of very difficult application, from the want of water and timber, and from the vast extent of land-carriage by which iron must be conveyed. The English association, therefore, formed for working the mines of the Rio de la Plata, after investing a large capital, have judged it wiser to submit to the entire loss than to proceed. This branch of industry will never, perhaps, regain its former height; and the prosperity of the state must rest upon other and more solid foundations.

6117. *There is scarcely any manufacture*, except that of ponchos, or riding cloaks, which are universally worn, and from habit are made better than those hitherto supplied by the Manchester manufacturers, who are exerting themselves, however, to improve the fabric of this article. That indolence, which the South Americans inherit from the Spaniards, will, probably, long prevent them from becoming a manufacturing people.

6118. *The commerce of Buenos Ayres* is large, compared with the population and general wealth of the state. The country is dependent on foreign supplies for almost every article, both of manufactured goods and colonial produce, and even for a little grain; in return for which it gives the refuse of its cattle, hides, horns,

hair, and tallow. The trade with Great Britain has increased considerably. It is difficult, however, to form any precise estimate of its amount, as the exports to Monte Video as well as Buenos Ayres are confounded, in our Custom-house accounts, under the general name of the states of the Rio de la Plata. In 1831, the declared or real value, of the various articles of British produce and manufacture exported to them was 339,870*l.*, little more than the half of the exports to Chili. During 1832, forty-seven British ships, of the burthen of 8884 tons, entered Buenos Ayres. Hides are the great article of export. In 1832 there were, dry hides, 877,132; salted, 48,378; horse hides, 4076; nutria skins, 1456 dozen; horns, 2,049,017, &c. (M'Culloch's *Commercial Dictionary*, 2d edit.) A very considerable inland trade is also carried on by enormous waggons, which are driven very rapidly across the Pampas to Mendoza and other towns at the foot of the Cordillera, and, having often to be dragged over bog, quagmire, and torrents, arrive commonly in a very shattered state. They carry some manufactures and colonial goods, and bring back wine, brandy, and mineral produce. The intercourse with the countries up the river is, at present, obstructed by political causes.

6119. *Roads, canals, and bridges* have no existence in the territory of La Plata. It is supposed to be enough, in this immense flat surface, that successive travellers beat down the grass, shrubs, and thistles, for

those who are to succeed them. But, though the ground be even, great obstacles are opposed by swamps, torrents with steep banks, and sometimes broad rivers, which can only be crossed by fording, though the water should reach breast-high. A still greater danger arises from holes made by animals, called *biscachos*, which burrow in the ground like rabbits. Into these the horse and his rider are ever and anon precipitated, with the danger of breaking a limb, at the distance of 500 miles from medical aid. Spirited half-wild horses are, indeed, to be had in abundance, but as they know no pace between a walk and a gallop, it is only by the extreme skill of the drivers that the light waggons (*fig. 1003.*), employed for the conveyance of travellers, pursue the journey without being dashed to pieces.

THE PAMPAS.

SECT. VI. *Civil and Social State.*

6120. *The population* of the territory of La Plata bears, undoubtedly, a very small proportion to its vast extent. It is by no means well ascertained, but is generally supposed not to exceed 700,000; exclusive of the territory governed by Francia, and of the Banda Oriental, of which Monte Video is the capital. These may raise the whole to somewhat above 1,000,000.

6121. *Society*, over all Spanish America, wears a very uniform aspect. The creoles, now every where the ruling class, are acute, polite, courteous, indolent, unenterprising, passionately fond of diversion, especially in the forms of dancing and gaming. Every lady holds her *tertulia*, or evening party, to which even the passing stranger will sometimes be invited. They are less charged with intrigue, however, than in other great cities of the New World; the conduct of the young ladies is very strictly watched, and they are married at thirteen or fourteen. The lower ranks pass through the streets in a very orderly manner; but they are too much addicted to frequenting *pulperias*, or drinking-houses, where gaming sometimes gives rise to deadly quarrels. Horses being easily procured at Buenos Ayres, it is an object of pride to keep a number of fine quality, on the equipment of which the inhabitants often bestow more care than on the due clothing of their own persons. Every one has a horse; even the beggar begs on horseback.

6122. *The Gauchos*, who inhabit the wide surface of the Pampas, and appropriate the numberless herds that roam over them, are a very singular race. Some travellers hold them as downright savages; but Captain Head assures us, that they are often of good birth, and very estimable persons. The gaucho is at once the most active and the most indolent of mortals. He will scour the country whole days at full gallop, breaking wild horses, or chasing the jaguar or the ostrich; but once alighted and seated on the skeleton of a horse's head, nothing can induce him to move. He considers it a degradation to set his foot to the ground; so that, notwithstanding a general vigour almost preternatural, the lower limbs are weak and bent, and he is incapable of walking to any distance. His dwelling is a mud cottage, with one apartment, and so swarming with insects, that in summer, the whole family, wrapped in skins, sleep in the open air. All round is a desert, with the exception of the *corral*, or circular spot, enclosed by stakes, into which the cattle are driven. Neither grain nor vegetables are cultivated, nor is the cow made to yield milk. Beef is the only food; and it is roasted, or rather twisted, on large spits stuck in the floor, in a slanting direction, so as to overhang the fire, a twist being from time to time given, to expose all sides of the meat in succession, and slices are cut out by the surrounding family: the juices, of course, fall into the fire, and are lost. A certain proportion become robbers, for which vocation these desolate plains afford scope; and Captain Head does not consider it safe to meet a party without a display of three pistols ready cocked.

6123. *The Indians of the Pampas*, a savage and terrible race, driven before the Gauchos, have in no degree coalesced with them, but continue in a state of deadly and raging hostility. Whoever encounters them in these wilds must expect death in its most terrible forms for his immediate lot; and the travellers, meeting each other, ask, with trembling voice, if any Indians have been seen on the route. They appear of the genuine Arauco breed; are nobly mounted, having each two or three horses, so that, when one is exhausted, the rider leaps on another. They delight in midnight expedition and surprise. On reaching the hut of an unfortunate Gaucho, these marauders set fire to the roof, when the family, who, at the same time, hear the wild cry which announces their doom, must rush to the door, and are instantly killed, without any distinction, except of the young girls, who are placed on horseback, and carried off to serve as wives, in which capacity they are well treated. A large body were lately in a state of regular war with the colonists, but they have been defeated, and driven beyond the Colorado.

6124. *The Catholic religion* prevails exclusively in these states, as over all South America; but the splendour of the churches, and the endowments of the clergy, appear to be greater here, compared at least with the means of supporting them, than in any other province. There prevails, also, a particular laxity in the conduct of the clergy. A late traveller, one Sunday evening, in passing the arena for cock-fighting, saw a number of clergymen, each with a fighting-cock under his arm. The government at Buenos Ayres has shown a considerable activity in reforming the abuses of the church, having suppressed a number of convents, and at one time prohibited any accession to the number of monks and nuns; but the influence of these communities is

still very strong in the interior provinces, to which this conduct of Buenos Ayres has rather served as a ground of disunion.

6125. *Knowledge*, as in the other new states, is encouraged by the government, without having yet made any very deep impression on the body of the people. Several large schools have been established on the plan of mutual instruction, and an university has even been founded, without permission from the pope; but it is little more than a classical school. There are three newspapers, but no literary or scientific journals. A history of the country, by Don Gregorio Funes, enjoys reputation.

SECT. VII. *Local Geography.*

6126. *The city of Buenos Ayres* (fig. 1004.) is situated on the southern bank of the Rio de la Plata, about 200

1004

BUENOS AYRES.

miles above its mouth; and, being raised about twenty feet above the river, and presenting the spires of numerous churches and convents, it makes rather a fine appearance. The houses are new, built of brick, white-washed, and with flat roofs, over which may be taken a pleasant and even

extensive walk. The windows are protected by iron bars, causing each mansion to resemble a lock-up house, and to form, indeed, a complete fortification; which enabled the town to make a formidable and effectual resistance to the British army, absurdly marched into it by General Whitelock. Along the beach there is a street which resembles Wapping, being crowded with grog shops. The cathedral, though built of brick, is a very handsome structure, as are several of the other churches and monasteries. The fortress in which the viceroy formerly resided is situated near the river. The town, on the whole, is rather handsome, especially the houses surrounding the great square. The environs on the land side have a very monotonous aspect, being animated neither by varied vegetation, nor by the chirping of birds. The population is estimated at 70,000. Large vessels cannot approach nearer than two or three leagues.

6127. *Monte Video*, capital of the Banda Oriental, or eastern shore of the Plata, possesses the best harbour upon that river, and before the late disturbances was a flourishing city; the population of which was estimated at 15,000 or 20,000. It has suffered severely in passing through the hands of the insurgent Artigas, and then of the Portuguese. For an American town it is well built, with wide and regular streets, but few prominent edifices. The country around is agreeably diversified with hills and valleys, and the gardens abound with the finest fruits and flowers; but there is otherwise little cultivation; though extensive cattle farms are found in the interior. It exports large quantities of hides. Monte Video, it appears, is now to be the seat of an independent republic, though doubtless in close alliance with Buenos Ayres, by whose exertions its independence has been vindicated against Brazil. Below Monte Video is the small port of Maldonado, and, above, the still smaller one of Colonia del Sacramento, with a good but neglected harbour.

6128. *The province of Entre Rios*, which is situated higher up, between the Uruguay and the Plata, derives from these two rivers some of the most extensive and rich alluvial plains on the surface of the globe. Even the swampy and inundated tracts might easily be converted into the most luxuriant meadows. The herb of Paraguay is found there, and it is supposed might be produced of equally good quality as in the upper quarter, where only it has been hitherto reared in perfection. Mr. Rodney calculates the population of this province and of the Banda Oriental to be as yet only 50,000. Corrientes, at the junction of the Plata and the Paraná, must, from this happy situation, rise in time much above its present moderate importance. Lower down, on the opposite side of the river, is Santa Fé, distant eighty leagues from Buenos Ayres, which has risen to considerable importance by becoming a depôt for the goods on the river. This city, with its district, has formed itself at present into an independent state, strongly repelling all union with Buenos Ayres. The Santa-Ferino was represented to Mr. Caldeleugh as more wild, and cruel, and regardless of the laws, than any of the other provincials. The population of the town is not supposed to exceed 4000; and of its district, 30,000.

6129. *Paraguay*, still farther up, between the Plata and the Paraná, forms a very fine district, which has fallen under the absolute dominion of a person of the name of Francia. Having taken a degree at the university of Cordova, he applied his knowledge in astronomy and physics, and the instruments connected with those sciences, to impress this simple race with a belief in his supernatural powers. By these and other arts, he rules them with absolute sway; and his first maxim is to allow no person or thing to come into or go out of Paraguay. Of things, the most valuable is the herb of Paraguay, which the neighbouring countries, were they permitted, would take off to the value of 1,000,000*l.* sterling; and of persons, Bonpland, the illustrious botanist and companion of Humboldt, was long detained in prison, though recently liberated. The violent steps, however, by which this person is now supporting his sway, seem to indicate that it has gone beyond what the temper of the nation will bear, and therefore is not likely to be permanent. Asuncion, the metropolis of the Upper La Plata, is a considerable place, with about 7000 inhabitants, but with little regularity and beauty. It is built on a bank above the river, which is daily washing away part of the ground beneath it. This place, with the smaller ones of Coruguaty and Villa Rica, were the staples for the herb of Paraguay. Two other villages, Santa Lucia and Little Santa Fé, sent down to Buenos Ayres and Monte Video lime and gypsum, for the purpose of whitewashing the walls of those cities.

6130. *Cordova, Tucuman, and Salta* form together an extensive region, which has been often comprehended under the general appellation of Tucuman. They fill the interval between the Rio de la Plata and the Andes,

which does not consist of dead level plains, like those in the south, but is crossed by branches of the Andes, and even by parallel chains, of which the most considerable is that called the Sierra de Cordova. Between these mountains are found valleys and extended plains of great fertility, on which every species of tropical produce is raised; but the prevailing stock consists in cattle, sheep, and, above all, mules, which, being indispensable for conveyance across the Andes, are reared with great care, and exported in great numbers to Peru. There are also many species of valuable wood; honey and wax are produced of excellent quality; and wool, both of the sheep and vicuna, is manufactured into cloth. This district eminently distinguished itself in the war of independence, contending in favour of that cause at once against the governors of Buenos Ayres, Chili, and Peru; and the first congress of the La Plata provinces was held at Tucuman. They at present hold aloof, being unwilling to acknowledge the superiority claimed by the distant capital of Buenos Ayres. The people, according to Mr. Caldcleugh, bear the reputation of being more industrious, religious, and orderly, than those of the other provinces.

6131. *Of the capitals of these provinces*, Cordova is a neat small town, well paved, with a handsome cathedral and market-place. It possesses the only university in the interior provinces, which has recently produced some men of considerable eminence. It carries on a manufacture of cloths, and a trade in mules. Salta is a considerable place of 400 houses, situated in the beautiful valley of Lerma, on the high road from Buenos Ayres to Potosi. It is the capital of Tucuman, and a bishopric. About 60,000 mules are reared in the neighbourhood. An annual fair is held in February and March for mules and horses. The people, and those of other towns in the district, have a hard struggle to maintain with the tribes of unsubdued Indians, who hem them in on all sides. Tucuman and St. Jago del Estero are also old towns, situated in fertile plains, and deriving some importance from their position on the main route from Buenos Ayres to Peru. Near Tucuman are some silver mines, not yet worked.

6132. *Mendoza*, a province separated from that of Cordova, consists of some beautiful, fine, and well-watered valleys, overshadowed by the amazing rocky and snowy steeps of the Andes. Its staples are the same as at Cordova, mules, wool, cloth. A considerable number of mines of gold, silver, and copper occur both here

1005

ROUTE OVER THE ANDES.

and farther north; but, as already observed, they are not likely to answer the sanguine hopes once cherished by British capitalists. The importance of Mendoza rests on its fertile soil, and on its being the sole route of communication between Buenos Ayres and Chili; which, though rugged, leading over the loftiest steeps of the Andes (fig. 1005.), is a continual thoroughfare. A product, almost unique in America, is that of wines and brandies, which are very tolerable, and are sent to the neighbouring provinces. Mendoza is a neat town, well built of brick, the streets refreshed by streams from the river, and the interior of the houses well fitted up. The population is generally reckoned from 8000 to 10,000; though Mr. Caldcleugh makes it 20,000. They are described as a quiet, respectable, well-disposed people, though they give themselves up without reserve to the indolence generated by the climate, enjoying an unbroken siesta, or sleep, from twelve to five in the afternoon, when they rise to walk on the alameda, which commands a noble view of

the plain and the Andes: but this is the usual train of life in these interior cities. San Luis, to the east of Mendoza, on a frequented though circuitous route from Buenos Ayres, is a much smaller place, consisting of a number of mud huts, scattered over a large space of ground, but in a situation highly picturesque, being enclosed by a lofty branch of the chain of Cordova. San Juan, to the north of Mendoza, has another but much less frequented route through the Andes.

6133. *Patagonia*, which, since the settlement formed on the Rio Negro, the Buenos Ayreans number as one of their provinces, is in full possession of an Indian race, all mounted on horseback, and in habits and aspect closely resembling those who desolate the Pampas. They have drawn the attention of navigators by their size, and have been actually reported as a nation of giants. Although this be exaggerated, yet they really seem tall above the ordinary standard. They are described to be excellent horsemen. The eastern coast of this country is bordered by a prolongation of the Andes; but these mountains, after passing Chili, display no longer that stupendous elevation which has marked so great a portion of their range. Their general height from thence to the Straits of Magellan is not supposed, by Captain King, to exceed 3000 feet, though some peaks rise to 5000 or 6000, when they wear a most dreary aspect, being covered with perpetual ice and snow. This part of the chain has no valley interposed between it and the ocean, whose stormy waves beat direct against its cliffs, and have furrowed the land into almost numberless islands, separated from the continent and each other by long and narrow channels. One continental peninsula alone, that of Tres Montes, is said to be directly exposed to the waves of the Pacific. Of these isles, the largest and most northerly, called Wellington, is separated from the continent by the channel of Mesier, 160 miles long, whose shores are bordered by low hills, covered with thick woods. To the southward is the archipelago of Madre de Dios, which is little known; but the channel of Concepcion, which divides it from the continent, is broad and safe, and the opposite coast deeply indented with bays, the principal of which, called St. Andrew, is terminated by abrupt mountains, covered by enormous glaciers. Next follows Hanover Island, of considerable extent, and to the south of it a numerous group, called the Archipelago of Queen Adelaide, which borders on the Straits of Magellan. In the interior from the coast are two large saline lakes, one fifty and the other thirty-four miles long, called Otway and Skyring.

6134. *Opposite to the southern boundary of the American coast* extends the dreary region of Terra del Fuego. Narrow straits, crowded with islets, divide it into three parts, of which the most eastern, and much the largest, is called King Charles's Land, the middle and smallest, Clarence Island, the most westerly, Desolation Land. Between Terra del Fuego and the continent extends the long narrow winding strait, celebrated under the name of Magellan, who by it first penetrated into the Pacific Ocean. This channel presents three entirely distinct portions. The most western, composed of granite and other primitive rocks, exhibits mountains irregularly heaped together, a coast deeply indented by bays, forming bold promontories, while the passages are filled with innumerable islets and dangerous rocks. In the central part the mountains, composed of slate clay, are bold, elevated, and in some parts covered with perpetual snow; but no rocks or islands occur to obstruct the navigation. In the eastern quarter, the coast again assumes a granitic character, and is also diversified by islands, though not so numerous as in the western channel. The southern coast of Terra del Fuego is also broken into numerous islands. Two of them, Hoste and Navarin, are separated from the main land by a long narrow channel, stretching almost in a direct line, and named, from Captain King's ship, the Beagle. Staaten Land, another large island, lies off the eastern coast, from which it is separated by the Straits of Le Maire. One of the islands belonging to the group, called L'Hermite, is remarkable as containing Cape Horn, the most southerly point of America, and facing directly the wastes of the ocean which surround the Antarctic pole. It was once deemed "infamous for tempests;" but it is now found that in a proper season Cape Horn may be passed with little danger, and it is commonly preferred to the winding and difficult channel of Magellan. The Petcherais, who inhabit Terra del Fuego, are a handful of miserable savages, in the lowest state of wretchedness, and subsisting solely by the shell-fish which they pick up on the shore. The Spaniards

made an early attempt to form a settlement at Port Famine, in the middle of the strait, but could not maintain it.

6135. *The eastern coast of Patagonia* is comparatively low. That immediately north of the straits is covered in a great measure with extensive plains, or pampas; but from Port St. Julian, in about 49° S. lat., to 44° , it is broken by considerable eminences. Ports Desire, St. Julian, and Santa Cruz afford tolerable anchorage, often resorted to by vessels destined for the southern fishery. The natives are seldom seen on this coast, which they are said to frequent only for the purpose of interring their dead.

CHAP. XI.

BRAZIL.

6136. *Brazil* is a very extensive region, which occupies nearly the whole of the eastern tracts of South America, and, after being long held as a Portuguese colony, has of late, by peculiar circumstances, been formed into a separate empire. It extends over more than half the continent of South America.

SECT. I. *General Outline and Aspect.*

137. *Brazil* is bounded on the east by the Atlantic, whose shores describe round it an irregular arch, broken by very few bays or inlets of any consequence. In the interior, this empire borders on every side upon the former provinces of Spain; but the two nations, in the course of 300 years, could not determine on the boundary lines to be drawn through the interior of these vast deserts. The discussion was rendered still more intricate by attempts to refer the question to the authority of the Pope, who allowed to the Portuguese 100 leagues west from the islands of the Azores and Cape Verd, without indicating which island or what league was to be used; and by successive congresses of pilots and cosmographers, who had only imperfect and often ideal maps by which to guide themselves. The line seems to begin on the south with the great estuary of the Rio Grande do Sul, whence it passes to the Paraná, and thence by the Madera to the junction of that river with the Amazons. The sea-like channel of the lower Amazons has been supposed to bound Brazil on the north, and to separate it from Guiana; but Humboldt seems to reckon all Portuguese America as Brazil. The separation from Colombia is then marked for a great length by the Parime, and afterwards by a line drawn direct to the sea, without regard to any natural feature. The Brazilian government, taking advantage of the dissensions which reigned in the new state of Buenos Ayres, occupied with its troops the whole territory as far as the Plata, which it insisted made the most natural and compact of all boundaries; but the Buenos Ayreans, unable to discern the beauties of this arrangement, took arms in order to oppose it; and the contest has issued in the disputed territory being formed into a separate republic.

6138. *The dimensions of this immense range of territory* may be taken from about 1° N. to 32° S. lat.; and from about 45° to 65° W. long. This will give about 2300 miles of extreme length, and 2000 of breadth. The area of the whole has been estimated by Humboldt, after careful measurement of the best maps, at 257,000 square marine leagues, or 3,340,000 square miles. It is thus twenty-five times the extent of the British Islands, nearly three times that of either Mexico or Colombia, and greater by a fourth than the entire domain of the United States from the Atlantic to the Pacific. It is rather more than half of all South America. Of this immense space, indeed, not above a fourth can be considered as at present in an effective and productive state; and that part is scarcely cultivated and peopled up to a fourth of its actual capacity. But nearly the whole, from soil, climate, and communications, is capable of being brought, at some future and distant period, into full improvement.

6139. *The Brazilian ranges of mountains* are of great extent, but reach by no means to that stupendous height which distinguishes the Andes of Colombia and Peru. The principal mass of these mountains lies N.W. of Rio de Janeiro, towards the sources of the rivers San Francisco, Paraná, and Tocantines. From that point extends a parallel chain towards the north coast, under the names *Cerro das Esmeraldas*, *Cerro do Frio*, and others; another chain extends south in a direction equally parallel; and a third, that of Mato Grosso, reaches towards the N.W. as far as the plains of Pareses, the central savannah of South America. This last chain pours its waters on one side into the rivers Tocantines and Ghingu, and on the other into the Paraguay and the Paraná. Some mountain chains, but little known, cross near the Tocantines. Towards the banks of the San Francisco is another great plain, called Campos Gerães. On the north coast, between Maranhão and Olinda, occurs the Sierra de Itiapoba, one of the most considerable in Brazil. These mountains are not generally higher than from 2000 to 3000 feet; only a few detached peaks rising to about 6000. Geographers have filled the interior with lofty chains, which have remained as fixtures in modern maps; but it seems now ascertained that these vast regions are in general very level; and that even the separation of the waters of the Amazon, the La Plata, and the Madera, is made by plains, the highest ridges of which are only apparent by that separation. The banks of the Lower Amazons present plains almost boundless.

6140. *Rivers*, the greatest in America and in the world, flow around all the borders of Brazil. Its northern frontier is watered by the course of the Amazons, its western by the Madera and the La Plata. Within its territory flow, tributary to the Amazons, the Topayos, the Ghinga, the Araguay, and Tocantines, which, though here secondary, may rival the greatest waters of other continents. But these rivers, flowing through regions which will one day be the finest in the world, when they will bring down an endless succession of valuable products, roll at present through savage deserts, and impenetrable forests, which have never felt either the axe or the plough. The only really useful rivers are those between the coast chain and the sea, none of which can attain any long course. Much the greatest is the Rio Francisco, which, flowing northward along the back of these mountains to their termination, there finds its way to the Atlantic. There are two Rios Grandes, one falling into the sea north of Porto Seguro, the other (Rio Grande do Sul) in the extreme south, watering the province that bears its name. Yet so little is Brazil at present dependent on

internal navigation, that none of its great ports are situated upon these rivers, but merely upon small interior bays.

6141. *Lakes* are not leading features in Brazil: but in the southern province of Rio Grande, there are the Patos and the Mirim, extensive and shallow, communicating with the sea, yet chiefly fresh, and forming the receptacle of all the streams which come down from the interior. Farther inland, the Paraguay, by its superfluous waters, forms the Lakes Xarez and Ibera, which spread in the rainy season over a prodigious extent of ground.

SECT. II. Natural Geography.

SUBSECT. 1. Geology.

6142. *Granite*, occasionally associated with syenite, appears to abound in Brazil, forming the basis of the low country, and also the central, and often the higher parts of the mountain ranges. Resting upon it there occur gneiss, mica slate richly impregnated with iron ore, chlorite slate, talc slate, quartz rock, limestone, hornblende rock, and greenstone. Upon these old rocks repose sandstone, with slate clay, and upon these various alluvial formations. True volcanic rocks have not hitherto been met with. Eschwege has published a section of the country extending from Rio Janeiro to Villa Rica, which exhibits all the different rock formations just enumerated.

6143. *The minerals* distributed among these formations occur in cavities, veins, beds, or disseminated; and of these the gems and ores are the most important. The most precious and beautiful of the gems, the diamond, is one of the characteristic minerals of Brazil. Hitherto it has been found chiefly in alluvial sands and conglomerate (*cascalho*). Eschwege mentions having seen it embedded in brown iron ore. The district of Serra do Frio is that in which it occurs most abundantly; and it is said also to be a native production of the territory of Matto Grosso. According to Eschwege, the supply of diamonds during the eighty-four years from 1730 to 1814 was at the rate of 36,000 carats per annum; but the return from the registers of the administration of the diamond mines from 1800 to 1806 was only 19,000 carats.

6144. *Large diamonds* do not abound in Brazil, but some of considerable size are occasionally met with. Topazes of great beauty and of considerable size are met with in the diamond district, the chrysoberyl and the green tourmaline or Brazilian emerald in the Serra dos Esmeraldas, and splendid rock crystals and beautiful amethysts are of frequent occurrence.

6145. *Iron*, in the form of magnetic iron ore, specular iron ore, and brown iron ore, is found in vast quantities. Gold in grains is found in the sands of most of the principal rivers and their chief branches; or it occurs in the consolidated sand and gravel named *cascalho*. Gold also occurs disseminated in different primitive rocks, but there are not mines for the gold they contain; all the gold exported from Brazil being obtained by washing the sands of rivers. Native copper and also ores of copper are met with, but hitherto they have not been turned to any use. Common salt occurs in some clays and marls, and nitrate of potash or saltpetre is produced in abundance in the extensive limestone beds of Monte Rodrigo, between the Rio dos Velhos and the Paraná.

SUBSECT. 2. Botany.

6146. *Brazilian botany* is almost too extensive for us to touch upon; yet, with the powerful aids of St. Hilaire, Martius, and others, it would be unpardonable not to attempt giving some idea, however imperfect, of it. Dr. Abel, in his Voyage to China in the Alceste, has conveyed, in few words, a striking picture of that portion of the country which is most frequented, and must, consequently, have been visited by thousands of Europeans; and he shows how great is the advantage possessed by a traveller acquainted with natural history over the common observer, both with respect to pleasurable expectation, and the chances of its fulfilment. The objects of his studies are infinitely numerous, and each in its simple relations is so completely a centre of observation, that he must always be repaid for the labour of research. "On first entering the harbour of Rio Janeiro he feels unutterable delight. No apprehension of disappointment darkens his prospect. The certainty of meeting Nature in her gayest and most exalted colours, in all her varied and attractive forms, gives him unmixed enjoyment. The brilliant tints of the mountain foliage feed his botanical imagination; whilst the dazzling insects which flutter about the ship tell to him the stores of animated nature. As a geologist, he may almost remain on the deck of the vessel and prosecute his researches; immense ridges of primitive mountains, traversed by deep ravines, and rising in succession to the very boundary of his vision, afford him an ample subject of interesting investigation. When once the naturalist has landed, he quickly bends his way to the rocky woods that cover these hills, and finds himself encompassed by all the beauties of Flora. Thus I was entirely overwhelmed for some minutes by my sensations, on first beholding the glorious productions of a tropical climate in their native soil. Plants that are reared in England at great expense, and attain, under the best management, but a puny and uncharacteristic form, flourished around me in all the vigour and luxuriance of their perfect being. A thick coppice was formed by numerous species of Cassia, Cæsalpinia, and Bauhinia, whose gay colours and elegant forms were curiously contrasted with the grotesque characters of the Aloe and Cactus. The trunks of the forest trees were covered with beautiful Creepers, and parasitic Ferns occupied their branches. Emerging from the wood, I entered groves of Orange trees, bearing fruit and flowers in the greatest profusion. I approached them in wonder, and scarcely dared to taste their abundant produce, when I was astonished by receiving permission to gather them in any quantity. Having laden myself with plants, I returned along the rocky beach to my boat; walking, at every step, over land

crabs and the larvæ of insects, whose numbers gave an appearance of animation to the soil. Standing on the beach, with my back to the sea, I had immediately before me the dark face of the Sugar-Loaf Mountain, rising from a wood of flowering trees. To the right hand, the same wood climbed the precipitous ground, intersected by paths leading to a rugged rock. Here, groves of orange trees afforded a retreat from the blaze of the unclouded sun; while the cool sea breezes heightened the effect of the scene, and, blowing over fields of bloom, came charged with delicious fragrance."

6147. *Martius most fully corroborates* all that Dr. Abel has stated. "Scarcely," says he, "were we beyond the streets and noise of Rio Janeiro, when we stopped, as if enchanted, in the midst of a strange and luxuriant vegetation. Our eyes were attracted sometimes by gaily coloured birds, or splendid butterflies; sometimes by the singular forms of the insects, and the nests of wasps and termites, hanging from the trees; sometimes by the beautiful plants scattered in the narrow valley, and on the gently sloping hills. Surrounded by lofty, airy Cassias, broad-leaved, thick-stemmed Cecropias, thick-crowned Myrtles, large-blossomed Bignonias, climbing tufts of the honey-bearing Paullinias, far-spreading tendrils of the Passion-flower, and of the richly-flowering Coronilla, above which rise the waving summits of Macauba Palms, we fancied ourselves transported into the gardens of the Hesperides. Passing over several streams which were turned to good account, and hills covered with young coppice wood, we reached the eminence along which the spring-water for the city is conducted. Between the woody hills, there are diversified romantic prospects into the valleys below. Sometimes you traverse open spots, where a stronger light is reflected from the flowery ground, or from the shining leaves of the neighbouring high trees; sometimes you enter a cool shady bower. Here a thick wreath of Paullinias, Securidacæ, Mikantias, Passionflowers adorned with an incredible number of blossoms, climb through the crowns of the Celtis, the flowering Rhexias and Melastomas, Bauhinias, delicate Mimosas, and glossy Myrtles; there, bushy Nightshades, Sebestanas, Eupatoria, Crotons, Ægiphilas, and innumerable other plants, form an impervious thicket, amidst which grow immense stems of the Silk Cotton Tree (*Bombax*), of silver-leaved Cecropias, thorny Brazil-wood tree, of the Lecythis, with its singular fruit resembling a pitcher, slender stems of the Cabbage Palm, and many other sovereigns of the wood. The majestic sight, the repose and silence of these woods, interrupted only by the buzz of the gay Humming-Birds fluttering from flower to flower, and by the singular notes of unknown birds and insects, peculiarly affect the mind of the man of sensibility, who feels himself, as it were, regenerated in the prospect of the glorious country. The stream, which the aqueduct conveys to the city, falls in one place in beautiful cascades over the granite rocks. Oblique-leaved Begonias, slender Costus and Heliconias, the red flower-stems of which shine with peculiar splendour, contrasted with the gloom of the forest arborescent Ferns and Grasses, hanging bushes of Vernonias, Myrtles, and Melastomas, bending under a load of blossoms, adorn the cool spots that surround them. Large and small-winged butterflies sport above the rippling water; and birds of the gayest plumage contend, as it were, morning and evening, to overcome the noise of the brook by their various notes. The higher one ascends, the more rare do the large trees become, and the Bamboos and Ferns more numerous, among which is a beautiful arborescent Fern, fifteen feet high. Coffee trees are planted on the sides of the hills, the top of which is crowned by the Brazilian Pine (*Araucaria imbricata*), with its dark grotesque branches, extended like candelabra. In the surrounding forest grows a kind of Bark, which has been exported under the name of Quina do Rio (*Coutarea speciosa?*), the efficacy of which, in intermittent fevers, has been proved by experiments made in Portugal. Though not possessing all the anti-febrile qualities of the Peruvian bark, it is preferable to many other sorts which come to Spain from Peru, mixed with the better kind; and, were the pieces of wood carefully selected, it might afford a very powerful medicine. Another Brazilian plant, containing a great quantity of bitter, is the Carqueja (*Baccharis genistelloides*), which is much used against intermitting fevers."

6148. *It is remarkable that upon all the shores of the New and Old World* between the tropics, *Rhizophora* Mangle, the Mangrove Tree (*fig. 1007.*), *Bruguera*, *Conocarpus* and *Avicennia*, with seeds, shooting, while at-

MANGROVE TREE.

attached to the parent plant and branches striking into the earth, seem by their roots above and below, at once to convey the image of that rich and generous vegetation which we admire in these latitudes. As these plants belong in an especial manner to the sea-coast, so every large river has a flora of its own along its whole course, which forms one of the most important features in the physiognomy of the country through which it flows. Thus, on the shores of those immense rivers, the Rio de San Francisco, the Tocantin, the Parnaiba, and the Amazons, there are certain species which mark the peculiar character of their vegetable productions, and are extremely interesting to the botanical geographer, as indicating, to a certain degree, the basis of the forms of each individual flora. Those shrubs and trees which emit roots from their branches require to come into contact with the sea, in order to attain their perfect growth; and, with their wide-spreading and very superficial roots, they appear especially to affect the swampy soil of its shores. Though their wood be solid and not unfrequently thick, they grow with extraordinary rapidity. The Mangrove (*Rhizophora Mangle*, *Mangue vermelho*) is distinguished by forming a very thick bark in a proportionably short period. In those places where the scarcity of timber does not make it necessary entirely to cut down the Mangle Trees, as, for instance, in Maranhao, it is usual, particularly

at the commencement of the rainy season, when the sap begins to flow between the wood and bark, to tear off the latter and use it for tanning. On the summits of these forests growing on the shore, are seen, in sailing along, the most beautiful white herons sitting, gay-coloured halcyons watching for fish, and within the thicket various waterfowl, running about or swimming. Wherever these trees grow, the whole neighbourhood is converted into marshes and swamps, and serves only for an abode for a peculiar species of crab.

6149. *The celebrated Russian voyager and traveller, Baron von Langsdorff*, has a beautiful country residence in Brazil, at the foot of the Organ Mountains, called Mandioca, on account of the excellence of the Mandioca roots (*Jatropha Manihot*) which are cultivated there. This estate is bounded on the northward by a chain of mountains, traversed by several narrow dells, and covered with wood. In the midst of these great forests are the tracts (*rossados*) which, after burning the felled trees, are planted by the landowners with Mandioca, Maize, Beans, Coffee, &c. These plantations (*rossas*) are generally abandoned after a few harvests, and in a few years are covered again with a thick brushwood (*capoeir*) which is particularly distinguished by the absence of large kinds of trees, of a slower growth. The primeval forests, which stand, as testimonies of the creative energy of the New Continent, in all their original wildness, and still unprofaned by human hands, are called, in Brazil, Mato Virgem, Virgin Forests. In them, European coolness refreshes the wanderer, and, at the same time, presents the image of the most luxuriant profusion; the never-ceasing power of vegetation makes the trees shoot up to a majestic height; and, not contented with these gigantic primeval monuments, Nature calls forth, upon every stem, a new creation of numerous verdant flowering parasite plants. Instead of the uniform poverty of species in the forests of Europe, there is an endless diversity in the forms of stem, leaves, and blossoms. Almost every one of these sovereigns of the forest, which here stand near to each other, is distinguished, in the total effect of the picture, from its neighbour. While the Silk Cotton Tree, partly armed with strong thorns, begins at a considerable height from the ground to spread out its thick arms, and its fingered leaves are grouped in light and airy masses, the luxuriant Lecythis and the Brazilian Anda shoot out, at a less height, many branches profusely covered with foliage, which unite to form a verdant arcade. The Jacaranda attracts the eye by the lightness of its doubly-feathered leaves; the large gold-coloured flowers of this tree and the Ipé dazzle by their splendour, contrasted with the dark green of the foliage. The Spondias arches its pinnated leaves into light oblong forms. A very peculiar and most striking effect in the picture is that produced by the Trumpet Tree (*Cecropia peltata*), among the other lofty forms of the forest. Its smooth, ash-grey stems rise, slightly bending, to a considerable height, and spread at the top

into verticillate branches, standing out at right angles, which bear, at the extremities, large tufts of deeply lobated white leaves. The contour of the tree appears to indicate, at once, hardness and pliability, stiffness and elasticity, and affords the painter a subject, equally interesting and difficult, for the exercise of his pencil. The flowering *Cæsalpinia*, the airy Laurel, the lofty *Geoffræa*, the Soap Trees with their shining leaves, the slender Barbadoes Cedar, the *Ormosia* with its pinnated foliage, the *Tapia* or Garlic Pear-tree, so called from the strong smell of its bark, the Maina, and a thousand undescribed trees, are mingled confusedly together, forming groups, agreeably contrasted by the diversity of their forms and tints. Here and there, the dark crown of a Brazilian Pine (*Araucaria imbricata*) among the lighter green, appears as a stranger among the natives of the tropics, while the towering stems of the palms, with their waving crowns, are an incomparable ornament to the forests, the beauty and majesty of which no language can describe. If the eye turns from the proud forms of those ancient denizens of the forest, to the more humble and lower, which clothe the ground with rich verdure, it is delighted with the splendour and gay variety of the flowers. The purple blossoms of the *Rhexia*; profuse clusters of *Melastoma*, *Myrtle*, and *Eugenia*; the tender foliage of many *Rubiaceæ* and *Ardisiæ*, with their delicate flowers blended with the singularly formed leaves of the *Theophrasta*; the *Conchocarpus*; the reed-like Dwarf Palms; the brilliant spadix of the *Costus*; the ragged hedges of *Maranta*; magnificent *Stiffias*; thorny *Solana*; large-flowering *Gardenias* and *Contarea*, entwined with garlands of *Mikania* and *Bignonia*; the far-spreading shoots of the mellifluous *Paullinias*; of the burning *Dalechampsias* and the *Bauhinia*, with its strangely lobed leaves; strings of the leafless milky *Bindweed*, which descend from the highest summits of the trees, or closely twine round the strongest trunks, and gradually kill them; lastly, those parasitical plants by which old trees are invested with the garb of youth; the grotesque species of *Pothos* and *Arum*; the superb flowers of the *Orchideæ*, the *Bromelias*, which catch the rain water; the *Tillandsia* (fig. 1008.), hanging down like *Lichen pulmonarius*, and a multiplicity of

BROMELIA.

TILLANDSIA.

curiously formed Ferns; all these admirable productions of so young a soil combine to form a scene which alternately fills the European naturalist with delight and astonishment.

6150. When here attempting to sketch the interior of a tropical forest, it is requisite to point the attention of the reader to the relative situation of each individual plant, with regard to the tendency to self-preservation. With such a fulness of life, and such a vigorous striving at development, even so rich and fertile a soil as this is not capable of furnishing the necessary nourishment in sufficient abundance; hence those gigantic trees are in a constant struggle for their own preservation, and impede each other's growth, still more than do the trees in our forests. Even the stems which have attained a considerable height, and require a large supply of nutri-

ment, feel the influence of their stronger neighbours, are suddenly arrested in their growth by being deprived of the requisite juices, and thus become, in a short time, subject to the general laws of nature, which lead them to a rapid dissolution. Thus we see the noblest trees, after suffering an atrophy of some months' duration, eaten away by ants and other insects, seized with decay from the root to the summit, till, to the terror of the solitary inhabitants of the forest, they fall down with a tremendous crash. In general, it is remarked that stems which stand singly, among several of a different kind, are more easily kept down by the latter. When, at some future period, a regular system of forest cultivation, which, indeed, has not yet been thought of in these thinly peopled woods, shall be introduced, it will be found necessary, not so much to promote the growth of the trees close together, as to take care that they stand at a sufficient distance from each other.

6151. Brazil nuts are the fruit of *Bertholletia excelsa*, (fig. 1009.) one of the most interesting plants of the

BRAZIL NUTS.

New World, and which deserves to be cultivated in the warm parts of America, as we grow the almond and walnut. It has been stated that the weight of the fruit is so enormous, that at the period when it falls, the savage natives dare not enter the forests without covering their heads and shoulders with a strong buckler of wood. The people of Esmeraldas still describe the dangers which they run, when this fruit, which is as large as a child's head, and whose shell is so hard as almost to defy the sharpest instrument, drops from a height of fifty or sixty feet. The produce is abundant, each containing from fifteen to twenty large and well-flavoured kernels. Humboldt declares himself to have been most fortunate in procuring Brazil nuts during his voyage on the Orinoco. He and his party had subsisted for three months on bad chocolate and boiled rice, without butter or salt, when they procured a quantity of the fruit of the *Bertholletia excelsa*, which the Indians had just been gathering in the month of June. The Portuguese of Para have long carried on a considerable traffic in these nuts, which they export to Guiana, Lisbon, and England; and the oil extracted from them is much esteemed in Brazil. A French privateer

captured, during the war, an English vessel, loaded with Brazil nuts, which were purchased by a merchant of Rouen, who found the oil they afforded so preferable for burning to that extracted from any European fruit, that he wrote to Paris to enquire the botanical name of the tree that bore these nuts, and for information as to its native country, with a view to obtain a larger supply.

6152. The Brazil Wood of commerce is the produce of *Cæsalpinia brasiliensis*; and Rosewood, now so well known and extensively employed as an ornamental material for furniture, that of a *Jacaranda*.

6153. Balsam of *Copaiva* is afforded by the genus *Copaifera*.

6154. *Ipecacuanha*, the true Brazilian drug, respecting which there has been so much discussion, is the root of the *Cephaelis Ipecacuanha* of Richard (fig. 1010.). Its discovery is due to the native Brazilians. Marcgraaff and Pison were the first who made it known in Europe, and experiments proved the utility of this truly valuable drug. Their description, however, was so defective that *Ipecacuanha* was long used before the plant that produced it was known: till, in 1800, Dr. A. Gomes brought flowering specimens to Europe, which Brotero described in the *Transactions of the Linnean Society*, and thus set all uncertainty at rest. The use of *Ipecacuanha* is too universal to render a long detail of its qualities necessary. Every body knows that it is emetic and sudorific, and useful in chronic catarrh, strengthening the digestive organs, and curing the dysentery. A small trade is carried on in *Ipecacuanha* at Rio Janeiro. According to Gomes, 430 arrobas

were exported in 1795, and 314 in 1800.

CEPHAELIS IPECACUANHA.

beverage, that the temporary want of it is considered quite a misfortune; almost as heavy as the loss of tobacco. Such inveterate smokers are the fair Popayanejas, that when the possession of Cauca by the patriot

CHOCOLATE TREE.

are perfectly purified, they are pounded in a mortar of heated iron over burning charcoal, and thus reduced to a coarse paste, which is set to cool on a marble slab. A second rolling is bestowed with a steel cylinder on a smooth freestone, and as soon as the paste becomes sufficiently smooth, it is mixed with sugar in a hot basin and poured into tin moulds. Cadet mixed 8 lbs. of the Caracca Cacao, which is the finest kind, with 2 lbs. of the third kind (Island Cacao), and 8 lbs. of powdered sugar. The addition of ginger, cloves, and pimento, and even musk and ambergris, commonly given in America, renders chocolate, which is by no means easy of digestion, still more heating and exciting. Cadet recommends that only 2 oz. of cinnamon and 3 oz. of vanilla should be put into 20 lbs. of plain chocolate paste. Chocolate is not very much consumed in England; it is in greater esteem in France; it forms the ordinary breakfast in Spain; and in Mexico, according to Humboldt, it is not considered an object of luxury, but of prime necessity.

6157. *The botany* of the northern parts of South America, namely, Guiana and Colombia, is far less known than that of Brazil. Guiana presents a singular appearance as you approach it from the sea, being remarkably low for a great extent towards the interior, so that it cannot be discovered, even from the mast-head of a vessel, until close to it. It then presents a curious fringed aspect; for nothing but the tops of the tall trees by which the land is covered are visible on the horizon, apparently floating in the air; being seen through the medium of an atmosphere charged with watery vapours, that are raised by the excessive heat of the climate from a humid soil. "Up the Orinoco," says the lively author of *Campaigns and Cruises in South America*, "the scenery is strikingly beautiful; and, when viewed from a ship's deck as she glides slowly along the smooth water, presents a magnificent moving panorama. The banks on each side are covered with imperious forests of majestic trees, chained to each other, as it were, by the Bejuco or gigantic creeping plant of South America, which grows to the thickness of an ordinary cable. These ancient trees, when decayed through length of years (for the axe of the woodsman has never yet resounded in these wilds), are supported upright by these enormous plants, which bear a striking resemblance to the huge water snakes that lurk in the swamps beneath. There are many other parasitical plants which bear flowers of various brilliant colours, forming festoons on the trees to which they cling. Among the branches, monkeys of every description gambol and follow the vessel, springing from tree to tree by means of the Bejuco, which has obtained, from this circumstance, its Indian name of monkey's ladder. The most conspicuous among this mischievous tribe is the araguato, a large red monkey, always seen in herds, the young ones clinging to their mother's shoulders. These are very destructive among the plantations, where they pull up and destroy more roots and fruit than they eat or carry away. Their howling during the night is much louder than could be considered possible, considering the size of the animal. The noise they make may be easily fancied to proceed from panthers, or other large beasts of prey. This is so much the case, that three English soldiers, who had deserted from Angostura, were so terrified by the noises made by these animals in the middle of the night, that they hailed the boats in which the other troops were, and begged to be taken on board, declaring that they were surrounded by tigers. Parrots and macaws, with toucans and other birds of beautiful plumage, complete this splendid picture, and fill the air with their discordant screams, to which the metallic note of the darra or bell-bird, responds at measured intervals; at one moment sounding close to the ear, and the next, dying away in the distance. Up the small creeks, which are completely embowered by magnificent evergreens, are seen pelicans, spoonbills, and garzons, or gigantic cranes, all busily employed in fishing. When to this is added the occasional appearance of that tyrant of the stream, the alligator, floating in conscious superiority among the bulky manatis and the more agile toninos, which are incessantly rising and blowing in shoals, the scene may be somewhat imagined, but cannot be adequately described."

6158. Among the many medicinal and poisonous plants growing on the banks of the Orinoco, one of the most singular is a species of Bejuco, which, when properly administered, proves a powerful preservative from the effects attending the bite of every description of poisonous serpents. It even appears to deprive these reptiles either of the power or inclination to use their fangs. Some of the leaves and small branches are pounded, and applied in this state as a cataplasm to both arms; the skin having been previously scarified freely above the elbows. This species of inoculation is repeated at stated intervals; the juice of the bruised plant, diluted with water, being also occasionally drunk. Several soldiers, belonging to General Zedillo's division of the patriot army, had undergone this treatment, and frequently found the advantage they thus had acquired. They were thereby enabled to take shelter in deserted huts, which others dared not enter, for

The substance is easily recognised, and this is the only ipecacuanha actually sent abroad from the capital of Brazil; for it is not true that the roots of *Ionidium Ipecacuanha*, still less those of *Ionidium parviflorum*, which grows in a very distant province, are mixed with those of the true *Cephaelis Ipecacuanha*. Though this latter has been exterminated in the environs of Rio Janeiro, and near most of the large towns, it is still very common in many spots; but the practice of pulling up the plant indiscriminately, whether the seeds be ripe or otherwise, with the daily diminution of the virgin woods where it grew abundantly, cannot fail to render it scarce; and it were most desirable that some plan for cultivating it were adopted. This is easily accomplished by seeds or runners; and it requires no care, if grown under the shade of large trees; but an artificial shelter would be necessary, if it were cultivated in open spots.

6155. *Cacao*, probably an aboriginal native of Brazil, though extensively cultivated in other warm countries, is the fruit of the *Theobroma* or Chocolate tree (*fig. 1011.*). The latter, which is an Indian appellation, is derived from the neighbouring coast of Choco, where the Cacao is much grown; and so fond are the Columbian and Peruvian ladies, more especially the nuns and *devotas*, of this national beverage, that the temporary want of it is considered quite a misfortune; almost as heavy as the loss of tobacco. Such inveterate smokers are the fair Popayanejas, that when the possession of Cauca by the patriot army cut off their supply of this article and of sugar, they used to send their slaves to pick up such ends of cigars as had been dropped in the streets; and when they had exhausted all the *caramelas* and syrups of the apothecaries' shops in sweetening their indispensable chocolate, they bethought themselves of boiling dried figs, and using the sweet liquor thus obtained, as a substitute for sugar. The generic name *Theobroma* (food of the gods), was conferred on this tree by Linnaeus, to mark his opinion of the excellence of its seeds; though Benzoni, who travelled in South America in the sixteenth century, formed a different estimate of its merits, and declared that chocolate was "a drink fitter for a pig than a man." The Cacao is the kernel of this tree, which it is customary to bury for forty days, in order to deprive it of its acrid flavour: many aromatic ingredients, especially Vanilla, being added to do away its native nauseous taste—"Le moëlleux Cacao s'embaume de Vanille," according to the author of *Les Jardins*.

6156. *The following* is the process used by the chemist, M. Cadet, in preparing Chocolate. The Cacao seeds are roasted like coffee beans, either in an iron pan or a cylinder; and, when half cold, are spread on a table, and bruised with a wooden rolling-pin, to remove the arillus: then they are winnowed, sifted, and cleansed. When the kernels

fear of the snakes always lurking in such places; although those men could bring them out in their hands without sustaining any injury. No deception was practised, nor any reward asked or expected, for exhibiting their skill in destroying these reptiles. The Zarsaparilla grows in the same neighbourhood in great abundance. Some of the creeks are so full of it, that the natives come to them for leagues around, to bathe, and drink the water, which they assert to be sufficiently impregnated with the virtues of the plant to effect cures in many obstinate chronic complaints.

6159. Among the splendid parasitic orchideous plants, which invest the living as well as the dead trunks of the forest trees with verdure and blossoms not their own, is the Vanilla (*V. aromatica*) (fig. 1012.); the fruit of

VANILLA AROMATICA.

which is so well known for its very sweet and balsamic odour, and its warm, pungent, and highly agreeable taste. A volatile and odoriferous oil is extracted from it, which both water and alcohol take up. Three kinds of vanilla are distinguished in commerce, the Pompona or Bova, which has very thick, swollen, and strong-scented pods; the Vanilla de Ley, or legitimate vanilla, which is the best, and has slender and very fragrant pods, of a deep rich brown, neither black nor red, neither too dry nor too gummy: of this kind it is requisite that the packet of fifty should weigh at least five ounces, that which carries down eight ounces being considered *sobre buena*, or superexcellent. The fragrant scent of this latter kind produces an intoxicating or drowsy effect; the fresh pod being filled with an oily fluid, replete with innumerable small black seeds. The third sort is called Bastard Vanilla, and is the worst of all. It is probable that all the kinds are but varieties, arising from soil, culture, degree of maturity, and perhaps mode of preparation. According to Aublet, the following is the process to which the inhabitants of Guiana subject the vanilla:—When a dozen or more pods are gathered, they string them as quickly as possible near the peduncle, and bleach them instantaneously, by dipping them into boiling water. Then they are hung up in the open air exposed to the sun, and the following day smeared with oil, to prevent their shrinking or drying too fast. It is necessary, also, to bind them round with an oiled thread, that the pods may not split open. While hanging up, the superabundant viscous fluid

flows from the point which is downwards, and they lose their clamminess, and become brown, wrinkled, soft, and shrunk to a quarter of their former size. In this state they are rubbed with oily hands and deposited in a varnished pot, to keep them fresh. In the torrid parts of America, it were most easy to cultivate vanilla, and to produce much larger quantities than are now obtainable; but the inhabitants only collect such fruit as is found on the wild plants, which are confined to the shores of creeks and other swampy spots liable to occasional inundation. There, the vanilla twines over the stems of the mangrove, and flowers in the month of May, bearing its fruit in September. The use of vanilla should be confined to persons of feeble constitutions; its heating and irritable qualities would render it dangerous to such as are liable to feverish, inflammatory, or cutaneous symptoms. It is used in cakes, lemonade, sherbet, and ice; but especially for giving a flavour to chocolate.

6160. *Cayenne Pepper* is the fruit of *Capsicum annum*.

6161. *The Bixa Orellana*, or Arnotta, which yields the dye with which cheeses are coloured red, arrives to the stature of a large tree in Guiana.

6162. *Quassia*, that intensely bitter drug, is the wood of *Quassia amara*.

6163. *The Cannon-ball Tree* (*Couroupita guianensis*) is a striking plant, an inhabitant of Guiana, remarkable for the size and beauty of its blossoms and for the magnitude of its fruit. The tree grows to 50 or 60 feet high, covered with foliage that is mixed with racemes of flowers, sometimes containing a hundred highly fragrant blossoms, of a lovely crimson red colour, succeeded by enormous fruits. The fallen shells or husks that strew the ground, so nearly resemble a cannon ball, that one might easily imagine a company of artillery had bivouacked in its shade. If we may trust in the poetic language of M. Descourtilz, *Flore Pittoresque et Médicale des Antilles*, the noise these fruits make in falling affords an additional reason for the name. "Beneath a pure and dazzling sky," says he, "gracefulness is ever united to the magnificence of nature; there the hidden streams only reveal their presence in gentle murmurs, or by the silvery light that they cast upon the rocks, or the soft sound with which they trickle through the grass, or the increased verdure with which they endow the plants. But when the silence of nature is broken by those violent hurricanes which too often, in the torrid zone, blast all the hopes of the cultivator, you may hear the report of the fruits of the cannon-ball tree, whose bursting produces an oft-repeated echo, and resembles the rolling fire of a discharge of artillery." The shell is used in South America for domestic purposes, as the calabash. The pulp contains sugar, gum, malic, citric, and tartaric acids, and is employed to afford a refreshing drink in fevers; but in the perfectly ripe state, it exceeds whatever is filthy, stinking, and abominable in nature; yet the scent is remarkably vinous, and so permanent, that our late friend, the Reverend Lansdown Guilding, on examining some portions of the fruit that had been preserved in rum two or three years, found the native odour of the plant so strong, as to render the apartment almost insupportable. Insects revel in this filthy and disgusting pulp. Beetles and earwigs feed upon it; while the formicas find shelter in the hollow of the shells.

6164. Among the palms, the Manicot Palm and the Cokarita are the most celebrated.

6165. Of the different kinds of Yam, which are cultivated in most tropical countries, though only natives of intertropical India, we shall speak more fully when we come to treat of the vegetable productions of the South Sea Islands, where they form one of the principal articles of food to the natives.

6166. *Batatas*, or sweet Potatoes, are the fleshy, spindle-shaped roots of a *Convolvulus* (*C. Batatas*). There are several varieties, the culture being easy, and the plant bearing *Batatas* at all seasons of the year, those put into the ground in February being fit for use from June to March of the following year. In the South of France, the *Convolvulus Batatas* is cultivated in the open air, in a warm situation and light soil, but a hotbed is requisite for its growth in more northern countries. This root is nourishing and of easy digestion; and forms a staple article of food in many parts of South America, especially Guiana. There are various modes of cooking it, either made into cakes, boiled, or baked; but the best way for preserving its genuine flavour is to steam the roots or to bake them under the ashes. This is the kind of potato which is alluded to by Shakspeare, as possessing stimulating properties (in his comedy of the *Merry Wives of Windsor*), and not the root of *Solanum tuberosum*, which was unknown in Europe in the time of the great English dramatist. The *Batatas* contain a great deal of saccharine matter, and when submitted to the process of distillation, afford an alcohol, of which many of the South American nations are but too fond. The foliage is much relished by cattle; and cows that are fed upon it yield an increased and improved quantity of milk.

6167. *Cassava bread* is nowhere, perhaps, more abundantly prepared than in Guiana. It is produced from the root of the *Jatropha Manihot* (fig. 1013.), and in the following manner:—The root is rasped on large tin or wooden graters, fixed on benches, behind which the women employed in making it stand in rows. A sufficient quantity having been rasped for one time (as the surplus would ferment and spoil), they put it in long circular baskets of plaited rushes, about 10 feet long, and 9 inches in diameter, called *mangueras*. These are hung up, with weights attached to the lower end, which draw the plaited work tight together, diminishing its capacity, and squeezing out the juice. When all the fluid is extracted, the *mangueras* are emptied of their contents on raw hides, laid in the sun, where the coarse flour soon dries. It is then baked on smooth plates, made of dry clay, with a slow fire below. This is the most difficult part of the process. The coarse flour is laid perfectly dry on the hot plates, where the women, with a dexterity only to be

acquired by practice, spread it out in a round and very thin layer, nearly the size of the plate it is laid

1013

JATROPHA MANIHOT.

on. This they do, merely with a piece of calabash, which they keep in constant motion; pressing gently every part of the surface, until the heat has united the meal into a cake, without in the least altering its colour or scorching it. Their method of turning a cassava cake of that size resembles sleight of hand; for they effect it with two pieces of split cane, without breaking it, though scarcely so thick as a dollar, and only as yet half cemented together, and of a substance always brittle, especially when warmed. This bread is very nourishing and will melt to a jelly in a liquid; but it is dangerous if eaten in any quantity when dry, as it swells, on being moistened, to many times its original bulk. It will keep good for any length of time, if preserved in a dry place. The expressed juice deposits, after standing for some time, a fine white starch, which, when made into jelly, is not to be distinguished from that prepared from the arrow-root.

6168. When it is considered that the *Jatropha Manihot* belongs to a highly poisonous tribe, and is itself one of the most virulent of the species, it cannot but excite astonishment to find that it yet yields so abundant a flour, rendered innocent by the art of man, and affording nourishment to many thousands in South America. Even in our own country it is largely imported and served up at table, under the name of Tapioca. Such is the poisonous nature of the juice of Manioc, that it sometimes occasions death in a few minutes; and thus many of the unhappy Indians destroyed their Spanish persecutors. A Surinam physician administered it, by way of experiment, to dogs and

cats, who died after twenty-five minutes of dreadful agony. Dissection proved that it operated by means of the nervous system alone, an opinion confirmed by thirty-six drops being afterwards given to a criminal. These had scarcely reached the stomach when such torments and convulsions ensued, that the man expired in six minutes; three hours afterwards the body was opened, when the stomach was found shrunk to half its natural size; so that it would appear that the fatal principle resides in a volatile substance, which may be dissipated by heat, as indeed is satisfactorily proved by the mode of preparing the root for food. The root of manioc is also the basis of several fermented liquors, and the leaves are boiled and eaten. An acre of ground planted with the *Jatropha Manihot* yields nourishment to more persons than six acres cultivated with wheat.

6169. A delicate aromatic seed is known in this country by the name of Tonquin Bean. This is the seed of *Dipterix odorata*.

6170. Among the numerous interesting plants of Colombia, two are especially deserving of notice; the Cow Tree and the Arracacha. The first of these (*Galactodendron utile* of Humboldt) is almost confined to the coast Cordillera near the Lake of Maracaybo. Humboldt had often heard of this tree, and been assured that the negroes on the farm, who drank plentifully of this vegetable milk, regarded it as wholesome: but so acrid and poisonous are all other lactescent trees, that nothing but experience convinced him that the virtues of the Palo de Vaca are not exaggerated. The tree is handsome, with the general aspect of the Star Apple (*Chrysophyllum Cainito*). When incisions are made in the trunk, an abundant gummy and thick milk exudes, which diffuses a pleasant balsamic smell. Humboldt drank a large quantity of this milk, night and morning, without experiencing any disagreeable effect, the tenacity of the fluid being the only thing that was unpleasant. The negroes soak their Maize or Cassava bread in it; and give the name of *cheese* to the curdy, tough, membranaceous substance which collects on the surface, after some days' exposure to the air. Humboldt says*:—"Among the many curious phenomena that I beheld during my journey, there was hardly any that struck my imagination so forcibly as the Cow Tree. Every thing connected with milk and with farinaceous food inspires us with interest, and reminds us of our helpless infancy. Ancient and modern nations have felt a religious veneration for grain; and milk seems exclusively an animal production. Such being our first impressions, the surprise that seizes the mind at the sight of such a tree is but natural. It grows on the rocky side of a mountain, scarcely insinuating its roots in the stone. For many months, not a shower of rain falls on its dry and coriaceous leaves, the branches seem dry and dead; but pierce the trunk, and a sweet and nourishing milk flows. At sunrise, this vegetable source is most abundant; then the blacks and native people hurry from all parts, provided with jugs, to catch the milk, which turns yellow and thick on the surface. Some drink it on the spot, and others carry it to their children, till one might fancy that a cowherd was distributing to his family the milk of the flock."

6171. From this extraordinary fluid, Dr. Thomson, Professor of Chemistry, has extracted a new substance, which he calls Galactine.

6172. The Arracacha (*Arracacia esculenta*, Bot. Magazine, t. 3092.) is a productive and hardy root, grateful to the palate, and of easy digestion. It is peculiar to the hilly country, and is particularly cultivated near the city of Santa Fé, where it is planted in the same manner as potatoes, to which it is preferred, resembling, in shape and taste, the Jerusalem artichoke. The natives frequently use it, together with maize, for making that celebrated Indian beverage called *chica*, which is commonly drunk by the mountaineers. The roots are irregularly shaped, and adhere in clusters to the original plant. The culture of the Arracacha root has lately been extended to Jamaica, the climate of which seems perfectly suited to its nature. The soil which suits yams appears equally adapted to the Arracacha.

SUBJECT. 3. Zoology.

6173. The Zoology of Brazil is of such a nature, that we know not how to convey an adequate idea of its magnificence or its richness. Yet, if we view it in reference to that of any other region of equal extent, it is beyond dispute the most splendid in the world. This extraordinary luxuriance of animal and vegetable life, which is the chief characteristic of the New World, but more particularly of its intertropical regions, has been the astonishment and admiration of all who have visited its shores. But no one has more happily illustrated, with every appearance of truth, the probable causes of this fecundity, than the celebrated Humboldt. "The narrowness," observes this accomplished traveller, "of this variously indented continent, its great extension towards the icy pole, the wide ocean over which the tropical winds blow, the flatness of the eastern coasts, the currents of cold sea-water which flow northwards from the Terra del Fuego towards Peru; the number of mountains, the sources of countless springs, and whose snow-clad summits tower above the clouds; the abundance of large streams, which, after many windings, always seek the remotest coast; deserts without (naked) sand, therefore the less heated; impenetrable forests which cover the well-watered plains near the equator, and which in the interior of

* *Relation Historique*, book v. ch. xvi. p. 109.

the country, where the mountains and the water are most remote, exhale immense masses of imbibed or self-producing water: all these circumstances give to the flat portion of America a climate which, by its moisture and coolness, forms a surprising contrast with that of Africa. To these causes are to be ascribed that extraordinary luxuriance of vegetation, that exuberant foliage, which forms the peculiar characteristic of the New Continent."

6174. *In applying these philosophic observations to Brazil*, some modifications must be made, and some exceptions pointed out. Two years spent in traversing these enchanting regions, and exploring their zoological treasures, enable us to state the following particulars from personal observation. Vegetation, indeed, covers every portion of this immense empire, but in very different degrees, and with some remarkable modifications. A stupendous range of virgin forests may be said to extend from one extremity of Brazil to the other, running parallel with the coast, and forming a magnificent belt between that and the interior: here the soil is uncommonly rich, being principally vegetable mould, or a fat red loam. In these virgin forests vegetation attains its greatest luxuriance: they produce all the large timber trees; and the ground, when cleared for cultivation, gives an amazing increase. But no sooner does the traveller pass beyond these limits, than he meets with a totally different country. The *Sertam* districts then commence; a name indiscriminately applied by the Brazilians to all inland parts situated beyond the virgin forests of the coast; nevertheless, the natives give more accurate distinctions to the different features of the interior. The names of *Campo* and *Tabulara* are applied to those extensive and somewhat elevated plains which are covered with coarse grass, or interspersed, like a park, at short distances, with low and often stunted evergreens. Clear of underwood, and open to the traveller in every direction, these plains are frequently broken by narrow valleys, or gentle hollows, where the trees become rather higher and acquire a more flourishing growth, thus forming woods; yet they are so matted with an underwood of cacti, bromeliæ, and other spiny shrubs and plants, as to be almost impassable to any but the hunter. These dry woods are termed *Catingas*. The general character of the soil in all these situations is more or less sandy, and, although never destitute of verdure, the vegetation can scarcely be called luxuriant, particularly when compared to that of the coast and the majestic virgin forests which border its shores. These observations are not, of course, applicable to the mountainous districts of the mines, but are descriptive, with little variation, of all those provinces north of Minas Geraes. It is this diversity in the aspect of the country which so naturally influences the distribution of its animals as well as its vegetables. The number and variety of insects towards the coast is inconceivable; moisture and shade, with rich and soft vegetable juices, seem essential to numerous tribes; but on the campos and tabularas, and in the catinga woods, where the soil is dry and hot, water scarce, and the foliage harsh and stunted, insects really appear to be scarce; for the traveller may journey onwards for hours, without being attracted by the appearance of a butterfly. The birds, indeed, are much more numerous, particularly those of the Tanager family, as these derive their principal food from the small fruits and berries which the catinga trees produce in abundance. But we must no longer dwell on these general peculiarities, however interesting, but proceed to a rapid sketch of those tribes most remarkable in the zoology of Brazil.

6175. *Among the Quadrupeds*, we are struck with the number and variety of Monkeys and Bats. The satyr-like Apes and Baboons of the Old World far exceed in size any of their tribe yet discovered in America; neither are the genera of this continent similar to those of Africa or of India; all have tails, but are without cheek pouches or naked callosities on their buttocks. The Howling Monkeys (*Myctes* Ill.) live in the deep recesses of the virgin forests, and are heard morning and evening sending forth such tremendous and frightful howls, as to impress the listener with the idea of the sound proceeding from some gigantic and ferocious animal. The Ursine Howling Monkey (*M. ursina* Humb.) is of this description, and although small, its voice, louder than that of a bear, is perfectly terrific. Monkeys are only abundant in the virgin forests: they live entirely among the loftiest trees; and their tails, being prehensile, give them an additional facility in leaping and jumping from branch to branch with the most perfect ease. No less than sixty-five species are described as natives of Brazil and the regions adjacent.

6176. *The Bats* are surprisingly numerous; and are, no doubt, powerful instruments to keep within due limits the myriads of flying insects: some, however, live almost entirely upon fruits, while others, like the deadly vampire of the East, enter the cattle stables, and even the huts of men, and suck the blood of both. We have more than once had a horse or mule so much weakened by these animals during the night, as to be incapable of travelling.

6177. *The ferocious Quadrupeds* are mostly small, and, although of many species, they appear to be few in number, and are fearful of man. The largest are the Puma and the Jaguar, the last being a most formidable animal. There are, besides, several small and elegantly marked Tiger Cats; but the Lion, Tiger, Panther, Hyæna, and the whole list of savage quadrupeds so common in Africa or in India, are totally unknown in the New World.

6178. *The Puma* (*F. concolor*) may be said to represent the Lion in the New World; like that, it is large and uniformly yellow, but without a mane or tufted tail. It is about five feet long, and two and a half high. Azara informs us that it climbs trees with the greatest ease, although it generally lives in the forests, and lies concealed in underwood. In its wild state, it never attacks man; and when in confinement becomes as gentle as a dog. Whether this Paraguay species is the same as the Puma mentioned by Major Smith, (*Grif. Cuv.* 2438.) is not quite clear.

6179. *The Jaguar* (*F. onca* L.) is not unlike the American panther: they are solitary animals, inhabiting thick virgin forests. They attack cows, and even bulls of four years old, but are especially enemies to horses. It will, indeed, not attack man, unless pressed by hunger; but this is no security to the traveller, as Azara mentions an instance of two men who were seized and carried away by these animals when sitting before a large fire. There are two races, the one larger than the other, but both are fierce and untameable. The Tapir and different species of Sloth are well known inhabitants of tropical America, and have been repeatedly described. The Armadillos likewise belong to this continent. Travellers mention small deer; while numerous Cavys, Squirrels, and lesser quadrupeds, abound. Horses and mules are the only beasts of burden, and sheep are almost unknown.

6180. *The ornithological features of Brazil* have already been noticed; and, in regard to species, it may safely be pronounced the richest in the whole world. Not more than one fifth of the whole empire has been yet explored; yet upwards of 500 different birds have been already discovered, and new objects are continually enriching our museums. To enumerate these would be tedious, even were it possible; but a few general particulars will not be misplaced.

6181. *The Rapacious Birds* are not proportionably numerous. Large Black Vultures are every where seen perfectly tame, and sitting on trees by the way side, ready to devour offal or any dead animal substance. They appear of a different species to the turkey buzzard and black vulture of the United States. The King Vulture (*V. papa* L.) is nearly of the same size, but is much more rare, and is remarkably elegant in its plumage. The forests of Guiana, Pará, and other parts of Brazil, shelter the Aquila destructor, or Great Destroying Eagle, one of the most formidable and ferocious of birds. It considerably surpasses in size the golden eagle of Europe, measuring near three feet long; the back and upper plumage is black, the under greyish white, and on the hind head is a semicircular crest of feathers, which is erected at pleasure. It flies with majestic rapidity, and preys only upon the larger quadrupeds, as deer, sloths, monkeys, &c., pursuing them indiscriminately, and tearing them to pieces by its enormous talons. In contrast to this formidable bird of prey is a little owl, not much bigger than a sparrow, a pair of which were the first birds we shot after landing in South America. The Caracara, or Brazilian Crested Eagle, we have recently illustrated (*Zoological Illustrations*, Pl. 2.), and many other buzzards occur towards Paraguay.

6182. *The extensive order of Perching Birds* offers numerous tribes conspicuous for their beauty, their

splendour, or their singularity. The Tyrant Flycatchers (*Tyrannina* Sw.) are seen in all the open tracts, perched on the surrounding branches, and perpetually on the watch for insects. The Water-chats (*Fluvicolina* Sw.) run along the sides of the rivers and lagoons bent on the same pursuit, and perpetually wagging their tails. In the damp and thick virgin forests reside small troops of those elegant little birds, the Manakins (*Piprina* Sw.), varied with black, golden, and azure blue, seeking the soft berries of the *Melastomæ* and other similar shrubs. The Trogons (*Trogonina* Sw.), Motmots (*Prioniti* Ill.), and Puff-birds, seek the most sombre shades; the Ant thrushes (*Myotherina* Sw.) and the Bush Shrikes (*Thamnophilina* Sw.) are more frequent in the catinga woods; while perched upon the higher trees are seen flocks of Toucans (*Ramphastidæ* Sw.). The Fruit-eaters are heard morning and evening from the same situations; and one, called the Araponga, Blacksmith, or Bell-bird (fig. 1014.), uttering a loud note like the noise of a hammer upon the anvil. On proceeding more inland, different tribes and new species await the traveller. The Chatterers (*Ampelina* Sw.), Woodpeckers (*Piciana* Sw.), and Tree-creepers (*Certhiana* Sw.) frequent the catinga woods, the former to feed upon berries, the latter to search for insects on the stems. Innumerable Tanagers, with flocks of variously coloured Parrakeets, occur in the tabulara woods, and on the less naked campos; while the palms, common to these districts, are frequented by splendid Mackaws, which crack the stone-like nuts with perfect facility.

ARAPONGA.

6183. *Humming-birds* are to be seen wherever a tree is in full blossom, darting about from flower to flower, among splendid butterflies often much larger than themselves.

6184. *The Water Birds*, along the swampy coasts of Pará and in some other parts, are abundant; but these tribes, upon the whole, are but locally dispersed. The splendid scarlet Curlew and the red Flamingo are met with near Pará, in flocks of many hundreds.

BRAZILIAN FROG.

could scarcely walk with it in both hands: its body was certainly bigger than the head of an ordinary man. We omitted to ascertain the precise species (fig. 1015.).

CUPID BUTTERFLY.

found the insect. The Diamond Beetle we have before mentioned; but even this is surpassed in magnificence by two others of the same genus, peculiar to the more southern provinces towards St. Catharine's.

GREAT FIRE-FLY.

also occur in the forests, one of which, the

6185. *Serpents and Reptiles* appear much less frequent than in the equinoctial regions of Africa. Alligators of a small size are often seen basking on the sunny edges of the savannahs; but others are mentioned by travellers of a much larger size and of more ferocious habits. The Rattlesnake appears to be unknown, or very rare, although there are other snakes whose bite is believed to be equally venomous: we must, however, observe that the Brazilians are uncommonly ignorant in these matters, and that we were particularly struck with the paucity of these reptiles met with in our daily journeys and woodland excursions. Many, however, are very beautiful in colour. Boas of a large size are said to be met with on the banks of the great rivers. The frogs in some situations are innumerable, and their croaking is almost deafening. We well remember a little negro boy bringing to us, as a curiosity even to the natives, a frog of such vast dimensions, that the little urchin

6186. *To enumerate the countless variety of Insects* would be almost impossible. Near the virgin forests they absolutely swarm. The diurnal Butterflies (*Papilionidæ*), more particularly, are of a size and brilliancy unrivalled by any in the whole world; of these gaily coloured tribes we estimate that between 600 and 700 species are found in Brazil alone. Some of the lesser are perhaps the most brilliant. One, in particular, named after the God of Love (*Pap. Cupido* L.) (fig. 1016.), has the under wings embossed with gold spots in such a way as to appear as if liquid drops of that metal had fallen upon the wings and cooled without injuring them. Ants are as numerous as in Western Africa; but the scorpions and centipedes are small, rarely seen, and do not appear to alarm the natives. Many of the Beetle tribe are remarkable for their grotesque appearance, and others for the splendour of their colours. The Great Fire-fly (*Phaenocarpa lanternaria*) (fig. 1017.), is said to emit from its snout a light more sparkling than that from a dozen glow-worms. This fact, however, we have never verified, although we frequently

6187. *The Marine Shells* of the Brazilian coast are remarkably few, the *Capsa brasiliensis* (fig. 1018.) being almost the only example of a genus peculiar to these seas. The exterior is covered with an olive epidermis; the interior is tinged with violet. Two new species of *Modiolæ* or Date-mussels (fig. 1019.) have recently been brought from Rio de Janeiro, and the rare *Voluta brasiliensis* of Lamarck is stated to have come from this coast. Few bivalve shells have yet been found in the large rivers; but these are different from all the North American species, and may be known by their superior iridescence. The genus *Hyria* Lam., and its various subgenera, among which is the *Castalia* of the same author, are all from the Brazilian rivers. Some very singular land shells

BULIMUS OVALIS.

SECT. III. *Historical Geography.*

6188. *The coast of Brazil* was first touched in 1499 by Vincent Yanez Pinzon, one of the companions of Columbus, who does not appear, however, to have penetrated far beyond the mouth of the Marañon. Next year it occurred unsought to Alvarez Cabral, while conducting a fleet from Lisbon to the East Indies, then the almost exclusive object of Portuguese ambition. In endeavouring to avoid the coast of Africa, he came upon Porto Seguro, which then appeared to be part of a large island. Cabral immediately sent back one of his ships with tidings of the discovery; and Brazil, as it was called from the ornamental wood which appeared its most valuable commodity, was speedily colonised. As it seemed, however, to yield no other important article, and as the ground could be kept only by severe contests with the savage natives, the progress of the settlement was slow, and it was long before it could come into any rivalry with those which had been formed by Spain.

6189. *The other European nations* did not fail to dispute the possession of so wide and open a coast. Villagagnon carried over a body of French Huguenots to Rio Janeiro, which was even for a short time termed Antarctic France; and the English attempted to fix themselves in the north at Paraiba: but the fierce and determined attacks of the Portuguese rooted up both these establishments. A more formidable effort was made by the Dutch, after the transference of Brazil to Philip II., with whom they were at open war. Under Prince Maurice they made themselves masters of the whole north of Brazil, which they held for nearly half a century. But their establishment having been too much reduced, and their attention being engrossed by other objects, the Portuguese, in 1654, commenced a series of brisk attacks, by which they soon recovered possession of the whole territory. After several attempts to retrieve their affairs both by arms and negotiation, the Dutch, in 1661, were obliged to make a final cession of Brazil to Portugal. The Brazilians had subsequently some occasional quarrels with the Spaniards, especially in 1762, when the governor of Buenos Ayres took from them the fortress of Colonia del Sacramento, which, however, was restored at the conclusion of peace in 1763.

6190. *The great prosperity of this colony* dates chiefly from the year 1699. That was the epoch of the discovery of gold, which was succeeded by that of diamonds; two brilliant objects, which placed Brazil completely on a level with the richest of the Spanish possessions. At the same time the fertility of the soil was fully ascertained, and some progress was made in causing it to yield the richest articles of tropical produce.

6191. *The separation of Brazil from Portugal* was first occasioned by events in Europe. Napoleon having sent Junot, in 1807, with an army to occupy Lisbon, the Prince Regent with all his court sailed on the 25th of January, 1808, for Rio Janeiro. Even after the downfall of the French imperial power had restored him to the dominion of Portugal, this prince, now king, lingered in Brazil, which seemed to be considered as decidedly the most valuable of the two portions of the empire. In 1821, however, the constitutional movements in both hemispheres induced him to return to Europe, leaving his son, Don Pedro, Regent of Brazil. The violence of the Portuguese cortes called upon the prince also to return, and his endeavour to reduce Brazil into a subordinate appendage of Portugal drove the transatlantic state into open resistance and decided separation. At the king's death, Don Pedro did not attempt to follow up his right of inheritance over both kingdoms, but contented himself with the American share. In consequence of internal disturbances, however, he has since been obliged to abdicate in favour of his infant son.

SECT. IV. *Political Geography.*

6192. *The constitution of Brazil* is ostensibly a limited monarchy, on the model of the British, except that there is no hereditary house; the senate, as well as representatives, being elected by the people, with some concurrence of the sovereign. There is, however, a great difficulty in enforcing the measures of any general and central administration over so wide an extent of country, and over provinces so deeply imbued with a local spirit. The northern districts, in particular, have made vigorous attempts and still cherish the wish to form a separate and republican government, on the model of those now established over the rest of America.

6193. *The revenue of Brazil* is stated at about 20,000,000 crusados, about 2,300,000*l.* This is burdened with a debt of 30,000,000 crusados. The military force consists of 30,000 troops of the line, with 50,000 militia; and there is a considerable marine.

SECT. V. *Productive Industry.*

6194. *The natural capacities of Brazil* are fully equal to those of any region in the New World. The soil is capable of yielding profusely sugar, cotton, coffee, tobacco, all the richest tropical productions; the forests are immense, and abound in the most valuable timber; the fields are covered with numberless herds of cattle; and the most precious of

metals are found near the surface of the earth. Its chief defect is, that, destitute of those fine elevated table lands, which cover so much of Spanish America, it affords no eligible situation for European colonists; and the labouring classes consist almost wholly of negro slaves; a circumstance adverse to its prosperity, and necessarily engendering many evils.

6195. *Dense and impenetrable forests* (fig. 1021.) cover a great part of the interior of Brazil, and exhibit a

BRAZILIAN FOREST.

luxuriance of vegetation almost peculiar to the central regions of South America. "The infinite variety of tints which these woods display, give them an aspect wholly different from those of Europe. Each of the lofty sons of the forest has an effect distinct from that of the rest. The brilliant white of the silver tree, the brown head of the Mangoa, the purple flowers of the Brazil wood, the yellow laburnums, the deep red fungus, and the carmine-coloured lichens, which invest the trunks and the bark, all mingle in brilliant confusion, forming groups finely contrasted and diversified. The gigantic height of the palms, with their varying crowns, give to these forests an incomparable majesty. All these are interwoven with a network of creeping and climbing plants, so close as to form round the large trees a verdant wall, which the eye is unable to penetrate; and many of the flowering species, that climb up the trunks, spread forth and present the appearance of parterres hanging in the air. These woods are not a silent scene, unless during the deepest heat of noon, but are crowded and rendered vocal by the greatest variety of the animal tribes. Birds of the most singular forms and most superb plumage flutter through the bushes. The toucan rattles his large hollow bill; the busy orioles creep out of their long pendent nests; the amorous thrush, the chattering manakin, the full tones of the nightingale, amuse the hunter; while the humming-birds, rivalling in lustre diamonds, emeralds, and sapphires, hover round the brightest flowers. Myriads of the most brilliant beetles buzz in the air; and the gayest butterflies, rivalling in splendour the colours of the rainbow, flutter from flower to flower. Meantime the beautiful, but sometimes dangerous, race of lizards and serpents, exceeding in splendour the enamel of the flowers, glide out of the leaves and hollows of the trees. Troops of squirrels and monkeys leap from bough to bough, and large bodies of ants, issuing from their nests, creep along the ground." It concerns us here to remark, that these immense forests are rich in timber of every description for use and ornament, suited either for carpentry, shipbuilding, dyeing, or furniture. That kind specially called Brazil wood is particularly celebrated for the beautiful red dye which it produces.

6196. *Agriculture is exercised in Brazil* upon valuable products, and in fertile soils, but in a very slovenly manner. The farmers, till of late, were a most ignorant race, not believing that there were any countries in the world except Portugal and Brazil, nor any except the last in which the sugar cane grew. They have begun, however, to hold intercourse with the world in general, and to introduce improved processes from the West India islands. Land is so abundant that they never think of employing manure, but break up a fresh spot whenever a cultivated one is exhausted. They do not even grub up the trees, but plant the sugar canes among the stumps, the luxuriant shoots from which cannot be cleared away without great labour.

6197. *Among the objects of culture* sugar has long been prominent; the rich and moist soils on a great part of the coast being particularly suited to it. Notwithstanding the cheapness of land, a considerable capital is necessary to establish a sugar plantation, including at least forty slaves and a variety of machinery. The amount is from 3000*l.* to 10,000*l.*, which is often borrowed, payable by successive small instalments. Cotton has of late become a leading article, in consequence of the extensive demand in Britain. The best is that of Pernambuco; that of Maranhão and Seara being coarser, though it is the staple of both places. In the districts southwards it also declines, and at Rio Janeiro is of little value. Tobacco is cultivated, along with the sugar, for home use, and is an object of traffic between the provinces. Coffee is only of recent introduction; but within these few years the culture has been so vastly extended as to render it the most important object of Brazilian commerce. For food, chiefly to the negroes, manioc and kidneybeans are the articles most raised. Maize and bananas are not so much used as in most tropical countries. Rice is largely cultivated only in Maranhão.

6198. *Cattle* multiply to an immense extent in all the provinces of Brazil, but more especially in the south. The great farms contain 2000, 3000, 4000, and sometimes even 40,000 head. The bulk of these roam at large in a wild state, with no attendance except that of two or three peons or herdsmen, riding constantly round the wide pastures, to keep them within the bounds, and defend them against the attacks of wild beasts. Once a year only they are collected within an enclosure, and branded with the mark of the master. Portions of these roving herds are from time to time caught and killed, chiefly for the hide, though the flesh also is dried in a peculiar manner, and sent to the northern provinces. A certain number, notwithstanding, are tamed, to supply milk, and to serve for meat, which is considered more delicate than that of the wild cattle.

6199. *Mines*, however, form the most celebrated, though by no means the most valuable, source of Brazilian wealth.

6200. *The gold of Brazil* occurs, like that of Africa, in the form of dust brought down by streams which descend from the hills, and from which it is separated by agitation in water. No attempts seem yet to have been made to penetrate into the interior deposits of this precious metal. When the auriferous streams overflow their banks, the inhabitants, to whom the search seems generally left open, hasten in crowds to this attractive occupation. A man takes his station at the edge of the stream, and begins with a small hoe to open a trench, which may be carried in any direction that suits him, provided it does not encounter that of another adventurer. The water is allowed to stand through the day, and is poured off at night; the sediment deposited, called *cascalho*, is then carried home, and made, though by very rude processes, to render up its gold. That the soil may be impregnated in every direction, channels are formed down the sides of the golden mountain, and pits dug, by which processes it is perforated like a honeycomb; and the earth being all washed away, presents a picture of desolation which excites the astonishment of strangers. The produce of gold has greatly diminished, and on the whole the precious metal has proved to Brazil a fatal gift. The eager search and hope have continued after the amount ceased to repay the labour. A few instances of wealth suddenly acquired have generated a dislike of steady and regular occupation; and the rich soil in the neighbourhood of the mines, and

from which the most solid wealth might have been derived, is allowed to lie waste. The fifth claimed by the king, though extensively evaded, presses heavily on this branch of industry.

6201. *The diamonds of Brazil* are a source of wealth still more brilliant, yet even less productive. The principal diamond ground is in a circuit of sixteen leagues round Tejuco, in the district of Serro do Frio. The trade has been monopolised by the government; and, as usual in such cases, has been conducted at a very great expense. Not less than 35,000*l.*

1022

DIAMOND RIVER.

broad as the Thames at Windsor. When worked, the channel is turned aside either by canals or pumps, and the earth from the bottom dug out. The cascalho is then laid in

1023

WASHING FOR DIAMONDS.

heaps by the side of a flooring (*fig. 1023.*), divided into various compartments, into each of which a current of water is admitted. While this passes through, the cascalho is kept in constant motion by raking it till the earthy particles are washed away. The negro stationed at each compartment then begins a most diligent search for the diamonds. When he finds one, he claps his hands, and holds it up between his forefinger and thumb to the overseer, who places it in a bowl suspended from the centre of the structure. When a negro presents a stone of seventeen carats and a half, he receives his liberty; and handsome presents are given whenever any diamond of inferior, though of considerable, size is found. On the other hand, the strictest precautions are taken to prevent any from being secreted. Three overseers, placed on high seats, command a view of the whole group; and the negroes are frequently changed from one compartment to another, lest

they should thrust a diamond into a corner, and return to take it away. There is an infinite variety in the size of the diamonds. Some are so very small that sixteen or twenty are required to make up a carat; while, on the other hand, two or three are usually found in the course of a year, weighing from seventeen to twenty carats. It is not expected that one weighing thirty carats will be found oftener than once in two years. The diamonds of Brazil are larger than those of India, and as brilliant, but not so hard. At the first discovery of the mines they sent forth no less than a thousand ounces of diamonds, which made a prodigious impression on the market; but of late their annual produce has not much exceeded 22,000 carats.

6202. *Of other mineral products*, iron and copper are said to abound in the interior province of Matto Grosso; but they have not yet been worked. There are also topazes larger than those of Saxony and Siberia, tourmalines, and rock crystal.

6203. *Manufactures* have made smaller progress in Brazil than in any other of the South American colonies. The only fabric of importance is that of gold and silver, which is carried on in the capital to a great extent. The articles wrought are of great beauty, and are an object even of export.

6204. *Commerce flourishes* in consequence of the very dependence of the country upon foreign manufactures, as well as the valuable products of its soil. Rio Janeiro is the centre of trade for the southern coasts, which send to it provisions for its own consumption, as well as hides, tobacco, sugar, and cotton; vast trains of loaded mules also come and go to the interior provinces, especially S. Paulo and Minas Geraes. Bahia carries on most of her trade, and Pernambuco and Maranhão nearly all of theirs, direct with Europe. In 1829, the trade between Britain and Brazil employed 254 ships, 57,682 tons, and 3044 men outwards; 168 ships, 38,322 tons, 1968 men inwards. The principal articles of export from

Britain were, cottons to the value of 1,488,000*l.*; woollens, 278,000*l.*; linens, 181,225*l.*; silks, 10,969*l.*; brass and copper manufactures, 134,306*l.*; hardware, 67,996*l.*; iron and steel, 49,913*l.*; glass, 25,958*l.*; hats, 53,045*l.*; earthenware, 37,050*l.*; apparel, 20,614*l.*; soap and candles, 24,100*l.* The chief imports were, 28,878,000 lbs. cotton; 3,393,000 lbs. coffee, 85,202 cwt. sugar. The total exports of Brazil may at present be estimated at

	£		£
Sugar, 75,000 tons, worth in Brazil	- 20	-	1,500,000
Coffee, 40,000 —	- 55	-	2,200,000
Cotton, 180,000 bags	- 5	-	900,000
Hides, 500,000	- 1	-	500,000
Bullion, rice, tobacco, dye and other woods, cocoa, &c.	-	-	500,000

£5,600,000

The real or declared value of the various articles of British produce and manufacture exported to Brazil in 1831 was 1,238,371*l.* Cotton goods amounted to more than the half of this sum; of the other articles the principal were linens, woollens, soap and candles, and earthenware.

(M'Culloch's *Com. Dict.*, 2d edit., art. RIO DE JANEIRO.)

6205. The roads from Rio to the leading points of the interior are said to be tolerable; though the entire absence of waggons seems to imply a very low degree of improvement. In the more unfrequented districts the roads are merely paths cut in the woods, and made ex-

1024

CROSSING A RIVER.

tremely narrow, not only that less labour may serve to make them, but that the constant tread over one spot may check the continual encroachments to be dreaded from tropical vegetation. The numerous streams, destitute of bridges, and, in many cases, of ferryboats, are crossed on rafts moved by poles, while the horse, held by the head, is made to swim over (*fig. 1024*).

SECT. VI. Civil and Social State.

6206. The population of Brazil has been very vaguely estimated, and generally much under the truth. Sir George Staunton, in the end of the last century, did not suppose it to exceed 200,000 whites, and 600,000 negroes. From further enquiries it was ascertained that the number could not be less than 3,000,000. But according to a report made to the king of Portugal in 1819, and different statements furnished by the captains-general and other officers, Brazil, between 1816 and 1818, contained 3,617,000 inhabitants. Of these there were 843,000 whites, 426,000 freemen of mixed blood, 159,000 free negroes, 1,728,000 negro slaves, 202,000 slaves of mixed blood, 259,000 Indians. The number must since that time have increased greatly, both from immigration and from the introduction of negro slaves, which, by Mrs. Graham's tables, averaged 23,000 in the years 1821 and 1822. Probably, also, many of the returns were defective; and we therefore incline to agree with Humboldt in thinking that the real number is a good deal more than 4,000,000.

6207. The great predominance of the negro population distinguishes Brazil unfavourably from the other South

American states. By the above statement, it appears that not a fourth of the population are of unmixed white race, and that more than half the entire number are slaves. The continual importation of these negroes, the numbers who perished in the voyage, and the manner in which they were exhibited in open market (*fig. 1025*), presented scenes equally distressing and degrading to humanity. By a law of the state, however, this importation was, in February, 1830, finally to cease. The existing slaves are exposed, of course, to all the capricious and brutal treatment of their masters; and with less protection from law than in the West Indies. On the whole, however, their actual condition is much more favourable than either there or in the United States. The religious principles of Christianity, even

1025

SLAVE MARKET.

in its most corrupted state, must always impress a sense of the original and essential equality of man. It is a matter of course that the slaves must be baptized and receive some elements of religious instruction; marriage is encouraged, and various privileges are conferred. Even the multitude of festivals affords a relief to the slave, and gives him opportunities of doing a good deal for himself. Public opinion is against the master who obstructs the negro in endeavouring to procure his own emancipation, and refuses a reasonable price for it. What is of more importance, as soon as the negro or mulatto is free, he labours no longer under that dire proscription which disgraces the boasted freedom of the American States. He is admissible to all offices, is equal to the white in the eye of the law, and not very much inferior in public opinion. Mrs. Graham saw at the levee several negro officers taking in their black coarse hands the fair hands of the queen, and applying them to their lips. Mr. Mathison even conceives that, in the event of a slave insurrection, all the class of free negroes would make common cause with the whites.

6208. *Of the Brazilian character* report does not speak very favourably. The emigrants consist, in a great measure, of adventurers, often of inferior rank, who have gone out with the view of amassing a fortune in any shape, and pursue a traffic partaking more of peddling and retail habits than of any liberal principles of trade. Many of the free negroes and mulattoes seem to have a good deal of the scoundrel about them. The ladies have less liberty than in Europe, and do not make the very best use of what they have. The charges against them seem often too sweeping; but, from the concurrent testimony of travellers, they rank lower than those of Europe, and have not the same graces either of attire or manners. Mrs. Graham, however, observed a warmth of domestic affection which she never saw equalled, unless in some of the Highland clans, and which shows itself rather unluckily by marriages of uncles with nieces, nephews with aunts, and others within the forbidden degrees. On the whole, the night of ignorance in which Brazil has hitherto been involved must serve as an excuse for many faults; and, in proportion as this is dispelled, much improvement may be expected.

6209. *Science, literature, and art* have scarcely yet any existence in Brazil. Some of the higher classes, and of the officers of the government, are well informed, and the sea-port towns are beginning to imbibe the spirit and knowledge of Europe; but these improvements have made little way into the interior. In 1808, the prince regent carried out a library of 70,000 volumes, which is open to the public; and there is a museum, containing a fine collection of diamonds, crystals of gold, and other Brazilian minerals, but not rich in any other respect. The plan of founding an university is not yet executed; and the Brazilians who seek a finished education must cross the sea to Coimbra.

6210. *The Indians in Brazil* are in a much more uncivilised and unpromising state than in the Spanish settlements. They have never been incorporated in any shape with the European population, but have always retired before the progress of civilisation into the depths of their forests. They have borrowed, indeed, from the Portuguese some scanty portion of raiment. But they have never attempted the taming of animals, or the planting of grain; they subsist solely on the spontaneous fruits of the earth, the roots which they can dig up, and the game brought down by their arrow, which they shoot with marvellous dexterity, taking an almost unerring aim at the distance of forty or fifty yards. They have always ranked, even among American savages, as pre-eminently rude and barbarous. They have been regarded as anthropophagi; though, perhaps, the evidence of late travellers to this point is not quite decisive; for we cannot admit as such the hideousness of their aspect, or their custom of devouring flesh half roasted. As among other savages, some most uncouth customs prevail. The Botocudos, who inhabit the back settlements of Porto Seguro, have a favourite mode of ornamenting themselves by what is called the *botoque*. This consists of large pieces of wood pendent from the ears and the under lip, to which they are fastened by holes bored for that purpose. The result is, that the ears are stretched till they hang down, like wings, sometimes to the shoulder; while the lip is made to project, and half the lower teeth are protruded in the processes of eating and speaking. They sometimes also paint themselves frightfully, the body black and the face red, probably to strike terror into their enemies. The Puries, Pataches, Machacaries, with sundry other tribes, of name and aspect equally uncouth, have the same general character, with sundry fantastic peculiarities belonging to each.

SECT. VII. *Local Geography.*

6211. *The provinces of Brazil* can scarcely as yet be exhibited in any very minute local and statistical details. In taking a view of their leading features, we may divide them into the provinces of the southern coast, Rio Janeiro, St. Catharine, Rio Grande do Sul or Pedro, Espiritu Santo, Porto Seguro; those of the northern coast, Bahia, Serecipe, Alagoas, Pernambuco, Paraiba, Rio Grande do Norte, Seara, Piahy, Maranhã; the interior provinces, Minas Geraes, San Paulo, Uruguay, Paraná, Goyaz, Matto Grosso, Pará.

6212. *Rio Janeiro* (*fig.* 1026.), the capital of the province of that name, and of the kingdom, may now, perhaps, rank as the largest and most flourishing city of South America. It lies on the western side of a noble bay, seventy or eighty miles in circumference, forming one of the most spacious and secure receptacles for shipping in the world. Mrs. Graham, after successively admiring the bay of Naples, the Frith of Forth, and

Trincomalee, considers the bay of Rio Janeiro as surpassing them all in beauty. It is studded

RIO JANEIRO.

with upwards of 100 islands; the ships of all nations are seen passing through its channels, and innumerable little boats flitting about. The shore rises immediately into green and wooded hills, thickly planted with villas and convents, and behind which lofty mountains shoot up their heads in the most picturesque and romantic forms. These objects compose the most enchanting scene that can be imagined. It struck a late traveller

as greatly resembling the Trosachs at the entrance of Loch Katrine. The town is tolerably well built, much in the European style, the houses being three or four stories high, though the streets are rather narrow. Two of them extend the whole length, with new and broad streets striking off from them; and there are several very handsome squares. The town is well supplied with water, by excellent aqueducts. There is a greater stir and bustle than is usual in an American city, though the crowd of half-naked blacks and mulattoes offends the eye of the newly arrived European. The population has been fixed only by rude conjecture. Before the arrival of the court, it was supposed to fall short of 100,000; but that event caused a great increase, and it has even been estimated as high as 150,000. The environs of Rio de Janeiro are delightful in the extreme, the valleys and sides of the hills being covered with trees, shrubs, and creeping plants of peculiar beauty. The bay of Botafogo, and the sides of the rude and lofty mountain called the Corcovado, are the spots most particularly celebrated. The king has a rural palace, called San Christovao (*fig. 1027.*), of light and pavilion-like architecture, and which from its site has a much more pleasing effect than that in the city. We have already noticed the trade of Rio Janeiro, centring in itself that of all southern Brazil. The cultivation of sugar, coffee, tobacco, cotton, and other tropical products, is rapidly extending; but the greater part of the flour made use of is brought from the United States and the Cape of Good Hope. The trade is chiefly in the hands of the British. The arsenal, the dockyard, and marine establishments are on a small island within the harbour.

6213. *St. Catharine* is a long narrow province, which is chiefly remarkable for the island of the same name. It has a fine climate: its perpetual verdure and its conical rocky hills give it a beautiful aspect from the sea. The town has 5000 or 6000 inhabitants, many of whom have chosen it merely as an agreeable residence. The coast is as yet thinly peopled, though it contains several excellent harbours, as Laguna, Guaropas, and particularly San

PALACE OF SAN CHRISTOVAO.

Francisco, on a river of the same name, which will increase in importance when a road is opened over the mountains into the fine plain of Orotava.

6214. *Rio Grande do Sul*, the most southern province, comprises a long extent of level and alluvial coast, in which the large lakes of Patos and Mirim run parallel with the sea. The plains are covered with vast herds of cattle, which afford hides and *charque*, or beef dried in a peculiar manner, making a copious object of export. Some of the fazendas, or farms, comprise no less than 600,000 acres. The chief town is Portalegre, to which the opportunities of its trade have attracted

even English settlers. Being situated at the head of the lake, its maritime intercourse is carried on by the port of St. Pedro, which is also flourishing.

6215. The provinces of *Espirito Santo* and *Porto Seguro* extend for about 400 miles along the coast northward from Rio; but though the latter was the point first discovered, and though they possess ample natural advantages, they have remained always in a comparatively rude and unimproved state. The coast ridge of Brazil is here formed, according to the observation of Prince Maximilian, of a broad tract of high forests, extending from Rio de Janeiro to Bahia, which has not yet been occupied by Portuguese settlers. Only a few roads have been opened, with considerable labour, along the rivers which traverse them. A few settlements have been formed along the coast, which supply with timber and manioc flour the large cities of Rio and Bahia. These are so closely pressed by the Puries, Botocudos, and other tribes of Indians, that it is dangerous for settlers to penetrate into the interior, unless well armed and in large parties. These tracts, susceptible of the highest cultivation, are covered at present with noble virgin forests, in which the cedar, the Brazil wood, the Peruvian balsam tree, and other aromatic and valuable species, abound. The Rio Doce is the only river of a long course; and it can be ascended in canoes propelled by poles. It is in most places bordered by forests so thick and impenetrable, as seldom to leave ground on which a house could stand: they echo with the roar of the tiger, the ounce, and the wild boar, and of men still more savage and dangerous. Among numberless other birds are seen the magnificent macaws, screaming aloud and soaring above the tops

of the highest trees. Of the sea-ports, the largest is Casa Velha, to which may be added those bearing the names of the provinces, Espiritu Santo, or Victoria, and Porto Seguro; as also Benavento and St. Mattheus. These towns consist generally of houses one story high, and the streets are straggling, unpaved, and covered with grass. In Porto Seguro, though so near the sea, they have no other food than salted fish, which renders the scurvy very prevalent.

6216. *The fine province of Bahia, or St. Salvador*, follows north from the two rude regions already described. It is the most flourishing and industrious part of all Brazil. Besides being originally the metropolitan province, it was long occupied by the Dutch, who introduced their own commercial and improving habits. The territory called the Reconcale, containing a sweep of from twelve to forty miles in breadth, is in high cultivation, and contains many flourishing interior towns. Sugar, tobacco, and cotton are largely cultivated and exported.

6217. *The city of Bahia, or St. Salvador*, is situated within Cape St. Antonio, the eastern boundary of the noble bay of All Saints, which strikingly resembles that of Rio Janeiro. It is similarly studded with many islands, and traversed by numberless sails, almost all the provisions and vegetables being brought by water. The shores, though not mountainous, are high and richly wooded, and the town has a magnificent appearance from the water. With these attractions the interior does not correspond, at least that of the lower town, where the houses are high, the streets confined and narrow, wretchedly paved, never cleaned, and therefore disgustingly dirty. The upper town, however, placed upon the side of a hill which rises abruptly behind, though not well built, has a number of handsome private houses and public buildings. The sites and prospects are beautiful in the extreme. Every step brings to view some magnificent scene; the woods, the steep banks and gently sloping lawns, generally opening to the sea or the lake behind the town, have a peculiar freshness and amenity. The cathedral and several other churches are handsome and richly ornamented; but the finest of them, the Ex-Jesuits' church, built entirely of marble imported from Europe, has been converted into barracks. Society is not considered, by Mrs. Graham, to be so polished as at Rio; the dress and appearance of the ladies in the morning are extremely slovenly, though in the evening they appear fully attired in the French style. Gaming, the resource of vacant minds, is eagerly followed by both sexes. Intellectual pursuits seem little regarded; and though there is a large library, with some valuable manuscripts respecting the interior of America, it is allowed to lie in a neglected state. The police is bad, the dagger being generally worn, and too often used: the deaths by assassination are estimated at 200 in the year; yet St. Salvador is esteemed the gayest city in Brazil. In 1832, 124 British ships, of the burden of 27,119 tons, cleared out from Bahia.

6218. *Of the other towns of Bahia*, Cachoeira, the principal of those in the Reconcale, is handsome and well built, and contains nearly 10,000 inhabitants. Jacobina, more in the interior, was formerly enriched by mines, which are now given up. Ilheos, a prettily situated port, was once very considerable, but it sunk with the banishment of the Jesuits, and is now of little importance.

6219. *Pernambuco* is the next province to Bahia, with the intervention of the small and unimportant ones of Serecipe and Alagoas. Pernambuco ranks decidedly as the third province in the empire, being comparatively very industrious, and having experienced a rapid improvement from the extension of the growth and export of cotton. The harbour is one of the most singular in the world. It is formed by a *recife* or reef of rocks, which run parallel with the shore, and on the exterior side of which a heavy sea is perpetually breaking. To the interior channel, however, this reef serves as a complete breakwater, and vessels which have once turned its point hear the surf dashing without, and see the spray, while they themselves are sailing on calmly and smoothly. What is called the town of Pernambuco is a compound of four towns: Olinda, seated above on a range of rocky hills, and the most ancient, but now much decayed; Recife, built on a sand-bank level with the water, and deserving its name from the reef opposite to it already mentioned, — the seat of trade, highly flourishing, and rapidly increasing; St. Antonio, or the middle town, composed of large and broad streets, and containing the governor's house, and two principal churches; lastly, Boa Vista, an extensive agreeable suburb, where the principal merchants have commodious gardens. Pernambuco has flourished extremely and increased rapidly, chiefly in consequence of the augmented culture of cotton, and the ample market for it in Europe. The cotton of Pernambuco is said to be the best in the north of Brazil. In 1809, Mr. Koster reckoned the population at 29,000; while, in 1821, Mrs. Graham's estimate was 70,000. Probably the increase could not be so very great, and there must be some error. The spirit of liberty, and even of republicanism, is very strong at Pernambuco. It showed itself first in promptitude to separate from the mother country, and next in reluctance to submit to the sway of the emperor, to which the inhabitants were at last reduced only by force of arms. This city, the third in the empire, carries on an extensive commerce in cotton, hides, sugar, and wood.

6220. *The river St. Francisco*, much the largest of any which belongs wholly to Brazil, enters the sea in the southern border of this province, after a course of nearly 900 miles through the back territories behind the coast chain. The navigation is much injured, however, first by a succession of falls, and then by shallows at the mouth of the river, which render it scarcely passable even for boats. Till of late, therefore, its banks were occupied only by a few scattered fishermen and banditti. Now towns and villages are rising, and Penedo, the port, about eighty miles up, is becoming a thriving place.

1028

SERTANEJO.

6221. *The interior country* behind Pernambuco consists of plains reaching to a vast extent, though traversed in part by the great middle chain of mountains. They are called the *Sertam*, a term contracted from Desertam, which, however, they do not merit in its most rigorous sense, but bear more analogy to the Llanos of the Orinoco, or the Pampas of La Plata, being covered with luxuriant grass, on which vast herds of cattle are fed. The Sertanejos (*fig. 1028.*), as they are called, occupy *fazendas*, or cattle farms, of such vast extent, that few know their bounds, though they attempt to calculate them by the hundreds of heads of cattle pastured upon them. Their leagues, as in all other thinly inhabited tracts, are of immeasurable and deceiving length, sometimes four miles. Their dress consists of jacket, hat, and long pantaloons or leggings, all of brown untanned leather, a tanned goatskin over the breast, and a pair of coarse cotton drawers or trousers. They live in mud cottages thatched with leaves, and if they possess a table, consider it useless at meals, when the whole party squat round on a mat, with the bowls, dishes, or gourds in the centre. The wife seldom appears, and would be suspected of holding undue sway in the household, were she to make any

attempt to discourse. They eat meat three times a day, with milk and a little manioc flour, or French beans. The children are often suckled by she-goats, which are thence called *comadies*, or godmothers. All their religious ministrations are derived from itinerant priests, who carry about an altar, and all the apparatus for mass, on so small a scale as to be thrust into a pack-saddle; from which they are drawn whenever a sufficient number is found to pay for the ceremony. This, with implicit faith in charms and relics, forms the whole of their religion, to which they are yet so strongly attached as with difficulty to deem it credible that Mr. Koster, whom they understood to be a heretic, should be of the same shape with themselves. They are, on the whole, after all, rather a good sort of people; hospitable, liberal, and open-hearted. Their distance from the seat of justice renders them too prone to take the law into their own hands, and to wash out any deep offence with the blood of the offender. Hence arise deadly and lasting feuds. The traffic is conducted by travelling pedlars, who give them, in exchange for their live stock, hides and cheese, various trinkets, articles of luxury, and English cottons, which are now superseding the coarse fabrics of the country. The Sertam keeps up its intercourse with Pernambuco by Goiana, a considerable and increasing town, forty miles in the interior, on a navigable river of the same name.

6222. *The other provinces of the northern coast*, Paraíba, Rio Grande do Norte, Seara, Piauí, and Maranhão, extend chiefly from east to west towards the mouth of the Amazon. They, in general, present an aspect resembling Pernambuco; the coast containing many fertile and improvable districts, but the interior occupied extensively by the great Sertam, already described, which reaches as far as Bahia. They are chiefly employed in the culture of cotton, and rest their prosperity upon the increasing demand for that material. Maranhão, in particular, an alluvial isle, formed by the branches of great rivers, exports, on an average, 70,000 large bales, of 180 lbs. each, besides a considerable quantity of rice and hides, and has attained a population variously estimated at from 12,000 to as high as 30,000. The other capitals are small. Paraíba, noted for the abundance of Brazil wood, was formerly considered of more importance than now; however, it has in fact continued to increase, though eclipsed by the superior importance of Pernambuco. Rio Grande is covered to a great extent with hills of fine and white sand, and is fertile in sugar, yet thinly inhabited; and Natal, its capital, is little better than a village. Seara has a pretty brisk trade on a small scale; but, according to Mr. Koster, the difficulty of land carriage, the want of a good harbour, and the dreadful droughts, prevent any sanguine hopes of its rise to opulence. Piauí is almost entirely an inland province, and its little interior capital, Oeiras, is scarcely at all known. The isle of Majo dos Soanes, situated at the mouth of the Amazons, is very fertile; but the heats would be insupportable were they not tempered by the sea-breezes. A great part of its surface is covered with woods, tenanted by wandering Indians.

6223. *The interior provinces* consist, in the first instance, of the three in the south, São Paulo, Paraná, and Uruguay; which, with the exception of the chain separating them from the coast, form a vast lowland, traversed by noble and navigable rivers; but as these do not direct their course towards the sea, but all towards the central channel of the Plata, they are as yet of little benefit to commerce.

6224. *São Paulo* was at first an Indian settlement, formed by a Jesuit missionary in 1550; but, being reinforced by numerous refugees and adventurers, a mixed race was formed, of a lawless and daring character, who make a great figure in the early history of Brazil. These Paulistas, as they were called, set the Portuguese government almost at defiance, and made themselves formidable to the neighbouring provinces. They are now brought down to the character of tolerably quiet subjects; but they still maintain, throughout Brazil, the reputation of hardy frankness, undaunted courage, and a romantic love of adventures and dangers. Their features are strongly marked and expressive, their eyes full of fire, and all their motions lively and vigorous. They are the strongest, healthiest, and most active inhabitants of Brazil; and their adventurous spirit leads them to migrate through all its provinces. A good deal of maize is cultivated, sufficient for private consumption; but the chief wealth of the inhabitants consists in the vast herds of horses and cattle with which the plains are covered. The former are of an active and valuable breed; and the inhabitants display a surprising strength and activity in pursuing and taming them. The Paulistas are frank and jovial; but the inferences hence made to their disadvantage are said to be unfair. The ancient province of San Vicente is enclosed in that of São Paulo.

6225. *Uruguay* is formed of seven missions on the eastern bank of the river of that name, ceded by Spain in 1750. Its chief importance consists in the production of the tea or herb of Paraguay, which is considered, over a great part of South America, as much a necessary of life as the tea of China is with the English. That of Uruguay is indeed inferior to what is produced in the territory west of the Paraná; but as Dr. Francia, the present ruler of that region, has capriciously prohibited its exportation, the Brazilians supply all the neighbouring countries with this valuable commodity. The whole country, as far as the La Plata, has indeed been lately erected into a new province, named Paraná; but part of this is, in fact, the undisputed domain of Francia, while his claim to the rest has been successfully resisted by Buenos Ayres.

6226. *Minas Geraes*, the most central province in Brazil, is distinguished as containing the principal mines of gold and diamonds. In passing into it from São Paulo, a decided change is observable in the aspect of nature. The country swells into hills, and gradually assumes the features of a romantic and alpine region. The golden mountains, which traverse the whole extent of Minas Geraes, do not rise above 3000 or 4000 feet; they exhibit not the rugged clefts or gigantic rocky summits of the Alps or of the Cordilleras; they consist of long series of detached ranges, with agreeable campos on their summit, and separated by sloping and pastoral, but not very deep, valleys. The country is often extremely fertile, and might yield the most valuable productions, were not the attention of the inhabitants drawn off by the glittering but often useless treasures found in the bowels of the earth. S. João del Rey is a neat little town of whitewashed, red-tiled houses, surrounded by a singular scene of round hills and broken rocks, with tracts entirely sterile, and others covered with the most luxuriant verdure. Its situation is so agreeable and central, that an intention was once formed of making it the capital of Brazil. The mine from which its distinction is derived is merely a deep pit, into which the streams from the neighbouring hills are directed, and in which any one is allowed to search. Its produce, and the hopes formed from it, have much diminished, and S. João supports its somewhat languid prosperity chiefly by an inland trade, keeping four caravans, of fifty mules each, constantly going backwards and forwards to Rio Janeiro. Villa Rica may be regarded as the El Dorado of Brazil, from its highly productive gold mines, already described. The place is large, its inhabitants being variously reported from 8500 to 20,000. There are 400 or 500 good houses; and the government palace, the town-house, the theatre, and the prison, have rather an unusual air of magnificence. Water is supplied from fourteen fine public fountains. The produce of the mines has declined; but the internal trade is very brisk. Tejuco, the capital of the diamond district of Serro do Frio, is situated in a most dreary tract, where all the necessities of life must be brought from a considerable distance. It is well built, on very rugged ground, and contains 6000 free inhabitants, and as many slaves employed in searching for diamonds. Villa do Príncipe, in a fine country, on the borders of the diamond district, enjoys a more solid prosperity, and contains about 5000 people.

6227. *There are still several exterior provinces of Brazil*, which have been occupied by the Portuguese only at a few detached points, while by far the greater part remains in full possession of the unsubdued Indians. These provinces are, Goyaz, Matto Grosso, and Pará. To them may be added the still more exterior regions beyond the Amazons and the Madera, Solimões and Guiana, the domination over which can be considered by the Portuguese as only future and prospective.

6228. *Goyaz* is a province, or rather kingdom, of vast extent, watered by the mighty streams of the Tocantins and the Araguay, which unite in their progress towards the Amazons. The aspect is described as generally uneven, though seldom mountainous, comprising many sandy sterile plains, wooded only upon the banks of the rivers. Gold was the lure which attracted settlers into this desolate and unfrequented region; and in the country round Villa Boa, the capital, the quantity produced was for some time considerable, though now it is much diminished. Villa Boa contains also a governor, a bishop, and about 6000 inhabitants.

6229. *Matto Grosso*, west of Goyaz, is a still vaster region, extending far into the interior, and bounded

only by the Madera and the Upper La Plata. It consists for the most part of immense plains, similar to the Llanos or Pampas; for the lofty chain which our maps have hitherto interposed between the Amazons and the Plata, has, according to Humboldt, been ascertained to be a mere dividing ridge, rendered sensible only by the separation of the waters. The principal settlement is at Cuyaba, in the south-western district, where it can hold communication with the more civilised regions. Here, too, gold was the first attraction, and even when the quantities which it produced began to diminish, the country was found so fine and fertile, that its cultivation amply indemnified the Cuyaban settlers. They amounted, in 1809, according to Mr. Mawe's estimate, to 30,000. The official capital, however, is Villa Bella, on the Guapore, one of the principal heads of the Madera; a neat small city, perhaps the most advanced point which the Portuguese hold in America. The most powerful of the native tribes in this region are the Guaycurus, a numerous people, who have adopted and carefully reared all the domestic animals of Europe, and have thereby greatly added to their power and numbers, without any deduction from their ferocity. They never cultivate the ground, but subsist entirely on their herds, and the produce of the chase; and, like the Tartars, when pasturage and game are exhausted, they migrate in large bodies from one spot to another. The mothers, it is said, still retain the savage practice of destroying the embryo, till they have attained the age of thirty. The Guaycurus are the terror of all the neighbouring Indians; when successful in war, they massacre all the adults, and carry off the children into slavery. Perhaps in the struggle which must finally ensue between them and the Portuguese, the triumph of the latter may not prove quite so certain as some have anticipated.

6230. *Pará* forms the southern part of this vast interior, filling the interval between the two last-mentioned provinces and the stream of the Amazons. The greater part is, if possible, still less known or occupied than even Matto Grosso; but there is a district near the mouth of the great river, which is not only very fertile, but cultivated to a considerable extent. It is well fitted for sugar, and, since the cotton trade rose to such importance, has particularly prospered, yielding a description little inferior to that of Bahia. The population of *Pará* has been stated at 20,000; but probably this includes the immediately surrounding district. The water communications, however, of this city with the interior are so immense, that it must continue to advance with the progressive settlement of the provinces of Goyaz and Matto Grosso.

6231. *The province of Solimões* is still more remote from the sphere of European and civilised existence. It extends beyond the Madera, south of the Upper Amazons, which here receives four great rivers; destined, perhaps, to be the scene of a crowded navigation, but whose banks at present are only traversed by nameless and thinly scattered tribes of savage Indians. Its only tincture of civilisation has been derived from Franciscan missions, of which nine have been established along the banks of the great rivers.

6232. *The region of Portuguese Guiana* is still more vast, extending 900 miles by 600, and nearly on an equality as to settlement and civilisation. It includes nearly the whole course of the Rio Negro, the rival of the Orinoco, and one of the greatest tributaries of the Amazons. The Rio Negro derives its name from the black colour which its waters present to the eye; notwithstanding which, taken out of the river, they appear perfectly clear and pellucid. Its navigation is good, and by the Cassiquiare it has a communication with the Orinoco, which may hereafter prove of the greatest importance. Three leagues above the mouth of the river, the Portuguese have established the town of Rio Negro, where they not only keep their stores and a small garrison, but have endeavoured to form manufactures of cotton and pottery, which must be considered here as very forced undertakings. They have also several small settlements and missions higher up the river, and on the Rio Branco, its chief tributary. Still farther up, the Amazons receives the Yapura, another immense tributary, coming across from the Cordillera. Its banks are covered with noble woods, indicating a fertile soil; but the navigation is rendered difficult by the rapidity of the current; and the shores have been found unhealthy for European constitutions. The channel of the Lower Amazon, for about 1600 miles, forms a sort of inland sea, in which the opposite banks are often not visible, and the whole of which is believed to be navigable for the largest vessels. This course is through an immense and magnificent plain, not encroached on even by a hillock from the bordering Andes, but sloping gradually and almost insensibly down to the Atlantic. But this region, which will one day be the most flourishing on the face of the earth, is at present occupied only by tribes of wandering Indians, and a few settlements, which the Portuguese have formed by banishing their felons into it. These emigrants, at a distance from all law and restraint, have availed themselves of their superior arms and skill cruelly to oppress the natives, against whom they carry on a regular system of slave-hunting. Charges of cannibalism have been made against these Indians to all travellers, including Mr. Mawe, who descended the river; but they have never been confirmed by credible eye-witnesses, and are alleged by D'Acunha to have been invented by the Portuguese, in order to justify their own outrageous conduct. Equally ancient and continued have been the reports of tribes of warlike females inhabiting the banks; and, though destitute of any regular confirmation, and evidently much exaggerated, they may probably have some foundation in truth.

CHAP. XII.

THE WEST INDIES.

6233. *The West Indies* consist of an archipelago of large and fine islands, situated in the wide interval of sea between North and South America. Their rich products, their high cultivation, and the very singular form of society existing in them, have rendered them in modern times peculiarly interesting.

SECT. I. General Outline and Aspect.

6234. These islands extend in a species of curved line, first east, and then south, beginning near the southern point of the United States' territory, and terminating at the coast of South America, near the mouth of the Orinoco. On the east and north they are bounded by the Atlantic; on the south, the Caribbean Sea separates them from the coast of Colombia; on the west, the broad expanse of the Gulf of Mexico is interposed between them and that part of the continent. They are situated generally between the fifty-ninth and eighty-fifth degrees of west longitude; and, excluding the Bahamas, between the tenth and twenty-third degrees of north latitude. The largest are those which extend from the Gulf of Mexico eastward; Cuba, St. Domingo, Jamaica, and Porto Rico. Those which run from north to south are smaller; but many of them, as Barbadoes, Martinico, Guadaloupe, Trinidad, are very important from their fertility and high cultivation. This latter part of the group is frequently called the Windward Islands, from being exposed to the direct action of the trade winds, blowing across the Atlantic; they are named also the Antilles, and frequently the Caribbee Islands, from the name of the people, called Caribs, found there by the discoverers.

6235. Mountains of considerable elevation diversify each of these islands, causing them to resemble the elevated remains of a portion of the continent, which some convulsion overwhelmed. Generally speaking, the interior is composed of a range or group, sometimes of little more than a single mountain, the slopes of which, and the plain at its feet, constitute the island. The most elevated peaks of Cuba, St. Domingo, and Jamaica exceed 8000 feet; while the highest summits of the Windward Islands range from 3000 to 4000 feet. Most of these eminences have evidently been the seat of volcanic action; but this appears to have ceased in all of them, except the Soufrière of Guadaloupe, which still exhibits some faint indications of it.

6236. *The streams* which descend from these lofty heights, and water the plains along the sea shore, are numerous and copious, and form one main cause of the fertility which distinguishes this region; but as they soon reach the sea, none of them are so important as to call for notice in this general survey. Neither do their waters expand into lakes of any importance.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

6237. *Cuba.* A range of mountains traverses this island from east to west, dividing it into two parts. At the foot of these the country opens into extensive savannahs. The lower districts are composed of secondary formations, through which we observe granite, syenite, gabbro, and gneiss rising in masses of greater or less extent. The highest mountains, probably composed of mica slate, and named the Copper Mountains (*Sierra de Cobre*), at the south-eastern end of the island attain an elevation of nearly 10,000 feet. From hence towards the east there is a hilly range 1800 feet high, in which pure limestone and argillaceous sandstone are the predominating rocks. Near Villa Clara a silver mine has been discovered, and also native gold, ores of copper, and coral marbles, of various kinds, are mentioned as occurring in the island.

6238. *St. Domingo.* We have no account of the geology of this island.—The long and narrow granitic tongue of land, which extends, in St. Domingo, from Port au Prince westwards to Cape Tiburon, was fearfully wasted by an earthquake, in the year 1770. Whole mountains were overturned. The other parts of the island were not disturbed by the earthquake. Hence it may be conjectured, says Von Buch, that this chain rests upon a great internal vent.

6239. *Jamaica.* A part only of the geology of this island has been described by Mr. De la Beche, in the *Geological Transactions*. The tract examined is confined to that quarter situated to the eastward of a line drawn from Alligator Pond Bay to St. Anne's Bay, thus taking in nearly the eastern half of the island, where the highest mountains occur. The Blue Mountain range is principally composed of transition rocks, as greywacke, associated with trap rocks. Resting upon these, at a lower and lower level, are red sandstone and conglomerate, white marl and limestone, in some places intermingled with traps and porphyries; the flat country, from Somerset to Kingston, being diluvium and alluvium. An extinct volcano occurs at Black Hill, in St. George's.

6240. *Volcanic Islands.*—The smaller islands, named the *Caribbean Islands*, geognostically considered, form two groups; an eastern, or exterior, of Neptunian formation, and a western, or interior, of Volcanic formation. The volcanic islands appear, according to Von Buch, to stand in immediate connection with the primitive ranges of the Caraccas, because the earthquakes in the Caraccas ceased when the volcano in St. Vincent broke out. But, if this is the case, the connection must be through the islands of Tortuga and Margarita. This range of volcanic islands extends onwards in a curved direction, and terminates in a new primitive chain, at that point where the range has again assumed the same direction as the Silla of Caraccas. The Blue Mountains in Jamaica, the granite mountains in the southern part of St. Domingo, and in Porto Rico, run parallel with the Silla, and they (as appears on inspecting the map) are equally a continuation of the volcanic series of the small Antilles, as these are of the Silla. None of these volcanoes are very lofty, the highest scarcely attaining an elevation of 6000 feet above the level of the sea. *The Volcanic islands* are Grenada, St. Vincent, St. Lucia, Martinique, Dominica, Guadeloupe, Montserrat, Nevis, St. Christopher, and St. Eustatia: the *Neptunian islands*, which are low, and principally composed of limestone, are Tobago, Barbadoes, Marie-Galante, Grande Terre, Deseada, Antigua, Barbuda, St. Bartholomew, and St. Martin.

6241. *Neptunian Islands.*—The only island of this group of which we have a detailed account is Antigua, described by Dr. Nugent in the sixth volume of the *Geological Transactions*. It contains, besides the characteristic Neptunian rocks, also formations of volcanic origin; and hence may be considered as connecting, in a geognostical point of view, the Neptunian and Volcanic islands. The whole north-eastern part of the island is composed of a yellowish white, earthy, nearly friable, limestone, which in its upper strata contains *Helices* and *Bulimas*, but in the lower, great abundance of *Cerithiæ*, principally enclosed in a siliceous bed of a dark colour, which is subordinate to the limestone. It appears to belong to the tertiary class, and forms hills from 300 to 400 feet in height. The island is crossed from N. W. to S. E. by a conglomerate, which, in a clayey basis, contains many crystals of felspar, abundance of green earth, probably disintegrated augite, and masses of basalt, also of amygdaloidal dolerite or greenstone, lava, hornstone with impressions of corals, and numerous pieces of petrified wood of all sizes and forms, principally palms and other tropical trees. Trees of the same kind also occur in the siliceous bed in the limestone. The rocks of this conglomerate are generally steep towards the S. W., and gently inclined towards the N. E. The limestone evidently rests upon this conglomerate. To this follows, in the south-western part of the island, a doleritic basalt, which forms the greatest height. The separation of these rocks is accurately in the direction of the volcanic islands, that is, from N. W. towards S. E. Hence the island of Barbuda, which is farther removed from the volcanic range, lies entirely in the limestone region. The shells in the limestone differ but little from those of the surrounding sea; but the limestone expands over the whole island, which, although it is eighteen miles long, and thirteen miles and a half wide, is nowhere higher than about 110 feet above the sea. A basaltic cover, therefore, separates this limestone from the volcanoes; and probably these latter, before reaching the surface, have previously forced their way through the basalt. It occurs again in Tobago: specimens of dolerite, containing remains of *cerithiæ*, have been sent from the island; showing that a limestone similar to that of Antigua lies over it. Barbadoes, in its general composition, is very much like Antigua; and the same would appear to be the case with St. Bartholomew and St. Martin. In Deseada, Marie-Galante, and Grande Terre, limestone only appears. This limestone extends to the north and east sides of Martinique.

6242. *Volcanic Islands.*—*Grenada.* Coral reefs bound the coast from S. W. to N. E., but not on the west side. Basaltic pillars occur on two places on the coast. The *Morne Rouge*, formed of three conical hills, from 500 to 600 feet high, is entirely composed of slags and vitrifications. It is, therefore, probably a cone of eruption.

6243. *St. Vincent.* The volcano Morne Garou, which is the loftiest mountain in the island, is 4740 feet high. It was ascended on April 26. 1812, the day immediately preceding the eruption which has made the island so well known to geology. The crater was half a mile in diameter, and from 400 to 500 feet deep. In the middle of it there rose a concave hill, from 260 to 300 feet high, covered, in the lower part, with vegetation, but the summit with sulphur. Vapours of sulphur also ascend from many crevices in the rocks. The crater, according to Anderson, exhibited the same appearance in 1785; and he remarks how evidently St. Vincent, the Soufrière of St. Lucia, Montagne Pelée in Martinique, and Dominica, were extended in the same line. On April 27. 1812, ashes burst from the crater, and, during the night, flames; on the 20th, during the night, lofty pyramidal flames were seen; and, on the 30th, at 7 A. M., lava burst open the north-west side of the mountain, and flowed so rapidly downwards, that it reached the sea in the course of four hours. At three o'clock, a frightful eruption of ashes and stones took place from the great crater, which destroyed nearly the whole of the plantations in the island.

6244. *St. Lucia.* The crater occurs in a sharp and steep chain of hills, from 1200 to 1800 feet high, which traverses the island from N. E. to S. W. The sides of the crater are very lofty and steep, especially on the south-east side. Vapour breaks out on all sides. At the bottom there are numerous small lakes, in which the water appears to be perpetually boiling, and in some places the ebullition is so violent that the water is thrown up to a height of four or five feet. Many places are incrustated with sulphur; and brooks which flow down the sides of the mountain abound in carbonic acid. It is reported that, in the year 1766, an eruption of stones and ashes took place.

6245. *Martinique*. The mountain Pélée, in the northern part of the island, which is 4416 feet high, contains a great crater, or a *soufrière*. Many smaller craters, at a height of 3000 feet, show former lateral eruptions. On the 22d of January, 1762, a small eruption, preceded by a violent earthquake, took place. Dr. Chisholm says the mountain is surrounded with pumice, and granite (trachyte) forms its body; Dupugot also speaks of a hillock of pumice, thirty feet high, on the west side of the mountain, which announces the existence of trachyte in its interior. The Piton of Carvet, probably the highest in the Antilles, rises in the middle of the island. Streams of felsparry lava appear on its acclivity, and basaltic pillars in the hollow between this and the third peak of the island, in the southern part, on the Pic de Vauclin.

6246. *Dominica*. Dr. Chisholm says this island is a confused mass of mountains, the loftiest of which is 5700 feet high. Many solfataras occur in it, which are not burnt out, but, on the contrary, occasion small sulphur eruptions. The lower parts of the mountains are of trachyte.

6247. *Guadalupe*. The Saints Islands, composed of columnar basalt, connect this island with Dominica. The highest hill among them is on the Terre d'en Haut, which is 966 feet. Probably these basalts form a border around trachyte hills. The *Soufrière* of Guadalupe is 4794 feet high, according to Le Boucher; 5100 feet, according to Amie. It is situated in the centre of the island. On the 27th of September, 1797, after the Antilles had been agitated by earthquakes for eight months, this crater threw out a quantity of pumice, ashes, and dense sulphureous vapours, which evolution was attended with loud subterranean noises.

6248. *Montserrat*. Nearly the whole island is composed of trachyte, with embedded, broad, beautiful crystals of felspar and of black hornblende. The *Soufrière* is situated in the Heights of Galloway, and is from 300 to 400 yards long, and about half as broad. Vapours of sulphur rise through the loose stones and heat the ground. The water which flows along in the neighbourhood of these vents is heated to boiling; that which flows at a distance remains cold. But the sulphur does not always rise from the same vents: new vents are daily forming, and old ones are closing up. Hence it happens that the whole mass of rock in the neighbourhood becomes impregnated with sulphur. A similar *soufrière* is situated an English mile distant from this.

6249. *Nevis* has a very characteristic crater, from which vapours of sulphur are condensed, and many hot springs rise in different parts of the island.

6250. *St. Christopher's*, or *St. Kitt's*, is composed of rough precipitous mountains. The loftiest among them, Mount Misery, rises to a height of 3483 feet above the sea. This mountain is composed of trachyte, and conceals at its summit a perfect crater. The island formerly suffered much from earthquakes; but since the great eruption, in June, 1692, the ground has been but rarely agitated.

6251. *St. Eustatia* is a conical mountain, about twelve miles in circumference, provided in the middle with a crater which much exceeds, in magnitude, circumference, and regularity, all the craters in the Antilles.

6252. *Bahama Islands*. This numerous group, as far as we know, is entirely composed of limestone; which, in many places, displays magnificent caves. They may be considered a continuation of the limestone islands of the Caribbean Sea.

6253. *Trinidad* appears to make a part of the continent; and Dr. Nugent remarks, that its rocks are either primitive or alluvial. The great northern range of mountains that runs from east to west, and is connected with the high land of Paria on the continent, by the islands of the Bocas, consists of gneiss, of mica slate containing large masses of quartz, and, in many places, approaches in nature to talc slate; and of bluish limestone, traversed by veins of calc spar. From the foot of the mountains, for many leagues to the northward, there extends a low and perfectly flat land, evidently formed by the debris of the mountains, and by the copious tribute of the waters of the Orinoco, deposited by the influence of currents. The famous asphaltum or pitch lake, situated amidst a clayey soil, is about three miles in circumference; and, in the wet season, is sufficiently solid to bear any weight, but in hot weather is often in a state approaching to fluidity. The asphaltum appears to be supplied by springs. At the south-west extremity of the island, between Point Icacos and the Rio Erin, are small cones, resembling those of the volcanoes of air and mud, near Turbaco in New Granada, which are of the same nature with those of Macaluba and the Lake Naftia in Sicily.

SUBSECT. 2. Botany.

6254. The splendour of the vegetation in the islands of the West Indies is the theme of every traveller there. We must content ourselves with noticing some of the most important of its productions.

6255. Few plants are more extensively valuable, in a commercial point of view, than the *Mahogany* (*Swietenia Mahagoni*) (fig. 1030.). The uses of this wood are too well known to render it necessary here to

MAHOGANY.

mention them, further than to say that almost all our valuable furniture is formed of it, and that it is particularly adapted to such purposes by its great beauty, hardness, and durability, and the exquisite polish it is capable of taking. It is said, too, to be indestructible by worms or water, and to be bomb-proof: hence the Spaniards used to make their vessels of mahogany, and Captain Franklin took with him to the Arctic Sea, boats constructed in England of that material, as being the lightest (in consequence of the thinness of the planks), and the most portable, combined with great strength. Jamaica formerly yielded the greatest quantity of this wood, and the old Jamaica mahogany is still reckoned the most valuable; though the largest importations are now made from Honduras, where 200 years are considered necessary from the time of the plant springing from seed, till its perfection and fitness for cutting. This operation commences about August; the gangs of labourers employed in this work consisting of from twenty to fifty, each being headed by one man, called the captain, and accompanied by a person termed the huntsman, whose business it is to search the bush and find employment for the whole. The latter cuts his way among the thickest woods, where he climbs the highest tree, and thence minutely surveys the country.

The leaves of the mahogany tree are invariably of a reddish hue; and an eye, accustomed to this kind of exercise, can at a great distance discern the places where the tree is most abundant. Thither he directs his steps, without other compass or guide than his recollection affords, and never fails of reaching the exact spot, though he is sometimes obliged to use dexterity to prevent others from availing themselves of his discovery, and seizing first on the hidden treasure, those who follow him being entirely aware of any arts he may use, and their eyes being so quick, that the lightest turn of a leaf, or the faintest impression of a foot, are unerringly perceived.

6256. The *Mahogany tree* is commonly cut about ten or twelve feet from the ground, a stage being erected for the axeman. The trunk, from its dimensions, is considered the most valuable portion; but for ornamental work the branches are preferred, the grain being closer and the veins more variegated. The cutting of roads is the most laborious and expensive part of the work; but it is customary to facilitate this as much as possible, by placing the scene of operations near a river. The underwood is cleared away with cutlasses, which the people use with great dexterity; but it is often necessary to clear away some of the harder and larger trees with fire. The quantity of road to be cut in each season depends on the situation of the body of mahogany trees, which, if much dispersed, will increase the extent of road-cutting: it not unfrequently happens that miles of road and many bridges are made to a single tree, which tree may ultimately yield but one log. The roads being now all ready, which may generally be effected in December, the *cross-cutting*, as it is technically called, commences. This is merely dividing crosswise, with the saw, each tree into logs, according to its length; some trunks yielding but one, others four or five logs: the chief rule for dividing the trees being so as to equalise the loads which the cattle are to draw. A supply of oxen are constantly kept in readiness,

lest the usual number should be overburdened by the weight of the log : this is unavoidable, owing to the very great difference of size of the mahogany trees ; the logs taken from one being about 300 feet, while those from the next may be 1000. The largest log ever cut in Honduras was of the following dimensions : length 17 feet, breadth 57 inches, depth 64 inches ; measuring 5168 superficial feet, or 15 tons weight. The largest log of mahogany ever brought from Honduras to Glasgow is thus described : — It was taken to the wood yard on a four-wheeled carriage, and there placed between two other logs, preparatory to being cut up, as no saw-pit was capable of containing it. The length was 16 feet, depth 5 feet 6 inches, and breadth 4 feet 9 inches. It contained 418 cubic feet, and 5016 feet of inch deal ; the cost of sawing it, at 3d. a foot, amounted to 62*l.* 14s. The value of the whole, estimated at 1s. 2d. per foot, was 292*l.* 12s. ; and the weight was 7½ tons. The time of drawing the logs from their place of growth is April or May, the ground at all other seasons being too soft to admit of the heavily laden trucks passing without sinking, and it is essential that not a moment of dry weather be lost in drawing the wood to the river. The night is employed in this work, as the days are too hot. Nothing can present a more extraordinary spectacle than this process of trucking, or drawing down the mahogany to the river. Six trucks are commonly employed together, occupying a quarter of a mile of road : the great number of oxen ; the drivers, half naked (clothes being inconvenient from the heat and dust), each bearing a lighted torch ; the wildness of the forest scenery, the rattling of chains, the sound of the whip echoing through the woods ; then all this activity and exertion so ill corresponding with the still hour of midnight, makes it wear more the appearance of some theatrical exhibition than what it really is, the pursuit of industry which has fallen to the lot of the Honduras woodcutter. In the end of May the periodical rains recommence : the torrents are so great as to render the woods impracticable in the course of a few hours ; when all trucking ceases, the cattle are turned into pasture, and the trucks, gear, and tools, &c. are housed. In the end of June, the logs of mahogany are floated down the swollen rivers in *pitpans* (a kind of flat-bottomed canoe) followed by the gang of labourers, to disengage them from the overhanging branches and to form them into rafts at the end of the voyage, where they are taken out of the water, re-smoothed with the axe, and the ends, which have frequently been split and rent, by dashing against rocks in the river, are sawed off, when the mahogany is ready for shipping. The average expense of mahogany cutting is usually estimated at about 70*l.* sterling each labourer per annum, independent of the capital sunk in the purchase of the works, cattle, trucks, &c. &c. In St. Vincent's, where the mahogany is not indigenous, the trees do not attain a greater height than fifty feet, and a diameter of eighteen inches. The bark of mahogany is very astringent and bitter ; and in its action on the human frame has been said to coincide nearly with the Peruvian bark.

6257. *The Maranta arundinacea* is a plant of considerable interest, as it is believed to yield Arrow-root, a well known and elegant article of diet, which is prepared, according to the late Dr. Sims, from its roots, not by drying and pounding, as has been stated, but by maceration in water, in the same manner as starch is made from wheat, potatoes, and other farinaceous substances. Great quantities of arrow-root have, of late, been imported into this country from the West Indies, and much recommended as food for young children, and as a light nourishment in sickness. A similar substance, probably in every respect of equal efficacy and not less salubrious, has, of late years, been prepared in considerable quantities, in the Isle of Portland, from the roots of the common Cuckow Pint (*Arum maculatum*). The *Maranta arundinacea* is an herbaceous perennial, and increased by parting the roots. It grows two or three feet high, with broad leaves and a spike of small white flowers.

6258. *Myrtus Pimenta*, the handsome tree which produces the Allspice or Pimento of commerce, is a native of the West Indies, and especially the island of Jamaica. Its profusion of white blossoms contrast most agreeably with the dark green leaves that clothe its numerous branches, while the rich perfume that is exhaled around, renders an assemblage of these trees one of the most delicious plantations of even a tropical clime. When the foliage is bruised, it emits a fine aromatic odour, as powerful as that of the fruit, and by distillation, a delicate oil, which is often substituted for oil of cloves. The allspice tree is of difficult cultivation, seeming to mock the labours of man in his endeavours to extend or improve its growth ; not one attempt in fifty to propagate the young plants, or to raise them from the seeds, in parts of the country where the tree does not grow spontaneously, having succeeded. The enormous crop which the pimento tree sometimes yields, would render its culture very profitable. In a favourable season, one tree has been known to afford 150 lbs. of the raw fruit, or 1 cwt. of the dried spice ; a loss of one third generally occurring in curing it. So plenteous a harvest seldom occurs above once in five years. Pimento combines the flavour and properties of many of the oriental spices ; hence its popular name of Allspice.

6259. *The Avocado Pear* is a beautiful smooth fleshy fruit, the production of *Laurus Persea*. Its flavour combines the taste of artichoke and filberts, but is not comparable to many of the European fruits ; lemon juice and sugar, pepper and vinegar, are often added to give it pungency. All animals are extremely fond of it, and many virtues are ascribed both to the fruit and an infusion of the buds of this tree, which is frequently ordered by the physicians in the West Indies.

6260. The native country of the *Papaw Tree* (*Carica Papaya*) (fig. 1031.) has been much contested ;

writers on the East and writers on the West Indies being equally disposed to claim it as an aboriginal. That learned botanist and philosopher, Robert Brown, infers, from various circumstances, that the papaw tree is a native of America and the West Indies, but has been naturalised in Hindostan, the Philippines and Moluccas. It is a tree of rapid growth. St. Pierre probably spoke from his own knowledge, when he described Virginia as having planted a seed, which in three years' time produced a papaw tree twenty feet high, loaded with ripe fruit. It is for the sake of this fruit, mainly, that the tree is cultivated ; but if the flavour in its native country be not better than what is produced in our stoves, we cannot speak highly in its favour. In Jamaica, it is generally eaten boiled, and mixed with lime juice and sugar, or baked like apples. The juice of the pulp is used as a cosmetic to remove freckles, and the negroes in the French colonies employ the leaves to wash linen, instead of soap. As a medicinal tree it is deserving of notice, the milky juice of the fruit or the powder of the seed being a very powerful vermifuge. But the most extraordinary property of the papaw tree is that which was first related by Brown in his *Natural History of Jamaica*, namely, that water impregnated with the milky juice of this tree makes all sorts of meat washed in it very tender ; but that eight or ten minutes' steeping will make it so soft, that it

will drop in pieces from the spit before it is roasted, or turn to rags in boiling. This circumstance is confirmed in Mr. Neill's interesting *Horticultural Tour through Holland and the Netherlands*, and by the testimony of gentlemen who have been long resident in the West Indies, who state that the employment of this juice for such a purpose is of quite general occurrence ; and more, that old hogs and old poultry, which are fed upon the leaves and fruit, however tough the meat they afford might otherwise be, are thus rendered perfectly eatable, and excellent too, if used as soon as killed ; but that the flesh soon passes into a state of putridity. The very vapour of the tree serves the purpose ; it being customary in Barbadoes to suspend the fowls and meat from its trunk, to prepare them for the table. The existence of this astonishing property in the papaw tree is attributed to the *fibrine*, which has been proved by M. Vauquelin, the eminent French

chemist, to exist in its juice, a substance that had previously been supposed to belong exclusively to the animal kingdom.

6261. The tree which produces the Cashew nut (*Anacardium occidentale*) bears much resemblance to the walnut, and its foliage has nearly the same scent. The fresh nut is well tasted, it improves the flavour of many dishes, and forms great part of the food of the inhabitants of the Philippine Isles and many parts of India. They roast it in the husk, and eat it with salt. The husk contains a mucilaginous, acrid, burning, and caustic juice, which affords so indelible a stain, that it is used for marking ink, and for cleansing foul ulcers. It also consumes excrescences and warts, but it is necessary to wash the parts with water immediately after its application. A more dubious property is that attributed to the *Anacardium*, of brightening the faculties, strengthening the memory, &c.

6262. With regard to the Banana or Plantain (*Musa paradisiaca* and *M. sapientum*) (figs. 1032. and 1033.),

Humboldt thus writes:—"It is to be doubted whether there is another plant in the world which on so small a space of ground produces such a mass of nourishing substance. In eight or nine months after the sucker is planted, the Banana begins to show its flowering stem, and the fruit may be gathered in the tenth or eleventh month. When the stalk is cut down, one among the many shoots is always found, which is about two thirds as high as the parent plant, and will bear fruit three months later. Thus a banana ground is kept up without any further trouble than that of cutting down the stem of which the fruit has ripened, and stirring the ground a little, once or twice a year, about the roots. In one year a space of 100 square metres, containing 30 or 40 banana plants, gives upwards of 2000 kilogrammes or 4000 lbs. weight of nourishing substance. What a difference between this produce, and the grain that is yielded by the most fertile parts of Europe! Calculations prove that the amount of nourishing substance obtained from a banana ground is as 133 to 1, when compared with the growth of wheat on the same space; and as 44 to 1, of potatoes. In the stoves of our country, the banana never ripens properly; the soft saccharine mucilage that fills it bearing no more resemblance to the matured and mealy fruit, than the milky substance that is contained in the green corns of wheat does to the hard and ripened farinaceous kernel. It would be difficult to describe the various processes by which the South Americans and West Indians prepare this fruit. I have often seen the natives, after a day of great fatigue, make their dinner on a very small quantity of manioc and three bananas of the larger kind. Generally speaking, in hot countries, the people are partial to saccharine food, which they consider not only palatable, but highly nourishing. The muleteers on the coast of the Caraccas, who conveyed our baggage, frequently preferred raw sugar for their dinner to fresh meat. The ripe fruit of banana, exposed to the sun, dries like a fig; its skin turns black, and the whole smells like smoked ham: in this state it is most wholesome. A great advantage arises from the facility with which the banana is raised, which makes it even preferable to the bread-fruit, which, though loaded with fruit for eight months of the year, when once destroyed, as it often is during the native wars, causes lasting distress to the country."

1034

PASSIONFLOWERS.

represents the crown of thorns, or, as some have it, the crown of glory; but as it required even more than monkish ingenuity to have made the twelve apostles out of the ten divisions of the floral covering, they limit the number of these saints to ten; excluding Judas, who betrayed his master, and Peter, who denied him. Old cuts still exist, where all the flower is made up of these things.

6264. The Pine Apple, of which several species are natives of the West Indies, is too well known in this country to require any lengthened description:—

"Its luscious fruit *Anona* rears
Amid a coronet of spears."

The careful cultivation that it receives in Europe is said to render the fruit even better than in its native soil; a circumstance that may readily be believed, when we know how far superior are the grapes of our

hot-houses, to those raised in the open air, a skilful treatment and choice of sorts more than making up for the want of sun and the deficiency of natural temperature.

6265. The Mammee (*Mammea americana*) is a lofty tree, bearing a yellow fruit, not unlike a very large russet apple, of which the pulp resembles a fine apricot, and is highly fragrant, with a delicious flavour. The Mammee is abundant and much prized in the West India markets, where it is considered one of the best native fruits.

6266. In the West Indies, so fine are the climate and soil, that tropical plants, from all parts of the world, are readily cultivated; and a beautiful picture of the garden and surrounding country of St. Vincent's is given by the late Reverend Lansdown Guilding, an eminent naturalist and most successful draughtsman, whose loss to science we have recently had cause to deplore. "The part that is crowded with trees of larger growth is, perhaps, most calculated to interest the European visiter. If he derives any pleasure from the beauties of picturesque scenery, he will scarcely be able to define what most excites his admiration, the individual beauty and contrast of forms,

'or that eternal spring
Which here enamels every thing,'

and calls forth a luxuriance of vegetable life in every direction. Nature appears prodigal of organic matter. The ground is overloaded with plants, which have scarcely room for their developement. The trunks of the older trees are every where covered with a thick drapery of ferns, mosses, and orchideous plants, which diffuse into the air the richest odours, and almost conceal from sight the noble stems that uphold them. Their growth is favoured by the great moisture of the air, and these lovely parasites, sheltered from the direct rays of the sun, are seen ascending on every side, even the larger branches. So great is the variety of vegetable beauties that sometimes decorate a single trunk, that a considerable space in an European garden would be required to contain them. Several rivulets of the purest water urge their meandering course through the brushwood; various plants, of humbler growth and which love humidity, display their beautiful verdure on their edges, and are sheltered by the wide-spreading arms of the Mango (*Mangifera indica*), Mahogany (*Swietenia Mahagoni*), Teak (*Tectona grandis*), Mimosas, and other woods, remarkable for their stateliness, and clothed in wild and magnificent pomp. The vegetation every where displays that vigorous aspect and brightness of colour, so characteristic of the tropics. Here and there, as if for contrast, huge masses of trap, blackened by the action of the atmosphere, and decayed Tremellæ, present themselves; those blocks which, in colder climates, would be doomed to eternal barrenness, or, at most, would only nourish the pale and sickly Lichen, here give support to creeping plants of every form and colour, which cover with yellow, green, and crimson, the sides of the sable rock. In their crevices, the succulent species are daily renewed, and prepare a soil for larger tenants; from their summits, the Old Man's Beard (*Rhizalis Cassutha* of Hooker), and similar weeds, which seem to draw their nourishment from the air, hang pendent, floating, like tattered drapery, at the pleasure of the winds. At a distance is seen the Trumpet tree, whose leaves seem made of silver plates, as the blast reverses them in the beams of the mid-day sun. In a solitary spot rises a wild Fig tree (*Ficus religiosa*), one of the gigantic productions of the torrid zone. The huge limbs of this tree, covered with perpetual verdure, throw down, often from the height of eighty or ninety feet, a colony of suckers of every possible size, from that of packthread to the vast cable of a ship, without any visible increase in their diameter and without a joint; these, reaching the ground, become other trees, but still remain united, — happy symbol of the strength which proceeds from union. At other times, the suckers blown about by the winds are entangled round the trunk or some neighbouring rock, which they surround with a network of the firmest texture, as if the hand of man had been employed. All the beauties which Nature has lavished on the equinoctial regions are here displayed in their fairest and most majestic forms. Above the rocky summit of the hills, the Tree Ferns, which are the principal ornament of our scenery, appear at intervals: Convolvuli and other creepers have climbed their high stems and suspended their painted garlands. The fruits of our country scattered around within our reach, and the wide green leaves of the Bananas and Heliconias, planted beneath, serve to minister to our refreshment, and to convey water from the neighbouring spring. On every side, innumerable Palms of various genera, the Cocoa-nut, Date, Cabbage Palm, &c., whose leaves curl like plumes, shoot up majestically their bare and even columns above the wood. The portion of the botanic garden near the house of the superintendent has been devoted to the reception of the Spices, the medicinal and other useful plants. In the same group are seen the precious Nutmeg (*Myristica officinalis*), exposing, in the centre of its bursting drupe, the seed surrounded by the crimson Mace; the Cassia, with its pendent pods of curious length; the magnificent Lagerstræmia (*L. Reginæ*), displaying one extended sheet of lovely blossoms; the Cannon-ball Tree (*Lecythis bracteata* or *Couroupita guianensis*), with its sweet and painted flowers, scattering its fetid fruit, so much resembling the fatal shell, that we might suppose a company of artillery had bivouacked in its shade; the Calabash, with its large green pericarp, so useful in the poor man's hut; and the Screw Pine (*Pandanus odoratissima*), with its fruit carved in rude and curious workmanship, and its ribbed stem, supported on a bundle of fagots. Assembled together are the various fruits, transplanted from the islands of Asia and other distant lands, or the Antilles, attracting, by their nectared flowers, the gaudy humming-birds. You behold the Bread-fruit (*Artocarpus incisa*) of the Friendly Islands, the most precious gift of Pomona, and the Jack of India (*A. integrifolia*), bearing their ponderous fruit of the weight of 60 or 70 lbs. on the trunk and arms; huge deformities for the lap of Flora. Here, too, a stunted Cork Tree (*Quercus Suber*), and a small European Oak (*Q. Robur*), sadly contrast their sickly forms with the proud offspring of the tropics. The Vanilla (*Epidendrum Vanilla*), with its long suckers, the Black Pepper (*Piper nigrum*) of Asia, hang suspended on the boughs; the gaudy blossoms of the Passiflora and the long tubes of the Solandra (*S. grandiflora*) appear amid the wood, mingling their blossoms with those of the neighbouring trees in wild confusion; while, at intervals, the Agave throws up its princely column of fructification from a host of spears. Innumerable Cacti and Euphorbiæ, covered with fruit or flowers, differing in the articulation of their stems, the number of their ribs, and the disposition of their spiculæ, give variety to the scene. At every step, plants remarkable for their beauty or fragrance ornament your path. But the reader will weary of the enumeration of the vegetable wonders that adorn this paradise. In proper beds are the useful herbaceous species, or the vegetables with which our tables are supplied. By the side of every rivulet rise large clusters of the Bamboo (*Bambusa arundinacea*), without a doubt the most generally useful of our plants. Nothing can exceed the beauty of this arborescent Grass, which rises to the height of sixty or eighty feet, waving its light or graceful foliage at every breath of the wind. The Sago (*Cycas revoluta*) and several kindred plants, so valuable for their nutritious fecula, are scattered about, attaining their greatest height in spots where nothing is allowed to impede their free developement."

SUBJECT. 3. Zoology.

6267. The Zoological productions of our West Indian possessions have been but little attended to. Botanists of nearly every nation have repeatedly visited and explored the principal islands, that the conservatories of the great might be decked with blooming exotics; but, as regards Zoology, nearly a century has elapsed without any material addition being made to the antiquated history of Sir Hans Sloane on the animal productions of these islands. Of their native quadrupeds, many have, doubtless, been exterminated by civilisation; and, although we have no good data to go upon for the surmise, it may be supposed that caviæ, armadilloes, and other smaller quadrupeds, still exist in the woody and less cultivated districts of the interior. An indescribable sort of mental lassitude, not to say apathy, appears to seize upon a European the moment he becomes resident in a hot country, and to this cause do we attribute the indifference of our countrymen to pursuits of a scientific nature.

6268. The Agouti (*Dasyprocta Acuti* Ill.) (fig. 1035.) may be considered in the West Indies as representing

the hare of Europe, and it is about the same size. Although once common, it is now only met with in the less cultivated islands. It runs with great celerity, particularly up rising ground, but will frequently roll over, like the hare, in descending a hill - it feeds on all vegetables, but is very fond of nuts. In Cayenne, the Agouti is more common, and is there seen in troops of more than twenty.

1035

AGOUTI.

birds: the ruby-topaz, the ruff-necked, and the emerald-crested Humming-birds are particularly splendid; the crimson-throated Maize-bird (*Agelaius militaris* Vieil.), the Mexican Hangnest (*I. mexicanus* D.), and the Red-headed Tanager (*Aglaia gyrola* Sw.) have all been sent from this island. Turkey Vultures of a large size, and entirely black, are not uncommon; but the precise species has never been clearly ascertained. Most of the North American summer birds pass the winter in these islands, which seem to be the farthest point of their southern range.

1036

BRAZILIAN MOTMOT.

6269. The Birds are almost as little known as are the quadrupeds: they seem, however, to belong to the same families, and in numerous instances to the same species, as those of the neighbouring parts of Florida and Georgia, mixed with several others more particularly belonging to the Terra Firma. Our friend, Mr. Lees, has transmitted us, from the Bahama Islands, the Brazilian Motmot (*Prionites Momota* Ill.) (fig. 1036.), the *Trichas velata* Sw. or Veiled Yellow-throat, a beautiful new Trogon, &c.; while the celebrated Mocking-bird of the United States (*Orpheus polyglottus* Sw.) is known to have a range over Jamaica, Cuba, and several other islands. Trinidad, however, appears to be the chief island for

6270. The wading and swimming birds have the same general character as those of the adjacent continent. Pelicans, Great White Herons, Flamingoes, and other well-known birds, haunt the salt-water marshes; while the Jacana, and a beautiful waterhen with a yellow bill and deep blue plumage, called the Martinico Gallinule (fig. 1037.) are common in the freshwater swamps. The Snake-neck or Darter is sometimes met with; its colour is dark, interspersed all over with innumerable white spots, while its long thin neck more resembles that of a serpent than of a bird (fig. 1038.).

6271. We may pass over an enumeration of serpents and reptiles, to notice two which afford delicious food. The Guana lizard is by some thought as great a delicacy as the green turtle, and both these are common in the West Indies.

6272. The Common Guana (*L. Iguana* L.) (fig. 1039.) is sometimes five feet long: its general colour is green, prettily variegated, but its hues are changeable, like those of theameleon. According to Catesby, these animals are, or were, particularly abundant in the Bahama Islands, so as to constitute one of the chief articles of food with many of the natives; and Brown mentions them as inhabiting Jamaica. They are exces

1037

MARTINICO GALLINULE.

1038

SNAKE-NECK OR DARTER.

sively nimble, and are hunted by dogs. Such as are not wanted for use are salted and barrelled. Guanas are also found on the continent; and when roasted, we can affirm that their flesh is peculiarly delicate, being tender, sweet, perfectly white, and not unlike the inside of a lobster's claw.

1039

COMMON GUANA.

6273. The Green Turtle (*Testudo Mydas* L.) (fig. 1040.) is that particular species so highly prized by epicures. So common does it appear to be in these seas, that, when Sir Hans Sloane wrote, forty sloops were employed by the people of Port Royal, Jamaica, in their capture. The Bahamans also are extensively concerned in this fishery, carrying them to Carolina and other parts where turtle are scarce. This species derives its name from the fat being green, and it feeds on a kind of grass, called turtle grass, which grows at the bottom of the sea. They are principally caught, says Catesby, in April, when the fishermen go in little boats to Cuba and the neighbouring islands, watch the turtle during

the evening, turn them on their backs, and afterwards collect them at leisure.

6274. The marine shells are few, and, when compared with those of the Indian Archipelago, sink into insignificance. The largest are the Horned Helmet (*Cassis cornuta* L.) (fig. 1041.) and the Strombus Gigas, with a pink mouth, both much esteemed for mantel-piece ornaments. Those inhabiting the land, on the contrary, are much more numerous than in Asia. Jamaica, in particular, produces a very great variety; while it is in the island of St. Vincent alone that the rare *Plecocheilus undulatus* (fig. 1042.) has hitherto been found.

1040

GREEN TURTLE.

6275. The Insects offer nothing of particular interest to the unscientific reader, and it is a general remark, that in all islands the species are much fewer than upon continents. A

very excellent naturalist, the Reverend Lansdown Guilding, long resident in St. Vincent's, has recently discovered that the substance generally known by the name of seed pearl, and so frequently sent over in boxes with small shells, is the exuviae of an insect which lives among, and preys upon, the ants. This substance has the appearance of

CASSIS CORNUTA.

PLECOCHILUS UNDULATUS.

roundish seeds, somewhat larger than those of the mustard, and of the same tint, yet shining with a rich gloss of gold; indeed, they might, by a superficial observer, be easily mistaken for grains of that precious metal. They are, however, very light, and, on close examination, a small hole will be perceived, through which the adult

insect has made its escape from the shell, which is, in fact, the chrysalis. Unfortunately for science, Mr. Guilding has fallen a victim to the climate, since this last paragraph was written.

SECT. III. *Historical Geography.*

6276. *The grand career of discovery* in the New World commenced with the West Indies. Columbus, in 1492, when he sailed to explore a new route to India, landed first on one of the Bahamas, and then on Hayti, or St. Domingo. He, and the navigators who immediately followed him, visited successively the different islands. They formed settlements, but were soon engaged in contests with the natives, whom they treated with such reckless cruelty, that the whole race were nearly exterminated. For about a century and a half these islands remained in possession of the Spaniards, though neglected by them for the more splendid regions of Mexico and Peru. During the 17th century they became the hold of a desperate band of outlaws and pirates, called Buccaneers, who waged with success a predatory warfare along the whole circuit of the Spanish main: at the same time, the English and French, not without some concurrence with these adventurers, sought to obtain possessions in this archipelago. Before the end of the century, the English were masters of Jamaica, the French held half of St. Domingo, and the two nations had divided between them nearly the whole of the Windward Islands. These acquisitions, though much inferior in extent and natural advantages to those still held by Spain, were so much better improved and cultivated, that they soon became of far superior value. This prosperity, however, was in some measure procured by means deeply to be deplored; the compulsory labour of numerous bands of slaves, who, conveyed from Africa under circumstances of the severest hardship, have become much the most numerous part of the population.

6277. *A memorable crisis in West Indian history* took place in 1792, when the National Assembly of France passed rash decrees, abolishing all distinction of ranks, and proclaiming the complete equality of mankind. This step was soon followed by a general rising of the negroes in St. Domingo, who, after a long and bloody struggle, succeeded in establishing their independence, and in incorporating into their new state the Spanish part of the island. At the same time, the condition of the slaves in the colonies belonging to England drew the attention of the philanthropists of that country, who, after long representations and efforts, succeeded in procuring a complete prohibition against the further importation of negroes from Africa. Nor did they cease their efforts till arrangements were made which will ensure, in a few years, the entire liberation of this unfortunate class of human beings.

SECT. IV. *Political Geography.*

6278. *The political relations* of all these islands are subordinate to those of the mother country, to which they are subjected. In those belonging to Britain, the white proprietors are represented in houses of assembly, which exercise some of the functions of the British parliament. The limits between the two jurisdictions, however, have not been very precisely defined; and in several instances, particularly that of the treatment of the slaves, some rather serious collisions have taken place. Hayti, as already observed, forms an independent republic.

SECT. V. *Productive Industry.*

6279. *An uncommon measure of wealth and prosperity* was for a long time enjoyed by these islands. They flourished especially during the last century, when they supplied almost exclusively sugar, coffee, and other articles, the use of which had become general over the civilised world. After the French revolution and that of the negroes in St. Domingo, the islands belonging to Britain became almost the sole quarter whence Europe was furnished with West India produce. The prosperity thus caused excited in an extraordinary degree the envy of Napoleon, who made astonishing efforts to shut first France, and then the whole Continent, against all merchandise coming from Great Britain or her colonies. But this exclusion was never complete. The last twenty years have produced a very severe reverse. The great encouragement thus afforded led to an over-production, and consequent depreciation, which was further augmented by the competition that arose in South America and other quarters of the world, and also by the commercial depression in Europe. Hence it is complained that the prices obtained by West India cultivators have for some time ceased to be remunerating, and that it is only with great difficulty, and by incurring heavy incumbrances, that they have been able to continue their operations.

6280. *A sugar plantation* forms a great manufacturing as well as agricultural establishment, in which a large capital must be invested. It cannot be carried on with advantage, especially since the fall in the value of produce, unless on a considerable scale; as the white servants and the machinery must be nearly the same

on a small as on a large estate. Plantations, according to Mr. Hibbert, vary from 500 to 3000 acres, and from 100 to 500 negroes. An average one may contain 300 negroes, who may produce about 200 hogsheads of sugar. This will require 300 acres of land planted with cane, and 300 head of cattle, for the maintenance of which 600 acres will be requisite. For negro grounds and wood 500 more will be necessary. The whole extent will thus be 1400 acres. The original price of good land is 10*l*.; the expense of clearing, 10*l*.; of planting, 10*l*.; in all, 30*l*.; making 4200*l*. of original outlay upon the land. The buildings and machinery are estimated as follows:—A mill, 400*l*.; warehouse, 1200*l*.; curing-house, 600*l*.; distillery, 600*l*.; copper and still, 2000*l*.; dwelling-house, 900*l*.; trash-houses, 310*l*.; in all, 7360*l*. currency, or 5250*l*. sterling; which, added to the cost of the land, makes 9450*l*. The expense of rearing a slave is reckoned by Mr. Hibbert at 86*l*. Of this, 36*l*. is supposed to be incurred the first year, including 20*l*. for loss of the mother's labour; in the next thirteen years he allows annually 2*l*. for food, 1*l*. 1*s*. for clothes, 16*s*. 8*d*. for medicine, taxes, &c. By the age of fourteen, the labour of the negro is supposed more than to compensate his maintenance. The negroes of a great plantation are divided into three gangs: the first of which, composed of the most vigorous and active, amounts to about seventy-seven; the second, to thirty-one; the third, to twenty-seven. Besides these there are eleven grass-cutters, fifteen watchmen and cooks; nine drivers of mules and carts; twenty-eight masons, carpenters, smiths, and coopers; twelve for attending cattle; seventeen overseers; twenty-one hospital attendants; six for watching grounds, &c. The export of sugar to Britain, during the year 1832, amounted to 3,585,188 cwts., which, at 28*s*. per cwt., amounts to 5,119,000*l*. and the duty, at 2*s*., was 4,352,000*l*. The exportation of rum, in 1832, amounted to 4,753,789 gallons, the value of which, at 2*s*. 9*d*. a gallon, would be 753,644*l*. Of this amount, 3,513,000 gallons, retained in Britain for home consumption, paid a duty of 1,570,000*l*.

6281. *Coffee* ranks next to sugar in importance, and, though introduced from a remote quarter of the world, has been cultivated with such success, that the coffee of Berbice and Jamaica ranks second to that of Mocha, and superior to that of any other country. Within the last few years, however, the competition from other quarters has been so great as to give the planters occasion to complain that it is still more unproductive than sugar, and its culture has in consequence somewhat declined. The importation into Britain, in 1832, amounted to 24,600,000 lbs., the value of which, at 6*d*. a pound, may be 685,700*l*. A few other articles, though very secondary to those above mentioned, are produced in these islands. Cotton was formerly considered one of their staples. In 1786, the produce was 5,800,000 lbs.; and in 1828 it was almost the very same, or 5,890,000. But this amount, which in the first period was nearly a third of the whole British consumption, was in the second period not a fortieth part of that consumption. In 1831 and 1832, it averaged only 1,950,000 lbs. The United States have supplanted the islands, both as to the abundance and quality of this commodity. Yet the cotton of the latter, though inferior to the best American, still maintains a respectable price in the market. Cacao, the principal material of chocolate, has also much declined, chiefly perhaps on account of that beverage being almost entirely disused in Britain. The recent reduction of duty, however, may probably lead to an extended consumption. The average of 1831 and 1832 was 1,050,000 lbs.

6282. *Manufacturing industry*, from the peculiar state of society in these islands, scarcely exists, even in its humblest form, for domestic use.

6283. *Commerce, on the contrary*, is carried on to a much greater extent than in any other country of the same wealth and populousness. Almost every product of West Indian labour is destined for the market of the mother country, from which in return these islands receive all their clothing, and a great proportion of their daily food. They supply the British empire with nearly all the sugar, rum, and coffee consumed in it.

6284. *In 1832, the shipping employed* in the trade between Britain and the West Indies was to the following amount:—Inwards, 828 ships, 229,117 tons, and 12,656 men. Outwards, 803 ships, 226,105 tons, and 12,804 men. The value of the imports in 1829 was 9,807,914*l*.; of the exports, 3,612,075*l*. The leading articles of import were, 4,152,614 cwt. sugar; 6,934,759 gallons rum; 26,911,785 lbs. coffee; 4,640,414 lbs. cotton; 684,917 lbs. cacao; 390,626 cwt. molasses; 3,585,694 cwt. pimento; 6,081 cwt. ginger; 13,285 tons mahogany; 9748 tons logwood; 2105 tons fustic; 212,000 lbs. indigo; 63,850 lbs. cochineal; 9041 lbs. castor oil; 128,536 lbs. sarsaparilla; 6345 lbs. pepper. The articles of export from Britain, stated according to their value, were, cottons, 1,050,280*l*.; linens, 385,303*l*.; woollens, 120,192*l*.; silks, 19,383*l*.; apparel, 251,192*l*.; hats, 56,594*l*.; manufactures of iron and steel, 163,197*l*.; of brass and copper, 67,220*l*.; hardware, 90,101*l*.; tin, 15,637*l*.; lead, 10,026*l*.; earthenware, 30,259*l*.; leather, 116,512*l*.; saddlery, 26,267*l*.; beef and pork, 113,831*l*.; beer, 55,565*l*.; butter and cheese, 79,488*l*.; fish, 94,165*l*.; cordage, 23,537*l*.; coals, 32,523*l*.; soap and candles, 117,168*l*.; glass, 76,660*l*.; painters' colours, 30,042*l*.; plate, 29,500*l*.; stationery, 23,827*l*.; books, 10,893*l*.

6285. *The West Indies* also carry on an extensive intercourse with the United States and the British colonies in North America, to which they send their staple productions, and receive in return grain, provisions, fish, and timber. The trade with the British colonies employed, in 1831, 486 ships of 75,896 tons, with 5074 men, outwards. That from the United States in the same year employed, according to Mr. Bliss, 58,825 tons, of which more than two thirds were American.

SECT. VI. *Civil and Social State.*

6286. *The population of the different portions of the West Indies* has been ascertained with varying degrees of accuracy. Reserving more precise details for the local section, we shall give the following, as a near approximation of the whole:—

Spanish islands	-	-	-	-	1,000,000
British (inclusive of Demerara)	-	-	-	-	788,000
Hayti	-	-	-	-	800,000
French islands (inclusive of Cayenne)	-	-	-	-	222,000
Other European islands (including Dutch Guiana)	-	-	-	-	150,000
					2,960,000

Of these it is probable not above 500,000 are Europeans; the rest are of negro origin, and, unless in Hayti, the greater part of them are in a state of slavery.

6287. *The social state* of these islands is peculiar and painful. The population consists of three portions, between which scarcely any sympathy exists:—1. The whites; 2. the slaves; 3. the mixed population and emancipated negroes. On a subject which has excited so much interest, and given rise to so many controversies, into which our plan forbids us to enter, some very general observations will be sufficient.

6288. *The whites*, who form so small a part of the population, are the masters, in whom all the power and property centre. They consist, partly of proprietors superintending the cultivation of their own lands, partly of agents and overseers employed by owners residing in Britain. As a body, they do not merit many of the reproaches thrown upon them by the zealous friends of humanity. Inheritance rather than choice has placed most of them in circumstances of severe trial and difficulty. Some of them have abused their inordinate power in deeds of wanton cruelty, which have brought a stain upon the whole body; but such conduct does not appear to be general, and others have distinguished themselves by showing to their slaves every degree of indulgence of which their unfortunate situation admitted. In their intercourse with each other, the planters are peculiarly frank, liberal, and hospitable. They are strongly animated by a spirit of liberty, and even a sense of equality, which may seem strangely inconsistent with their habits and situation. Yet the same anomaly has occurred in Greece, in Rome, and in the United States of America. The sanguine temper, and

extravagant estimate of their wealth, with which Mr. Edwards reproaches them, is likely to have been effectually cured by the great reverses which they have recently experienced.

6289. *The slaves* form the most numerous part of the population; but their situation has been the subject of so much controversy, that a precise estimate of it would be difficult. They are undoubtedly in a worse situation than the serfs of Europe, who were merely attached to the soil, and obliged to deliver a certain portion of what their labour had drawn from it. Their lot is harder also than that of the Oriental slave, who, employed as a domestic servant, rises often to the rank of a favourite. The West Indian slave is placed continually under the lash of a taskmaster, and is regarded only according to the amount of labour which can be extracted from him. It never can, however, be the interest of the master to inflict physical injury on his slave, or to withhold whatever is necessary to preserve him in health and vigour. The bondsman has even an assurance of being supplied with the necessaries of life more complete than is possessed by the labouring classes in a free community. Yet this very security tends to degrade their character, and to prevent them from acquiring habits of reflection and foresight. Their lot must depend too entirely on the personal character of their master or overseer: those who are fortunate in this respect may enjoy much comfort; but others have no sufficient protection or redress against the bursts of passion and caprice to which human nature invested with power is liable. Edwards seems to admit their liability to the vices to which men are exposed, when held in a state of degradation: these are, dissimulation, a propensity to pilfer, and a proneness to low sensual indulgence. It is impossible not to look forward with interest and hope to the recent arrangements of the British legislature, by which this bondage is to be immediately converted into a species of apprenticeship, and at the end of seven years to be entirely abolished; while the planters are to be indemnified by having distributed among them the large sum of 20,000,000*l.* sterling, to be raised by small additional taxes on the principal articles of West India produce.

6290. *A considerable part* of the negro population have already obtained their *liberty*, which was either granted by masters who had conceived an attachment to them, or earned by the industrious employment of their leisure hours. The intercourse, also, between the black and white races has produced a number of mulattoes, who are never enslaved. This class, however, have not derived all the advantages which should naturally have followed from the possession of freedom. They considered it inconsistent with their situation to share the toils of their enslaved brethren, yet had little means of attaining any higher employment. They were excluded from all intermarriage or association with the ruling class, and from all offices of trust or importance; their testimony in many cases was not received by a court of justice. The females, despising the young men of their own class, form, very generally, illicit connections with Europeans, though it is said that their general behaviour is modest, and that they view this tie in nearly the same light as marriage. On the whole, the character and deportment of the freed negroes, when existing as a detached and degraded class, cannot be taken as a criterion of that which they would exhibit when invested with the rights of citizens, and forming the main body of the people.

SECT. VII. *Local Geography.*

6291. *The division* of the West India Islands, as they appear interesting to Europeans, is, according to the nations by whom they are occupied, into British, Spanish, French, Dutch, to which are to be added a few Danish and Swedish, and, finally, the independent negro republic of Hayti.

6292. *The British possessions*, though not the most extensive or naturally fruitful, are, since those of France have sunk into secondary importance, undoubtedly the best cultivated, most wealthy, and productive. Perhaps no part of the globe, in proportion to its extent, yields such an amount of valuable commodities for exportation. The following table exhibits the population and commerce of each of these islands. It is drawn up from materials furnished by Mr. M'Culloch in his *Dictionary of Commerce*, which, like the other statements in that work, are derived from the most authentic sources.

Places.	Whites.	Free Coloured.	Slaves.	Produce of			General Value of

This table will afford an accurate notion of their relative importance, and will render unnecessary any minute details respecting a region which presents in general so uniform an aspect.

6293. *Jamaica* is the largest and most valuable island in the British West Indies. The lofty range of the Blue Mountains in the interior, covered with ancient and majestic forests, gives to its landscapes a grand and varied aspect. From these heights descend about a hundred rivers, or rather rills, which dash down the steepes in numerous cascades, and, after a short course, reach the sea. From these elevated tracts the island is supplied with the vegetable productions of a temperate climate; and the Guinea grass,

which has prospered remarkably, enables the planters to maintain numerous and valuable

Fig. 1043.

MAP OF JAMAICA.

not been preserved from the pestilential influence of the climate, which renders it extremely dangerous to European constitutions.

6294. *The towns of Jamaica*, as of the other islands, are all sea-ports, and supported by commerce. Spanish Town, the most ancient, and still the seat of the legislature and courts, is of comparatively little importance, and has not more than 4000 or 5000 inhabitants. Port Royal, possessed of a secure and spacious harbour, was, in the end of the seventeenth century, enriched both by the trade of the island, and the contraband traffic with the Spanish main. It was then, with the exception of Mexico and Lima, the most splendid and opulent city in the New World. Suddenly an earthquake swallowed up the greater part of the city and its inhabitants. Yet the advantages of its situation caused it to be soon rebuilt, and ten years after, when it had been burnt to the ground, it was reared again from its ashes. But in 1792 it was assailed by a hurricane, the most dreadful ever known, even in these latitudes. The sea rose seventeen or eighteen feet, undermined and overthrew a great part of the houses; the shipping in the harbour was entirely destroyed, with the exception of a few large vessels, which had only their masts and rigging swept away. Port Royal, being then viewed as a fatal spot, was abandoned for Kingston, and is now reduced to 200 or 300 houses. The fortifications, however, which are very strong, are still kept up, and the navy yard is maintained there. Kingston, about twenty miles S.E., is now the real capital of Jamaica. It is situated in a fine plain, extending six miles in breadth to the foot of the mountains. Its commerce, though not equal to what that of Port Royal once was, is great, and is favoured by a spacious and commodious roadstead. All these towns are on the south-eastern coast, which is the most level and fertile, and most favourable for trade. Montego Bay, a place with about 4000 inhabitants, carries on the more limited commerce of the northern coast. Savanna la Mar, in the west, is little more than a village, since it was nearly destroyed by the hurricane of 1780; yet it has a good harbour, and a little trade.

6295. *Barbadoes* is the island which ranks next in value and importance; indeed, it was the earliest settled and improved of all the English possessions. Having been founded during the period of the civil wars, it afforded a refuge to persons of various parties who successively suffered persecution. It thus made very rapid progress, and in 1650 there were estimated to be 20,000 white men in the island, half of whom were able to bear arms. It has been alleged to have undergone a considerable decline towards the end of the eighteenth century, in consequence of the dreadful hurricanes with which it has been ravaged, and of the exhaustion of the soil, which now requires manure in order to maintain its fertility; yet the population and produce were greater in 1829 than in 1753, the supposed period of its highest prosperity. Barbadoes, having no mountains in the centre, is less copiously watered than the other Antilles; and, being farther out in the Atlantic, is peculiarly exposed to the general scourge of hurricane. Its soil, though deficient in depth, being composed chiefly of a fine black mould, is well fitted for the culture of sugar; and its rich plantations, diversified by the gentle hills which rise in the interior, present a delightful landscape. Bridgetown, the capital, is one of the gayest and handsomest towns in the West Indies, containing above 20,000 inhabitants. It has an excellent harbour, much frequented, not only for the trade of the island, but by vessels which, in consequence of its easterly position, reach it before any of the other islands, and touch there for refreshment.

6296. *St. Christopher's*, known often by the familiar appellation of *St. Kitt's*, is not the next in importance; but, on account of its early settlement, may be noticed here, in preference to recent acquisitions. It was first occupied by the English in 1623; and, though repeatedly disputed by the Spaniards and French, has, with the exception of some short intervals, remained in the possession of Britain. The interior, rising into the lofty peak of Mount Misery, is peculiarly rugged and mountainous, but the plain along the sea surpasses in richness and beauty that of any of the other islands, abounding in the black mould which is peculiarly fitted for sugar. Basseterre, the capital, on the south-west coast, contains 6000 or 7000 inhabitants.

6297. *Antigua*, to the east of St. Christopher's, is by no means so uniformly fertile; a large proportion consisting of a stiff clay, which yields only bad grass. Being deficient in springs or rivulets, water is procured only by preserving the rain in cisterns, and in years of drought the crop sometimes entirely fails. In favourable seasons, however, there is a very considerable produce of sugar. Antigua, St. Christopher's, and several others now to be mentioned, form what are called the Leeward Islands, which, running from east to west, are supposed to be less exposed to the action of the trade wind. All the Leeward Islands have one governor, who resides at Antigua. Hence John's Town, its capital, admired for its agreeable situation and the regularity of its buildings, derives a considerable degree of importance, and is a favourite resort.

6298. *The other Leeward Islands* consist of Montserrat, Nevis, Barbuda, Anguilla, and the Virgin Islands. The first is agreeable and picturesque, but by no means fertile. Nevis is a small, but beautiful and fertile island, consisting of one conical mountain above twenty miles in circuit. Barbuda and Anguilla, still smaller, are also fertile, but little cultivated: Anguilla has a valuable salt-pond; the tobacco of Barbuda is particularly esteemed. The Virgin Islands are, upon the whole, the most arid and least productive of any

in the West Indies. They are numerous, and in some degree shared by the Spaniards and Dutch; but Tortola, the only one of much consideration, belongs to the English. — The islands now enumerated include all that were originally settled and colonised by Britain. But conquest within the last seventy years has conveyed to her others of great value, by which her possessions in this quarter of the world have been nearly doubled. Part of these were captured during the war which closed in 1763, others in that which broke out on occasion of the French revolution.

6299. *Dominica* stands in the former predicament. It is a large island, but not productive altogether in proportion to its extent, much of the surface being mountainous and rugged. Several of its volcanic summits throw out from time to time burning sulphur, but they do not act to any destructive extent. It is interspersed, however, with fertile valleys; a large quantity of coffee is raised on the sides of the hills. Roseau, the capital, is by no means so flourishing as before the fire of 1781; it is well built, but many of the houses are unoccupied.

6300. *St. Vincent's*, ceded by the same treaty, is one of the most elevated and rugged of the Antilles. It contains the only very active volcano in these islands, which, after being dormant for a century, burst forth in 1812 with tremendous violence, exhibiting the most awful phenomena. Several plantations were destroyed, and almost all those on the eastern coast were covered with a layer of ashes ten inches deep. The peak of Morne Garou is nearly 5000 feet high. Yet the intermediate valleys, being fertile in a high degree, render *St. Vincent's* on the whole a very productive island. It contains small remnants of the native Carib race, mingled with some free negroes, who were early introduced, and have adopted many of the Indian usages. Kingston, the capital, has been supposed to contain 8000 inhabitants.

6301. *Grenada* exhibits a considerable variety of surface, which, on the whole, however, is extremely productive, and renders it an important acquisition. The scenery, though not so grand as that of some of the others, is peculiarly beautiful, and has been compared to that of Italy. *St. George*, the capital, named formerly Port Royal, possesses one of the most commodious harbours in the West Indies, and has been strongly fortified.

6302. *Tobago*, the last of the cessions of 1763, is a small but fertile and beautiful island. Notwithstanding its southerly situation, the heat is tempered by breezes from the surrounding ocean, while at the same time it appears to be out of the track of those hurricanes which have desolated so many of the other islands. It yields the fruits and other products common to the West India Islands with those of the bordering Spanish main. Scarborough, a town of about 3000 inhabitants, is its capital.

6303. *Trinidad*, separated only by a strait from the coast of South America, where that mainland is traversed by the branches of the Orinoco, shares in a great measure its character. It is covered with magnificent forests, and presents scenery peculiarly grand and picturesque. The island is unhealthy, but fruitful, and being the largest next to Jamaica, forms an acquisition of great value. It was Spanish till 1797, when it was captured, and confirmed to Britain by the treaty of Amiens. One remarkable object in this island is a lake of asphaltum, three miles in circumference. This substance, being rendered ductile by heat, and mingled with grease or pitch, is employed with advantage in greasing the bottoms of ships. *Trinidad* contains still about 900 native Indians. Port Spain (*Puerto España*) is a considerable town, well fortified, and with an excellent harbour. It is built regularly and handsomely, with a fine shaded walk and spacious market; and the churches, both Protestant and Catholic, are very richly ornamented.

6304. *Demerara, Berbice, and Essequibo* extend along the coast of Guiana; but they participate so largely in the character of West India colonies, that a view of them is necessary to complete that of these important settlements. They are also of recent acquisition, having belonged to the Dutch till the last war, when they yielded to the naval supremacy of Britain, and were confirmed to that power by the treaty of 1814. They extend about 300 miles along the coast, and each colony is situated at the mouth of a broad river, bearing its own name. The territory is low, flat, alluvial, and in many parts swampy; and the greater portion, when it came into the possession of Britain, was covered with dense and almost impenetrable forests. Since that time a prodigious improvement has taken place; British industry has cut down the woods, and, availing itself of the natural fertility of the soil, has rendered this one of the most productive regions in the New World. *Demerara*, as will appear by the commercial table, ranks as to West India produce second only to Jamaica: its rum is inferior only to hers; and the coffee of *Berbice* ranks above that of any of the islands. *Staebroek*, now *St. George*, is built on the low bank of the river *Demerara*. The houses are of wood, seldom above two stories high, and, with a view to coolness, are shaded by colonnaded porticoes and balconies, and by projecting roofs; and Venetian blinds, or jalousies, are used instead of glass windows. Canals are conducted on each side of the town, which presents a busy scene, every road being like a wharf strewn with casks and bales. The town contains from 8000 to 10,000 inhabitants, mostly negroes, with a considerable proportion of people of colour, some of whom have attained to considerable wealth. *New Amsterdam*, the small capital of *Berbice*, is agreeably situated, intersected by canals, and with a considerable spot of ground attached to each house.

6305. *The Bahama Islands* form a very extended and numerous group, being successively parallel, first to Florida, then to Cuba and part of *St. Domingo*. Five hundred have been counted; but many of them are mere rocks and islets. The island called the Great Bahama is remarkable as being the first part of the New World that was discovered by Columbus. These islands were very much neglected till about the beginning of the last century, when a British settlement was formed there under Captain Woodes Rogers. The Bahamas, notwithstanding their favourable situation, have never been productive in the West India staples. The soil is in general arid and rocky; and even those islands which might be capable of improvement have been neglected. Cotton is the only article which has been cultivated to any extent, and even this has declined. They produce, however, a considerable variety of fine timber and dye-woods, and some of them supply the neighbouring coasts with salt. Between the western islands and the coast of Florida is the Bahama channel, through which that celebrated current called the Gulf Stream, from the Gulf of Mexico, rushes with such impetuosity that it is perceptible upon the northern coasts of Europe. Its force renders the passage extremely dangerous, and has given occasion to frequent wrecks. The difficulty of navigation in these seas is increased by the great bank of Bahama, interposed between Cuba and these islands. *Nassau*, in the island of New Providence, from its situation upon this frequented channel, is a place of some importance. It is the general seat of government, and contains a population of about 5000 persons.

6306. *The Bermudas*, situated in the midst of the Atlantic, about 600 miles east from the coast of North America, may, for want of a more appropriate place, be described here. About 400 are numbered; but most of these are mere rocks, and only eight possess any real importance. These islands, which began to be settled about 1612, drew for some time greater attention than their natural advantages justified. During the internal troubles which soon after took place in Great Britain, they became the asylum of many distinguished personages, and among others of the poet Waller, who, by celebrating the beauty of their aspect and the felicity of the climate, spread around them a poetical lustre. The Bermudas are indeed in these respects peculiarly fortunate; being exempted from the scorching heats of the tropic, enjoying almost a continued spring, and being clothed in perpetual verdure. But though they afford thus an agreeable and healthful residence, they have not proved productive in any of those commodities which can become the staple of an important traffic. Cotton has been tried, but without any great success. They have been used as a place of deportation for criminals, but in this respect are now superseded by the Australian settlements. The rocky nature of the coasts renders them easily defensible, but unfavourable to navigation. *St. George*, the seat of government, on an island of the same name, is only a large village.

6307. *The western colonies of Spain*, which for some centuries comprised the greater part of the American continent, with all its richest and most splendid regions, are now limited

to the two islands of Cuba and Porto Rico. Yet these are so considerable and so fruitful, that, since a more liberal policy has been adopted towards them, they have in no small degree compensated for her immense losses.

6308. *Cuba*, extending upwards of 700 miles in length, though only 117 in its greatest breadth, is more extensive than all the other West India islands put together. Being traversed throughout its whole extent by chains of mountains, whose highest peaks, Patrillo and Cobre, exceed 8000 feet, the plains beneath are most copiously watered, and rendered fit for producing in the highest perfection all the objects of tropical culture. The situation of this island, commanding the entrance of the Gulf of Mexico, and the communication between North and South America, gives it a high commercial importance. Spain long viewed Cuba merely as the key of her greater possessions, and the passage by which she reached them. This great island did not, in the value of its produce, equal some of the smallest Antilles. During the last thirty years, however, and especially since the separation of the continental colonies from the mother country, a more liberal and protecting policy has been adopted: the ports of the island have been thrown open; strangers, and even emigrants, have been encouraged to settle there; and, amid the political agitations of the mother country, the expulsion of the Spanish residents from Hispaniola, and the disasters of those, in the continental states of America, who adhered to old Spain, Cuba has become a general place of refuge. Its progress, from these causes, has been most extraordinary. The inhabitants have applied themselves to the culture of the great West India staples of sugar and coffee, and with surprising success. Between 1760 and 1767, the exports of sugar amounted to only 5,570,000 lbs.; in 1832, they are believed to have exceeded 250,000,000 lbs., or above 110,000 tons. (M'Culloch's *Dictionary*, 2d edit.) In 1800 there were only 80 coffee plantations on the island; in 1827, they amounted to 2067, and the export was 50,037,000 lbs. In 1775, the population was only 170,370; in 1827, a census gave 704,487. Of this the white population amounted to 317,064; the mulatto to 57,514; the free negroes to 48,980; the slaves to 286,942, of whom 183,300 were male, and 103,652 female. This advance has, however, unhappily been in a great measure produced by the active prosecution of the slave trade, which the Spaniards have continued, after it had been renounced by other civilised nations. Within the last few years, it is stated that forty or fifty vessels have regularly cleared out for Africa as for an ordinary trade, but with the well-understood object of practising this nefarious traffic. This mode of supply is accompanied with the distressing circumstance of the great

inequality of the sexes; the female slaves on a plantation being seldom more than a third of the whole, and often bearing a much smaller proportion, since the masters find it cheaper to purchase than to rear. Of late, however, many of the slave-dealers have become bankrupt in consequence of the number of cargoes captured by the British vessels employed in the suppression of the trade, and of a fall in the value of the commodity, caused by the number of coffee plantations that have been given up, the slaves employed on which have been thrown upon the market. In 1828 there entered inwards 1889 vessels of 277,000 tons burden; and 1686 vessels, of 229,830 tons, cleared outwards. The imports in that year amounted to 19,534,000 dollars, the exports to 13,114,000.

6309. *Havana*, or the *Havannah*, the capital of Cuba, is one of the greatest and most flourishing cities of the New World. It once carried on the whole, and still retains more than two thirds of the commerce of the island. The harbour is admirable, capable of containing a thousand large vessels, and allowing them to come close to the quay: its narrow entrance has been found disastrous when fleets were seeking shelter from a pursuing enemy. The fortifications, particularly the Morro and Punta castles, are remarkably strong; but in 1762 they yielded to the British fleet, which captured nine sail of the line, and merchandise to the value of about 3,000,000*l.* sterling. Since that time, however, the works have been so carefully strengthened as to make the place nearly impregnable; and during the late war, while the British navy was generally so triumphant, no attempt was made to reduce the Havannah. The arsenal and dock-yard are also on a large scale. The city presents a magnificent appearance from the sea, its numerous spires being intermingled with lofty and luxuriant trees. The churches are handsome and richly ornamented; and several private mansions are reckoned to be worth above 60,000*l.* each. The interior, however, for the most part consists of narrow, ill-paved, and dirty streets, crowded with merchandise and waggons, and presenting entirely the appearance of busy trade. Yet the alameda, or public walk, and the opera, on the appearance of a favourite performer, exhibit a gay and even splendid aspect. The recently constructed suburbs are also built in a superior style. The Havannah has patriotic and literary societies, which are improving. Seven journals are published, one of them in English. The population is estimated by Balbi at 112,000.

6310. *Other towns in Cuba* have risen to importance since the monopoly of the trade absurdly conferred on the Havannah was withdrawn. Matanzas, only about sixty miles east of the capital, has acquired a considerable commerce. In 1827 it contained 15,000 people, and exported 30,000,000 lbs. of sugar; 231 vessels entered, and 251 left its port. Trinidad, since it was permitted, carries on with activity the trade of the southern coast; it exported, in 1827, sugar to the amount of 10,361,000 lbs. Santiago de Cuba, at the eastern extremity of the island, was the original capital, and suffered severely when this distinction was transferred to the Havannah; but since 1788, when its port was opened, it has shared in the general prosperity, and its exports and imports amount each to about 300,000*l.* It contains 27,000 inhabitants, and is somewhat better built than the other towns. Villa del Principe, in the heart of the island, though the seat of the *real audiencia*, or supreme court of appeal, and containing 49,000 inhabitants, is poor, dirty, and ill built; and much inconvenience is felt from the marshy soil on which it stands.

6311. *Porto Rico*, about 140 miles in length, and 36 in breadth, is much smaller than Cuba, but is extremely fertile. Till within the last half century it was equally neglected, and its wealth was derived entirely from woods and pastures; but since 1778 its progress has been equally rapid, the population having increased from 80,640 to 288,473. Of this last number in 1827, 28,408 only are stated to be slaves: there were 101,479 free labourers. This remarkable fact, connected with so great a progress in cultivation, would deserve to be investigated. San Juan de Porto Rico is a strong place, with a spacious and secure harbour, and contains about 30,000 inhabitants.

6312. *The possessions of France* in the West Indies, previous to the revolutionary war, were more valuable than those of any other nation. The exports from St. Domingo alone amounted to 5,000,000*l.* That valuable island is now entirely lost to her. During the late war all her islands were captured, and she ceased to exist as a colonial power. At the peace, Martinico and Guadaloupe were restored, and, with Cayenne, form territories of considerable value and capability. Their progress, however, was of course checked during the period when they were under foreign occupation, and it does not appear to have been rapid even since the restoration. The anti-commercial system introduced by Napoleon, and even the preposterous attempt to raise sugar in France out of the beet-root, have not wholly ceased their operations. In 1827, the imports of France from her colonies amounted to 2,300,000*l.*, the exports to 2,100,000*l.* The ships employed in it were 842, tonnage 274,000. Of this trade much the greater part must have been with the West Indies. It appears that there entered and were despatched from French ports to Martinico, 345 ships, of 90,173 tons and 4983 men; to Guadaloupe, 345 ships, of 85,376 tons and 4812 men.

6313. *Martinico*, as compared with the other Antilles, is a large and fine island, about fifty miles in length and sixteen in breadth. The surface is generally broken into hillocks, and in the centre rise three lofty mountains, the streams descending from which copiously water the island. The progress of Martinique took place between 1700 and 1732, during which period the negro population increased from 14,500 to 72,000. The English, when they took it a second time in 1809, found next year a population of 96,413. The census of 1827 gave 101,905, of which 9937 were whites, 10,786 free coloured, and 81,182 slaves. Port Royal, the capital and the seat of the courts of justice, is a well-built town, with 7000 inhabitants; but the chief trade centres in St. Pierre, the largest place in Martinico and in all French America. Its excellent road has rendered it an entrepôt of the trade of the mother country with this quarter of the world.

6314. *Guadaloupe* is a larger island, being from fifty to sixty miles long and twenty-five broad. It may almost be considered as two islands, since a channel, from thirty to eighty yards broad, crosses the narrow isthmus by which its eastern and western portions are united. The western, called Basseterre, notwithstanding

the name (which is derived from its position with regard to the trade-wind), contains a chain of lofty and rugged mountains, one of which displays some volcanic phenomena, emitting volumes of smoke, with occasional sparks of fire. However, its plains are copiously watered and fruitful. The eastern division is more flat, and labours under a deficiency of water. The progress of Guadeloupe was contemporaneous with that of Martinico, though slower. In 1755 it contained 50,800 inhabitants; in 1812 these had increased to 114,000. In 1827 the population was found to be 135,516, of which 17,237 were whites, 16,705 free coloured, 101,564 slaves. Basseterre, on the part of the island bearing that name, ranks as the capital; but having a bad harbour, is supported merely by the residence of government, and has not more than 9000 inhabitants. Point-à-Pître, on the eastern side, or rather at the junction of the two, carries on almost all the trade, and has a population of about 15,000. The islands of Marie-Galante and Deseada are appendages to Guadeloupe, of little importance.

6315. *Cayenne*, or French Guiana, is an extensive tract belonging to the South American continent, but which, for reasons already stated, we shall here consider in connection with the West Indies. Cayenne Proper consists of an alluvial island about eighteen miles long and ten broad, formed by the branches of the river of that name; but the term is applied generally to a coast about 500 miles in length, having Dutch Guiana on the west, and Portuguese or rather Brazilian Guiana on the east; but the limits of the latter are disputed to the extent of 120 miles, in consequence of the ambiguity occasioned in the treaty of Utrecht by the terms Yapock and Oyapock; and the Brazilians, in spite of every remonstrance, continue to occupy the coast as far as the latter river. Cayenne is an alluvial swampy region, covered with majestic forests. The trees astonish Europeans, not only by their prodigious size, but by their great variety; M. Noyer having counted no less than 259 that were fitted for human use. Fine aromatics, unknown to the other regions of the west, have been cultivated there with success. The Cayenne pepper is the most pungent and delicate kind of that spice; and the clove, long supposed exclusively attached to the Moluccas, has succeeded so well, that a part of the consumption of Europe is supplied from Cayenne. The natural advantages of this colony are very great. The cutting down of these noble woods would afford the material of a valuable timber trade, and the ground thus cleared would be fit for sugar and every kind of West India produce. Yet the tract is cultivated in only a few scattered patches, not exceeding in all 10,000 acres. Serious obstacles are indeed presented by the pestilential vapours exhaled from these dark woods and marshes. In a settlement on a great scale, attempted in 1763, no less than 13,000 persons perished, so that the deportation to Cayenne of deputies obnoxious to the ruling party, during the revolution, was inflicted as conveying almost a sentence of death. Yet, if due precautions were used, and the woods cleared, it would probably be as healthy as any other settlement in this quarter. Cayenne is a small town, neatly built of wood, with a spacious and commodious road, and a population of 3000. Kouron, Sinnamaree, La Mana, and Oyapock are small settlements scattered along the coast.

6316. *The possessions of the Dutch* in the West Indies, when compared with their eastern colonial empire, appear exceedingly limited. Their only islands are St. Eustatia, Saba, and Curaçoa. The first two are small isles lying immediately north of St. Christopher's: St. Eustatia consists almost entirely of the sloping sides of one high conical hill, terminating in a rocky summit. It is, however, cultivated with great care, and abounds particularly with tobacco; also in cattle and poultry, of which it affords a surplus to the neighbouring islands. The capital is well fortified, and forms a species of entrepôt both of regular and contraband trade. The population of the island is estimated at 20,000; that of the town at 6000. Saba, only twelve miles in circuit, and destitute of a harbour, is a pleasant island, but of no commercial value. The Dutch participate with France the small island of St. Martin, valuable almost solely for its salt-works. Curaçoa is a larger island, far to the west of the others, and only about seventy miles distant from the Spanish main. It is about thirty miles long, and ten broad; but the greater part of its surface is arid and unfertile, and its importance was chiefly derived from the contraband trade which its situation enabled it to carry on, while the continent was exclusively possessed by Spain, and studiously shut against the vessels of other countries. Since Colombia became independent, and threw open her ports to all nations, Curaçoa has sunk into a secondary station. Willemstadt, its capital, however, with a fine harbour, has still a considerable trade, and a population of 8000.

6317. *Surinam*, on the coast of Guiana, constitutes the most important part of the Dutch western possessions. Dutch Guiana formerly included Demerara, Berbice, and Essequibo; but Britain having in the last war captured these three districts, her capital was employed with such advantage in improving them, that she determined, at the peace, on retaining them, and left to Holland only the larger but less valuable territory of Surinam Proper. This coast, like that of the rest of Guiana, is flat and alluvial, and is traversed by several broad rivers, coming from a considerable distance in the interior. That of Surinam has a channel about four miles wide, but shallow and rocky, navigable only for boats. The Dutch, since they regained possession of it, have made very considerable efforts for its improvement, and it is decidedly rising in importance. Paramaribo, at the mouth of the river, where it affords excellent anchorage for vessels, is a considerable town, well built of wood, and arranged in regular streets, adorned with fine trees. Its commerce, though now surpassed by that carried on in English Guiana, is considerable, and supports a population of 18,000 or 20,000 persons.

6318. *The Danes* have three small islands in the West Indies. St. Croix, the principal one, lies to the south of the Virgin Islands: it has a surface of eighty-one square miles, and a population of about 30,000, all slaves, except 2500 whites and 1200 free coloured. It is productive, in proportion to its extent, in the usual West Indian articles. St. Thomas, one of the Virgin Islands, is of little importance, unless as a favourable station for introducing into the other islands those goods which the great states have declared contraband. St. John's, another of the same group, is very small, and only noted for its excellent harbour.

6319. *The Swedes* have only one small island, St. Bartholomew, situated about fifty miles north of St. Christopher's. It is not quite twenty-five square miles in extent, and is generally described as fertile and well cultivated, though an eye-witness assures us that neither of these characters can apply to it. Gustavia, the capital, acquired considerable wealth during the war, when it continued long to be almost the only neutral port in these seas.

6320. *Hayti*, now an independent negro republic, forms one of the most peculiar and interesting portions of the New World. It is a very fine island, situated between Jamaica and Porto Rico, about 450 miles in length, and 110 in breadth. In the centre rises the lofty range of the mountains of Cibao, of which the peak of La Serrania rises to the height of 9000, and that of La Sella to 7000 feet. These mountains are covered nearly to the summit with vegetation and noble woods, and from them descend numerous streams, which, uniting in four large rivers, bestow extreme fertility on the plains beneath. This was the first large island discovered by Columbus, who landed there on the 5th of December, 1492, and made it, under the name of Hispaniola, the seat of his first colony. That great man, however, soon lost all control over the Spanish adventurers, who gave full scope to their cruelty and rapacity. The gold, which was then found in considerable abundance, formed the chief object of their avidity; and the unhappy natives, forced to labour in the mines, and otherwise inhumanly treated, were in the end completely exterminated. The gold being in some degree exhausted, and its amount completely eclipsed by that of Mexico and Peru, Hispaniola, called now St. Domingo, was in a great degree neglected. About the

middle of the sixteenth century a daring band of French buccaneers established themselves in the western districts. They were owned and supported by the French government, which ultimately became possessed of this part of the island. Its progress was at first checked by the injudicious restraints of an exclusive company; but a more liberal policy being adopted in 1722, it rapidly advanced to a degree of prosperity altogether unprecedented. Though forming little more than a third of the island, it far surpassed in opulence not only the Spanish part, but the whole Spanish West Indies. In 1789 the imports were valued at upwards of 5,000,000*l.* sterling.

6321. The French revolution caused an extraordinary change in the state of Hayti. In 1791 the Convention caused to be proclaimed throughout the island their favourite doctrine, that all men were free and equal. This proclamation gave rise, in the first instance, to a contest between the white and the free coloured population. But while these parties were contending for the application of the principle, the slaves felt that it applied also to them. They rose in a body, massacred or drove out the other two classes, and became entire masters of French St. Domingo. This revolution, with the excesses which accompanied it, soon ended, like other revolutions, in a military despotism, which was established in 1806 by Dessalines, who assumed the title of James I. He was succeeded by Christophe, his second in command, who named himself Henry I., hereditary king of Hayti. Meantime, however, the republic of Hayti was established in another part of the island, under the presidency, first of Pétion, and then of Boyer. Henry, harassed by attacks from this and other quarters, ended his life by suicide in 1820. Boyer then, by a series of vigorous operations, not only extended his sway over all the French part of the island, but annexed to it also that belonging to Spain; so that the whole is now comprehended in the republic of Hayti. France in 1803 made strong efforts to regain this valuable island, but without success. At length, on the 17th of April, 1825, a treaty was concluded, by which she acknowledged the independence of Hayti, on condition of receiving the large sum of 150,000,000 francs, to be paid in five annual instalments.

6322. An independent negro state was thus established in Hayti; but the people have not derived all the benefits which they sanguinely expected. Released from their former compulsory toil, they have not yet learned to subject themselves to the restraints of regular industry. The first absolute rulers made the most extraordinary efforts to overcome the indolence which soon began to display itself. The *Code Rural* directed that the labourer should fix himself on a certain estate, which he was never afterwards to quit without a passport from the government. His hours of labour and rest were fixed by statute. The whip, at first permitted, was indeed ultimately prohibited; but as every military officer was allowed to chastise with a thick cane, and almost every proprietor held a commission, the labourer was not much relieved. By these means Mr. Mackenzie supposes that the produce of 1806 was raised to about a third of that of 1789. But such violent regulations could not continue to be enforced amid the succeeding agitations, and under a republican régime. Almost all traces of laborious culture were soon obliterated: large tracts, which had been one entire sugar-garden, presented now only a few scattered plantations. The export of sugar, which in 1806 had been

47,516,531 lbs., amounted in 1825 to 2020 lbs. Coffee, which continued to be a staple production, was also much diminished. The only indemnification which the people sought was in the easy task of cutting down the forests of mahogany and campeachy wood, which were found of greater value than had been supposed. Mr. Mackenzie, in viewing the extreme fertility of the soil and climate, and the contented indolence of the inhabitants, was struck with extreme despondence as to their ever making any improvement. The slightest labour is sufficient to secure subsistence; the adults wear merely such portions of dress as decency most absolutely requires, while the children of both sexes have no covering whatever. It would rather appear, however, that Hayti had reached its utmost point of depression, and was beginning, after the example of its industrious neighbours, to avail itself of its great natural advantages. The revenue in 1825 is stated at 3,101,000 dollars, and the expenditure at 3,105,000; but Hayti is severely pressed by the enormous sum which she has engaged to pay as the price of her independence. In 1829, the declared value of the imports from Britain was 297,709*l.*, of which 210,000*l.* consisted in cotton goods, and 57,000*l.* in linen. The principal exports were 248,000 lbs. coffee (but this rose in the following year to above 900,000), 149,000 lbs. cotton, 4939 tons mahogany, 125 tons logwood, 24 tons fustic.

6323. *Hayti* has been divided into six departments, named, chiefly after their positions, West, South, Artibonite, North, North-east, South-east. The last two comprehend the part lately possessed by the Spaniards. Port au Prince, in the department of the West, is the capital, and the chief seat of trade. It has a secure and excellent roadstead, but the country around is marshy, and, during the summer, very unhealthy. The city is built mostly of wood, its streets unpaved, and containing no remarkable edifices. The population may be from 12,000 to 15,000. Port Haytien, in the department of the North, the seat of the kingdom established by Christophe, is better built, with well-paved streets, and some handsome squares, and has a population of about 10,000. Near it is the citadel, constructed at vast expense on the top of a mountain, as a place of security for himself and his treasures. Les Cayes, in the department of the South, the seat of an ephemeral government, which sprung up during the disturbances, is a neat town, with a flourishing trade; but it was almost destroyed by a hurricane in August, 1831. St. Domingo, the capital of the Spanish part of the island, presents the remains of a very handsome city; a solid and spacious cathedral, a large arsenal, houses in general commodious and well built; but it has been long in a state of decay, and is not supposed to contain now above 10,000 inhabitants.

BOOK V.

AUSTRALASIA, POLYNESIA, AND THE ISLANDS IN THE POLAR SEAS.

6324. *Islands and groups of islands* form an extensive and important portion of the surface of the globe. Those which are in the close vicinity of the great continents, and situated in gulfs enclosed by them, have been considered as appendages to these continents, and treated of in connection with them. But, in that wide expanse of ocean, which covers more than half the surface of the globe, there occur some very large and numerous small islands, widely separated from any continent, and a survey of which is requisite to complete the description of the world. They present human society under rude, indeed, but striking and picturesque, aspects; and, through the extension of commerce and navigation, colonies have been established, and a frequent intercourse maintained with them by the maritime nations of Europe.

6325. These islands may be divided into three great classes, marked by distinctive characters: — 1. Australasia. 2. Polynesia. 3. The islands in the Polar Seas.

CHAP. I.

AUSTRALASIA.

6326. *Australasia*, as already observed, is the name given to an assemblage of huge insular masses of land occupying the western parts of the Pacific, and extending southward from eastern Asia. These great oceanic tracts consist, according to Mr. Barrow, of, 1. New Holland, called often *Australia*; 2. Van Diemen's Land; 3. New Zealand; 4. Papua, or New Guinea; 5. New Britain, New Ireland; 6. Solomon Islands; 7. New Hebrides; 8. New Caledonia. Of these, New Holland is by far the most extensive, attaining even the importance of a continent; and since, for well-known reasons, a peculiar interest attaches to it and its close appendage of Van Diemen's Land, these will be chiefly regarded in the general description, while the local head will comprehend the other insular regions by which it is encircled.

1. *New Holland.*

SECT. I. *General Outline and Aspect.*

6327. *New Holland*, or the continental part of Australasia, may be stated as lying between 10° 30' and 39° S. lat., and between 112° 20' and 153° 40' E. long. Hassel assigns to it 2977 miles from east to west, and 2004 from north to south. The superficial content is estimated with difficulty and variously. Zimmermann's Geography makes it 3,300,000 square

English miles; Freycinet, more recently and with fuller materials, allows very little more than 3,000,000. The late discoveries of Captain King must somewhat modify any calculation, though they affect more the details than the general mass. The form of the whole is compared by Hassel to that of a horse-shoe.

6328. The surface of this continent is too extended, and the explored portion too small, to allow us with safety to hazard any general conclusions. The prevailing feature, so far as yet observed, has been barren and wooded plains, traversed by long ridges of precipitous, but not very lofty mountains; and rivers, which often spread into marshes, and do not preserve any course which may be called long when compared with the size of the continent. There are few deep bays, nor does the sea, so far as yet discovered, receive any river whose magnitude corresponds to that of the land. It is still, notwithstanding the spirited efforts lately made, only a corner of the interior of this huge mass of land that is at all known. A great part of this, through the mixture of broad mountain masses and of heavy inundated plains, is rendered unfit for cultivation, and even for travelling. These obstructions, however, do not prevent the occurrence, on a great scale, of fine meadow tracts, where the richest herbage grows spontaneously, and where industry may raise the most plentiful crops.

6329. The mountains of New Holland form a ridge nearly round it, rocky, and in many

parts almost inaccessible. The Blue Mountains, in particular, which rise behind the colony, tower up almost like a wall; their cliffs being so steep, and separated by such dreadful abysses, as to have been long considered as presenting a barrier absolutely impassable. It was not till 1813 that a route was discovered through them, which has since been made completely patent. Their highest summits do not appear much to exceed 3000 feet. The western and southern coasts present generally a most dreary, arid, and rocky aspect. Mount Cockburn, a mass of hills at the head of Cambridge Gulf, has a singular appearance, resembling the bastions and ramparts of a fortress. A considerable extent of level and fertile territory has lately been discovered in the vicinity of Swan River. Captain King, however, sailed 600 miles along the northern coast, which he found to present a continuous low and woody tract of shore.

6350. *The rivers of New Holland have been the subject of anxious enquiry, as being the channels of its future prosperity. The Hawkesbury, with its tributaries the Grose and the Nepean, is most valuable to the colony, but forms only a stream of secondary magnitude. In the interior, beyond the Blue Mountains, have been traced the Lachlan and the Macquarie, running respectively courses of upwards of 200 and 300 miles. On the east coast are, also, the rivers Williams, Hunter, and Paterson, forming Port Hunter; the Hastings, forming the fine port of Macquarie; and the still larger stream of the Brisbane, falling into Moreton Bay. On the north coast, the only important feature consists of three estuaries which fall into Van Diemen's Gulf, and which Mr. Patrick Cunningham vainly believed to be the termination of the Macquarie. More importance seems to belong to Prince Regent's River, on the north-west coast, which, at the distance of fifty miles from the sea, was found to have a full stream of 250 yards broad; but the marshes of the Macquarie have since been found dried up, and those of the Lachlan to carry that river into the Morrum-bidgee, which rises to the westward of the dividing range of the colonial mountains, and, taking a western course of 1000 miles, forms by far the longest river yet discovered, under the name of the Murray, and falls into Lake Alexandrina at Encounter Bay, on the south coast.*

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

6331. *Our information regarding the geognosy of New Holland and Van Diemen's Land is extremely meagre. In Dr. Fitton's memoir, appended to Captain King's Voyage to Australia, are the following notices in regard to the rocks:—*

1. *Granite.* Cape Cleveland; Cape Grafton; Endeavour River; Lizard River; round hill near Cape Grindall; Mount Caledon; island near Cape Arnheim; Melville Bay; Bald Head; King George's Sound. — 2. *Mica slate.* Mallison's Island. — 3. *Talc slate.* Endeavour River. — 4. *Hornblende slate.* Pobasooos River; Half-way Bay; Prince Regent's River. — 5. *Granular quartz.* Endeavour River; Montague Sound, north-west coast. — 6. *Quartz conglomerates and ancient sandstones.* Rodd's Bay; islands of the north and north-west coasts; Cambridge Gulf; York Sound; Prince Regent's River. — 7. *Limestone, resembling in the character of its organic remains the mountain limestone of England.* Interior of New Holland; near the east coast; Van Diemen's Land.

6332. *The coal formation.* East coast of New Holland; Van Diemen's Land. The coal formation on the east coast has been traced from Botany Bay more than one hundred miles to the north; and it extends nearly the same distance into the interior, the position where it has been most particularly examined being on the branches of Hunter's River. The coal is worked at Newcastle. Ironstone is found along with the coal, and ores of this metal, particularly bog iron ore, occur in considerable quantity in different parts of New Holland.

6333. *Fossil wood in coal formation.* In our lectures on organic remains, when discussing the subject of fossil trees, we have strongly recommended to our hearers the importance of characters of distinction for geognostical groups of plants from internal structure, and recommended them to examine all fossil woods and even recent wood in order to obtain such characters. Fortunately, one of our pupils, Mr. Nicol, well known for his extreme accuracy, took up the subject, and, after much labour, succeeded in contriving a very elegant and satisfactory method of obtaining views of the internal structure of fossilised woods. This method is explained in Mr. Witham's work, entitled "*Observations on Fossil Vegetables*," and is followed by him in his mineral dendrological researches, and now by all the investigators in this department of geology on the Continent. We put into the hands of Mr. Nicol specimens of fossil woods sent us by our active and intelligent friend, Colonel Lindsay, and by Mr. Burnet, from the coal formation in New Holland. Thin transverse sections of each were made, which, on being viewed by help of the microscope, or even a common pocket lens, displayed such structures as to show that five of the specimens examined belonged to the family of Coniferae, and two to the tribe of true Dicotyledons. Four of the Coniferae are common woodstone; the fifth is wood opal. One of the dicotyledonous specimens is woodstone, and shows the organic structure throughout the whole mass; but the other specimen, which is in the state of opal, shows the organic structure only in certain parts of the mass. Specimens of fossil wood from Van Diemen's Land were also examined, which proved to be Coniferae.

6334. *Fossil bones.* Through the exertions of Major Mitchell, Mr. Rankin, Dr. Lang, and Colonel Lindsay, many interesting fossil bones have been forwarded to the Edinburgh Museum, which have been determined by our labours, and those of Cuvier, Pentland, Cliff, and Adam. These relics were found in limestone caves in Wellington Valley, New Holland; and in the first collection sent to Edinburgh were bones of the following animals:—1. *Dasyurus*, or Devil of the colonists, one species; 2. *Hypsiprymnus*, or Kangaroo Rat, one species; 3. *Macropus*, or Kangaroo Proper, three or four species; 4. *Hæmaturus*, two species; 5. *Phascalomys*, or Wombat, one species; 6. *Elephant*, one species. Mr. Pentland remarks, in regard to these bones, 1. That of these nine animals, only two species of kangaroo do not differ in their anatomical characters from species inhabiting the same continent; whereas there is reason to suppose that the seven remaining species differ from all those hitherto known to zoologists, and that some of them belong to extinct species. 2. That, with a single exception, all the genera to which these bones are referable are now found inhabiting the Australasian continent; a remarkable coincidence with the fossil animals of the same geological epoch in Europe, where, with few exceptions, the animals which have been found in what have been called Diluvial Deposits belong to genera still inhabiting our countries. 3. That the *elephant* was an inhabitant of New Holland at a very remote period, as it appears to have been not only of every part of the Old World, but of the

American continent. In the *Edinburgh Philosophical Journal* for January, 1833, Mr. Pentland, in a letter to Professor Jameson, says:—"Since I transmitted you the notes on the fossil remains from New South Wales, I have had occasion to examine another collection presented to Cuvier by Major Mitchell, from the same locality as Wellington Valley. In my former communication, I stated that the fossils you submitted to my examination were referable to nine distinct species of Mammalia, belonging, with a single exception, to the order *Marsupialia*. The specimens sent to Baron Cuvier enable me to add five more species to the list: viz. two species of *Dasyurus*, one of which does not seem to differ from the *D. Macrourus* of Geoffroy; a small species of *Perameles*; a species of kangaroo, of the sub-genus *Hæmaturus*, and certainly very different from every known species of this genus; a small animal of the order *Rodentia*, belonging to a new genus, and of which the bones are scattered in immense abundance in certain portions of the osseous breccia; and a *saurian animal*, nearly allied to the genus *Gecko*, but which the incomplete nature of the fragments I have examined, prevents my determining more accurately. A careful examination of the specimens of Major Mitchell's collection leaves no doubt that the bones of most of the animals collected in these caves were transported thither by *carnivorous* animals, as in the bone-caves of Yorkshire, of Germany, France, &c. I have discovered several fragments evidently ground and worn down under the teeth of small carnivorous animals; and among nearly 100 specimens of long bones, still enveloped in their stalactitic crust, I have not found one to which the epiphysis remains attached, although in adult subjects; an evident proof of their having been gnawed off by the animals which formerly inhabited these recesses. What these animals were, it is easy to guess from the catalogue already given."

6335. Indications of the *new red sandstone* (red marl), afforded by the occurrence of *salt*. Van Diemen's Land.

6336. *Oolite limestone*. Van Diemen's Land.

6337. Rocks of the trap formation.—1. *Serpentine*. Port Macquarie; Percy Isles.—2. *Syenite* (greenstone). Rodd's Bay.—3. *Porphyry*. Cape Cleveland.—4. *Porphyritic conglomerate*. Cape Clinton; Percy Island; Good's Island.—5. *Compact felspar*. Percy Island; Repulse Bay; Sunday Island.—6. *Greenstone*. Vansittart Bay; Bat Island; Careening Bay; Malus Island.—7. *Clinkstone*.—Morgan's Island; Pobasooos Island.—8. *Amygdaloid with calcedony*. Port Warrender; Halfway Bay; Bat Island; Malus Island.—9. *Wacke*.—Bat Island.

6338. *Alluvial deposits*. Upon the coast in many places there are extensive alluvial deposits, which are often calcareous, abounding in the shells of the neighbouring sea. These occur under the sea, at the sea level, and sometimes considerably above high water, which latter position is to be attributed to the upraising of the land through subterranean agency. Pipe-clay and potter's clay occur abundantly. No volcanoes have been met with. Topaz is the only gem, and agate is the principal ornamental stone mentioned by authors. The ores have been but little noticed.

SUBJECT. 2. Botany.

6339. In *New Holland*, which constitutes an island so vast in extent and so separated from every other continent, as to rank as one of the great divisions of the globe, every thing relating to natural history is wonderful: its quadrupeds, its birds, its insects, and last, but not least in point of singularity, its vegetable productions,—all are, comparatively speaking, new; yet, what is truly remarkable, a very small portion of the latter have been ascertained to be useful in any way, and almost none to produce esculent fruits. "It is *New Holland*," says Mr. Barron Field, "where it is summer with us when it is winter in Europe, and *vice versa*; where the barometer rises before bad weather, and falls before good; where the north is the hot wind, and the south the cold; where the humblest house is fitted up with Cedar (*Cedrela Toona*); where the fields are fenced with Mahogany (*Eucalyptus robusta*); and Myrtle trees (*Myrtaceæ*) are burnt for fuel; where the Swans are black, and the Eagles are white; where the Kangaroo, an animal between the squirrel and the deer, has five claws on its fore paws, and three talons on its hind legs like a bird, and yet hops on its tail; where the Mole (*Ornithorhynchus paradoxus*) lays eggs, and has a duck's bill; where there is a bird (*Melliphaga*) with a broom in its mouth, instead of a tongue; where there is a Fish, one half belonging to the genus *Raia* and the other to that of *Squalus*; where the Pears are made of wood (*Xylomelum pyriforme*), with the stalk at the broader end; and where the Cherry (*Exocarpus cupressiformis*) grows with the stone on the outside."

6340. Our green-houses and conservatories have rendered us so familiar with the appearance and names of a great variety of *New Holland* productions (for however unimportant as food, in the arts, or in domestic economy, they are peculiarly interesting to the botanist), that the general appearance of its vegetation may be understood by observing that the great mass of it belongs to the natural orders *Proteaceæ*, *Epacridæ*, *Myrtaceæ*, *Leguminosæ*, and *Compositæ*; and that these have such harsh, and narrow, and lurid, though ever-green foliage, that, instead of the majestic forests of the New World, or the delicate gracefulness and elegance of those of Asia, or the fresh and varying charms of those of Europe, they present a sombre and melancholy appearance. "A part of their economy," says Brown, "and which contributes somewhat to the peculiar character of the Australian forests, is, that the leaves both of the *Eucalyptus* and *Acacia*, by far the most common genera in *Terra Australis*, and if taken together, and considered with respect to the mass of vegetable matter they contain (calculated from the size as well as the number of individuals), nearly equal to all the other plants of that country, are vertical, or present their margin, and not either surface, towards the stem, both surfaces having consequently the same relation to light." And Leschenault assures us, that even the grasses, which in other countries are soft and flexible, here partake of the rigidity of the other plants, as may especially be seen in the *Uniola distichophylla* of La Billardièrre, and in *Festuca*, whose leaves resemble so many needles. Those who wish, however, to obtain a more full acquaintance with the botany of *New Holland*, than can be expected from a work of this nature, may consult the writings of La Billardièrre, Brown, Cunningham, Leschenault, and Freycinet. We must be satisfied with mentioning some of the more interesting plants.

6341. In the extensive genus *Eucalyptus*, of which considerably above 100 species have been detected, most of the individuals are trees, and some of them remarkable for their great, and others for their enormous, dimensions. *Eucalyptus globulus* of La Billardièrre, and another species found by Mr. Brown at the south end of Van Diemen's Land, not unfrequently attain the height of 150 feet, with a girth, near their base, of 25 to 40 feet. In the colony of Port Jackson are also several species of great size, but none equal to those of Van Diemen's Land; and no very large trees of this genus are seen, either in the south-west or the equinoctial part of *New Holland*. The natives distinguish and apply proper names to nearly fifty kinds which grow about Port Jackson: these they recognise by their colour, texture, and the scaling of the bark, by the ramification and general appearance, more readily than botanists have yet been able to do. The beautiful genus *Melaleuca*, too, of the same natural order, yields very numerous species.

6342. Among the *Leguminosæ*, Mr. Brown observes, is a most extensive tribe or group of the *Mimosas* of Linnæus, *Acacia* (fig. 1047.) of Willdenow, described as having simple leaves, but being in reality aphyllous; the dilated foliaceous footstalk performing the functions of the true compound leaf, which is produced only in the seedling plant, or occasionally in the more advanced state, in particular circumstances, or where plants have been injured. The great number of species of *Acacia* having this remarkable economy in *Terra Australis*, forms one of the most striking peculiarities of its vegetation. Nearly 100 species have been observed, very generally diffused over the whole country. But while the leafless *Acaciæ* are thus numerous and general here, they appear to be very rare in other parts of the world, only seven additional species having been found elsewhere. Another considerable group of the same order consists of such as have free (not combined) stamens in their papilionaceous flowers.

6343. Among the *Compositæ* is a considerable number with dry and everlasting flowers, which Mr. Brown names *Gnaphaliadæ*. *Goodenoviæ*, of the same author, is a distinct natural order, approaching *Lobelia*. The

genus *Stylidium*, belonging to another allied order, is very curious in the structure of its flowers, possessing the peculiar property of having the column, or the support of anthers and stigma, endowed with an irritability of so active a kind, that we hardly know of any parallel in other plants. The slightest touch of a pin on the outside of it, when curved, is sufficient to make it leap to the opposite side of the flower, and invert the whole of its highly curious apparatus for propagation. It is said that this motion is designed for the protection of those parts from insects; an explanation which, like many others applied to the peculiarities of the vegetable kingdom, is, perhaps, more fanciful than true, and which only serves to show how little we are able to comprehend of the mysteries of the vegetable world.

ACACIA.

beautiful, if we except the Waratah (*Telopea speciosissima*) (fig. 1048.) has been consecrated to the earliest investigator of the natural history of the country, the friend and companion of Cook, Sir Joseph Banks.

TELOPEA SPECIOSISSIMA.

“Upwards of 400 species of this order,” says Mr. Brown, in the botany of Flinders’s voyage, “are at present known: more than half of these are natives of Terra Australis*, where they form one of the most striking peculiarities of the vegetation. Nearly four fifths of the Australian Proteaceæ belong to the principal parallel, in which, however, they are very unequally distributed; the number of species at its western extremity being to those of the eastern as two to one; and, what is much more remarkable, the number, even at the eastern extremity, being to that of the middle of the parallel as at least four to one. From the principal parallel the diminution of the order in number of species is nearly equal in both directions; but while no genus has been met with in the tropic, which does not also exist in the principal parallel, unless that section of *Grevillea* having a woody capsule be considered as such, several genera occur at the south end of Van Diemen’s Island, which appear to be peculiar to it. No Australian species of the order Proteaceæ has been observed in any other part of the world; and even all its genera are confined to it, with the exception of *Lomatia*, of which several species have been found in South America; and of *Stenocarpus*, the original species of which is a native of New Caledonia.”

6346. The genus *Casuarina* is very remarkable, having branches which appear jointed, like the stem of an *Equisetum*. Its maximum appears to exist in Terra Australis, where it forms one of the characteristic features are found in the principal parallel, in every part of which they are almost equally abundant. In Van Diemen’s Island the genus is less frequent, and within the tropic it is comparatively rare; no species, except *C. equisetifolia*, having been observed on the north coast of New Holland. Beyond Terra Australis only two species have been found, namely, *C. equisetifolia*, which occurs on most of the intratropical islands of the southern Pacific, as well as in the Moluccas, and exists also on the continent of India; and *C. nodiflora*, which is a native of New Caledonia.†

6347. Of the *Coniferae*, the *Phyllocladus rhomboidalis* of Richard (*Podocarpus asplenifolia* of La Billaudière) forms a new genus. *Callitris* is quite peculiar to New Holland; and the famous *Araucaria excelsa* Caledonia, has been ascertained, by Mr. Cunningham, to extend from Mount Warning on the east coast, in lat. 29° S., thence sparingly towards the tropic, within which, however, it is very abundant, forming upon several islands the only timber. This is, probably, the nearest approach of the species to the equinoctial line; and, although it occupies an area of 900 miles, it is very probably limited, in Terra Australis, to its immediate shores, and, as appears to be the case with *Pandanus*, exists only within the influence of the sea air.

ARAUCARIA EXCELSA.

6348. The *Orchideæ* are in great variety, and highly curious in the extratropical parts of New Holland, and are chiefly terrestrial.

6349. Notwithstanding that so large a portion of New Holland is intratropical, and with a climate so well suited to their growth, it is wonderful how deficient the country is in Palms; which can only be accounted for, according to Mr. Cunningham, by the great tendency to drought of at least three fifths of its shores. Only six species of this order are enumerated by Mr. Brown, belonging to three genera, *Corypha*, *Seaforthia*, and *Livingstonia*: to which, according to Mr. Cunningham, *Calamus* may now be added, one species having been detected, bearing fruit, in the vicinity of Endeavour River. The *Corypha australis* extends to lat. 24° S., and this is nearly the southern limit of the order in this country. Upon the north-west coast, the genus *Livingstonia* has alone been met with, in lat. 15°; but along the whole of the west side no other palm appears to grow.

6350. Among the *Asphodeleæ* of Terra Australis, the genus *Xanthorrhæa* is considered one of the most remarkable in habit, giving a peculiar aspect to the vegetation of the district where it abounds, which extends to the south end of Van Diemen’s Island, and is also found within the tropic. All the species yield a gum resin. The *X. arborea* is the Yellow Gumtree of White’s History of New South Wales, and is described as attaining the size of a walnut tree, growing pretty straight for about fourteen or sixteen feet, after which it branches out into long spiral leaves, which hang down on all sides, and resemble those of the larger kinds of

* Mr. Brown has made an addition to the number, of upwards of 160 species, in the Supplement to his *Prodromus Floræ Novæ Hollandiæ*.

† Mr. Allan Cunningham, in King’s Voyages.

grass or sedge. From the centre of these leaves springs a single footstalk, eighteen or twenty feet high, perfectly erect, resembling the sugar cane, and terminating in a spiral spike, not unlike an ear of wheat. This large stem, or footstalk, is used by the natives for making spears and fish-gigs, being pointed with the teeth of fish or other animals. But the most valuable produce of this plant appears to be its resin, the properties of which vie with those of the most fragrant balsams. This resin exudes spontaneously from the bark, and still more readily from incisions: it is of a yellow colour, fluid at first, but being inspissated in the sun it acquires a solid form; burnt on hot coals it emits a smell somewhat like storax. It is perfectly soluble in spirit of wine, but not in water, nor even in essential oil of turpentine, unless digested in a strong heat, and the varnish it affords is of little strength or use. It was found by Mr. White to be a good pectoral medicine, and very balsamic. It is not obtainable in such large quantities as the Red Gum produced by *Eucalyptus resinifera*.

1050

DORYANTHES EXCELSA.

6351. *Doryanthes excelsa* (fig. 1050.), or the New Holland Lily, is, without any question, the most stately of the *Nobiles* of the vegetable kingdom, as Linnæus called the order *Amaryllideæ*. In the green-houses of our country this plant has flowered, and attained a height of twenty-four feet, bearing at its summit a crown of blossoms of the richest crimson, each six inches in diameter. The leaves are very numerous, sword-shaped, and many of them six feet long.

6352. *The Cephalotus follicularis* (fig. 1051.) is a most singular plant, belonging, indeed, to the natural order *Rosaceæ*, but having, among its leaves, *Ascidia*, or pitcher-shaped bodies, with a lid to them, very similar to the appendages of the well-known *Nepenthes*, which it resembles, however, in no other particular. These *Ascidia*, or *Pitchers*, were observed to be in general nearly half filled with a watery fluid, in which great numbers of a small species of ant were frequently found drowned. This fluid, which has a slightly sweet taste, may perhaps be in part a secretion of the pitcher itself, but more probably consists merely of rain-water received and preserved in it. The lid of the pitcher, in a full-grown state, was found either accurately closing its mouth or having an erect position, and therefore leaving it entirely open; and it is not unlikely that the position of the lid is determined by the state of the atmosphere, or even by other external causes.

6353. We must not entirely omit a singular and interesting plant lately discovered in New Holland, producing fruit larger than a Spanish chestnut, by which name it is known. It is the *Castanospermum australe*, of which a figure and description are given in *Hooker's Botanical Miscellany*, vol. i. p. 243. t. 51, 52. The pods are large, solitary, and pendent, containing from three to five large seeds; the foliage is

1051

CEPHALOTUS FOLLICULARIS.

beautifully green and pinnated, and the shade afforded by the whole tree excels that of any in New South Wales. By the natives the fruit is eaten on all occasions. It has, when roasted, the flavour of a Spanish chestnut; and Europeans, who have subsisted on it exclusively for two days, experienced no other unpleasant effect than a slight pain in the bowels, and that only when the seeds were eaten raw.

6354. At the time when Mr. Brown estimated the Australian Flora at 4200 species (in 1814, and many more have since been discovered), they were referable to 120 natural orders; but so great is the predominance of certain tribes, that full half of the number just alluded to belong to eleven orders. The *Leguminosæ* and *Compositæ* comprehend one fourth of all the *Dicotyledonous* plants, while the *Grasses* form an equal part of the *Monocotyledonous* ones. About one tenth only of these has been observed in other parts of the world. Of the *Cryptogamic* plants, by far the greater number are natives of Europe. Among those, however, that are peculiar to New Holland, some are very beautiful and curious: we may particularly instance, among the Sea weeds, *Claudea elegans* (fig. 1052.); among the Mosses, *Dawsonia polytrichoides* (fig. 1054.), which has the leaves of a *Polytrichum* and the inclined capsule of a *Buxbaumia*, but is terminated by a beautiful tuft of white silvery hairs for a peristome; and among the Lichens, the *Cenomyce retispora* (fig. 1053.), whose frond is perforated like the most delicate lace.

6355. We mention NEW ZEALAND, for the sake of making some remarks on a most valuable plant, which was originally detected by Sir Joseph Banks, during Cook's first voyage, in 1770, the *Phormium tenax* (fig. 1055.) or New Zealand Flax. It serves the inhabitants instead of hemp or flax, and excels

1052

CLAUDEA ELEGANS

1053

CENOMYCE RETISPORA.

all that is applied to the same purposes in other countries. There are two sorts of this plant: in both the leaves resemble Flax, but the flowers are smaller and their clusters more numerous; in one kind they are yellow, and in the other deep red. Of the leaves of the *Phormium*, with very little preparation, the natives make all their common apparel, as well as their strings, lines, and cordage of every description, which are so much stronger than any thing we can fabricate with hemp, as not to bear a comparison. From the same plant, by another process, they draw long slender fibres, which shine like silk, and are as white as snow: of these, which are also surprisingly strong, the finer cloths are manufactured; and of the leaves, without any other preparation than splitting them into proper breadths, and tying the strips together, they make their fishing-nets, some of which are of enormous size. A plant which might be applied with such advantage to so many useful and im-

portant purposes, would certainly be a great acquisition to England, where it would probably thrive with very little trouble, as it seems to be hardy, and affects no particular soils, being equally found in hill and valley, in the driest mould and the deepest bogs: the bog, however, it seems rather to prefer, as near such places it grows larger than elsewhere. Since the discovery of the *Phormium tenax* in New Zealand, many ex-

periments have been made, which all prove the great strength and value of its fibre, which is now extensively used in New Holland for cordage, and imported for the same purpose to Europe. In the South of France,

DAWSONIA POLYTRICHOIDES.

PHORMIUM TENAX.

in Devonshire, and in other districts possessing a similar climate, it grows perfectly well in the open air, and has even survived the winter on the coast of Inverness-shire. But all the attempts that have been made to separate the fibre from the leaf of the New Zealand Flax, which it is requisite to do in a fresh state, as maceration is found materially to injure the strength of the thread, have proved unsuccessful. The native women perform this apparently simple operation with ease and quickness: holding the end of a newly cut leaf with their toes, they insert a shell between the green substance and the fibre, and readily effect the separation by drawing this shell through the whole length of the leaf. No machinery or other process has been found capable of thus dividing the thread, which undergoes no farther preparation, no hackling or cleaning, previous to being shipped for the English market by the Port Jackson traders, who must apparently still depend on the savage women and their shells for the cargoes they obtain! A representation and full account of this interesting plant are given in the *Botanical Magazine* for December, 1832, to which we must refer our readers.

SUBJECT. 3. Zoology.

6356. AUSTRALASIA. — *The Zoology of the Southern Archipelago* is more singular than beautiful, and is much more calculated to arrest attention from the peculiar habits and structure of the subjects themselves, than from the elegance of their forms, or the richness of their colours. Australasia has been termed the land of contrarieties; as if nature, in the creation of such forms as she appropriated to this region, had determined to mark them with some peculiar character inconsistent with those rules she had adopted in the formation of all her other productions. That form, for instance, which in other parts of the world she has confined to the smallest races of quadrupeds — the rats and the dormice — is here bestowed upon the Kangaroos, the largest tribe of four-footed animals yet discovered in this insular continent; but these wonderful creatures, instead of fabricating warm and skilful nests beneath the earth for the protection of their young, in like manner to all other mouse-like quadrupeds, are provided with a natural nest in the folds of their own skin, where the young are sheltered and protected, until they are able to provide for themselves. The Great Kangaroo (*Halmaturus giganteus* Ill.) (fig. 1056.) is, in fact, the largest and most typical quadruped of the

KANGAROO.

whole Australasian range: the total absence of such animals as lions, tigers, deer, oxen, horses, bears; in short, of all those races spread over the rest of the world, is the most striking feature in the zoology of this region. It is further remarkable that nearly all the quadrupeds either actually belong or are intimately related to the Glires of Linnæus. Two thirds of the Australasian quadrupeds make their way by springing in the air. All the Kangaroos, when using any degree of speed in their movements, proceed by prodigious leaps, while the Flying Phalangiers or Opossums (*G. Petaurista*), of which six species are described, are even more remarkable for this habit than the Flying Squirrels of North America. We might almost be tempted to believe that, if there really exists, in creation, an animal which would at once indisputably connect the two great divisions of the vertebrata, and demonstrate their union, such an animal will be hereafter discovered in the southern hemisphere. The Ornithorhynchus, or Duck-

bill, may be justly said to exhibit more decided indications of such a union than any quadruped yet known, and this is also a native of New Holland.

6357. On quitting the zoological province of Asia, the paucity of large quadrupeds is first apparent in the islands of New Guinea and New Caledonia, where, it may be remembered, in our preliminary observations, we supposed the first indications of the Australasian forms began to be developed. M. Lesson discovered several small animals in those islands (referred by him to the genus *Cuscus*) which exhibit a manifest affinity to the New Holland phalangiers; while of edible domestic animals, the Hog alone (of a peculiar breed, or more probably species) is to be found generally distributed through the Pacific islands. The Dogs are also peculiar: small, and wolf-like, they appear to want all those generous and sagacious qualities which are so conspicuous among the breeds distributed over more civilised countries.

6358. The ornithological productions of this hemisphere are equally interesting, and, from being more numerous than the quadrupeds, offer a wider field for geographic comparison. We have already devoted some attention to this part of our subject, when pointing out the natural relations of the Australasian groups with those of the Indian Archipelago and of Southern Africa. It is, therefore, unnecessary again to recapitulate.

tulate the proofs in favour of such affinities. The rapacious birds are by no means excluded from this region, although it is a matter of doubt whether any genuine species of vulture has yet been discovered. The largest bird of prey we yet know of is the Wedge-tailed Eagle (fig. 1057.), equal in size to the Golden, but having the legs feathered to the toes: several of the Hawks are altogether peculiar; among which is one entirely white; and there is reason to believe that the geographic range of the Peregrine Falcon of Europe (the Great-footed Falcon of the Americans), actually extends to New Holland. The mild temperature of the climate renders the services of Vultures unnecessary; but we are still to learn what agency is substituted for the removal of carrion and dead animal matter. The few nocturnal birds belonging to the families of Owls and Goatsuckers differ not from the European types, except, indeed, the large *Podargi*, or Great-billed Goatsuckers.

WEDGE-TAILED EAGLE.

6359. Among the perching tribes, the beautiful parrots, cockatoos, and parrakeets, demand our first attention, as being by far the most attractive and brilliant in their plumage. The genuine parrots, with a perfectly even tail, are very few: indeed, we know not at present of more than one species, the *Psittacus Fieldii* Sw. The Cockatoos, which first appear in Southern India, extend also to New Holland. Some of the species are white; the rest are of a black colour, richly variegated on the tail with red, as exemplified in the Crimson-tailed Cockatoo (*P. Cookii*) (fig. 1058.): they are of a large size; but a species lately discovered is no bigger than a small parrakeet: this group has not yet been traced in any of the South Sea islands. The Lories are also numerous, but belong to a different section from those of India: green, and not red, is the predominating colour of their plumage. Besides such as are only to be found in New Holland and Van Diemen's Land, several others of a very small size are locally distributed in the lesser islands. The Ground Parrakeets and those with broad tails (*Pezoporus* Ill., *Platycercus* V. & H.) likewise characterise these islands.

1058

CRIMSON-TAILED COCKATOO.

Estrela Sw.) correspond to our goldfinch.

6361. The paucity of gallinaceous birds is also evident. The great Emu or New Holland Cassowary, appears to have the same economy as that of America. To this order we refer that singular bird the Lyretail (*Menura superba* L.) already noticed.

1059

BRONZE-WINGED PIGEON.

such can only be taken by those higher naturalists, who direct their attention to the philosophy of the science. Judging from the collections transmitted to England, we deem the number and variety of insects, in comparison to the size of New Holland, much fewer than might have been expected: the Coleopterous tribes have a more insulated character than those of the Lepidoptera; as the latter, both in genera and in species, show a decided approximation to those of Africa and India, without having exhibited, as yet, a single American species. The insects of the smaller Pacific islands may be considered as unknown, it being impossible to understand their true forms or affinities from systems now obsolete. From a young but zealous Entomologist of this country, we may expect much additional information on this subject, in the valuable work he has just commenced.

1060

CEREOPSIS.

6362. The Aquatic tribes belong, for the most part, to groups found in other countries; but the genus *Cereopsis* (fig. 1060.) occurs only in New Holland: it is of a light grey colour, as big as a goose, and the only example of this form. The *Vaginalis*, or Sheathbill, seems more peculiar to the Pacific islands. There are, no doubt, many waders and swimmers not yet known to naturalists, for wildfowl are frequently mentioned by travellers as by no means scarce. Oceanic birds, particularly Gulls, Petrels, and Pelicans, may naturally be supposed to abound over such a wide extent of ocean.

6363. The Entomology of New Holland, in regard to species, has been illustrated by Donovan, and still more ably by Lewin, who studied the Lepidoptera in their different stages, and engraved the subjects on the spot. But from neither of these works can any general views be acquired on this portion of Australasian zoology; and, unfortunately, the Lepidoptera in their different stages, and engraved the subjects on the spot. But from neither of these works can any general views be acquired on this portion of Australasian zoology; and, unfortunately, the Lepidoptera in their different stages, and engraved the subjects on the spot.

6364. The Snakes and Reptiles offer no subject of popular interest, although some of the New Holland lizards and serpents are very curious. Fish, as may be expected, are plentiful.

6365. The Shells of the Southern Ocean are peculiarly attractive, and yield only to those of the Indian seas. It is here that the family of Volutes (*Volutidae* Sw.), so highly prized by collectors, is chiefly found. An attentive investigation of this charming group has enabled us to detect, in the distribution of the different genera, an exemplification of those laws to which nature is found to have adhered in every portion of her works which have been philosophically scrutinised. The pre-eminent type of this family is the genus *Voluta*

comprising the melon shells of collectors: and we accordingly find it has an almost general dispersion over the temperate parts of the old world. *Voluta olla* is found in Spain; *V. cymbium*, with several others, in Africa; *V. æthiopica*, *tessellata*, &c. in India; while *V. umbilicata*, and probably some others, occur in New Holland: here, however, this typical group ceases; while that of *Cymbiola Sw.*, which comprehends the Music volutes, appears in its full typical character. The *C. magnifica Sw.*, the largest of the genus, is chiefly found in the Australasian seas, and this form extends throughout the South Sea islands. The third type, composed of the Harp volutes (*Harpula Sw.*), and the fifth (*Scaphella Sw.*), under which is included the lovely Volutes, named *Junonia*, *Zebra*, *maculata* (fig. 1061.), &c., exclusively belong to the Pacific Ocean. The Cones, so abundant in India, have not been discovered in these seas; and only two or three cowries, of rare species, have yet been sent to Europe. The marine genus *Struthiolaria*, is also restricted to this ocean. The elegant genus *Phasianella*, or Pheasant Snail, is another group, principally confined to New Holland, where these beautiful shells occur, in some localities, in great profusion, and in endless variety of markings.

6366. The *Fluviatile species* are limited to a few plain-coloured bivalves and Nerites; while the land shells are still more rare. The conchology of the South Seas, however, offers a rich field for future discoveries.

6367. The following are the only genera and subgenera of quadrupeds belonging to this part of the world:—

Didelphis Auct.
Dasyurus Cuv.
Perameles Shaw.
Thylacinus Tem.

Phalangista Cuv.
Balantia Ill.
Petaurista Cuv.

Hypisprymus Ill.
Halmaturus Ill.
Phascolarctos Ill.

Phascalomys Geoff.
Echidna Cuv.
Ornithorhynchus Blum.

6368. The peculiar genera of birds, with the sections or subgenera (*), are all comprised in the following list:—

Podargus Cuv.
**Agrotheles H. & V.*
**Steatornis H. & V.*
Dacelo Leach.
Falcunculus Vieil.
Vanga Bnf.
Malurus Vieil.
**Acanthiza H. & V.*
Pardalotus Vieil.
Pachycephala Sw.

Grallina Vieil.
Sericulus Sw.
Petroica Sw.
Ptilonorhynchus Kuhl.
Scythrops Latham
Ptyctolopha Vieil.
**Calyptorhynchus H. & V.*
Psittacus Briss.
**Nanodes H. & V.*
**Leptolophus Sw.*

**Platycercus H. & V.*
**Pezoporus Ill.*
**Palaeornis H. & V.*
Lorius Briss.
**Trichoglossus H. & V.*
Climacteris Tem.
Orthonyx Tem.
**Sittella Sw.*
Dicaeum Cuv.

Philedon Cuv.
Melliphaga Linna
Ptiloris Sw.
**Ptilonopus Sw.*
Dromiccius Vieil.
Menura Lath.
Megapodius Tem.
Chionis Forst.
Cereopsis Lath.

6369. The following genera and subgenera of birds occur also in India or Africa, or in both:—

Merops Lin.
Chætura Stev.
Collaria Cuv.
Halcyon Sw.
Ocypterus Cuv.

Edolius Cuv.
Cebilepyris Cuv.
Pitta Vieil.
Oriolus Lin.
Gryllivora Sw.

**Campicola Sw.*
Estrela Sw.
Amadina Sw.
Glaucopsis Forst.
Ptilinopus Stev.

Mycteria? Lin.
Porphyrio Briss.
Burhinus Ill.
Aptenodytes? Forst.
Phaeton Lin.

6370. NEW HOLLAND.—The zoological features already sketched of the Australasian range apply with particular force to New Holland, as being the chief metropolis of this zoological province. It is, therefore, only necessary, in this place, to enumerate a few of the most remarkable animals yet discovered on this insulated continent.

6371. Of the *Marsupial or Pouched Quadrupeds*, the Great Kangaroo (*Halmaturus giganteus* Ill.) is the most conspicuous. Although a native of regions so distant, it is now become the most common animal in our menageries. The remarkable shortness of the anterior feet shows that they cannot properly be used for walking; an imbecility of structure, however, amply compensated by the great development of the hinder feet: the former are used when the animal is browsing, but when it wishes to proceed with the least activity, and especially to run, the strength of its hind feet and enormous tail gives it the power to take surprising leaps, and thus easily to escape its enemies. The Kangaroos live in small troops, headed by the old males. No less than eight species of this genus have been discovered in New Holland; that named *H. elegans* is the only one with a variegated fur, the back being marked with transverse stripes.

6372. The Hair-tails (*Dasyurus* Ill.) are a peculiar race of quadrupeds, allied both in habits and appearance to the polecat and marten; they may, in reference to their food, be ranked as beasts of prey, since they sleep during the day, and only steal forth in the night, searching for smaller animals and the bodies of dead seals. They receive their name from their long bushy tail, not unlike that of a fox. The Tapu-tafa (*Dasyurus tafa*) (fig. 1062.) is an elegant example of this tribe.

TAPU-TAFA.

resemblance, in miniature, to an otter, but is only thirteen inches long. It swims well, and, indeed, seldom quits the water, since the extreme shortness of its limbs renders it only able to crawl on land. These animals, of which there appear to be two species (distinguished only by colour), are principally found near Port Jackson. The foot of the male is armed with a spur, through which passes a poisonous liquor, rendering the animal dangerous. It has lately been clearly proved that these duck-moles not only lay eggs, but suckle their young.

ORNITHORHYNCHUS.

gaiety of plumage. Many of the Warblers, on the other hand, are uncommonly beautiful; one, called the Superb (*Malurus superbus*) (fig. 1064.), has the back of the head and the throat velvet black, divided by bands of the richest blue: it is constantly in motion, carries its tail nearly erect, and sings a short little song as it perches. The Emu bird is still smaller, being scarcely bigger than our wren, and having a long tail, quite transparent, consisting of one bifurcated feather, like those of the Emu, whence its name. But the two most magnificent birds are undoubtedly the Rifle-bird and the King Oriole.

6375. The Rifle-bird (*Ptiloris paradiseus* Sw.) is nearly the size of a jay, but its bill is long and sickle-shaped. Like the uniform of rifle troops, it seems, at a distance, entirely of a black green; but, on closer inspection,

its rich and magnificent tints astonish the spectator. The King Oriole (*Sericulus chrysocephalus* Sw.) (fig. 1065.) is of two colours only, golden yellow, and the deepest black, the feathers of the head resembling the softest velvet; so that nothing can exceed the richness of its appearance.

6376. The Spotted Grosbeak (*Amadina Lathamii* Sw.) (fig. 1066.) is a most elegant bird, not larger than

1064

SUPERB WARBLER.

1065

KING ORIOLE.

1066

SPOTTED GROSBK.

our greenfinch, and might easily be domesticated: it is light slate colour above, with the bill and rump deep crimson, the throat has a black collar, and the sides have snow-white spots on a black ground.

6377. The Crested Bronze-winged Pigeon (fig. 1067.) is, perhaps, the rarest bird of New Holland: only one specimen is known in Europe, now preserved in the museum of the Linnæan Society.

1067

BRONZE-WINGED PIGEON.

6378. Many of the shells are beautiful, and bear a high price among collectors. The Snow-spot volute, *Cymbiola nivosa* Sw.) (fig. 1068.), sells for three or four pounds; the *Cymbiola magnifica* Sw., the largest of the genus, when darkly coloured, is worth nearly as much. The Lineated Volute (*Scaphella undulata* Sw.) is common in some localities, while the Phasianellæ, or Beauty snails, are particularly elegant.

1068

SNOW-SPOT VOLUTE.

6379. The only native domestic animal is the Dingo, or New Holland Dog (fig. 1069.): it seems to partake of the singular contradictory nature of Australian animals, by never (as it is asserted) being known to bark. It is active, fierce, and voracious, runs with the tail carried horizontally, the head elevated, and the ears erect. One that was brought alive to this country leaped on the back of an ass, and would have destroyed it. All our domestic breeds of cattle, sheep, and horses have been long introduced, and have rapidly multiplied.

6380. VAN DIEMEN'S LAND.—The Zoology bears a general resemblance to that of New Holland, yet presents us with a few animals peculiar to this southern latitude. The chief quadrupeds of this description are the Dog-faced Opossum, the Ursine Dasyurus, the Brush-tailed Dasyurus, and the Dwarf Dasyurus. There are also two species of Balentia or Phalangus. From our young friend, Mr. Thomas Winter, recently gone to this interesting country, we hope to derive much valuable information on its zoological productions, for a future edition.

1069

NEW HOLLAND DOG.

1070

DOG-FACED OPOSSUM.

6381. The Dog-faced Opossum (*Thylacinus cynocephalus* Tem.) (fig. 1070.) suggests the idea of a union of the dog and the panther; the fur is short and soft, yellowish brown, the sides of the body being marked by broad transverse stripes, which do not, however, extend to the belly; the tail is compressed, which suggests the supposition that it is used in swimming, particularly as this animal inhabits the rocks on the sea shore, and is known to feed upon fish.

1071

GROUND PARROT.

6382. Many of the ground parrots of Van Diemen's Land do not occur in New Holland. The Black-spotted (*Pezoporus formosus* Ill.) (fig. 1071.) is the most singular, since it is never seen to perch upon a tree. The Blue-fronted Parrakeet (*Nanodes venustus*) (Sw. Zool. Illust. 2.) is also a rare and elegant species; while the Bronze-winged Pigeons of two sorts, are very common in the open country.

6383. The following glossary of the animals best known to the settlers of New Holland has been given by Judge Field, in his valuable *Geographical Memoirs on New South Wales*, London, 1825. It will answer the double purpose of informing both the scientific and the general reader:—

Quadrupeds.
 Forest Kangaroo. *Halmaturus giganteus*.
III.
 Brush Kangaroo. *Halmaturus pencillatus*.
 Flying Opossum. *Petaurus* ——— ? *Shaw*.
 Water or Duck Mole. *Ornithorynchus fuscus*.
Birds.
 Jabiru. *Mycteria australis*.
 Emu, or Cassowary. *Rhea Novæ Hollandiæ*.
 Emu Bird, or Catchfly. *Malurus malachurus Vieil.*
 Native Companion. *Ardea Antigone*.
 Black Swan. *Cygnus atratus*.

Goose of New Holland. *Anas semipalmata*.
 Pheasant, or Bird of Paradise. *Menura superba*.
 Swamp Pheasant. *Centropus* ——— ?
 Spur-winged Plover. *Charadrius* ——— ?
 Regent Bird, or King's Oriole. *Sericulus chrysocephalus Swains.*
 Rifle Bird. *Ptiloris paradiseus Swains.*
 Butcher Bird. *Vanga destructor Tem.*
 White Hawk. *Accipiter Novæ Hollandiæ Tem.*
 Satin Bird. *Ptilinorhynchus Macleayii*.
 Superb Warbler. *Malurus superbus Vieil.*
 Laughing Jackass. *Dacelo gigantea Leach.*

Green Pigeon. *Ptilonopus magnificus Sm.*
 Wonga-wonga. *Columba picata Lath.*
 Green Dove. *Ptilonopus purpuratus Sm.*
 King Parrot. *Platycercus scapularis H. & V.*
 Blue Mountain Parrot. *Platycercus hamatodus H. & V.*
 Rose Hill, or Nonpareil Parrot. *Platycercus eximius H. & V.*
 Macquarie Island Parrot. *Platycercus pacificus H. & V.*
 Lory Parrot. *Platycercus Pennantii H. & V.*
 Ground Parrot. *Pezoporus formosus Ill.*

SECT. III. *Historical Geography.*

6384. *The name of Australasia*, in the early records of navigation and geography, bears a vague and almost fabulous sense. It was imagined that the great mass of solid land known to exist on the northern side of the equator, must be balanced by a nearly equal extent in the southern hemisphere. To discover this mighty *Terra Australis Incognita* was the great object of ambition to navigators through the Pacific; and hope painted it equally filled, as the New World in the West had been found, with the objects which could gratify the desire of wealth and luxury. Indeed, it is little more than half a century since Mr. Dalrymple, one of the greatest names in geography, pronounced the existence and wealth of this southern continent to be a point not admitting of the smallest doubt. The second voyage of Cook, however, set this question at rest; for, though it has recently been proved that antarctic lands of some extent had escaped his notice, yet his route went across all the tracks in which such a great and fertile continent as modern fancy had supposed, could possibly have existed. From this period, the titles of *Australasia* and *Terra Australis* settled down upon New Holland and the other great islands by which it is surrounded.

6385. *The Portuguese first*, and afterwards the Dutch, were too active navigators to allow a tract of coast so closely contiguous to the rich and early settlements of Java and the Moluccas long to escape their research. In the King's library in the British Museum there is a chart by a French hand, dated 1542, in which is delineated to the south of Borneo and the Eastern Archipelagoes, a very large island, called "Great Java;" on the east side of which, immediately beyond the lat. of 30°, appears "*Coste des Herbaiges*," a singular coincidence with Botany Bay. This can scarcely be more than casual; but that the delineation in that chart of the north-western coast was founded on some actual surveys can scarcely, we think, be doubted. No memorial, however, of the early voyages, in the course of which these lands were laid down, can now be discovered.

6386. *It was by Spanish navigators* that the first distinctly recorded expedition was made, from an opposite quarter, and to an opposite extremity of the great Australasian group. In 1567, Don Alvaro de Mendana was sent by the Viceroy of Peru, with a squadron from Callao. After measuring the breadth of the Pacific, he fell in, near the eastern extremity of New Guinea, with a group of thirty-three islands, to which he gave the name of Solomon. It would be a singular instance of the chimeras which obtained credit in that age, if Mendana really hoped, as it is said he did by giving this name to the islands, to persuade the world that they were the Ophir, whence Solomon drew the treasures with which he adorned the temple of Jerusalem. There is nothing in the description of them to justify so wild an hypothesis. The natives of one of the largest (Santa Ysabel) were of a very dark complexion, with curly hair, wearing scarcely any clothes, feeding on cocoa-nuts and roots, and, it is supposed, on human flesh. Such repasts seem too well indicated by the horrid present made by the chief to Mendana, of "a quarter of a boy with the hand and arm." At San Cristoval, the natives mustered in a large body, armed with spears, clubs, and arrows, to give battle to the Spaniards; but a short discharge of musketry was sufficient to disperse them. Mendana was sent on a second expedition to examine these islands more carefully; but such was then the imperfection of maritime observation, that he sailed for a considerable time about that quarter, without being able again to light on them; so that it was tauntingly observed, that "what Mendana discovered in his first voyage, he lost in his second." He landed, however, at Santa Cruz, which is not very remote from them, though it appears more properly to form part of the New Hebrides. It is somewhat remarkable, that though these islands have been touched at by Bougainville, by Shortland (who gave them the name of New Georgia), and by other navigators, they have never been surveyed with care, nor has any important addition been made to our knowledge respecting them since the time of Mendana.

6387. In the footsteps of Mendana followed *Pedro Fernandez de Quiros*, whose name is great in the history of early naval discovery. On the 21st of December, 1605, he set out with a squadron from Lima in search of the great Austral continent. Quiros held a course considerably to the south of the equator, and for a long time discovered only small detached islands. At length, in April, 1606, he came to the islands called the New Hebrides, one of which is of such extent as to suggest the idea of a continent. Here he found a bay large enough to hold a thousand ships. With that familiar use of sacred names in which the superstitious devotion of the Spaniards delighted, they called the country Australia del Espiritu Santo, two fine rivers the Jordan and the Salvador, and the port Vera Cruz. The banks of these streams were delightful, being clad with a charming verdure, and every where enamelled with flowers. The bay was so well sheltered, that in all winds it continued smooth and calm. The land was covered with trees quite up to the mountains, which, like the plains, were always green, being separated from each other by valleys, watered by fine rivers. In a word, there was no country in America, and very few in Europe, equal to this. The Spaniards made some attempts to conciliate the inhabitants; but their conduct, being imbued with that tyrannical spirit which always distinguished the transmarine proceedings of their nation, soon excited a violent hostility, and they were obliged to make off without holding any other communication than that of a few smart skirmishes. They departed, therefore, with the empty ceremony of taking possession of it in the name of Philip III., and founding a city, which they called the New Jerusalem. Luis Vaes de Torres, at the same time, second in command to Quiros, pushed his discovery to the strait which separates New Holland from New Guinea, and saw both those large continents, but without well knowing what they were. Torres's Strait even dropped into oblivion, and was not rediscovered till 1770. Quiros published a splendid and highly-coloured description of the territory thus discovered by him, and addressed to the Spanish court no fewer than fifty memorials, urging them to send out a colony: but that cabinet, sinking into the supine indolence which has long characterised it, made no further exertions.

6388. *The Dutch* now took up the undertaking from the opposite quarter of Java and the Moluccas. The latter islands almost touched those of New Guinea; and it was natural that expeditions should be sent from them to explore the coast of that very great island. In 1605, the yacht *Duyfhen*, employed on this mission, and taking on her return a southerly course, touched at that part of New Holland which is

now called Cape York, but without knowing what she had discovered. This happened a few months before Torres saw the very same part of New Holland in the discovery of his strait; so that the commander of the *Duyfhen* was the first European that viewed any portion of that continent. In the course of thirty years, fresh expeditions, intending and believing themselves to be discovering New Guinea, sailed, in fact, along a great part of the opposite, and even to the western coast of New Holland. In Tasman's instructions it is already characterised by the name of the "Great unknown South land," and it is stated, that in the years 1616 to 1622, a range of its western coast from 35° to 22° S. lat., was discovered by the ship *Endragt*, under the command of Dirk Hartog. The name of that commander was, in fact, given to an island and large bay, called afterwards Shark's Bay by Dampier; and both by him in 1697, and afterwards in 1801, by Baudin, a tin plate was found here, bearing the name of the ship *Endragt*. In 1627, a vessel called the *Goede Zeepaard*, pushed its career farther, and turning the south-western point of Cape Leeuwin, explored a considerable extent of the southern coast, to which was given the name of Nuyt's Land. Abel Janes Tasman, however, took a wider range, which rendered him foremost in the career of Australasian discovery. On the 14th of August, 1642, he sailed from Batavia with two ships, the *Heemskerck* and the *Zeehaan*. He appears first to have sailed southward through a wide range of open sea, till he passed the latitude of 40° . He then steered west, still in the same latitude, which kept him at a distance from the coast of New Holland, but brought him upon that of the southern appendage to it, now so well known by the name, which Tasman gave to it, of Van Diemen's Land, in honour of the then governor-general of Batavia. Tasman, on this coast, saw neither man nor beast; yet he observed smoke in several quarters, and fancied he heard in one place a sound of people, and in another a noise like that of a trumpet; also footsteps resembling those of a tiger or some other wild beast. He observed too very lofty trees, with steps cut in them with a flint, five feet distant from each other, which gave the idea of a gigantic race, by whom such steps could be commodiously used. Tasman now continued his course eastward, till he came to the coast which he called New Zealand. He soon saw enough of the inhabitants, who were not long in displaying that ferocity, of which they have since given so many proofs. Having surprised a boat, they killed three of his men, and obliged four others to swim for their lives. Tasman does not seem to suspect the dreadful ulterior fate which probably awaited the victims. He gave, however, to this inlet, the name of the Bay of Murderers; and with some difficulty cleared the inhospitable coast to which it belonged. His course then led him to the Friendly Islands, whence, after beating a considerable time through little known and dangerous seas, he reached Batavia by the northern coast of New Guinea. Although the Dutch thus showed considerable interest in the exploration of these extensive coasts, there is no record of any intention or attempt to form a settlement upon them. According to one of their navigators, there were every where found "shallow water and barren coasts, islands altogether thinly peopled by divers cruel, poor, and brutal nations."

6389. *English navigators* were now found taking the lead. Dampier, first in the character of a buccaneer, and afterwards in a regular and official career of discovery, observed with characteristic accuracy the north-western coast of New Holland. But it was Cook, whose career enabled him to put together into one regular and consistent system the scattered notices of former navigators. He made a complete survey of the eastern coast of New Holland, which till then had scarcely been at all visited, and ascertained the almost forgotten fact of the complete separation of that continent from New Guinea. He examined, also, Van Diemen's Land, though not with minute attention, and without being aware of the strait which separates it from New Holland, and gives to it an insular character. Cook, also, circumnavigated New Zealand, traced its separation, by the strait which bears his name, into two great islands, and ascertained, by some agreeable and some bitter experience, the striking contrasts in the character of that remarkable people.

6390. *The British government*, in consequence of the discoveries of Cook, and the complete knowledge now obtained of the coast of New Holland, suggested plans, which gave a new character and interest to the Australian world. Although the territory was extensive and the soil fertile, it yielded none of those rare and brilliant products, either vegetable or mineral, which had hitherto tempted to the formation of colonies. But another motive, suggested by the philanthropic temper of the age, proved sufficient to impel to such an undertaking. The vast growth of the wealth and population of Great Britain was accompanied, unhappily, with increased temptations to crime. The many unfortunate persons, thus made amenable to the laws, for offences not of the deepest dye, when continued in prisons, suffered in health and morals, and came out commonly more corrupted than they entered. The transporting them to the opposite extremity of the globe was a punishment less cruel and debasing, and offered a much better chance of amended habits. It afforded, also, the distant prospect of covering these almost boundless deserts with the arts, industry, and civilisation of Europe. Such were the laudable motives which induced our government, in 1788, to establish the colony of Botany Bay. The settlement has ever since gone on increasing, and, notwithstanding some drawbacks, arising from the peculiar materials of which it is composed, it has, in a very tolerable manner, answered its purposes. The original source of supply has, no doubt, been powerfully reinforced and purified by that spirit of emigration which has recently become so strong, and which promises to realise, earlier and better than was ever expected, the hope of filling these vast regions with a civilised population. The progress of settlement, however, continually narrowed the space in which room could be provided for the numerous voluntary and involuntary emigrants. It became the first object of the settlers to discover such a space in the interior, across the hitherto impassable range of the Blue Mountains. This was done in 1813, by Messrs. Blaxland, Wentworth, and Lawson. Governor Macquarie afterwards despatched Mr. Evans, the deputy land-surveyor, by all possible means to find out or make a path down these mountains, to the fine country which these gentlemen had first seen beyond them. For twenty-six miles Mr. Evans passed over a succession of steep, rugged mountains, which seemed repeatedly, at first sight, to deny all passage. At length he reached the highest point, a lofty table plain, afterwards called the King's Table Land, whence stretched a prospect of prodigious extent. On the opposite side appeared a very abrupt descent into a deep and

romantic glen, beyond which rose another lofty chain of hills. After making his way for seventeen miles along the ridge, he came to a most tremendous precipice, above 600 feet high, called Mount York, down which, with great labour, a road was afterwards constructed, called Cox's Pass. His toils were now rewarded. He came to fine pastoral plains, well watered by two rivers, the Campbell and Fish, uniting into the Macquarie. As soon as this intelligence had been conveyed to Sydney, and the route reported practicable, in 1815, Governor Macquarie in person crossed the mountains, and examined this new accession to the colony. He founded a township there, to which he gave the name of Bathurst; and this rich and improvable district is now occupied by a thriving population.

6391. *Another expedition, under Mr. Oxley, the surveyor-general, was, in 1817, undertaken to discover the course of the waters which flowed westward from the Blue Mountains, and to explore the regions through which they rolled. Mr. Oxley first followed the course of the river Lachlan, which was found proceeding directly westward; but nothing appeared along its banks which could afford the promise of a flourishing settlement. The hills were rugged and steep, the plains either sandy, or marshy and inundated, and the river finally dwindled into a narrow channel running through a morass. As Mr. Oxley was returning by another route, disappointed in the object of this expedition, he came upon a noble river, watering a rich and romantic valley, and which proved to be the Macquarie, a broad and considerable stream, flowing in a north-west direction. He returned at this time to Bathurst, but next year set out on a fresh expedition, to find, if possible, the termination of this important river. He traced it to the north-west through a series of rich flats and extensive level plains, till, unfortunately, it too began to spread into marshes; and, at length, appeared to terminate in a vast watery plain covered with reeds, through which it flowed with a channel only five feet deep. He now determined to return, not by re-ascending the river by the same track, but by striking to the east, across a mountain range, which led more directly to the sea. On this track many interesting discoveries were made. The party passed over high mountain ridges, whence they descried to the southward several vast plains covered with the richest herbage. They observed a succession of rivers flowing to the northward, and, at length, came to a considerable one, directing its course to the eastern coast. To this they gave the name of Hastings; and a good harbour, found at its mouth, has, under the name of Port Macquarie, become the seat of a settlement, which promises to flourish. On the whole, this expedition, notwithstanding the disappointments which attended it, enlarged greatly the known extent of lands in the interior fit for cultivation and settlement. It is only to be wondered that, with officers so enterprising, the career of discovery should have been suspended by government after penetrating only to about a tenth part of the breadth of the continent, and that no further efforts should have since been made, except by private individuals, to enquire into the secrets of the great Austral wilderness, until the year 1827. A well-appointed expedition was then placed by the colonial government under the direction of Mr. Allan Cunningham, the King's botanist, who had already traced a route from Bathurst to Liverpool Plains, a fine country discovered by Mr. Oxley in his second expedition, and who now effected a journey from Hunter's River to the River Brisbane, on the banks of the latter of which a penal settlement had already been established for several years; and near to which, with a pass to them through the dividing range of mountains 4000 feet high, he discovered some very spacious pastoral downs, ready for the colonist, whenever the government should be pleased to convert the penal settlement into a free one, as they had successively done Hunter's River and Port Macquarie.*

6392. *In the year 1828, an expedition was despatched, under the direction of Captain Sturt, an officer of His Majesty's 39th regiment, to Mount Harris, a detached hill upon the Macquarie River, where Mr. Oxley had left his boats upon proceeding easterly towards the coast. Upon reaching that remarkable eminence, on the 20th of December, Captain Sturt ascended the summit to survey the country below. But how much had evaporation in three years changed the face of those regions! The plains which Mr. Oxley had left entirely under water in 1818, now presented an expanse of dried up surface, which to all appearance extended northerly, without the slightest semblance of rising ground, to a distant "clear unbroken horizon." Encouraged by these appearances, the expedition traced the Macquarie through its last stage to the woodlands below Mount Harris, where its channel ceased "to exist in any shape as a river." In exploring the country beyond this point, the party traversed the bed of that extensive morass, into which the late surveyor-general had, ten years previously, descended in his boat: this they now found "a large and blasted plain, on which the sun's rays fell with intense heat;" the ground itself, parched to an extreme, exhibiting in many places deep and dangerous clefts, which clearly demonstrated the long existence of those droughts, to which every known part of New South Wales was at that period exposed. On these inhospitable levels, Captain Sturt passed a week; and in that period he skirted three distinct patches of marsh, in which were found broken channels of the river, forming so many stagnant lagoons or canals, surrounded by reeds. In whatever direction they advanced to satisfy themselves as to the fate of the Macquarie, whe-*

ther on the plains or wooded grounds, reeds of gigantic stature (the clearest indication of what such a country is in a regularly wet season) encompassed them, and greatly obstructed their progress. Captain Sturt now directed his expedition to the north-west, with a view to farther discoveries, aware, as he was, from the observations he had previously made during his own short excursion, that a clear open country was before him in that direction. In continuing their journey westerly over this level country, its total want of water, excepting in creeks where the supply was both bad and uncertain, became a source of considerable annoyance to the party; who ultimately were obliged to follow one of the watercourses, which, being traced to the north-west, brought them (on the 2d of February) to the left bank of a large river, the appearance of which "raised their most sanguine expectations." To the utter disappointment of the travellers, however, its waters were found perfectly salt; and this circumstance was the more severely felt, as the horses of the expedition had travelled long in an excessively heated atmosphere, and had been without water a considerable time. After making some arrangement in favour of his exhausted animals, Captain Sturt proceeded to explore this river, to which he gave the name of Darling. They followed it in the direction of its course (south-westerly), about forty miles, and throughout found its waters not only not drinkable, but rather becoming, as they advanced, more considerably impregnated with salt. In one part they observed "brine springs," and the banks throughout were incrustated with "salt," or, probably, with aluminous particles. The breadth of the river was estimated at sixty yards, and its banks from thirty to forty feet high. At length the want of "drinkable water" along its bank, and the appearance of a loose red sandy soil, at the point to which the patience and perseverance of the travellers had induced them to trace the river, at once destroying all hope of meeting with the most scanty supply in the back country, obliged them to give up its further examination. The extreme point to which the Darling was traced, and from which it continued its course through a level country to the south-west, Captain Sturt marks on his map, in lat. $30^{\circ} 16' S.$ and long. $144^{\circ} 50' E.$

6393. *The Darling* may be justly considered the largest river which has been discovered in New South Wales, since it is formed by a junction of all the streams which were discovered by Mr. Oxley, in 1818 (and these were five in number, each of considerable magnitude), as well as of those met by Mr. Cunningham in his journey of 1827; and thus it constitutes the great drain of a tract of mountainous country lying between the parallels of 27° and $33\frac{1}{2}^{\circ}$. But what ultimately becomes of this river, beyond the spot where Captain Sturt and his comrade left it flowing through a desert country to the south-west, remains wholly unknown.

6394. To the same indefatigable officer was intrusted, at the close of 1829, the direction of a *second expedition*, destined to trace the course of the Morrumbidgee, another western stream, rising in a range of mountains situated to the southward of the parallel of 35° , and under the meridian of 149° , at a distance of about eighty miles inland from the eastern coast line, and within what is now denominated the county of Murray. Of the character of this river it may be here briefly remarked, that its bed forms a succession of planes, of which some are of great inclination; along these its waters flow with considerable velocity in nearly a west direction. After receiving the Yass River and some other minor streams, all which fall into it at an early stage of its progress, namely, in long. $148\frac{1}{2}^{\circ}$, the Morrumbidgee pursues a long and tortuous course for upwards of 300 statute miles, without deriving the slightest increase from the country it waters: and thus in this respect it resembles the Lachlan, which maintains a parallel course through the low interior to the northward. Thus far the river had been followed down some years ago, by stock-keepers in pursuit of strayed cattle, who also ascertained, in their long rides along its banks, the extent to which the country westerly, from its elevation above inundation, might be safely occupied by grazing stations. The direction which this river was also, at that period, known to take towards the marshes of the Lachlan, led to the conclusion, that both streams were united in those morasses; and on so low a level (as was ascertained by Mr. Oxley in 1817) as to favour the opinion that their confluent waters were rather dissipated over an extensively flat surface, than carried on in one body to the ocean, distant at least 300 miles. And this opinion, gratuitous as it was, would nevertheless have proved to have been correct, had the Morrumbidgee not pursued its course so far to the westward as to reach the channel of a much larger river; since, as will presently be seen, it has neither magnitude nor velocity sufficient to force its way 260 miles to the sea-coast; but which the principal stream, by its volume and strength, has the power to effect.

6395. *The second expedition* conducted by Captain Sturt proceeded from Sydney to explore the Morrumbidgee, in December, 1829. Tracing it down on its right bank, until he had passed every rapid or fall that might impede its navigation, he established a depôt, launched a boat, which he had conveyed over-land from Sydney, and having, by dint of great exertion, built another on the spot, he lost no time in commencing his examination of the river to the westward. On the 7th of January, the expedition moved forward down the river and on the fourth day, when they had passed extensive alluvial flats, on which were

patches of reeds, the navigation became much interrupted by "fallen timber," and as the current was frequently very rapid, particularly in those parts of the river where its channel had become contracted, the boats were frequently in great danger from sunken trees. After advancing on their voyage about ninety miles to the westward, through a country of level, monotonous aspect, the party were relieved from the state of anxiety, which a week's most difficult and dangerous navigation had caused, by their arrival (to use Captain Sturt's words) at "the termination of the Morrumbidgee;" for its channel, much narrowed and partially choked by drift-wood, delivered its waters "into a broad and noble river," the current of which was setting to the westward at the rate of two miles and a half per hour, with a medium width from bank to bank of from 500 to 400 feet. This new river, which was called the Murray, and into which the diminished waters of the Morrumbidgee fall, is evidently formed by a junction of the Hume and Ovens; which streams, taking their rise in the great Warragong Chain, were first made known to us by the travellers Messrs. Hovell and Hume, who crossed them, 250 miles nearer their sources, in their excursion to Port Philip in 1824. Pursuing the course of the Murray, on the 14th of January, the voyagers made rapid progress to the W. N. W., noticing, as they passed on, a low, unbroken, and uninteresting country, of equal sameness of features and vegetation to that observed while descending the intricate Morrumbidgee on quitting their depôt. After nine days' voyage down the Murray, in which period they proceeded about 100 miles westward, without observing the slightest improvement of the country, or the least rise in its surface, the expedition passed the mouth of a stream flowing from the north by east, with a strong current, and in point of magnitude but little inferior to the Murray itself. Ascending it, Captain Sturt found it preserving a breadth of 100 yards; and its banks, on which were many natives, were overhung with trees of finer and larger growth than those on the Murray. Its waters were, moreover, ascertained to be two fathoms in depth, of turbid appearance, but perfectly sweet to the taste. The confluence of these two rivers takes place, as appears by Captain Sturt's reckoning, in exactly long. 141° E., and immediately to the south of the parallel of 34° . It was at this stage of the expedition that the face of the country began to assume (comparatively speaking) an interesting appearance; and the first rise of ground which had been seen in the advance of the party to the westward in a direct line of more than 200 miles, was observed at a moderate distance from the river to the north-west. Previous to his reaching the point of confluence of the two rivers, Captain Sturt, it would appear, had entertained a doubt as to the decline of the vast plain through which the Murray flows, as well as of the probable fall of the waters of the interior to the north of it; but on observing a new stream flowing into the Murray, the circumstance of the meridian in which he had struck it, and the direction from which it came, combined to satisfy him that it could be no other than the Darling. However, the identity of this tributary to the Murray with the Darling remains still to be ascertained.

6396. There is an intermediate *tract of unknown country*, exceeding in extent 400 miles, between the southernmost point of Captain Sturt's examination of the Darling River, and the junction of the stream discovered in the progress of this second expedition flowing from the northward into the Murray; and as these exhibit no one character common to both, we cannot, in the present state of our information, arrive at a satisfactory conclusion, that the tributary to the last-mentioned river, and that great drain of the country to the north of the parallel of 34° , the Darling, are one and the same stream. The river flowing into the Murray is said to be sweet to the taste; the Darling, on the other hand, is described as strongly impregnated with salt.

6397. *To follow the expedition* down the Murray; — that river, after it receives the supposed Darling, continues its course upwards of a degree farther to the westward, and in that space receives a second stream, which falls in on its left bank from the south-east. This tributary stream, which is described as a river of considerable importance, and was named the Lindesay, is most probably the Goulburn of Hovell and Hume, whose journey overland to the south coast, in 1824, we have already adverted to, and who, in fording their river at a part where its channel presented a breadth of eighty yards, left it winding its course to the north-west. From this point, the banks of the Murray assumed a new appearance, and along the northern extended a range of cliffs, which appeared to the party, as they passed beneath them, to be of partial volcanic origin. The navigation at length became rather intricate, for those cliffs being immediately succeeded by others of limestone on each bank, the river was found to force its way through a glen of that rock, in its passage frequently striking the base of precipices of the same formation, which rose to a perpendicular elevation of 200 feet, and in which coral and fossil remains were remarked to be plentifully embedded. At this stage of their passage, those long ranges of forest hills, which extend along the eastern shore of the Gulf of St. Vincent, became discernible, indicating to the exploring party their approach to the coast. On the 3d of February, the river having reached the meridian of $139\frac{3}{4}^{\circ}$, the disposition of the bounding cliffs gave its course a decided bend to the southward, through a continuation of the glen, which at length opened into a valley. Here the river was observed to have lost the sandy bottom which it had

exhibited throughout its long course from the eastward; for, its bed having now dipped to almost the level of the sea, its waters had become deep, still, and turbid. On the 8th of February (the thirty-second day of the voyage from the depôt) the hills wore a bleak appearance, and the few trees, which had at one period fringed their ridges, were for the most part broken off, as if by the prevailing winds. At noon, upon entering the river's last reach, they could discern no land at its extremity; some low hills continued, however, along its left bank, while its right was hid by high reeds. Immediately afterwards, these enterprising voyagers entered an extensive lake, the expanse of which stretched away far to the south-west, in which direction the line of water met the horizon. This lake, which received the name of Alexandrina, was estimated at from fifty to sixty miles in length, and from thirty to forty in breadth. A large bight was observed in it to the south-east, and an extensive bay at the opposite point; still, notwithstanding these dimensions, this very considerable sheet of water appears to be but a mere shoal, since Captain Sturt states its medium depth at only four feet! Upon this vast but shallow lake, he pursued his voyage to the southward, remarking that its waters, which at seven miles from the point of discharge of the Murray into it were brackish, became at twenty-one miles across perfectly salt, and there the force of the tide was perceived. As the party approached the southern shore, the navigation of the boats was interrupted by mud flats, and soon their farther progress was effectually stopped by banks of sand. Captain Sturt, therefore, landed, and, walking over some sandy hummocks, beyond which he had, from his morning's position, seen the sea, almost immediately came upon the coast at Encounter Bay.

6398. We gather, as *the results* of this second tour of discovery of Captain Sturt, the termination of the Morrumbidgee, as well as of the several streams which were crossed by Messrs. Hovell and Hume, in 1824, and the waters of the Lachlan of Oxley, in 1817, all which unite; as also the nature of the unbroken, uninteresting country, lying to the westward of the marshes of the latter. In effecting this service, Captain Sturt has added largely to the geographical knowledge which we previously possessed; since the facts ascertained by him during the progress of his expedition have enabled him to fill up no inconsiderable blank on the map of that part of New South Wales lying to the west and south-west of Port Jackson.

6399. We have now given the *sum of our geographical knowledge* of New South Wales up to the present period; and dividing the map of that vast country into seven equal parts, one division will fully include the tracks of all the journeys which have been undertaken since 1817, with a view to discovery, by Oxley, Sturt, Hovell and Hume, Cunningham, and others; whilst the remaining six portions, which comprehend a great expanse of territory beyond the tropic, and the whole of the equinoctial part of the continent, continue, at this day, entirely unknown. The want of navigable rivers in this Great South Land must necessarily impede the progress of inland discovery.

6400. *The exploration of the vast shores* of the Australian continent was meantime carried on with activity. Captain Flinders and Mr. Bass, a naval surgeon, sailed from Port Jackson, in 1798, and ascertained the complete separation of Van Diemen's Land from New Holland, by the strait bearing the name of the latter gentleman. The French admiral D'Entrecasteaux, on the south-eastern coast of Van Diemen's Land, discovered, in 1792, that magnificent channel which bears his name, and which forms a series of the finest harbours in the world. Captain Flinders, in 1801, was employed by the British government to make a thorough survey of the coast of New Holland, which he completed with regard to the south-east and north-east; but the loss of his vessel prevented him from extending it to the west and north-west coasts. These were surveyed, about the same time, by the French expedition under Captain Baudin, but not in a very complete or careful manner. The British government, therefore, in the course of the last few years, employed Captain King to go again over the ground, and examine strictly all the points yet left in uncertainty, and particularly whether some river, proportioned to the magnitude of the continent, and capable of ministering to its interior commerce, did not there discharge itself into the ocean. Captain King made some valuable discoveries. He examined the northern bay of Van Diemen, which he found to be a gulf; inspected the channels of the Alligator rivers which fall into it; and discovered at the mouth of the bay two large islands, Melville and Bathurst, which had heretofore been supposed to be part of the continent. On the north-west coast he discovered Prince Regent's River, which, as already observed, is larger than any other yet found on this side of New Holland, though still not such as can well afford a channel to any great mass of its interior waters.

SECT. IV. *Political Geography.*

6401. *The government of a colony* like that of New South Wales must necessarily be attended with peculiar difficulties. A body of men who stand regularly opposed to the laws, and the laws to them, can only be maintained in peace and order by processes which must appear severe to those who are placed in more favourable circumstances. The difficulty has, perhaps, not been diminished by the admixture of that small but respectable class, whose emigration has been voluntary. The estrangement and even antipathy which must arise too readily between these bodies, from the contempt with which one is apt to view the other,

have sown fertile seeds of dissension, and render it very difficult to maintain a due temper between these inharmonious elements.

6402. *Nothing like a free constitution* has yet been granted to the colony. The executive power resides in the governor, assisted by a small council of the highest officers of the government, while the legislature is shared by him with a council, which includes a few of the principal settlers and merchants, both councils being appointed by the king. The proposal for any new law originates with the executive, which, before submitting it to the legislative council, must propound it to the chief justice, who is to pronounce whether it contains any thing contrary to the law of England. After passing the council, it must be communicated to the government at home within six months afterwards; and till three years have elapsed, the king may interpose his *veto*. It must also, within six months, be laid before the British parliament.

6403. *The judicial power of the colony* is vested in a chief justice and two assistant judges, who try all cases, criminal and civil. In the former, one of the judges is combined with what is called a jury, which consists not of the colonists, but of seven naval or military officers nominated by the governor, and which seems, therefore, to partake more of the character of a court martial. The jurors, however, are liable to challenge, the grounds of which are pronounced upon by the judge. In civil cases, he or one of the assistant judges is combined with two assessors, who must be magistrates of the colony, except where both parties consent to have a jury of twelve men as in England. Not above one instance has occurred, since the operation of this judicial charter in 1824, in which both parties have so consented. In cases where the value exceeds 500*l.*, an appeal lies to the governor, and, in case of reversal of judgment, and in all cases above 2000*l.*, to the king in council. The police seems to be maintained in a very superior manner to that of England, since Mr. P. Cunningham assures us, that in Sydney, where there are so many profligate individuals, person and property are as secure as in an English town of the same size. Such statements, however, must always be understood with some allowances. Van Diemen's Land, at first, had no separate jurisdiction, except for causes under 50*l.*, being a mere dependency on New South Wales; but it recently obtained both a separate lieutenant-governor and councils, and a separate court of justice. This last, except that it has only one judge, is constituted in the same manner as that of Sydney, to the governor of which, assisted by the chief justice, there lies an appeal from it in all cases of property above 500*l.*; and in cases above 2000*l.* a further appeal lies to his majesty in council.

6404. *The military force* stationed in the colony consists of two regiments, from which three companies are detached to Van Diemen's Land. There is no fixed naval force; which is complained of, both in reference to hazards of foreign attack, and to attempts sometimes made by the convicts to carry off colonial craft. A single ship of war is sent down to both colonies from the East India station.

6405. *The revenue of the colony* arises chiefly from custom duties, which are, or were, 10*s.* per gallon on British, and 15*s.* on other spirits; 4*s.* per pound on tobacco, and five per cent. *ad valorem* on all merchandise not British. The excise is 2*s.* 6*d.* per gallon on spirits distilled; and there are small port and wharfage dues, postages, auction duties, licence fees, market and other tolls, crown rents, office fees, and judicial fines. These duties amounted in 1822 to 44,769*l.*, of which 17,809*l.* was applied to purely colonial purposes, schools, roads, &c., 27,872*l.* to what are called British government purposes, the victualling in part of troops and convicts, &c., of which appropriation Mr. Wentworth complains as grossly unjust; but as he admits that a military force is necessary for the welfare of the colonists, and as they are greatly benefited by the cheapness of convict labour, and the markets which the victualling of troops and convicts afford for their produce, it does not appear why they should not contribute to the expense of this penal establishment. The revenue of New South Wales, in the year 1830, had risen to 126,998*l.*, and of Van Diemen's Land to 67,927*l.*

6406. *The entire expense of the colony* from 1788 to 1821 inclusive, amounted to 5,301,000*l.*, for which there had been transported 33,155 persons; and are now subsisted 20,494; the expenditure of 1821 being 425,000*l.* The entire expense per head for the last twelve years, including the voyage, and the whole support of the colony, has been 25*l.*, while Mr. Wentworth finds that of the hulks to vary from 27*l.* to 43*l.*, and that of the penitentiaries to be at least 38*l.* In 1830 the expenditure of New South Wales was 242,891*l.*, of Van Diemen's Land 61,513*l.* Transportation seems, therefore, more economical, if not more effective, than any other mode of penal infliction that has yet been devised. It appears from the Report of the Committee of the House of Commons, in 1832, on Secondary Punishments, that the colonies of New South Wales and Van Diemen's Land have, from relaxation of discipline, and the premature introduction of the free press and other institutions of the mother country, in a great degree failed as penal settlements, both to reform the convict there, and to deter the criminal here. The committee, therefore, recommends that, in future, no persons sentenced to transportation, with the exception of those selected for punishment in the Penitentiary at Millbank, should be allowed to remain permanently in Great Britain or Ireland, and that henceforth the convict establishments in England should be considered an intermediate station between the gaol and the penal colonies; that no male convict, whatever may have been his previous character or station in life, who may commit an offence deserving of actual deportation, should be exempted from the previous punishment of unrewarded hard labour in the dock-yards, or at Dartmoor, attended with solitary imprisonment at night; that all convicts in the service of the government, in the penal colonies, should be strictly confined in their barracks at night, in separate cells, and that the barracks be for that purpose altered upon the plan of the prisons in the United States; that all male convicts, on their arrival from the mother country, be assigned to settlers in the rural districts, and that none be allowed to enter the service of those living in the large towns, until after several years' residence in the colony; that none but persons of respectability be allowed to have convicts in their service; that no convict be assigned to a settler, until he shall have paid, or given security for the payment, by instalments, of the expense incurred in the conveyance of such convict from the mother country; and that the service in the colony necessary to the obtaining tickets of leave, viz. of four years for a transport for seven years, of six years for one for fourteen, and of eight for one for life, be not shortened in consequence of any punishment inflicted previously to transportation.

SECT. V. Productive Industry.

6407. *The fertility of the Australian continent* has been a subject of doubt, and it has even been branded with a character of comparative barrenness. The greater part of its coast, indeed, presents an aspect the most arid and dreary. The interior, however, is so exceedingly little known, that any sweeping conclusion respecting it seems yet premature. That part now colonised by the British, including Van Diemen's Land, though not quite uniform, is, on the whole, in point of fertility, above the average of other continents. The ground, indeed, in consequence of all the trees being evergreens, has acquired none of that excessive luxuriance which in America is derived from the deciduous leaves continuing for ages to mix with the soil. The grass, though good, is rather thin, and Mr. Patrick Cunningham says that it has been injured by excessive and injudicious pasturing; so that it has been necessary, on small farms, to introduce artificial grasses even for sheep. But when judiciously subjected to the plough, it is manifestly equal to the best European soils, since it is made to produce two crops in the year, one of wheat and the other of maize.

6408. *The deportation of convicts for crimes* is well known to be the mode by which the settlement of Australia has been effected. The sentence has usually been for seven or fourteen years, but, from the difficulty of finding a passage home, it has almost always been, fortunately perhaps for the convict, for life, both to himself and his posterity. At the end of his period, or even sooner, in case of good conduct, the convict becomes an *emancipist*, as he calls himself, obtaining his liberty, and sometimes a piece of ground to cultivate, or, as it has often happened, to make away with. Many of them have proved very industrious, and prospered exceedingly, insomuch that Mr. Wentworth calculates that the emancipists are now possessed of property worth 1,000,000*l.* sterling, but he does not pretend that this estimate is derived from any better authority than that of a census, as he calls it, though it was perfectly extra-official, taken by some of the

leading men among themselves, as petitioners to parliament, in 1820, by which it appears that the emancipists possessed 241,364 acres of land, and the free emigrants 209,106 acres. Now, in the very same year, Commissioner Bigge, in his official report to the secretary of state, says that he requested the magistrates, at the regular public *census* or muster of that year, to take an account of the land held by emancipists, and that those returns gave only 83,502 acres to them, leaving 305,786 for the free emigrants. It should seem, therefore, that Mr. Wentworth's estimates are entitled to no more credit than the petition of the emancipists to the parliament of 1828, for a legislative assembly and trial by jury, which stated that the population of the two colonies was 60,000 persons, of whom 40,000 were free settlers, assertions which Mr. Secretary Huskisson put down by simply saying that the total population of both colonies was only 49,000, of whom 18,000 only were free settlers, including in that number the emancipists, the expirees, and all others who were restored to their civil rights. Besides convicts, however, government have liberally and successfully exerted themselves in inducing another and better class to people, and to improve, the wilds of Australia.

6409. *Emigration*, in consequence of the excess of population, and the stagnation of manufactures in Great Britain and Ireland, has, for some time, been looked to as an important resource by small capitalists and persons somewhat above the lower ranks. This surplus population has been largely poured into Upper Canada and the back settlements of the United States. Mr. P. Cunningham, who has visited both, undertakes to prove, that the Southern Continent affords a more eligible sphere for the emigrant. The passage to America is, indeed, very light when compared with that to New Holland, which, occupying, on an average, eighteen weeks, costs, in the cabin, from 70*l.* to 100*l.* The American emigrant, however, has, besides, seldom less than 1000 miles of land journey to perform into the interior; he finds dense and deep forests, in which long and hard labour are necessary to clear a few acres; he pays a price for his land which, however comparatively moderate, drains his little capital; he can obtain service or assistance with difficulty, and only at a very high rate. All these things are on a more favourable footing in the southern settlements. The emigrant, on proving himself possessed of 500*l.*, has bestowed upon him a grant of 640 acres of land; and the gift rises always in proportion to the capital manifested, till it reaches its maximum of 2560 acres, corresponding to a sum of 2000*l.* As the bank of a river is usually taken as the base line of a grant, and the river frontage allowed is in every case the same, the small and the large grants are in the first instance almost of equal value. At the end of seven years, a redeemable quit-rent is imposed, amounting to 5*l.* per cent. upon the estimated value of the grant; but as this estimate has never exceeded 5*s.* per acre, the quit-rent will not, in ordinary cases, exceed 8*l.* per annum. It is levied less as a tax than as a security that the land thus granted shall be actually cultivated, and not taken as a mere speculation. The planter then, on his urgent petition, has assigned to him a proportionate number of thieves, to assist in the culture of his new domain. Such helpmates do not sound very tempting; yet it is averred that, if well managed, they may, in most cases, be broken in to be very tolerable farm servants. Some, indeed, fly off at once from a place where "they have not even a chance;" and, as a severe flogging would await them at the police office, they form or swell those bands of bush-rangers which have been so disastrous to the colony. Others endeavour to render themselves as unserviceable as possible, that their masters may be glad to return them whence they came. But after they have been fairly inured to a quiet life and regular industry, and estranged from the corrupting society of their comrades, the majority become nearly as good farm labourers as the bulk of those at home. The convict servants are quartered in little huts roofed with bark, and receive a weekly allowance of victuals, consisting of a peck of wheat, seven pounds of beef, or four pounds of pork, two ounces of tea or of tobacco, and a pound of sugar. They must have also two suits of clothes in the year, a few utensils, and a little soap; but it is optional with the master to give them wages and other indulgences. That they are really found efficient, seems proved by the consternation which, according to Mr. P. Cunningham, pervades the colony, when any ill-founded rumours are spread of an increasing morality at home, which will prevent the arrival of fresh detachments.

6410. *The first establishment of the emigrant in a new settlement* requires much consideration, and is attended with serious hardships. He must renounce all luxurious and European habits; he is deprived of accommodations which he has been accustomed to consider as most essential; he is shut out, as it were, from all society. There are said to be few who, in the first year or two, do not rue the choice they have made. They have no alternative, however, but to persevere: and if they proceed with any vigour and steadiness, prosperity soon begins to dawn upon them. They find themselves possessed of extensive and constantly improving property; and their family, instead of being a subject of anxiety and embarrassment, will be sure to add to their wealth. Great judgment is required in the choice of a situation. For those who wish to follow agricultural pursuits, Mr. Wentworth recommends one upon the coast, or the rivers connected with it; Hunter's River, Hastings River, or Moreton Bay. But for such as have the breeding of cattle or sheep in view, the vast and fertile plains beyond the Blue Mountains afford a much more ample scope; and the animals can convey themselves, or their wool, cheese, or butter, can be carried to the coast, at a very cheap rate. Van Diemen's Land, also, is suited to the pastoral farmer; and its cool climate, more resembling our own, with the greater beauty of its scenery, have rendered it rather a more favourite resort than the original settlement; though the latter affords the greater scope to speculation and enterprise. Australia is

not so closely timbered as America; it has many wide open plains; and even in the most wooded tracts, the trees are at such a distance from each other that the plough can pass between them. Mr. Wentworth warmly recommends that, disregarding the deformity thence arising, the stumps, in the first instance, should be left standing, under which system an acre may be cleared for 1*l.* 8*s.*, whereas by rooting and burning them out, the cost will be doubled. A rude wooden habitation may be got up for 50*l.*; which, unless the emigrant's money be more abundant than usual, it will be much wiser to build, than to waste his capital in a finished mansion, which would cost 1000*l.*

6411. *The mode and objects of culture* do not differ materially from those of Britain. The hoe prevailed at the outset of Australian cultivation; but, unless in lands entangled with brushwood, or where there is a want of cattle, the plough is now universally substituted. Wheat, maize, and potatoes are the chief crops in New Holland. The wheat is sown in April, and reaped in October or November; after which, maize is sown immediately, and reaped in March or April. Two crops of potatoes are also raised, one between February and July, the other between August and January. Maize requires much manual labour, and is exhausting to the soil; but the crop is so abundant, and so useful for cattle, that it cannot be dispensed with. It does not suit the climate of Van Diemen's Land, where, however, barley and oats are raised better and more largely.

In the year 1830 the number of acres held was as follows:—

Total held	-	-	-	-	-	-	2,766,933
Of which were cleared	-	-	-	-	-	-	225,812
cultivated	-	-	-	-	-	-	70,695
The number of horses	-	-	-	-	-	-	10,352
horned cattle	-	-	-	-	-	-	248,440
sheep	-	-	-	-	-	-	504,775

6412. *Animals.*—The pig is easily fed on wild herbs and roots, and, if a little maize be added, makes excellent pork. The horses are generally very hardy, but ill-broken, and are found restive and unsteady at draught, for which purpose bullocks are preferred. They are chiefly used for the saddle or gig, and for racing, which has become a favourite Australian sport. Horses of high blood bring from 150*l.* to 200*l.*, and a good one cannot be bought under 40*l.* Poultry are plentiful and excellent. The chase, in distant settlements, produces the flesh of the kangaroo, the emu, and the wild turkey, together with the eggs of the emu, which are all very good food; but these animals diminish with the progress of cultivation.

6413. *Manufactures* are not naturally suited to so young a colony, yet they have made much greater progress than might be expected; a circumstance against which Mr. Wentworth inveighs too bitterly, not considering the great distance of the markets, both for importing manufactured goods, and exporting their raw produce. It is not likely that the colonists should be so very blind, as he represents them, to the most profitable modes of employing their money. The articles made in the colony are chiefly coarse and bulky, such as could not have borne the expense of a long transport; agricultural implements, common pottery, woollen cloths, undyed and twilled, in resemblance of Scotch blanketing; leather from the skin of the kangaroo; hats, beavered with the fur of the flying squirrel; straw hats, and soap. The articles are in general dearer than those made in Britain, but fully as durable, especially the cloth.

6414. *Fish* are plentifully supplied to the markets of the colony, chiefly by the natives, among whom this is the only branch of industry pursued with any vigour. The coast absolutely teems with oysters, crabs, and other shell-fish. In the rivers the perch, the eel, and the cray-fish abound, and are of superior quality. The seal is generally found along the coast to the southward, and is killed for its skin, which finds a ready market in England. Whales of a large and valuable kind resort at a certain season to all the coasts of Australia; and since the absurd restrictions on the trade in oil were removed, this has begun to be an important branch of colonial fishery, and likely to increase rapidly. The chief seat of this trade is Sydney. Four vessels are stated to be constantly employed in whaling, and six in sealing.

6415. *The commerce of Australia* may be considered very great, when compared with its slender population and recent existence. Nothing, indeed, can more wonderfully illustrate the progress of maritime intercourse than that which Britain now holds with this continent. The circumnavigation of the globe, once to accomplish which was, a hundred years ago, an almost matchless exploit of the most daring navigator, is now a common trading voyage. The ordinary shipmasters who take goods to Sydney go out usually by the Cape of Good Hope, and return by New Zealand, Cape Horn, and Rio de Janeiro. Australia, however, which has only bulky raw produce to dispose of, has difficulty in finding exports that will bear the heavy freight that is necessary in these vast distances, which separate it from the civilised quarters of the globe. The fine wool of the colony affords in this respect the fairest promise, the export already amounting to about 2,000,000 lbs., worth nearly 100,000*l.* In 1830, the value of the imports was 420,480*l.*, of which 268,985*l.* were from Britain. They consisted chiefly of British manufactures, colonial produce, wine, tea, gunpowder, &c. The exports are 146,000*l.* The imports into Van Diemen's Land, in 1830, were 255,000*l.*, the exports were only 141,461*l.* of which 120,559*l.* were from Britain. Of the latter, the principal heads were, wool, 48,000*l.*; wheat, 40,000*l.*; oil, 17,000*l.*; whalebone, 6000*l.* In 1831, the vessels entered inwards in New South Wales were 157, tonnage 31,225; outwards 147, tonnage 28,822; in Van Diemen's Land, vessels inwards 101, tonnage 26,582; outwards 92, tonnage 25,045. There is also a traffic with New Zealand and some of the South Sea Islands, for spars, sandal-wood, arrowroot, salt pork, &c.

6416. *The mineral kingdom* in Australia has not yet yielded any very excellent products, though, as usual in untried cases, sanguine hopes have been sometimes cherished. There is, however, a very extensive coal formation, reaching from Botany Bay to Port Stephens, and particularly abounding at Hunter's River. A thousand tons are there dug out annually, and sold on the spot, at 5*s.* per ton; but raised, by a seemingly exorbitant freight, to 20*s.* at Sydney. The coal burns well, but does not cake; so that it is chiefly used in manufactures, and wood is preferred for domestic purposes. Cannel coal has lately been discovered between Reid's Mistake and King Town. There is plenty of fine freestone, but lime and gypsum are found only in the interior beyond the mountains; a great loss to the agriculture of the coast territory. Magnetic ironstone exists in large masses near Port Macquarie. The pipe and potter's clay are very fine. The same minerals are found plentifully in Van Diemen's Land.

SECT. VI. *Civil and Social State.*

6417. *The population* of this vast territory is European and native. The former has been in a state of rapid increase. The first cargo of 700 convicts was landed in January, 1788. In 1810, they still mustered only 8293; but in 1821 the census gives 29,783 for New Holland, and 7185 for Van Diemen's Land. Since that time the transmission both of convicts and emigrants has been so very active, that, by the census taken at the end of the year 1828, the numbers of the old colony amounted to 36,598; and in the year 1829, there were 3664, and in 1830, 3225, convicts transported thither.

6418. The following is the *detail* of the *population* of New South Wales in 1828:—

Free emigrants	-	-	{ Male - 2846	{ 4673	} 13,400
			{ Female - 1827		
Born in the colony	-	-	{ Male - 4473	{ 8727	} 7,530
			{ Female - 4254		
Convicts become free by servitude	-	-	{ Male - 5302	{ 6644	} 15,668
			{ Female - 1342		
Convicts pardoned	-	-	{ Male - 835	{ 886	}
			{ Female - 51		
Convicts	-	-	{ Male - 14,155		}
			{ Female - 1513		
Total	-	-	-	-	36,598

6419. *The population* of Van Diemen's Land amounted, in 1830, to 23,169.—Hassel has guessed the *natives* at 100,000; but the conjecture is evidently very rude, since not above one tenth part of the interior of the Australian wilderness has been visited, and not above a twentieth part of its coasts has been landed upon. Though more numerous upon the sea-shores, by reason of the resource of fish for food, it is certain that they are scattered over the interior in numbers excessively small. Social order is here of a very singular and ill-harmonising kind, being composed of three distinct elements: the native tribes, so low in the scale of humanity that not even the convicts will unite with them; the convicts transported; and the voluntary emigrants, between which two latter classes there is almost as entire a separation.

6420. *The native population* belongs to the class of Papuas, or Oriental negroes, who occupy also New Guinea and the interior of the Indian Archipelago. They have the thick prominent lips, white teeth, and, in Van Diemen's Land, the woolly hair, of the African negro; but their nose is less flat, and their limbs much leaner. Here, "human nature wears its rudest form." The theories of those philosophers who have represented man in the savage state as in the perfection of his being, and his evils as arising from the artificial arrangements of society, find here their most ample refutation. All idea respecting the fabled innocence of the state of nature must vanish on viewing the New Hollander. The state of nature is, indeed, complete. There is no society, no government, no laws; each

1072

NATIVE ON HIS LOG.

at navigation. In other quarters, canoes are hollowed out from a piece of wood merely sufficient to hold a single person, who, in various attitudes, sits and steers them (*fig.* 1073.).

1073

miserable tenant. At other times, two or three pieces of bark, put together in the form of an oven, afford hovels, into which six or eight persons may creep. But they often content themselves with cavities in or under the shelter of rocks, which in well-chosen situations form their most comfortable abodes. They roam about entirely naked, except a girdle round the middle, and occasionally a skin thrown over their shoulders. They are not, however, insensible to ornament, for which purpose the skin is thickly coated with fish-oil, regardless of the horrible stench which it emits; to which embellishments are added the teeth of the kangaroo, the jaw-bones of large fishes, and the tails of dogs. On high occasions, they smear

man acts according to his own fancy and caprice. The arts of life exist in their first and rudest elements. Fishing is their main occupation; yet their canoes are rude beyond all comparison, consisting of a sheet of tree-bark folded and tied up at each end. The native of Dampier's Archipelago has merely a log, on which he sits astride, guiding it with a paddle (*fig.* 1072.), certainly the rudest existing attempt. The people were found wholly unacquainted either with planting, or the breeding of tame animals, and deriving their support solely from hunting and fishing, chiefly the latter, in which they display a certain skill. Some erect weirs at the mouth of the rivers and small bays; others pursue and laying snares for the squirrel and opossum, and even devouring worms and grubs that are found in the trunks of trees. Their huts are of the rudest possible description, resembling the dens of wild beasts. They consist often of the bark of a single tree, bent in the middle, and placed on its two ends in the ground, affording shelter to only one

their faces with a species of red and white earth, which renders them perfectly hideous; to say nothing of the scars, sometimes tracing the forms of birds and beasts, which they cut into their bodies. Meantime they are well provided with arms, shields of bark or hard wood, and spears of various forms and lengths, either pointed, jagged, or barbed. These they throw with such skill, as usually to strike even at the distance of seventy yards. They have nothing that can be called war; yet their whole life is one continuous fight. The procuring of food, according to Collins, appeared to be quite a secondary object; the management of the spear and shield, agility in attacking and defending, and a display of constancy in enduring pain, seemed to be their first object in life. The only respectable mode of fighting is by single combat, the challenge to which is given and accepted with equal alacrity. The laws of honour, as they are called, are as strictly observed as among the most punctilious European duellists; they even throw back their adversary's weapon, when it has flown harmless by them. Yet they do not hesitate, under the impulse of revenge, to commit midnight assassination; though this is not sanctioned by public opinion, and always leads to bloody revenge. Their treatment of the female sex is of all other particulars the most atrocious. Their courtship consists in the most brutal violence. The intending husband, having contrived to find alone the unhappy victim of his inclination, begins by beating her to the ground with a club, then accumulates blows upon blows, till she becomes altogether senseless, when he drags her to his hovel, regardless of her striking against shrubs and stones, till, under such promising auspices, she is fixed in his domestic establishment. All their subsequent life is of a piece with this outset. Several of the colonists in vain attempted to count the scars with which the heads of these unfortunate females were variegated. These people seem to have nothing which can be called religion, but they have superstitions, such as a belief in spirits, and in some uncouth forms of witchcraft. The grandest ceremony of their life consists in a sort of initiation of the youth, by which they are entitled to assume spear and shield, and to fight. There is a general assemblage of the tribe and neighbourhood, and, after a variety of strange ceremonies or dances, consisting chiefly in imitating the gestures and movements of the kangaroo, the youth has a tooth struck out, and is thereby invested with all the prerogatives of manhood. All attempts to wean them from this mode of life have been abortive. Bennillong, one of them, was induced to go to England, was there dressed after the English fashion, behaved with tolerable propriety, and appeared to enjoy himself; but immediately on his return, he found himself deserted and despised by his countrymen for these foreign attainments, and lost no time in resuming his nakedness, his wildness, his spear and his club. As is usual among savages, and in this case but too natural, they have done no more than add the vices of the newly arrived colonists to their own. They have learned drinking, thieving, and importunate begging. Endowed with great talents for mimicry, they readily acquire the language, and become complete adepts in the slang of St. Giles's; and in the war of words with the convicts they fearlessly encounter the most able veteran, and generally come off victorious.

6421. *The convict English population* form, at present, the most prominent branch of society, being those, with a view to which the colony was actually formed, both that England might be rid of them, and the southern world be benefited by them. The classic adage, "*Cælum non animus mutant qui trans mare currunt*," cannot be expected to fail altogether in the present instance. These unhappy persons have here, however, means of retrieving their character and place in social existence, which they could never have attained at home. The very community of penal infliction renders their situation less deeply humiliating. The term *convict* has, by tacit convention, been erased from the English language as spoken in New South Wales. On first landing, they are called *canaries*, in reference to the colour of the habiliments in which they are invested; but after due probation, they are exalted to the name of *government-men*, which continues to be the received appellation. They are first employed in the public works, under strict surveillance; but as their conduct appears to admit of indulgence, they are distributed as farm-servants among the new settlers. Of course, the experiment must, in many instances, fail. The numerous runaways form a dangerous and destructive body, called the *bush-rangers*, who, in both colonies, but particularly in Van Diemen's Land, have often disturbed the peace of the interior districts, and rendered property, and even life, precarious. They conduct their plunder on a great scale, and even with forms of honour and courtesy which seem very foreign to its nature. The vigorous measures of government have now put down the system; first, in the old colony, and now in the new. Of these misguided fugitives some, under the most woful ignorance, imagine that, by wandering through the deserts of New Holland, they will come at length to some civilised country, Timor, China, and even Ireland; and one of them, after long wanderings, imagined he had found such a country, till it appeared that his devious course had brought him again within the fatal precincts of the colony. However, it is a most important circumstance, as already stated, that the majority make very tolerable servants; nay, that many, on arriving at the character of *emancipists*, set up trades which they carry on in a very prosperous manner. They are even said to maintain a more punctilious honesty than the same class of tradesmen at home; conscious, from the

delicate footing on which their character stands, that the smallest slip would be sufficient to overthrow it, and make them be considered as having thoroughly relapsed into all their old habits. It is an observation important beyond all others, that the young men born in the colony, of convict parents, acquire generally a character the reverse of that of which the example is set to them by their progenitors. This example seems rather to act upon them as a warning of the misery and degradation which irregular conduct produces. The fair sex, we are sorry to find, are the most turbulent part of society, both in coming out, and after their arrival. They are said to place trust in many circumstances which may prevent the arm of the law from pressing on them with extreme severity, and the great disproportion of their number to that of the other sex, being as one to ten, gives to each an importance which they are apt too highly to value. So many are the candidates for any fair hand which may happen to fall vacant, that a state of widowhood is scarcely tenable for the shortest period; and the lady has hardly time to array herself in weeds, when arrangements are made for fresh nuptials. The young females being thus too much an object of courtship, and irregularity of conduct being no bar to the matrimonial state, they do not always confine themselves within the strict limits of propriety. It seems impossible to contravene the position of Mr. Wentworth, that the most patriotic and valuable consignment which could be made to the southern continent would be that of a cargo of females. Accordingly, arrangements have been recently made by which those of respectable character, under the age of thirty, on payment of the sum of 5*l.*, are conveyed to Australia, where they are immediately provided with employment, in the expectation of their being soon united to a suitable partner.

6422. *The voluntary emigrants* form a third class, not distinguished by such marked features. They come out with the view of finding or making a country and society as like as possible to what they had left at home. In the towns, especially, the habits of fashionable society in England are almost punctiliously copied, though of course on a reduced scale. The pride of station is said to be carried to an extravagant height, as is usual among those who have the least pretensions to it. But the most deep-rooted and unhappy distinction is that which the emigrants can scarcely fail to make between themselves and the freed convicts, or, as they are termed, *emancipists*. The emigrants *pure* refuse to hold any social intercourse with this class, and brand as *confusionists* those who admit them at all to their houses or society. This treatment is borne most indignantly by the emancipist, who has been admitted to a complete footing of political equality, with the exception of not being summoned upon juries at quarter sessions. He himself, however, has established a similar distinction between the emancipist *pure*, who, since his landing, has maintained an irreproachable character, and the emancipist *impure*, who, having come out as an offender, has been committed and punished for fresh offences within the colony. These distinctions have been the sources of deep and lasting feuds. Governor Macquarie made great efforts to equalise and unite the classes; but, endeavouring to carry his point rather by power and authority than by time and conciliation, he only widened the breach. Meantime the emigrants have constituted another classification among themselves, expressed by the fanciful title of *sterling*, or natives of the mother country, and *currency*, or those born in the colony. The currency are said to be fine-spirited youths, yet, from some cause of climate or country, they have the same tall form and pallid aspect which present themselves in the children of the back settlements of America. In return for the unjust ridicule with which they are treated as *currency*, they adhere closely to each other, and have an exclusive attachment to the land of their birth, with a contempt for the mother country, which is generally by no means lessened by a visit to it.

6423. *Religious instruction, and the elements of education*, were obviously of the first importance, with a view to the reformation which it was proposed to effect by such a colony. It was, therefore, a most lamentable omission, which appears from the narrative of Colonel Collins, that for several years there was not a church in the colony, nor a school, except such miserable ones as a few of the convicts set up for their fellow offenders. Much is now done to repair this gross failure. There are, at least, fifteen clergymen of the church of England, and an archdeacon, under the diocese of India, and two Presbyterian and one Catholic clergymen, all paid by government. In 1850 there were 37 churches, the maintenance of which cost 10,941*l.* Besides the male and female orphan schools, day-schools are supported in every part of the colony, the whole number in 1850 amounting to 308, costing 13,292*l.*; and the means of elementary education are thus placed within the reach of the whole colony. One seventh part of the land in each county is now reserved for church and school purposes, nine tenths of which are devoted to the church, and the remaining tenth to national schools under the management of certain incorporated trustees. The Wesleyans have also sent out several missionaries, whose exertions, both in preaching and in teaching Sunday schools, appear to have been highly useful. Literature, amid the pressure of so many more vulgar wants, cannot be expected to have taken deep root; yet, under the auspices of Sir Thomas Brisbane, there was formed a Philosophical Society, and some valuable papers were contributed to it. According to Mr. Field, in his preface to a

collection of those papers, that infant society soon expired in the baneful atmosphere of distracted politics, but he fondly hopes it may prove to be only a case of suspended animation.

SECT. VII. *Local Geography.*

6424. *In considering the local divisions of Australasia*, the prominent place must, of course, be given to its great central mass of continent, chiefly with reference to the British settlement formed there. It has been now divided into counties, certain districts being called respectively Cumberland, Camden and St. Vincent, on this side of the Blue Mountains; Westmoreland, Georgiana, King, Argyle, and Murray, to the south; and Roxburgh, Cook, and Bathurst, to the west, of that great barrier. To the north of Sydney, divided by Hunter's River, and the county of Hunter, are placed the counties of Northumberland, Durham, and Gloucester on the east, and Phillip, Wellington, Brisbane, and Bligh on the west of the dividing mountains. The remainder of these vast regions has not yet been brought under any political nomenclature.

6425. *Cumberland* forms the original, and still the only fully settled portion. It has about fifty-six miles of coast, comprehending the noble harbours of Broken Bay, Port Jackson, and Botany Bay. Behind, the Hawkesbury, with its head, or tributary stream, the Nepean, makes an entire circuit round it; beyond which the broad and steep mountain ridge shuts in the county, leaving to it a breadth of only forty miles. The soil on the coast, as is the case generally throughout this continent, is light, barren, and sandy. In advancing into the interior, it improves, is covered with fine though not thick woods; and, though of a somewhat poor clay iron-stone, yields tolerable crops. Along the inundated banks of the rivers there is found a great luxuriance of natural pasture; but the inundation renders precarious the crops which are raised in these highly fertilised valleys. This province has already four towns of some importance, Sydney, Paramatta, Windsor, and Liverpool.

6426. *Sydney* (*fig. 1075.*), the capital of the New Southern World, is situated upon the cove bearing its name, which opens from the spacious basin of Port Jackson. This vast

1075

VIEW OF SYDNEY.

inlet passed unnoticed by Captain Cook, whose attention was engrossed by the neighbouring harbour of Botany Bay, also excellent and attractive by its rich and varied vegetation. When Governor Phillip, therefore, was sent out, in 1788, to occupy New South Wales as a penal settlement, his destination was for Botany Bay, a name which long continued to be given to the whole

establishment. But when he came to examine the coast, he soon discovered this new harbour, which was so superior to the first, and to almost any other ever yet seen, that he hesitated not a moment in fixing his colony upon it. From an entrance not more than two miles across, Port Jackson gradually expands into a noble and capacious basin, having depth of water sufficient for the largest vessels, and space in which a thousand sail of the line might manœuvre with the greatest ease. It stretches about thirteen miles into the country, and branches into not less than a hundred small coves, formed by narrow, rocky, yet wooded necks of land, which afford excellent shelter from every wind. From amongst this ample choice was selected Sydney Cove. It is more than half a mile long and about a quarter broad at its mouth, whence it gradually narrows to a point. For about two thirds of the length it has soundings of from about four to seven fathoms, and is perfectly secure from all winds; for a considerable way on both sides, ships can lie almost close to the shore, nor is the navigation in any part rendered dangerous by hidden rocks or shallows. The scenery, composed of rocks and hills covered with wood, and the shore diversified by numerous cliffs, is highly striking and picturesque. "The first occupation of this new world, the appearance of land entirely untouched by cultivation, the close and perplexed growth of trees, interrupted here and there by barren spots, bare rocks, or places overgrown with weeds, flowering shrubs, or underwood intermingled in the most promiscuous manner; then the landing, the irregular pitching of the first tents, where there appeared an open spot, or one easily cleared, the bustle of various hands employed in the most incongruous works, — all these gave a striking character to the first settlement." The town of Sydney is built at the head of the cove, on a rivulet which falls into it, and in a valley between two opposite ridges. That on the right, called the Rocks, was built first, and in the most irregular manner, each man studying his own convenience, without the least reference to any general plan. Governor Macquarie, however, determined to enforce a principle of *alignement*, and, under his direction, the principal street, called George Street, was carried in a straight and broad line of a mile, along the left ridge. Similar regularity was required in the smaller streets branching from it, and even the Rocks were brought into some sort of shape. That quarter continues, however, to be occupied by an inferior class, while all the fashionable houses are on the left side. The best houses are of white freestone, or brick plastered, and have a light and airy appearance. Many of them

being surrounded with gardens, they occupy a great extent of ground; and Sydney, which contains only 7000 souls, fills up the space of a town of 20,000. Yet Mr. Wentworth assures us, that ground and houses have in some quarters risen to a very high value; the former to 1000*l.* an acre, the latter to 300*l.* and 500*l.* per house: but surely, where land is so plentiful and so bad, and the place so little overgrown, the ground valued at such rates must lie within very narrow limits. Mr. P. Cunningham mentions that the best lodgings, for a single person, may be had for a guinea a week. The hard material of the streets renders paving unnecessary, but lighting has been lately introduced. A British air is studiously given to every thing; yet the parrots and other birds of strange note and plumage, and the show of oranges, melons, and lemons, in the market, bespeak a foreign country; while a sadder tale is told by the gangs of convicts in the employ of government, marching backwards and forwards in military file, with white woollen frocks, and grey jackets besmeared with sundry numerals in black, white, and red; and sometimes, by way of punishment, with the chains jingling on their legs. But the police is so good, that even in this strange society property and person are said to be in security. "Elbowed by some daring highwayman on your left hand, and rubbed shoulders with by even a more desperate burglar on your right, while a footpad stops your way in front, and a pickpocket pushes you behind, — you may jostle through the crowd with the most perfect safety." The principal public buildings are the governor's house, built at various times and by successive governors from Phillip to Darling, and having in front a very fine plantation of English oaks and Cape pines, the walk round the outside of which forms the favourite recreation of the citizens; the barracks, occupying one entire side of the principal square; the convict hospital, a large tripartite stone building with verandas all round to both stories, a smaller military hospital, a handsome convict barrack, a court and school house, &c. The gaol is bad and old, but a new one is building. Sydney has two English churches, St. Philip's and St. James's; also a handsome Gothic Roman Catholic, a plain Presbyterian, and a large Wesleyan methodist chapel. A monthly magazine was once published by the Wesleyans, chiefly with a view to religious objects, and two well-established newspapers appear, the *Sydney Gazette* three times, and the *Australian* twice a week.

6427. *The other towns of Cumberland* are in a rising state, but have not yet attained much importance. Parramatta, called formerly Rose Hill, is situated at the head of Port Jackson, and separated from Sydney by a flat and uninteresting country. Its harbour being unfit to receive vessels of burden, and the surrounding territory unproductive, it has not made the same rapid progress, and its population is variously estimated, at 1200 when Mr. Wentworth wrote, and at 3000, lately, by Mr. Cunningham. Its importance consists chiefly in carrying on the communication between the capital and the interior. It is merely a large assemblage of detached houses with gardens, without much arrangement; but there is a good government-house, a beautiful garden, and extensive natural pleasure-grounds; and here, the late governor, Sir Thomas Brisbane, constantly resided, and attached to his house an observatory. Windsor is about forty miles in the interior, at the head of the Hawkesbury navigation. It is finely placed at the base of the Blue Mountains, whose forest ridges are seen towering successively above each other. It has 800 inhabitants, who are chiefly cultivators, and the ground in the neighbourhood is rising in value, especially those parts which are out of the reach of inundation. It is well laid out, has a small government cottage, a church, a gaol, a handsome court-house, and the other usual appendages of a country town. Richmond and Wilberforce are, as yet, only hamlets. Liverpool was founded, somewhat prematurely, about fifteen years ago, by Governor Macquarie, and for some time its existence was only indicated by a post, saying, "This is Liverpool;" but it has now a good church, and is beginning to speak for itself; and though not lying in a very fertile country, yet, affording a route to the fine agricultural and pastoral districts of Camden and Argyle, it is a place of considerable bustle, and daily increasing in importance. Campbell Town, in the fine district of Airds, is yet only in its infancy; but it has a church and a court-house.

6428. *Camden county* is situated partly in the interior behind Cumberland, and partly along the coast southward from it. The Morrison and other ranges render it a hilly and even mountainous country, the hills rising steep, like the roof of a house, leaving between them only narrow gorges, through which flow rivulets which unite in forming the Nepean. Hence this county, though generally affording fine pasture, is fit for the plough only in particular parts, which, however, are exceedingly rich. It is peculiarly so in the district of Illawarra, or the Five Islands, on the coast. Here the most luxuriant vegetation prevails, and the trees, shrubs, and even birds, are entirely different from those of the rest of the colony. The cedar, the cabbage tree, the pine, the tree-fern, the black cockatoo and the green pigeon, make the spectator think himself in a new quarter of the world. The land is too closely timbered to be easily brought under cultivation; though much of that timber, being of cedar, is valuable; yet the soil is so very rich, that a great part of it has already been occupied. This district is separated from Sydney on the land-side by a range of precipices, down which a waggon can scarcely be driven. It, therefore, depends upon water communication, which is greatly facilitated by the Shoalhaven River, navigable twenty miles up for vessels of eighty or ninety tons.

6429. *The counties of Argyle and Westmoreland* form a large extent of country, situated to the south-west of the territories now described, lying partly upon the Blue Mountains, partly to the east, and partly to the west of that ridge. On the highest track are two considerable lakes, called Bathurst and George. It is only since 1819, that the enterprise of the colonists has opened it to our knowledge, and the descriptions have somewhat varied, and have even, according to Mr. Wentworth, been tinged with party spirit. It appears that the territory is crossed by large tracts, called *brushes*, that are altogether unproductive. The greater part, however, yields at least tolerable pasturage, and some appears fit for any species of culture. The most distant and best are the plains, or rather downs, of Monaroo, beyond Lake George, which are of great extent, clear of timber, and fitted, seemingly, either for agriculture or pasturage. These were first visited and surveyed by Captain Currie, in 1823. Grants have here been taken, at the distance of 160 miles direct from Sydney, and 30 miles from the sea, with which last there promises to be an easy communication, either by Jervis Bay, or by the newly discovered river Clyde, falling into Bateman's Bay. There seems some reason to think that these fine plains may extend the whole way to Western Port.

6430. *Western Port* is situated on the southern coast of New Holland, within Bass's Straits, ninety miles from their western extremity. The river Murray falls into it, forming an estuary thirty miles broad, with a large island in the centre, called Phillip Island. The harbour and anchorage are excellent; but the river cannot be approached even by boats at low water, owing to the extensive mud banks which surround its entrance. It is extremely winding in its course, and salt for five or six miles up, where it is met by a fresh-water rivulet, taking its rise from an adjoining swamp. The country for sixty or seventy miles along the

coast, and for fifty miles inland to the mountains, is described as the finest ever beheld, resembling an English ornamented park, with trees only thinly scattered in picturesque groups. The climate is cool and salubrious; and the position is also somewhat nearer to England. From Twofold Bay, near the southern extremity of the eastern coast, Messrs. Hovell and Hume travelled thither in a line parallel with the sea, but within the mountains, a distance of nearly 400 miles, and always through beautiful, well watered, and thinly timbered lands. The opening for settlement and prosperity on this side of the continent seems, therefore, to be immense.

6431. *The region to the west of the Blue Mountains*, discovered by Messrs. Blaxland, Wentworth, and Lawson, and surveyed by Messrs. Oxley and Evans, has been a most important acquisition to the colony, and has given a new character to its condition and prospects. It was found, as already observed, to be traversed by two large rivers flowing into the interior, the Lachlan and the Macquarie. The former presented the most dreary and hopeless aspect. All the flat country bordering it was subject to its sudden and destructive inundations, which swept all before them without producing any fertility. It constantly diffused and extended its waters over low and barren deserts, creating only low flats and uninhabitable morasses. Nothing could be more melancholy than the appearance of the level and desolate regions through which this river winds its sluggish course. The Macquarie, on the contrary, is a noble river, the inundations of which are so confined by primary, or at least by secondary banks, that they never produce any destructive effect. The shores present many highly picturesque scenes, and they consist generally of rich flats, or open valleys lightly timbered, and thus offer every advantage to the settler, alloyed, indeed, by the evil of being separated from the coast by the steep ridge of the Blue Mountains; but even this has been recently lightened by the discovery of a more level and direct route.

6432. *The banks of the Macquarie* have been made to divide two counties, Roxburgh on the right, and Bathurst on the left bank. Extensive locations have now been made on Bathurst Plains, in the former county, which might more properly be called downs, as they form a succession of gently swelling hills, 50,000 acres in extent, clear of timber, and covered with luxuriant herbage. But the south side of the river is still reserved by government. At the fine valley of Wellington, seventy miles down the river, a government depôt for convicts has been formed; but these, it is expected, will soon be made to give way to more eligible settlers. The heavy carriage discourages the raising of grain in these districts; but the stock farms are already very extensive, and Sydney is, in a great measure, supplied with cattle from them. Cheese is also made, of good quality, and wool is a rapidly increasing and improving article of export. Bathurst is now assuming the aspect of an English country neighbourhood. It has a literary society, composed of twenty members, and there is the "Bathurst Hunt," whose chase is the native dog, an animal as destructive to lambs as the fox. Being 1800 feet above the sea, it enjoys a climate remarkably cool and healthy.

6433. *On the north side of the colony* there extends a succession of fine rivers, the banks of which are in the course of being rapidly settled and cultivated.

6434. *Hunter's River*, the banks of which are now dignified with the titles of Northumberland and Durham, is situated fifty-five miles to the north of the Hawkesbury; but the road by land is nearly ninety miles. It rises from the continuation of the Blue Mountain range, which is here more distant from the sea than in the first settlement, and follows a course of 140 miles, during which it receives from the north William's and Paterson's rivers. On these, and for 100 miles up Hunter's River, settlements were formed when Mr. Cunningham left the colony, and the whole, we understand, has now been located. The soil is various, but contains many fine tracts, among which that of Wallis's Plains has only the disadvantage of being very closely timbered; but when cleared, the soil is most luxuriant. A hundred and twenty miles in the interior begins that vast extent of fine pastoral country, called Liverpool Plains, discovered by Mr. Oxley, at the end of his last journey, and into which the tide of settlement is beginning to pour, through a pass which Mr. Allan Cunningham, the botanist, has discovered from Bathurst, and routes which he and Mr. Dangar, the deputy-surveyor, have severally effected from Paterson's River. This river has also the advantage of very extensive mines of coal at its mouth, from which Sydney is supplied, and which has procured for the capital of the settlement the popular name of Newcastle, but its original name is King Town. This was opened as a mere convict station; but as soon as it was discovered to be so eligible, the convicts were removed to the Hastings River at Port Macquarie, and Hunter's River was given up to settlers. Newcastle, however, is yet only a cluster of brick and wood cottages, but its importance is rising with that of the settlement, and wharfs and stores are beginning to be erected.

6435. *The river Hastings with the country round it* has since, in its turn, been made a free settlement. The Hastings was discovered, as already observed, by Mr. Oxley, on his return from his second journey. It is not very important, in a navigable view, since it cannot be ascended more than ten miles by vessels of any size; but it flows through a great valley, extending for fifty miles inland, till it reaches the Blue Mountains, and with a breadth nearly uniform. This tract is various, but generally broken into a pleasing undulation of hill and dale, and consisting mostly of what is called open forest, by which is meant grass-land, lightly covered with good timber, and free from the peril of inundation. Captain King remarks, that there are here 12,000,000 acres, in which it is difficult to discover a bad tract. It is in general finely watered with clear small streams; an advantage not enjoyed by the more southern districts of the colony. The climate is nearly tropical, and rather too hot for wheat, which is apt to be burnt up or to run into straw; but maize and rice would, of course, flourish; and sugar and tobacco have been tried with success. The inland dividing Blue Mountains are very rugged and lofty, rising to 6500 feet; but to the south-west of these mountains is the extensive range of pastoral districts called Liverpool Plains. Port Macquarie is a bar-harbour, into which vessels drawing more than nine feet of water cannot safely enter; and they must be on their guard against a sunken rock on the south side; but there is good anchorage without, and the shore is not dangerous. A convict establishment was formed here in 1820; but since the quantity of good land became unequal to the demand for it, the convicts were removed to the still more remote station of Moreton Bay, and Hastings River is laid out for settlers. Not far from hence there was recently discovered another river, navigable for vessels of 300 tons to fifty-seven miles from its mouth, and which falls into Trial Bay. The banks consisted of open pastoral forest, hills with alluvial untimbered plains, holding out the most flattering prospects to the settler; and from a high hill upon this river, another large river was seen forty miles to the northward, discharging itself into the sea from the north-east. Southward, again, between Hastings and Hunter's rivers, Port Stephens receives another stream, called the Karner, whose banks, notwithstanding the first unfavourable reports, Mr. Dawson, the late agent of the Australian Agricultural Company, found to contain 1,000,000 acres of good land.

6436. *The Brisbane* is the latest discovered and the largest fully surveyed river which is found on the eastern shores of Australia. Moreton Bay, into which it falls, had been observed by Captain Flinders, who discovered one small river falling into it, but took only a slight view of the western shore. Here, however, in December, 1823, Mr. Oxley discovered a channel, bearing all the marks of a large river. He accordingly sailed up fifty miles, during all which space it continued navigable, as he thought, for vessels not drawing more than sixteen feet of water. A ledge of rocks then ran across, not affording more than twelve feet of water. It was traced, however, for more than twenty, and seen for forty or fifty miles farther, still without any apparent diminution of magnitude. The country was generally of the finest description, alternately hilly and level, but nowhere inundated; the soil equally adapted for cultivation and pasturage, covered with abundant and very large timber, particularly a magnificent species of pine, which seemed sufficient for the topmasts of the largest ships. From the slowness of the current, the depth of water, and the level aspect of the country, so far as it could be traced, there appeared reason to think that it was now very distant from any mountain source; and, on considering its position, a conjecture arose in some minds that it might be the ultimate termination of the Macquarie, after that river had issued from the reedy lake in which it appeared to be lost. Mr. Oxley himself thought that it would be found to flow, not from the Macquarie marshes, but from some lake, the receptacle of those interior streams to the south-west, crossed by him in his land expedi-

tion of discovery in 1818, namely, Parry's Rivulet, Bowen and York River, Field's River, and Peel's River. And Mr. Field has shown, in his Geographical Memoirs, that it is not probable that it can be the outlet of that inland lake in which the river Macquarie was found to terminate, since the whole course of that river for 300 miles is north-west, and it would require an immediate regular diversion to the north-east for nearly 400 miles to reach Moreton Bay, and then the height of its head above the level of the sea would allow the whole river only a fall of about two feet per mile, whereas the Macquarie falls already in one place 437 feet in little more than 50 miles, and in another 750, in about the same number of miles. These speculations have been since set at rest. "In the year 1825," says Major Lockyer, in his official report to the governor, "I traced the river Brisbane, as far as it was practicable to do with boats, and then by land, to where I consider it to take its rise, on a large mountain to the north-west of the settlement, after making a very circuitous course of 200 miles. On leaving the boats, I proceeded along the banks for two days, when I came to a bed of shingle with a very small stream, not three feet wide and six inches deep, which in the summer months I have no doubt is quite dry. At this time the river, where the boats were left, had risen from six to eight feet from the late rains; and as this place, not fourteen miles above, had not the least appearance of a rise, it convinces me that the Brisbane River has its chief supply from the Brisbane Mountains." And Mr. A. Cunningham is of opinion that Parry's, York's, Field's, and Peel's Rivers fall into the Darling. Major Lockyer also found that vessels of a large size can go into Moreton Bay by the passage at Amity Point; and that in a good channel all the way to a good anchorage inside Peel's Island, there is not less than $4\frac{1}{2}$ fathoms water. Major Lockyer took the very same cutter, drawing ten feet water, which Mr. Oxley had on his expedition prudently anchored in the bay, easily got over the bar at the mouth of the river, and is confident that such a vessel could go nearly thirty miles higher up. The entrance of Moreton Bay is tolerably safe, and Red Cliff Point, ten miles from the mouth of the Brisbane, or the western shore of the river itself, affords commodious harbours. The settlement is quite in its infancy, and is yet only penal; nor were there in 1826 more than eighty-five acres brought under cultivation; but the period cannot be very distant when it will become one of the most flourishing portions of the colony.

6437. *The remainder of the east coast of New Holland*, though viewed by Captain Flinders, has not been examined in any complete or satisfactory manner. Its general aspect is low and sandy, diversified with sand hills, covered however with a rich vegetation, becoming more and more tropical in its character. The coast is rich in fish, particularly turtle. Islets, single or in groups, are scattered along the whole of its extent. No attempt having been made to penetrate the country to any depth, or even to explore the coast minutely, it is highly probable that many fertile tracts of land may yet be found, as well as large rivers. Four, indeed, have been lately discovered: viz. the Clyde, in Bateman Bay, and the Boyne, in Port Curtis, which did not afford much promise; the Darling, under Mount Warning, and the Tweed, close to Point Danger; which have not yet been satisfactorily explored.

6438. *The northern coast begins at Cape York*, the most northerly point, opposite to which is the coast of New Guinea. The interval is called Torres' Strait, and is filled with various islands and groups of islands, among which last those of Prince of Wales and Clarence are the most numerous. Immediately afterwards opens the vast Gulf of Carpentaria, stretching about 650 miles inland, and 400 miles across. It was successively visited by the commander of the Duyfhen, Torres, Carstens, and Tasman, who all, however, viewed it under the impression of its being part of the opposite coast of New Guinea. Cook, in 1770, by sailing through Torres' Straits, dispelled this error; but it was still supposed that the vast opening might be an oceanic channel, dividing into two parts the east and west of New Holland. The coast was in general low, sandy, barren, beset with shallows, and sometimes with coral rocks; but woods and rich grass were seen in the interior. Numerous torrents descended from the mountains, and afforded a good supply of fresh water; but no river of any magnitude could be discovered; and Captain King considered this observation of Captain Flinders so satisfactory, that he did not repeat the search.

6439. *Arnheim's Land*, beginning at Cape Arnheim, which terminates the Gulf of Carpentaria, extends for upwards of 300 miles to the entrance of the Bay or Gulf of Van Diemen. It was almost unknown till the late careful survey made by Captain King. He found the woods sometimes luxuriant, and the vegetation rich. At other times, the trees were low and stunted, and the country had an almost desert aspect. Water was, in general, either found, or there was reason to believe that it existed. A river, the Liverpool, was discovered, which, at the mouth, was four miles broad; but after ascending by a winding course of forty miles, it dwindled to a trifling magnitude. There were a considerable number of tolerably large islands, Wessel's Islands, Goulburn Islands, &c. At its western extremity was found Port Essington, one of the finest of the many fine harbours on this continent, and which, from its situation in the direct line towards Port Jackson, from India, must become of great future importance.

6440. *Van Diemen's Bay and Land* form a portion of the continent on which Captain King landed. This gulf, named like the island of the same name from a Dutch governor-general of India, had been explored to a certain extent; but its real magnitude was by no means suspected. Captain King sailed completely round it, and discovered two large estuaries, which he named Alligator rivers, and the largest of which, after being traced upwards of 36 miles, was still 150 yards broad, and two or three fathoms deep. The western coasts had been hitherto supposed to be those of a large peninsula projecting so far as to leave only a narrow entrance into the bay; but they were now found to consist of two large islands, Bathurst and Melville, the former of which was 200 miles in circumference, and the latter 120.

6441. *The soil and climate* being fitted for growing all the vegetable productions of the East, particularly spices, and the situation being also commodious for the refreshment of vessels proceeding between our India possessions and Port Jackson, and adapted for the purposes of British trade with the Malays, it was determined, in the year 1824, to form a settlement upon Melville Island. Captain Bremer was accordingly sent from England in the ship Tamar, and sailed thither from Port Jackson, with a party of troops and convicts, and on the 21st of October, of that year, laid the foundation of Fort Dundas, in Port Cockburn, which appears to have not answered its intentions, and has therefore since been abandoned. The Dutch, we may observe, send annually to this coast, from Macassar, a fleet of perhaps 200 proas, for the purpose of catching the *tripang*, or sea slug, a gelatinous marine animal, for which there is a constant demand, as an article of food, in China. It is taken by diving, and is preserved by being split, boiled, and dried.

6442. *De Witt's Land* consists of a large extent of coast, about 600 or 700 miles long, facing the north-west. De Witt, however, had not the honour of its first discovery, which was made by the ship Vianen in 1628. Tasman and Dampier have given some hasty notices of it, and Baudin touched at some of its exterior points; but the only detailed survey, and that not complete, was made by Captain King. The low, flat, woody shore, which has continued for 600 miles, here ceases, and the general character of the coast is rocky, rugged, and even arid; fresh water being to be procured only at a few points. The coast is deep, indented by bays and gulfs, and bordered by numerous clusters of small islands. Cambridge Gulf is a long, narrow inlet, presenting, at first, the appearance of its being the mouth of a river; but none was found. Port Warrender is a noble harbour, but does not afford fresh water. York Sound is a very spacious bay, receiving two small rivers; but Brunswick Bay, which quickly follows, receives Prince Regent's River, the largest yet known to fall into the north-western coast. It was traced 60 miles up, when it had still a breadth of 250 yards. On this river there is a waterfall of a very striking and singular aspect (*fig. 1076.*); the stratified form of the rock causing the stream to appear as if falling down a range of steps. At length, Captain King came to a broad opening, called Cygnet Bay, which by an intricate channel he traced upwards for fifty miles, when he was obliged to return; but from the tides and other circumstances he is inclined to believe that it communicates with Collier's Bay to the southward, and forms this part of New Holland into a large island.

6443. *The western coast*, consisting of Endracht's Land, discovered in 1616 by Dirk Hartog, in the ship Endracht; of Edel's Land, discovered in 1619 by a Dutch navigator of that name; and of Leeuwin's Land, discovered in 1622 by the ship Leeuwin, is all of the most desolate and dreary description. It was ex-

attended by Dampier and Vlaming, and afterwards by Flinders, Baudin, Péron, and Freycinet; but by all

1076

WATERFALL, PRINCE REGENT'S RIVER.

without any cheering or promising discovery. Almost every where it consists of a ridge of low steep rocks, bordering on a sandy shore, accessible to boats only in a very few points. There are occasional openings, or rather rifts in these rocks, through which torrents sometimes pour, but without any enlivening or fertilising influence. Vegetation is either wholly absent, or its products include nothing that is fit for the use of man.

6444. In this dreary shore, extending for 800 miles, there are only two important openings, one made by the *Swan River*, to which a little naval expedition under Captain Stirling was sent in 1826, when the brackish stream was

explored for 50 miles, and the report which was made of the country on its banks was so highly favourable, that a western settlement, which had always been a desideratum, by reason of its much shorter distance from England, was formed there in the year 1829, under the government of Captain Stirling; but we are afraid that the emigrants to Swan River have met with at least as many disappointments and privations as usually attend upon new colonies. This settlement, being yet beyond the reach of New South Wales by land, was, by a temporary act of parliament, erected into an independent colony, by the name of *Western Australia*, and regular grants of its lands have been made to capitalists, who have taken with them free labourers; but the fertility of the soil had evidently been exaggerated, and however objectionable, in a moral and political view, may be a convict colony, the rapid progress of New South Wales and Van Diemen's Land has been proved to have been in a very great degree owing to the cheap and compulsory labour afforded by transported prisoners. The latest accounts from Lieutenant-governor Stirling, of Western Australia, are to be found in the following extract from the second volume of the *Journal of the Royal Geographical Society*:—

“The only products of the country of any value at present are its timber, which is inexhaustible and of excellent quality, and its grasses, which afford feed of superior quality for sheep, horses, and cattle. There is a good species of tobacco and perennial flax, similar to the kind usually cultivated in Europe; but these are as yet only valuable as indicative of the capabilities of the soil.

“For some time back, registers of the weather have been kept at King George's Sound and at Perth, the capital of Swan River; and hereafter it will be possible to ascertain with precision the ranges of the temperature, the barometrical pressure, and the degree of moisture in these districts, compared with other countries. At present, after three years' experience of the climate of the Swan River district, it may be said to be exceptionable only in the months of January, February, and March, when the heat and drought are as disagreeable as they can be without affecting health. The district of King George's Sound being exposed to southerly winds in summer, and frequently visited by showers, is the most equable, perhaps, in the world, and the most temperate. The heat on the west coast is certainly intense, and the mosquitoes, which abound there in summer, are serious evils in their way, and have caused some dislike to this part of the country as a place of residence. But notwithstanding these and other local and trivial objections, the climate, the ports, the position, and extent of the country, are such as fit it to be the seat of a wealthy and populous possession of the crown; and I feel justified in saying, in this stage of its occupation, that it will not fail to become such, from any natural disqualification of the soil.”

6445. The other is *Shark's Bay*, in *Endracht's Land*, which penetrates deep into the coast, with many windings, and would form an excellent harbour, but for the total absence of fresh water. To the south are some mountains, called *Moresby Range* by Captain King, and another, called, by the French, *Mont Naturaliste*; and the coast was here somewhat wooded. Notwithstanding its general sterility, the natives appeared as numerous as in any other quarter; and as its rocky barrier has been penetrated at so few points, it remains still uncertain whether there may not be within it something better than its gloomy aspect would indicate.

6446. *Nuyt's Land*, discovered in 1627, by Peter Nuyts, in the ship *Zeepaard*, extends along nearly half of the southern coast of New Holland, and has been since surveyed in parts by Vancouver, D'Entrecasteaux, Flinders, Baudin, and King. The coast continues low and sandy, but with mountain ranges in the back ground, similar to those which border the eastern coast. These mountains are altogether naked, composed sometimes of smooth and glittering rock. The soil consists generally of loose white sand, or of a crust of earth, which sinks under the feet, and is altogether unproductive. Yet even these arid deserts, like those of the Cape of Good Hope territory, are covered with brilliant plants and flowers, producing often the most enchanting scenes; as if nature, according to Péron, had sought to throw this veil of beauty over her deep sterility. King George's Sound, in its eastern quarter, was found by Vancouver and King to contain two harbours, receiving several small rivers, and abounding with timber. The natives are numerous, and carry on

with activity their fishing by means of stone weirs, which they set up at the mouths of the creeks and rivers. A small settlement of troops and convicts was made here, by the government of New South Wales, at the close of the year 1826, under the command of Major Lockyer, the first good effect of which was to reclaim several of the runaway convicts, both from New South Wales and Van Diemen's Land, who have long led a roving life, collecting the skins of seals and other animals for ships, on Kangaroo, King's, and other islands, in Bass's Strait. King George's Sound is now within the jurisdiction of the lieutenant-governor of Western Australia.

6447. *Flinders' Land* extends in a south-east direction from the boundary of Nuyt's Land for 400 or 500 miles. Baudin surveyed it also; and having, in consequence of the unjust detention by the French of Captain Flinders at the Mauritius, been the first to reach Europe, he called it Napoleon's Land; but an impartial public has now restored the name to the first discoverer. This coast has open, high, rocky banks, which do not, however, send down any thing but small rivulets. It is broken by two deep bays, called Spencer and St. Vincent; on the former of which is Port Norfolk, described by Péron as one of the finest on the face of the earth. The soil is like the bottom of the sea, covered with deep sand, and sandy hills full of the incrustations of marine animals and plants; even the water in the pools is brackish. There is an extent of thirty-five miles, at the extremity of this coast, which, having been actually first surveyed by Baudin, may, it is alleged, retain the name of Napoleon. It does not contain a haven, or a point at which it is possible to land; and facing nearly the west, is lashed by tremendous waves, collected from the whole expanse of the Pacific.

6448. *Grant's Land*, explored in 1800 by Lieutenant Grant, connected Flinders' or Napoleon's Land with Western Port, which Bass had reached from the opposite quarter, and thus completed the circuit of the New Holland coast. Western Port has been reached overland from the colony, in the manner already stated, by Messrs. Hovell and Hume; and towards the close of the year 1826, a settlement was established there by our colonial government, under the maritime direction of Captain Wetherall; but it has been since abandoned in favour of the more western port of Swan River. This tract has numerous and wide bays, among which are Portland Bay, King's Bay, and Port Philip. The coast continues diversified with sand-hills, on which the waves of the ocean break with fury; and behind which, as usual, rises a rocky chain, parallel with the shore. Many parts present the same aspect of dreary nakedness as the more westerly regions. In others, a great improvement is perceptible, the environs of Capes Northumberland and Albany being covered with noble woods, which give them a most romantic appearance. The environs of Port Philip are also most beautiful, and fit for yielding many valuable productions.

2. *Van Diemen's Land.*

6449. *Van Diemen's Land* is an insular appendage to the southern part of New Holland, but of much smaller dimensions. It lies between $40^{\circ} 42'$ and $43^{\circ} 43'$ S. lat., and $145^{\circ} 31'$ and $148^{\circ} 22'$ E. long., and is reckoned by Freycinet to contain an area of 27,192 square miles. It presents neither the same long and sharp mountain ranges, nor the same vast plains as the mainland. In general it is composed of alternate hill and dale, and even the high downs are generally fit either for cultivation or pasturage. The chief lines both of mountain and river run from north to south through the eastern part of the colony. Table Mountain, the most elevated hill in the island, nearly overhangs the southern settlement of Hobart Town, rising to the height of 3936 feet, being covered for nine months in the year with snow, and subject to violent whirlwinds. The northern peaks, called Ben Lomond and Tasman, are also considerable; but the chain of most continuous elevation is that nearly in the centre of the island, called the Western Mountains, which extend north and south for its whole length. They possess a general height of 3500 feet; enclose several large lakes, one said to be sixty miles in circumference; and give rise to most of the principal rivers in the island. These rivers are, the Tamar, which, uniting the waters of the North and South Esk from the east, of the Macquarie and Lake Rivers from the south, and of the Western River from the west, forms at Launceston a navigable stream, which soon opens into the broad estuary of Port Dalrymple, on the north side of the island. The Derwent, flowing in an opposite direction, and swelled by the parallel stream of the Jordan, spreads into a noble harbour on the south-east side of the island, on which Hobart Town is situated. Two rivers on the western side enter Macquarie Harbour, but their course is yet unexplored. The harbours of Van Diemen's Land surpass those of any country in the world, not excepting even the admirable ones of New South Wales. This island was first discovered by Tasman, who surveyed its southern and part of its western shores, but not the northern and eastern, with which almost exclusively we are acquainted. It was afterwards observed in parts by Marion, Furneaux, Cook, and particularly D'Entrecasteaux, who traced the remarkable channel which bears his name. All this time, however, it was believed to be a part of the continent; nor was it till Bass, in 1798, passed through the straits which are called after him, that its insular character was established. In 1803, Captain Bowen founded the first convict establishment at Risdon Cove, on the left bank of the Derwent, which was removed, in 1804, by Colonel Collins, to Hobart Town, on the right bank, in Sullivan Cove, about twelve miles up the river. Since that time the colony has been in a state of rapid increase, particularly during the last ten or twelve years, when it became the favourite resort of voluntary emigration. The climate of Van Diemen's Land belongs decidedly to the temperate zone, and is therefore more cool and more congenial to a British constitution than that of the original colony. It has not the same extremes of barrenness and fertility; there are some rich flats along the rivers, but in general the lands are somewhat high, and of a medium aptitude both for agriculture and pasturage. A greater proportion of it is quite clear of wood, and admits of the plough being applied without any previous preparation. On the road from Hobart Town to Port Dalrymple, there is a plain extending in one direction for twenty miles, and clear land is frequent on the north side of the island. Maize, tobacco, and, much more, sugar, are not compatible

with the climate; but wheat, barley, and oats are produced of superior quality; the potatoes are equal to any on the globe, and will keep through the whole year. The cattle are rather good; the sheep produce fine wool, though not quite equal to that of New South Wales; but this has, perhaps, been from want of care, and great efforts are making for its improvement. This land wants the cedar and rose-wood of the great continent; but the black-wood, the Huon pine, and Adventure Bay pine, are valuable trees peculiar to it. The natives of Van Diemen's Land (fig. 1078. and 1079.) are guessed by Hassel at only 1500, and

are, if possible, in a lower state than even those of the great continent. They are strangers

NATIVES OF VAN DIEMEN'S LAND.

to fishing, and to the construction of even the rudest canoes, but convey themselves in miserable rafts over any water they are obliged to cross. They are unacquainted with the throwing-stick; their spears are much less formidable, and their disposition more peaceable; but, unfortunately, they have been inflamed with the most deadly hatred against the English. This deplorable circumstance appears to have been solely owing to the rashness of an officer, who, at an early period of the settlement, fired upon a party approaching, as there was afterwards reason to

believe, with the most peaceable intentions. Since that time these unhappy creatures have seized every opportunity of attacking and killing the colonists; but the smallness of their numbers and courage has rendered their enmity far from terrible. The British population, in 1821, amounted to 7185, and in 1830, to 23,169. They are considered to form the most completely English colony that exists: yet the state of society is said, on the whole, to be ruder than that at Port Jackson. In particular, the most desperate convicts having been sent thither as a place of ulterior banishment, numbers escaped, and formed a body of bush-rangers, who kept the colony in a state of perpetual alarm, and have only been very recently put down. There are six clergymen of the church of England; also, at Hobart Town, a Catholic priest, a Presbyterian minister, and five Wesleyan methodist ministers, in different parts of the island. Government supports a male and female orphan school, and seven public day-schools. The exports consist of wool, wheat (to the extent, in 1821, of 47,000 bushels), salted beef, mutton hams and tongues (386,000 lbs.); with some hides, tallow, seal skins, whale oil, and spars. Two weekly newspapers are published at Hobart Town, entitled the *Hobart Town Gazette*, and the *Colonial Times*.

6450. *The present division of this settlement* is into two counties, marked by the parallel of latitude of 42° ; viz., Buckinghamshire, on the south, comprising the territory on the Derwent and the Jordan, and having Hobart Town for its capital as well as that of the colony; and Cornwall, on the north, comprehending the country on the Tamar and its tributary streams before mentioned, and of which the principal towns are Launceston and George Town.

6451. *Hobart Town* possesses a harbour, perhaps the finest in the world. The Derwent, for three miles above the town, is navigable for the largest vessels. Here the river begins to freshen, and continues hence for the distance of 20 miles, narrowing gradually, but affording a safe passage for vessels of fifty tons as far as New Norfolk, where a ridge of rocks forms a rapid, and abruptly terminates the navigation. The entrance by Storm Bay is somewhat exposed; but D'Entrecasteaux's Channel affords a continued harbour thirty-seven miles long, and sheltered from every wind. The town is delightfully situated upon two hills, between which there runs a fine stream of water from the heights of Table Mountain, which towers above it. The place, having been from the first laid out upon a plan, is much more regularly built than Sydney, has good substantial houses of two stories high, with some handsome public buildings, among which are a brick church with an organ, a good gaol, and a large substantial quay. The town census of 1821 gave 2700, and the number was believed, in 1824, to have increased to nearly 4000. All the other places in the county, namely, Elizabeth Town, at the farm settlement of New Norfolk, Sorell Town, Ross, Macquarie Town, and Brighton, are mere villages of less than a hundred houses.

6452. *Launceston*, the chief seat of the settlements in Cornwall, is situated forty miles up the Tamar, at its confluence with two small streams, called the North and South Esk. It is agreeably situated upon a hill bordering on a fertile country, and is about 120 miles across the island from Hobart Town; but it is yet a mere village, containing, in 1821, only 500 inhabitants, with a few good houses. The Tamar, from Launceston to the sea, forms a species of estuary, which admits vessels of 150 tons; but is so obstructed by banks and shallows as to render the navigation very difficult. With this view, the seat of government was removed, in 1819, to George Town, at the mouth of the river, in the fine harbour of Port Dalrymple. This arrangement has not been sanctioned by the settlers, who find the environs of George Town much less fertile and agreeable, and also more distant from the seat of culture, than Launceston, which, it seems probable, must again become the county capital. Norfolk Plains, consisting of sixty-two houses, Perth, Campbell Town, and other agreeable neighbourhoods, are rising in the interior; but the settlements are, on the whole, much less extensive than in the south, though there remains here a great extent of fine unoccupied land.

6453. *The circuit of the coasts* presents various features, and is not, on the whole, so forbidding as that of the adjoining continent. The eastern coast, for the northern half of its extent, is little indented, and presents generally sand-hills; but in the middle, between St. Patrick's Head and St. Helen's Point, exhibits a range of abrupt unapproachable rocks, with lofty and broken mountains behind. This coast terminates with the long steep Isle of Schouten, separated from the continent by a narrow strait. The south-east coast thence continues to present a series of long islands and winding peninsulas, enclosing deep and commodious havens. It begins with the large inlets, called by the English Great Swan Port, by the French, Fleurieu Bay: south from

which, the Island of Maria presents a formidable aspect, surrounded on all sides by perpendicular granite cliffs from 300 to 400 feet high, and filled with many caverns, into which the waves rush and make a roaring like the sound of distant thunder. The mariner passes with trembling, as he views the fury of the tempests which dash against it. Then begins the peninsula of Tasman, of great extent, winding and indented, connected with the continent by a narrow isthmus of a few hundred feet, and branching into several minor peninsulas, as slightly connected with each other. This was supposed to be an island, till Baudin ascertained its precise form. South-west from this is the long and irregular form of Pitt Island, called by the French Bruny: running parallel with the continent, it forms the long channel called, from its discoverer, D'Entrecasteaux, the waters of which are full of fish, and its shores covered with the most beautiful vegetation. Farther on, the Bay de la Recherche forms two good harbours, and the coast soon terminates in South Cape, the extreme point of the island. The western coast, including the north and south-western, is generally high and steep, with considerable mountains rising behind. Here are two important openings; Macquarie Harbour, with a narrow entrance, spreads into a very wide and deep basin, receiving, after eight miles, two rivers, called Gordon's, the course of which has been only partially explored. The country, however, is promising, having coal and fine timber; and a penal settlement has already been formed there—the precursor, probably, of one on a more desirable footing. Port Davey, more to the southward, with a wider entrance, but less interior extent, spreads into two harbours, of which that of Bathurst is good and secure; but the country is rocky and barren, and the timber difficult of access. On the north-west corner is Hunter's group, the chief of which are Barren Island, the three Hummocks, and Low Sandy Island, which answer to their unpromising names. Still farther north-westward from these is King's Island, large, humid, bleak, with great variety of rocks, full of streams, and with a lake in the centre. There are several other islands in Bass's Straits, — Furneaux's, Clark's, Cape Barren, — of tolerable size, but of no beauty or promise.

3. New Zealand.

6454. *New Zealand* ranks next to the countries now described, as the most important of the great southern insular masses. It ranges parallel to the south of New Holland, with a broad intervening expanse of ocean. It consists of two islands, but separated only by a strait, and composing properly only one country, lying between 34° and 48° S. lat.; being thus about 1000 miles in length; but the average breadth does not exceed 100 miles. The surface is estimated by Mr. Nicholas at 62,160 English square miles, or 39,782,000 acres. The northern island is known by the name, not very well fitted for English organs, of Eaheinomauwe; the southern by that of T'avai Poenamoo. The first is the smallest, but is distinguished by the finest soil, and by natural features of the boldest and grandest description. Chains of high mountains run through both islands, which, in the former, rise to the height of 12,000 or 14,000 feet, and are buried for two thirds of their height in perpetual snow; presenting on the greatest scale all the alpine phenomena. From these heights numerous streams flow down, watering in their course the most fertile and enchanting valleys. The huge glaciers and plains of snow which cover their higher regions; the mighty torrents which pour down from them, forming stupendous cataracts; the lofty woods which crown their middle regions; the hills which wind along their feet, decked with the brightest vegetation; the bold cliffs and promontories which breast the might of the southern waves; the beautiful bays decked with numberless villages and canoes—all conspire to present a scene, which even the rude eye of the navigator cannot behold without rapture. The soil in the valleys, and in the tracts of land at all level, is more fertile than in New Holland, and, with due cultivation, would yield grain in abundance. It produces, even spontaneously and plentifully, roots fitted for human food, particularly those of a species of fern, which covers almost the whole country. The natives breed pigs, and cultivate some maize, yams, and potatoes; and there is a species of very strong flax, which serves not only for clothing, but fishing-lines, and various other purposes. The mountains are clothed with a profusion of fir trees, of a variety of species unknown in other countries, and rising to a magnificent height, which the tallest pines of Norway cannot rival. The natives (*fig. 1080.*) are of a different race from those of New Holland, belonging

1080

MAN AND WOMAN OF NEW ZEALAND.

rather to that Malay race which predominates in the South Sea Islands. They are tall and well formed, with large black eyes; they are intelligent, have made some progress in the arts of life, and are united into a certain form of political society. These circumstances, however, have only tended to develope in a still more frightful degree those furious passions which agitate the breast of the savage. Each little society is actuated by the deepest enmity against all their neighbours; their daily and nightly thought is to surprise, to attack, to exterminate them; and when they

have gained that guilty triumph, it is followed by the dire consummation of devouring their victims. Such was the catastrophe which, in 1809, upon the jealous pride of one of the chiefs, befell the entire crew of the ship *Boyd*, only two or three children being saved, and afterwards recovered by Mr. Berry. Yet to the members of their own tribe, or those whom they regard as friends, they are not only mild and courteous, but display the fondest attachment and most tender sensibility. Families live together in great harmony, and are seen assembled in pleasing and harmonious groups (*fig. 1081.*). On the death of their relations, they exhibit the most impassioned and affecting symptoms of grief, cutting

their faces with pieces of shell or bone,

NEW ZEALAND FAMILY.

the visages of the chiefs are often entirely covered over with various regular figures. This, however, is not effected without severe pain, causing even attacks of fever; but to shrink

NEW ZEALAND CHIEF.

in any degree from the operation is considered as altogether derogatory to a manly spirit. They have also a horrid art, by which the heads of their enemies, being dried in an oven, and exposed to a stream of fresh air, are maintained in a state of perfect preservation. Their houses are by no means spacious; that of Korra-korra, a powerful chief, measured only nine feet long, six feet wide, and four feet high. They are placed in hippahs (*fig.* 1083.), or fortified villages, seated on high and steep hills, ascended by pathways, narrow, winding, and often perpendicular, so as to be most perilous to an European; but the New Zealander leaps up as if it were level ground. Their original arms consisted of clubs of stone and whalebone, of long and pointed spears, and of the pattoo-pattoo, or wooden battle-axe; but since the musket has been introduced to their knowledge, it has absorbed all their warlike regard; and the strength of a chief is counted, not by his men, but by his muskets. The report of fifty being in the possession of Korra-korra spread the terror of his name for 200 miles round. The New Zealander has no idea of the pitched combats in the open field, which give a sort of chivalric character to the New Holland fighting; his baser aim is to steal upon his enemy, and massacre him, unprepared and defenceless. This, however, is common in savage life among such small political associations, where the object is not personal glory, but to gratify the passions and promote the interests of the tribe. There seems also to be something like political alliance among them; and Colonel Cruise understood that upwards of 3000 were once assembled on a single plain for the purposes of deliberation. The entire population is estimated by Mr. Nicholas at upwards of 150,000. Several missionaries, animated by a noble spirit of philanthropy, have ventured to take up their abode among these ferocious hordes. They have not yet made much impression on their habits of barbarism, but they are viewed as friends, treated with kindness, and enter into their houses and fortified villages, without feeling the slightest apprehension. Among the many projects which have been lately floating through the minds of our countrymen, one has been to form a settlement in this country for the purposes of emigration; but surely, till every other sphere is exhausted, no wise man would venture into a situation where the colonists would soon find themselves in a hostile position with regard to the natives, and would be every moment in danger of being attacked, killed, and eaten by these furious savages.

FORTIFIED VILLAGE IN NEW ZEALAND.

gratify the passions and promote the interests of the tribe. There seems also to be something like political alliance among them; and Colonel Cruise understood that upwards of 3000 were once assembled on a single plain for the purposes of deliberation. The entire population is estimated by Mr. Nicholas at upwards of 150,000. Several missionaries, animated by a noble spirit of philanthropy, have ventured to take up their abode among these ferocious hordes. They have not yet made much impression on their habits of barbarism, but they are viewed as friends, treated with kindness, and enter into their houses and fortified villages, without feeling the slightest apprehension. Among the many projects which have been lately floating through the minds of our countrymen, one has been to form a settlement in this country for the purposes of emigration; but surely, till every other sphere is exhausted, no wise man would venture into a situation where the colonists would soon find themselves in a hostile position with regard to the natives, and would be every moment in danger of being attacked, killed, and eaten by these furious savages.

6455. The following recent information concerning *New Zealand* comes from original documents in the Colonial Office, and is extracted from the 2d vol. of the *Royal Geographical Journal*:—"In New Zealand, flax may be obtained in an unlimited quantity, and there is abundance of fine timber of all sizes and dimensions for ship-building and other purposes. Thousands of tons of shipping may be employed in the flax trade alone; and the timber, which grows occasionally to a great height, and not unfrequently six feet in diameter, may be procured in any quantity. The country is rich in mineral and vegetable productions; the soil fertile and easy of culture. With regard to the whaling establishments in New Zealand, it may be observed, that, as they are of use only for about four months in the year, they are not likely to become permanent, unless combined with some other pursuit for the summer season. And, from the destructive nature of the fishery (the females being killed at the time of calving), the trade cannot last many years; but, like the sealing, will eventually fail from extermination, or from the desertion of the land by the harassed animals. The fishery is confined to the Middle and Stewart's Islands, the whales not being found north of Cook's Straits. In the four church mission stations of Rangiliona, Renken, Paihia, and Waimate, there are, under a regular course of education, about 320 New Zealanders, whose average age is sixteen years. When the hours appointed for

instruction in reading, writing, and accounts are expired, the greater number of these natives are employed in the mission, some in building, others as carpenters, and others in general labour. There are three substantial chapels, capable of holding from 200 to 300 each, in which services are held three times every Sunday, and always well attended.

6456. All travellers agree that the New Zealanders are a noble race of savages, although they are clearly proved, by the long residences among them of Colonel Cruise and Mr. Earle, in spite of the scepticism of Mr. Barrow in the *Quarterly Review*, to be still cannibals. "If," says Mr. Gibbon, in speaking of the Attacotti, a Caledonian nation of the fourth century,—“if, in the neighbourhood of the commercial and literary town of Glasgow, a race of cannibals has really existed, we may contemplate in the Scottish history the opposite extremes of savage and civilised life. Such reflections tend to enlarge the circle of our ideas, and to encourage the pleasing hope that New Zealand may produce, in some future age, the Hume of the southern hemisphere.” Recent voyagers differ in their opinions as to the benefit which these islands, in common with the rest of those of the South Seas, derive from the various religious missionaries who are stationed upon them. Captains Beechey and Kotzebue, and Mr. Earle, accuse these persons of teaching nothing but asceticism; and the last attributes the progress of the natives of New Zealand in civilisation to the whalers who touch there. When we consider the nature of the education which this class of mariners receives, Mr. Earle's really seems to be a bold opinion. The interesting works of Mr. Nicholas, Colonel Cruise, Messrs. Tyerman and Bennet, and Mr. Stewart, present a different and (we should think) a truer picture of the labours of these isolated and pious men. We think the missionaries right in indulging the passion of the New Zealanders for English clothing, and in not waiting till they can master all the difficulties and subtleties of the English, but in at once translating the Gospels into the great Polynesian languages, and in teaching their children to read those translations. To translate a work into the language of the learner, is to explain it at the same time. To teach the learner the language in which a work is written, often leaves the meaning of the work to be still translated to a foreigner. True it is that, till their European costume shall become complete (and perhaps even then), they will look more noble in their mat-cloaks: but no barbarous country was ever civilised till the people had adopted the costume of their conquerors; and the expensive and complicated dress of refinement and fashion is the taste that will lead the savage to industry and the arts of peace—not the head-dress of plastered hair, and the garment made from the cloth-tree. We are happy to learn, from Mr. Earle's book, that the more general introduction of muskets and gunpowder is found to diminish intestine war. The savage sees that the bullet sets at nought strength and supersedes courage. Their armies, therefore, number muskets before they encounter; and, if they find these to be equally matched, they settle the dispute amicably. This is great ground gained; and the cultivation of the soil, the breeding of cattle, infant education, European clothing, are, under the direction of the missionaries, and their generous subscribers in England and in the United States, fast following. Thus it is that New Zealand will, in time, leave off the practices of war and cannibalism, and become, what we understand Otaheite and Owhyhee actually to be, a civilised and Christianised country.

4. *Papua, or New Guinea.*

6457. *New Guinea* is the largest mass of southern continent next to New Holland, being from 1200 to 1400 miles in length, and varying from 150 to 200 miles in breadth. There seems great reason to surmise that it is one of the finest countries in existence. The few navigators who have sailed along its coast observed ranges of mountains swelling behind each other, their summits rising in the most picturesque and varied forms, and clothed with immense pine forests. The Dutch maps represent some of those on the west coast as covered with perpetual snow, which would imply, in this latitude, a height of 15,000 or 16,000 feet. The copious moisture which must flow down from these heights, in a climate so intensely tropical, can scarcely fail to generate a most rich vegetation, while the close contiguity and similar climate of the Spice Islands, afford a presumption, that their valued products may find here a congenial soil. Yet this tempting region has been left almost a terra incognita, having been generally viewed only from a distance by navigators, except Forrest, who landed at several points of its northern coast. Some recent observations have also been made by the French navigators Duperrey and Lesson. The population, like that of New Holland, was found to consist of Papuans, or Oriental negroes, mingled with the still ruder race of the Haraforas, who inhabit the interior mountains. These Papuans appear to be a degree farther advanced in the social scale than the New Hollanders. This is shown in the very singular construction of their huts, raised on elevated planks or stages, resting upon poles that are fixed usually in the water. This scheme is supposed by Forrest to be adopted with a view to security from the attacks of enemies, and particularly of the Haraforas. These houses, which are divided among a

number of families, have a door both towards land and sea, so that, according to the quarter whence danger comes, they may betake themselves either to their vessels or to the woods. They construct and ornament their canoes on a large scale, and show considerable skill in fishing. They not only wage deadly war against each other, but manifest a particular jealousy and hostility towards strangers, which may be owing, in a great degree, to what they suffer from the inhabitants of Borneo and Celebes, who make frequent inroads, and carry them off as slaves. These vessels also carry away trepang, edible birds' nests, and tortoise shell. The Dutch, in 1828, formed a settlement in Triton Bay, in lat. $3^{\circ} 33'$.

6458. *The Louisiade* is the name given by Bougainville to a range of broken shores which he passed at the western extremity of New Guinea. He ranked them as an archipelago; but it seems doubtful whether they do not all form part of one large peninsula, and even whether that peninsula be not part of New Guinea. The aspect of both appears to be nearly the same, except that the natives seem to be still ruder.

5. *New Britain and New Ireland.*

6459. *A series of large groups of islands*, beginning near the north-western boundary of New Guinea, ranges in a circuitous line parallel to New Holland, and in the direction of New Zealand, though stopping considerably short of it. Their aspect is various, but in general mountainous and often rugged, as in the other regions of Australasia; like which, also, they contain valleys, and even plains, covered with the most profuse vegetation. The inhabitants are divided between the two great races, the Papuan, or Oriental negro, little, ugly, and black; and the Malay, taller, of a dingy brown, and of more pleasing features. All the islands exhibit only varieties of the most savage form of social existence. They are little known or frequented, as the route of the circumnavigator usually leads him from the Society Islands into the sea between New Holland and New Zealand, avoiding the coral rocks scattered through the Australasian gulfs. The group of New Britain, New Ireland, New Hanover, and other smaller islands, was partially seen by Le Maire, and afterwards examined with some care by Dampier and D'Entrecasteaux. Carteret also viewed a detached and more westerly part, which he called Admiralty Islands, and which appeared better cultivated, and inhabited by a more civilised race, than the others. Some more recent observations have been made by M. Lesson and his companions. The whole group lies between the first and sixth degrees of south latitude; and, were Arrowsmith's map (which is laid down, however, upon the most conjectural data) followed, one should estimate the superficial extent at 16,000 English square miles. New Ireland is very thickly wooded, and among its trees are mentioned the Areca palm, and even the nutmeg. The natives are Papuans, but are considered by the French navigators to be the most civilised in this archipelago. They have temples, and a regular form of idolatrous worship.

6. *Solomon Islands.*

6460. *The Archipelago called Solomon Islands* was, as already noticed, discovered, and that name given to them, by Mendana, in 1567. They were forgotten for two centuries, till Carteret, in 1767, and afterwards Bougainville and Lieutenant Shortland, passed several of the group, to which they gave the name of Egmont, Queen Charlotte's Islands, and New Georgia. Some retain the Spanish names of Isabel, San Christoval, &c.; while to others Bougainville gave his own and that of Choiseul. The prevailing population is Papuan, and as black as the African negro, but with a mixture of the Malays. They appeared to be numerous, subject to the sway of an absolute prince, and warlike. Both Mendana and Bougainville were led to suppose them addicted to feeding upon human flesh.

7. *New Hebrides.*

6461. *The New Hebrides* are a group situated to the south-east of the above, first discovered by Quiros, in 1606, who gave it the name of the Archipelago del Spiritu Santo: Bougainville afterwards touched at these islands, to which he gave the name of the New Cyclades; while Cook, who examined them more diligently than any of his predecessors, bestowed upon them that of New Hebrides,

to which we adhere; but the continental geographers maintain that the Spaniards, as the first discoverers, are entitled to have their appellation received in preference to any other. It is, in fact, still given to the principal island; while to other considerable ones Bougainville gave the name of *Iles de Lepreux*, and Cook those of *Tanna* and *Mallicolo*. These islands are generally covered with high mountains, from some of which flame is seen issuing. The territory, as usual in volcanic countries, is extremely fertile, and finely watered by numerous rivulets. The natives belong generally to the Papuan race; but those of *Mallicollo* are, even beyond its general average, diminutive, mean, and ugly; while those of *Tanna* (*fig. 1084.*) are, on the contrary, taller and handsomer than almost any other specimen yet seen. They are both extremely active, agile, and intelligent: the *Mallicolese*, in particular, appeared a most determined and energetic race. They go almost naked, and have few or no arts and manu-

1084

NATIVES OF TANNA.

SECT. I. *General Outline and Aspect.*

6464. *The Pacific Ocean*, over which these numerous islands are scattered, is a vast expanse extending, in its greatest breadth, 150 degrees, or nearly one half of the globe. It is by no means, however, completely filled with the groups of Polynesia. From the shores of Asia and Australasia, indeed, in a west and south-west direction, they closely follow each other to about 130° E. long., or for the space of nearly 100° of longitude. From north to south they range between the tropics of Cancer and Capricorn nearly 50 degrees of latitude. Beyond these limits, northward to the Aleutian Islands, eastward to the continent of America, and southward to the Antarctic Ocean, scarcely a rock rises to interrupt the unbroken waste of the Pacific.

6465. These islands rank with *the most fruitful and smiling regions* on the surface of the globe. Their situation, altogether between the tropics, and beaten by the rays of an equatorial sun, might have given them a parched soil and a burning and pestilential climate. These evils are averted by the moisture and breezes from such an extent of surrounding ocean; and by the interior mountains, which rise, in many instances, to a very lofty height. Several of the Polynesian peaks approach the elevation of those in the great continents. In the Sandwich Islands, Mouna Roa is about 16,000 feet, Mouna Koah about 15,000 feet above the level of the sea. In Otaheite, Oroeno rises to 10,800, and Tobronu to 9500 feet. Most of the other islands have mountains inferior, but considerable. An exception is, indeed, formed by the coral islands, those peculiar structures raised from the bottom of the sea by the incessant labour of myriads of insects. As the formation ceases as soon as it reaches the surface of the ocean, these islands are merely a few feet above its level, and are visible to the navigator only by the trees which rise from their flat surface. The higher islands are indented by deep bays, and finely variegated by streams descending from the mountains; but their extent does not admit the formation of rivers or lakes of any importance.

SECT. II. *Natural Geography.*SUBSECT. 1. *Geology.*

6466. *Easter Island*. 2000 miles from the coast of Chili, and 1500 from the nearest inhabited islands, Pitcairn Island excepted, which has been peopled by Europeans, is of igneous origin, and said by navigators to be studded with volcanoes.

6467. *Ducie's Island* is of coral formation; of an oval form, with a lagoon or lake in the centre, which is partly enclosed by trees, and partly by low coral flats scarcely above the water's edge. The height of the soil upon the island is about twelve feet, above which trees rise fourteen feet more, making its greatest elevation about twenty-six feet above the sea level.

6468. *Elizabeth or Henderson Island*. "We found that this island," says Captain King, "differed essentially from all others in its vicinity, and belonged to a peculiar formation, very few instances of which are in existence. Wateoo and Savage Islands, discovered by Captain Cook, are of this number, and perhaps, also, Malden Island, visited by Lord Byron. The island is five miles in length, and one in breadth, and has a flat surface nearly eighty feet above the sea. On all sides except the north it is bounded by perpendicular cliffs, about fifty feet high, composed entirely of *dead coral*, more or less porous, honeycombed at the surface, and hardening into a compact calcareous substance within, possessing the fracture of secondary limestone, and has a species of millepore interspersed through it. The dead coral, of which the higher part of the island is composed, is nearly circumscribed by ledges of living coral, which project beyond each other at different depths; on the northern side of the island the first of these had an easy slope from the beach to a distance of about fifty yards, when it terminated abruptly about three fathoms under water. The next ledge had a greater descent, and extended to two hundred yards from the beach, with twenty-five fathoms over it, and there ended as abruptly as the former, a short distance beyond which no bottom could be gained with two hundred fathoms of line." This island appears to have been raised above the sea through Plutonian agency.

6469. *Gambier's Islands*. This group consists of five large islands and several small ones, all situated in a lagoon formed by a reef of coral. The largest of these is about six miles in length, and rises into two peaks, elevated 1248 feet above the sea. All the islands are steep and rugged, particularly Marsh Island, which at a distance resembles a ship. The external form of these islands at once conveys an impression of their volcanic origin, and on examination they all appeared to be composed of rocks formed through igneous agency. The rocks are vesicular basaltic lava and tufa; in which various zeolites, calcedonies, jaspers, and calcareous spars occur. These rocks are traversed by veins or dikes, ranging from east to west, of a compact volcanic rock abounding in olivine. Forming a striking contrast to those rugged and lofty igneous rocks, is a series of low islands, owing their construction to myriads of minute zoophytes, endowed with a power which enables them to secrete calcareous matter in such quantity as to rear the magnificent structure many leagues in circumference. A great wall of this kind already surrounds the islands, and by the continued labour of these submarine animals is fast approaching the surface of the water in all its parts. On the north-east side it already bears a fertile soil, and beyond the reach of the sea sustains trees, and affords even a habitation to man. In the opposite direction it dips from thirty to forty feet beneath the surface, as if purposely to afford access to shipping to the lagoon within. "All the islands," continues Captain King, "we subsequently visited were similar to these, in having their western or eastern side more advanced than the opposite one. The outer side of the wall springs from unfathomable depths; the inner descends with a slope to about 120 or 150 feet below the surface. This abruptness causes the sea to break and expend its fury upon the reef, without disturbing the waters in the lagoon. The coral animals consequently rear their delicate structure there without apprehension of violence, and form their submarine grottoes in all the varied shapes which fancy can imagine. They have already encircled each of these islands with a barrier, which they are daily extending, and have reared knolls so closely as almost to occupy all the northern part of the lagoon. More independent bodies are in other parts bringing to the surface numerous isolated columns, tending to the same end; and all seems to be going on with such activity, that a speculative imagination might picture to itself, at no very remote period, one vast plain covering the whole of the lagoon, yielding forests of bread fruit, cocoa nuts, and other trees, and ultimately sustenance to a numerous population and a variety of animals subservient to their use."

6470. *Coral Islands*. Lord Hood Island, Clermont-Tonnerre, Serle Island, Whitsunday Island, Queen Char-

lotte Island, Lagoon Island, Thoun Cap Island, Egmont Island, Barrow Island, Carysfort Island, Osnaburg Island, Byam Martin Island, Gloucester Island, Bow Island, are throughout of coral formation; and Captain King adds, "the islands which were visited between Bow Island and Otaheite were all of the same character of formation as those just enumerated: one of these he named Melville, another Croker Island. The coral islands of this group are thirty-two in number; the largest of them thirty miles in diameter, and the smallest less than one mile."

6471. *Otaheite*. This island appears like one lofty mountain, intersected with deep, green valleys, bounded by dark rocks, and terminating above in a double-summit, Oruhenna and Pitohiti, the most elevated of which is said to be 10,000 feet above the level of the sea. The rocks are of an igneous origin, and principally common and amygdaloid basalt. The amygdaloid basalt affords apophyllite, needlestone, chabasite, and analcime, and the common basalt embedded augite, hornblende, and large masses of granular olivine. Hoffmann, who accompanied Kotzebue, observed, besides the minerals just mentioned, in some cavities siliceous stalactites in the process of formation; and the same naturalist found rocks of clinkstone, with embedded crystal of glassy felspar, some varieties of which much resembled trachyte. He also met with large masses of syenite in different parts of the island, but did not succeed in detecting this rock *in situ*. The islands of Huaheine, Otaha, Ulietea, Borabora, and Maura, are of the same general nature as the Marquesas: hence they may be considered basaltic islands, with volcanic craters of eruption.

6472. *Marquesas*. The highest of this group, the island of Dominica (Ohiwaua), may, in Von Buch's opinion, prove to be a trachytic principal volcano, with a crater. The other isles appear to belong to the basaltic class. In these islands the sea extends to the base of the mountains, there being no protecting coral reefs, as is the case in most of those in the Pacific.

6473. *The Friendly Islands* are generally low, few of them attaining a height of some hundred feet; but the small volcano, Tofua, rises to a greater height, probably 3000 feet. It appears in a state of constant activity; for every time it has been visited symptoms of agitation have been observed. As stated by Buch, a great stream of lava, flowing from the base of the mountain to the sea, produced frightful ravages; and Captain Edwards, in the Pandora, found the volcano in full activity. From the pumice which covers the coast of Tongataboo and Anamoka, it would seem that the mountain is formed of trachyte. In the northern part of this group, and in the most northern island, Gardner's Island, in $17^{\circ} 57' S.$ lat. $184^{\circ} 6' E.$ long., Captain Edwards, in 1791, observed traces of a recent eruption, and smoke rose every where from the border of the table-land.

6474. *New Hebrides*. The Island of Abrym, in this group, contains an active volcano; and the same thing is stated by Forster with regard to that of Taxna.

6475. *Sandwich Islands*. The eight islands forming this group are of volcanic origin, and, with the exception of some coral reefs and banks on the coasts, the prevailing rocks are lavas of various descriptions, basalt, with olivine and augite, clinkstone porphyry (probably trachyte), and amygdaloid, with zeolite. Hoffmann mentions several craters in the Island of Oahu (Woahoo); craters were also noticed by the same naturalist in Maui (Mowee). Hawaii, the Owhyhee of Captain Cook, is the largest and most elevated island of this volcanic group. Its structure and composition, like that of most of the islands in the South Sea, are but imperfectly known. Besides the great volcano of Kirauea, so graphically described by Ellis in his *Polynesian Researches*, which is in activity, there are several in an extinguished state. One of them, Mouna Roa, is calculated by Captain King at 16,020 feet in height, estimating it according to the tropical line of snow. Another, Mouna Koah, the peaks of which are entirely covered with snow, cannot be less, he thinks, than 18,400 feet. Mr. Ellis reckons the height at between 15,000 and 16,000 feet. The whole island of Hawaii, indeed, embracing a space of 4000 square miles, is, according to Ellis, one mass of lava and other volcanic matter, in different stages of decomposition.

6476. *South Shetland and South Orkney Islands*. In these remote and little known islands, judging from the few specimens brought to Europe by that enterprising officer Weddell, and some other navigators, we can only say, generally, that, although primitive rocks, and also those of the secondary class, occur, the volcanic appear to be the most frequent; and that, in some islands, volcanic action is still perceptible. Weddell, in his interesting *Voyage towards the South Pole*, remarks that, on passing within 200 yards of Bridgman's Island, in $S. lat. 62^{\circ}$, he observed smoke issuing with great violence through fissures in the rocks. The loftiest land among the South Shetlands, according to Weddell, is in James's Island, which rises to a height of 2500 feet above the sea; and the most southern islands hitherto discovered in the world are those named, by the same nautical discoverer, *Hope Island*, and *Jameson's Island*, situated in $S. lat. 63^{\circ}$. The most northern known land is also insular, viz. *Ross's Island*, in $N. lat. 80^{\circ} 45'$.

6477. *Juan Fernandez*. This island is about twelve miles in length and four in breadth, consisting of very high land, the loftiest summit of which rises to 3005 feet above the sea. Mr. Caldcleugh, the only geologist who has examined the island, could discover no trace of a modern volcano, said to exist there by former visitors: all the rocks, according to him, consist of basaltic greenstone, or rather basalt embedded with olivine.

6478. *The Gallapagos* form a very characteristic volcanic group. The principal volcano lies in the most westerly island, viz. Narborough Island, which is said to be the loftiest of them all. Lieutenant Shillibeer, on the 4th August, 1814, observed two volcanoes in this island in a state of activity. Captain Hall describes another of the group, viz. Abington Island, of basaltic formation, traversed by many craters of eruption. Lord Byron, on March 26. 1825, landed on Albemarle Island, which, he remarks, is the largest and loftiest of the Gallapagos group; and that several extinct craters show that fire has, at no remote period, been as active there as it then was in Narborough and some others. "Its length," continues Lord Byron, "from north to south, is about seventy-five miles, and the southern end appears to be well wooded. The heat was very great as we approached the land, the thermometer standing at 84° ; and as we shot into the cove we disturbed such a number of aquatic birds and other animals, that we were nearly deafened with their wild and piercing cries. The place is like a new creation: the birds and beasts do not get out of our way; the pelicans and sea-lions look in our faces, as if we had no right to intrude on their solitude; the small birds are so tame that they hop upon our feet; and all this amidst volcanoes which are burning around us on either hand. Altogether, it is as wild and desolate a scene as imagination can picture."

SUBSECT. 2. Botany.

6479. *The numerous groups of islands* scattered throughout the vast Pacific afford a very varied vegetation, and, what most concerns both us and the natives of them, a considerable number of highly useful plants. Among the esculent ones will especially rank

"that tree which in unfailling stores
The staff of life spontaneous pours,
And to those southern islands yields
The produce of our labour'd fields,"

the Bread-fruit (*Artocarpus incisa*) (fig. 1087.), which is to the natives of these islands the principal article of diet. They are fond of it, and it evidently suits their constitutions, as a very perceptible improvement is often witnessed in the appearance of the people a few weeks after the bread-fruit season has commenced. For the chiefs it is usually dressed three times a day; but the poorer classes seldom cook it more than once a day, and even rebake it on the next. Various are the modes of preparing this valuable fruit. Sometimes the natives of a district assemble to prepare it in a large and common oven, when it is called *opio*. This is done by digging a large pit, 20 or 30 feet round, and filling it with firewood and large stones, till the heat almost brings the latter to a state of liquefaction, when the covering is removed, and many hundreds of ripe bread-fruit thrown in, with a few leaves laid over them; the remaining hot stones are placed above them, and the

whole covered with leaves and earth. It remains in this state a day or two, when the parties to whom the fruit belongs dig a hole and take out what they want, till the whole is consumed. Bread-fruit thus baked will keep good several weeks after the oven is opened. This process is much discontinued since the introduction of Christianity, owing to the debauchery, rioting, feasting, and sleeping, which used to follow the opening of an opio oven.

ARTOCARPUS INCISA.

6480. Sometimes the fruit undergoes fermentation, by being piled in heaps and beaten to a kind of paste, when it is called *mahi*. It keeps many months, and, though sour and indigestible, is considered good food during the scarce seasons. The tree on which the bread-fruit grows, besides producing three or four regular crops annually, and being seldom quite destitute of ripe fruit, furnishes a valuable resin, that is used for making tight the seams of the canoes. The bark of the young branches affords cloth, and the trunks a valuable timber, of which canoes, houses, and most of the furniture of the people, are manufactured. There are 50 varieties of this tree, the principal being the *Paea* (*Artocarpus incisa*), and the *Ura Maohe* (*A. integrifolia*).

6481. In the Sandwich Islands the bread-fruit is usually eaten green, when its rind is thin, but hard, like that of a melon, and entirely covered with slightly marked and small pentagonal sections. It is cooked by throwing it immediately on the fire, when the outer coat becomes charred, and the inner parts only

roast like a potato, which it resembles in general consistency, though it is rather more spongy, and the whole, when the rind is removed, has the appearance of a beautiful light-coloured smoking loaf. The taste is like the hard-boiled yolk of an egg, slightly astringent; very good as a vegetable, though to English palates forming but a very indifferent substitute for bread.

6482. The low intratropical islands of Polynesia yield Cocoa-nuts in the greatest abundance, which are called *Haari*, and, after the bread-fruit, may be considered the most serviceable fruits. The tree, too, is useful and highly ornamental, imparting to the landscape all the richness and elegance of equatorial verdure; but so well is it known, by forming a striking feature in all Oriental views, that it is here unnecessary to describe its straight and tapering stem, or the beautiful crown of long green leaves which it bears at the summit, and which, like a graceful plume, waves in the fitful breeze, and nods over the spreading wood or the humble shrubbery. Unlike the bread-fruit, plantain, and almost every tree affording valuable fruit, which require a fertile soil to bring them to perfection, the cocoa-nut, though it will

DIOSCOREA ALATA.

grow in the rich valleys, and beside the streams that flow through them, yet flourishes equally on the barren sea-beach, amid fragments of coral and sand, where its roots are washed by every rising tide, and on the arid sides of sun-burnt mountains, where the soil is shallow, and where no stream is seen to flow. The trunk, whether in its timber or bark, serves the South Sea islanders for almost all purposes of shelter, protection, and defence, the best houses, canoes, spears, &c. being made of it; while the leaves serve for coverings to their heads, and are the emblems of authority used by the chiefs. The fibres that envelope the base of the leaves, woven in the loom of nature, afford a kind of cloth that is sometimes removed in pieces two or three feet wide, and cut into jackets and shirts by the natives, especially by the fishermen, who attach a cotton collar to the garment, and seem little annoyed by its wiry texture. But the fruit is the most precious part of this serviceable, hardy, and beautiful plant. In every stage, from its first formation after the fall of the blossom, to the hard, dry, and ripe nut that has almost begun to germinate, the fruit may be seen at the same time on the same tree; and, in one way or other, its pulp, milk, kernel, husk, or oil, are all rendered subservient to the wants of the South Sea islanders.

6483. The *Yam* is afforded by the roots of *Dioscorea alata* (fig. 1088.), which is cultivated with much care, though for that very reason to no great extent. It is requisite to plant it on the slopes of low hills, or the bottoms of valleys, where small terraces are purposely prepared for its reception, covered with rich earth, or decaying leaves. The roots are highly nutritive and well-flavoured, and are prepared for food either by baking or boiling. As they may be preserved longer out of the

ground than any other vegetable, and thus form an excellent sea stock, it is to be regretted that yams are not more extensively grown in the South Sea Islands.

6484. *Taro* is the root of *Arum esculentum*, a plant that forms the chief article of cultivation in the Sandwich and other Polynesian islands, answering to these nations the double purpose of vegetables and bread. The root requires to be planted in a hard soil, and kept covered with water from nine to fifteen months, when it is fit to eat, though it increases in size and excellence for two years or more. In the natural state, both the foliage and roots of taro have all the pungent acrid qualities that mark the genus to which the plant belongs; but these are so dissipated by cooking, whether baking or boiling, that they become mild and palatable, with no peculiar flavour more than belongs to good bread. The islanders bake the root in the native ovens, in the same way as the bread-fruit, already described, and then beat the paste into a mass like dough, called *Poe*. It is eaten by thrusting the fore-finger of the right hand into the mass, and securing as much as will adhere to it, passing it into the mouth with a hasty revolving motion of the hand and finger. The only name of the latter is derived from this use of it, "*Karina Poe*," the *Poe* Finger.

TACCA PINNATIFIDA.

6485. A kind of bread, chiefly used on festive occasions, is prepared from the root of the *Pia* (*Cheilea Tacca*, or *Tacca pinnatifida*) (fig. 1089.), which, though a spontaneous production of the soil, is also cultivated in the native gardens, by means of which much finer roots are obtained. The root is beaten to pulp and subjected to repeated washings, by which it becomes tasteless and colourless, when it is dried in the sun and fit for use. There is little doubt that, when the natives shall have acquired a better method of preparing it, this may become a valuable article of commerce, and vie with the West Indian arrow-root in appearance, as it already does in quality.

6486. *More rich and sweet to the taste than the cocoa-nut or bread-fruit*, yet far less serviceable as food, is the Maia of the South Sea islanders, by which name they indiscriminately call both the Plantain and Banana (the *Musa sapientum* and *M. paradisiaca*). These are indigenous, though cultivated; their fruit is rich and nutritive, yet too common in the tropics to need a particular description here. There are, perhaps, thirty cultivated varieties, besides nearly twenty wild ones, which are also large and useful. The Orea, or Maiden Plantain, comes to the highest perfection, and is truly delicious. The stalk is seldom more than eight to twelve feet high; its leaves are fine specimens of tropical verdure, being often twelve to sixteen feet long, nearly two feet wide, of a delicate pea-green colour when recent, but rich bright yellow when dry. The fruit is about nine inches long, somewhat like a cucumber, except that it has frequently well-defined angles, which give it the appearance of being triangular or quadrangular, when ripe of a delicate yellow hue. Sixty or seventy fruits are sometimes attached to one stalk. Each plantain produces only one bunch of fruit, and is then removed, its place being supplied by the suckers that rise round the root: if these be four or five feet high when the parent stem is cut down, they will bear in about twelve months. The plantain fruit is always acceptable, and resembles in flavour a soft and sweet, but not very juicy pear: it is good in milk, and also in puddings and pies, and, when fermented, makes excellent vinegar.

6487. *In certain seasons of the year*, when the bread-fruit is scarce, the natives supply the deficiency with the fruit of the Mape, or Rata, a native chestnut (*Inocarpus edulis*). This is a tree of stately growth and splendid foliage, rarely seen in high grounds, but generally flourishing on the margin of streams, the course of which may be frequently traced by the unbroken line of native chestnuts towering above the humbler trees. The singular trunk generally rises ten or twelve feet without a branch, and then has large umbrageous arms; but its chief feature is the supporting stems or buttresses, which it throws out from large projections on the stem, and which, striking root at a distance of three or four feet, appear like so many planks covered with bark, and placed around the original tree. The wood is fine-grained, but perishable: the nuts hang in clusters, covered with a thin husk; they are generally pulled when green, and eaten roasted. The Vi, or Brazilian Plum (*Spondias dulcis*), is an abundant and excellent fruit, oval, and of a bright yellow, not unlike a very large magnum bonum plum. The Ahio (*Eugenia malaccensis*) is perhaps the most juicy among the indigenous productions of the Society Islands. It resembles in its shape a small apple, and is of a beautiful bright red colour, containing a white and juicy, but rather insipid, pulp. Like the Vi, it bears but once a year, and is in season two or three months. Both these trees are propagated by seed.

6488. *Three species of fern afford food*; the *Pteris esculenta*, *Polypodium Medulla* (Forster), and *P. dichotomum* (Thunberg).

6489. *Besides the valuable esculent plants now mentioned*, is the Sugar-cane, or To (*Saccharum officinarum*), which grows spontaneously in the Sandwich Islands, and perhaps comes to greater perfection there than in any other part of the world. It was formerly cultivated to be eaten raw; the natives on a journey often carry a piece of sugar-cane, which furnishes a sweet and nourishing juice, appeasing at once both hunger and thirst. Within a few years they have been taught to extract the juice, and by boiling it prepare a very good sugar.

6490. *These various indigenous productions are not only eaten when dressed*, as taken from the tree or dug from the ground, but by a diversity of combinations several excellent kinds of food are prepared from them, which may be termed the confectionery or made dishes of the South Sea islanders. With ripe bread-fruit and plantain mixed, they prepare Pepe, which, when baked, is not unlike soft gingerbread. A composition of arrow-root and grated cocoa-kernel is called Taota; and of arrow-root and plantain they make a number of sweet puddings, which are folded in leaves, and baked in the native ovens. A sauce is furnished by the ripe cocoa-nut, sliced, and put into a calabash of salt water, which they shake daily till the nut be dissolved. This is called Mitiaro, and, though most nauseous, is eaten as sauce to fish, bread-fruit, and almost every article of food.

6491. *The native fruits of the South Sea islands are delicious*, and their number has been greatly increased by the addition of many of the most valuable tropical productions. Oranges, shaddocks, and limes were originally introduced by Captains Cook, Bligh, and Vancouver. Vines, which were cultivated successfully by the missionaries, have been nearly destroyed in the native wars. Citrons, tamarinds, pine apples, guavas, Cape mulberries, and figs, with custard apples (*Anona triloba*), and coffee plants, thrive well. Many foreign vegetables have been tried, but they do not answer, any more than Wheat; still pumpkins, melons, water-melons, cucumbers, cabbages, and French beans succeed tolerably.

6492. *To the list of esculent vegetables, fruits, and roots, given in the preceding pages, many might be added*; but these suffice to show the abundance, diversity, nutritiveness, delicacy, and richness of the provisions spontaneously furnished to gratify the palate and supply the necessities of the inhabitants of Polynesia. Here man appears to live only for enjoyment, and to be placed in circumstances where every desire is satisfied, and even the fear of want is unknown.

Amid the unrestrained enjoyment of a bounty so diversified and profuse, it is hardly possible to suppose that the Divine Giver of all should be neither recognised nor acknowledged, or that His mercies should foster insensibility and alienate the hearts of the participants of His bounty. Such, however, was the melancholy fact, although

“the soil untill'd

Pour'd forth spontaneous and abundant harvests,
The forests cast their fruits, in husk or rind,
Yielding sweet kernels or delicious pulp,
Smooth oil, cool milk, and unfermented wine,
In rich and exquisite variety;
On these the indolent inhabitants
Fed without care or forethought.”

1090

DRACÆNA TERMINALIS.

6493. *The art of preparing a spirituous liquor from the saccharine Ti root* (*Dracæna terminalis*) (fig. 1090.) was unhappily soon learned, and communicated from the natives of one group of islands to another, and all the demoralising and debasing effects of drunkenness were proportionably exhibited. The root may certainly be used for many valuable purposes; it is sweet and palatable when baked, and a kind of beer, very suitable for sea-store, is procured from it by fermentation; but much the greater part is employed in making an inebriating liquor that the natives use in great quantities. Whole districts frequently united to erect what might be termed a public still, which, though rude and unsightly, answered the purpose too well. A rude fragment of rock, excavated below to contain fire, and surmounted by the end of a large hollow tree, in which the macerated Ti root was placed, afforded the chief materials; while a bamboo cane, placed in a trough of cold water, condensed

the distilled vapour, which flowed into a calabash or other vessel set below to receive it. When all was ready, the men and boys of the district assembled to drink the Ava, as this spirit was called; and they continued so employed for several days together, quaffing the liquor as it issued from the still, and then sinking into a state of the most indescribable wretchedness, or often practising the most ferocious barbarities. Sometimes, in a deserted still-house, may yet be seen the fragments of the rude boiler and its other appendages scattered in confusion on the ground, and among them the dead and mangled bodies of those who had been murdered in the frays that generally ended their dissipation. Even the crews of European vessels have been inhumanly murdered on these occasions. The Ava root might probably be used with great advantage

as a medicine; Mr. Collie, the surgeon of Capt. Beechey's voyage, having attested its efficacy in cases of cutaneous diseases, which it removed in a few weeks, and even seemed to produce a renovating effect on the whole constitution. A representation of the Tahitian still, with many particulars respecting the Ava, may be found in Mr. Ellis's interesting work, the *Polynesian Researches*.

6494. Capt. Beechey states, that the roots and stalks of a species of Pepper (*Piper methysticum*) have also been distilled in many of the islands; and though the importation of foreign spirits has much superseded the use of Ava, that intoxication, with its attendant demoralisation, is far more prevalent than formerly. The colour of Ava made from the pepper resembles thick dirty water, and its taste is so nauseous, that it was customary to swallow a hearty draught of water after the intoxicating dose, to remove its unpleasant taste and burning effects.

6495. For clothing, the Polynesians avail themselves greatly of the bark afforded by the *Morus* (*Broussonetia*) *papyrifera*, or Paper Mulberry (fig. 1091). The manufacture of cloth, which is a tedious process, and the

MORUS PAPYRIFERA.

weaving of mats, which sometimes serve for garments as well as for bedding, fall to the department of the women. The inner bark is taken off in a single piece, by a longitudinal incision from end to end of the trunk; it is scraped, spread out, rolled and flattened, and so left to dry; the addition of other pieces being sometimes made, to increase the diameter. The wooden mallets with which the bark is beaten are four-sided; one side being smooth, the second coarsely grooved, the third furrowed more finely, and the fourth closely checked in squares or diamonds; and thus the pattern may be varied, and cloth may be produced, either smooth, striped like dimity, finely corded like muslin, or with a small check like diaper. The thickness of the cloth is various; some being like stout paper, or morocco leather, and others as fine and transparent as Italian crape. The cloth for sleeping, which is the largest and thickest, is made of ten sheets fastened together, and is as large as a common counterpane. This kind of cloth takes a beautiful dye, and much taste is exercised by the natives in blending the hues and figures. The best is little inferior in appearance to fine chintz; but its perishable nature (for it will not bear wetting), and the labour requisite for preparing it, render it a costly article. Occasionally the natives steep the cloth in cocoa-nut oil, in which chips of sandal-wood, or the fragrant berries of the Pandanus, have been infused, thus rendering it impervious to water, and imparting a perfume; but even this kind does not last many weeks. Five pieces, each four yards long, are requisite to make one Pau, as the cloth which the women wear round the waist is called.

6496. The leaves of the *Pandanus odoratissima* afford a very large kind of mat, generally used for laying on floors, sometimes twenty yards square, and beautifully fine, like the braid of a Leghorn bonnet. Sometimes they are quite white, or dyed of different colours, and finished with a rich fringe at the end. Necklaces, composed of the fragrant nut of this kind of Palm, or Screw pine, are worn round the neck on festive occasions.

6497. The *Tutui* tree, the *Viriviri*, and the Sandal-wood, must close our imperfect account of the vegetable treasures of these highly favoured islands. The first, or *Aleurites triloba* (fig. 1092), affords a nut, which was the principal substitute for candles among the islanders before the introduction of oil by the whale ships. It is full of a rich oil, and after being slightly baked is formed into torches by stringing thirty or forty nuts together on a rush, and enclosing four or five of these strings in the leaves of the *Ti* (*Dracæna terminalis*), or *Hala* (*Pandanus odoratissima*). After being lighted, before one nut is consumed, the flame communicates to the oil of the one below; and as the blaze expires, the shell of the exhausted nut is struck off, till the whole is consumed. The tree also yields a gum used in preparing the native cloth, and the bark affords a permanent dye; still the nuts are the most precious part. Sometimes they are burnt to charcoal and pulverised, for tattooing the skin, painting canoes, &c.

ALEURITES TRILOBA.

6498. The *Viriviri* is the *Erythrina Corallodendron*, a beautiful tree, covered with splendid flowers, and yielding a delightful shade. The ease with which cuttings of it strike root, and the lightness and fine grain of the wood, render it valuable for fences, and the best canoes and surf boards are made of it.

6499. The Sandal-wood of the South Sea islands is considered by Capt. Beechey to be the same as that of the East Indies (*Santalum album*); but the specimens brought home by the naturalists of that expedition prove it to be the *Santalum Freycinetianum* (fig. 1093.) of Gaudichaud, in *Freycinet's Voyage*, p. 442. to 445. It is, according to that navigator, the only commercial production of the Sandwich Islands. It is a tolerably heavy and solid wood; and, after the sap or part next the bark has been taken off, is of a light yellow or brown colour, containing a quantity of aromatic oil. Although a plant of slow growth, it is found in abundance in all the mountainous parts of the Sandwich Islands, and is cut down in great quantities by the natives, as it constitutes their principal article of exportation. It is brought down to the beach in pieces, from a foot to eighteen inches in diameter, and six to eight feet long, to small sticks, not more than an inch thick, and a foot and a half long. It is sold by weight; and the merchants, who exchange for it articles of European or Chinese manufacture, take it to the Canton market, where it is bought by the Chinese, for the purpose of preparing incense to burn in their idol temples.

SANTALUM FREYCINETIANUM.

6500. The Sandal-wood, it is known, requires many years to arrive at a fit state for the market, and, its cultivation not having been attended to, the wood is becoming scarce, while the debt of the nation is considerably increased. During Capt. Beechey's visit, in order to avoid the expense attending the collection of this wood, it became necessary to lay a tax upon the people of a pekul (or 133 lbs.) each, which they were required to bring from the mountains under a penalty of four dollars, and to deposit with the authorities of Honoruru. The greater part of the wood brought in was small and crooked, and only fit for the use of the jos-houses in China, where it is burned as incense; but the consumption of it there is diminished, in consequence of an order for its disuse in those places of worship. The odour of the sandal-wood of the Sandwich Islands is very inferior to that of Malabar, Ceylon, and other parts of India.

SUBJECT. 3. Zoology.

6501. The zoological character of the South Sea islands has already been indicated in our general observations upon Australasia. There are, however, many local peculiarities; but the limits imposed on this department of the work will no longer permit us to indulge in details.

SECT. III. *Historical Geography.*

6502. *The discovery of the Polynesian Islands* has been one of the leading achievements of modern maritime enterprise. They were entirely unknown till a period subsequent to the discovery of America and of the passage round the Cape of Good Hope. In 1513, however, Magellan passed through the Straits which bear his name, and measured the entire breadth of the Pacific. He sailed southward of most of these islands, touching only at the Ladrones, whence he proceeded to the Philippines. Drake and Cavendish, whose circumnavigation was connected with their attacks upon the Spanish possessions in Peru and Mexico, crossed the ocean too far north to come in contact with the principal groups.

6503. *The Spaniards*, about the end of the century, made considerable efforts to explore the South Sea from Peru. Mendana, in 1575, discovered in its eastern quarter the Solomon Isles; and, twenty years after, in proceeding to found a colony there, he lighted upon a group called from him the Mendana or, from his employer, the Marquesas Islands. Quiros, in the voyage distinguished by the discovery of New Holland, passed a considerable and fine island, which he named Sagittaria, and which there is great reason to suppose was Otaheite.

6504. *The Dutch* succeeded in the career of austral discovery. In 1615-16 Schouten and Le Maire doubled Cape Horn, discovering Staaten Land, and the Straits bearing the name of the latter navigator. About the same time Tasman, from Java, performed the important voyage in which, after discovering Van Diemen's Land and New Zealand, he arrived at the interesting group of the Friendly Islands. Roggewein, also, towards the end of the century, in crossing the Pacific, made several discoveries, and, in particular, that of Easter Island.

6505. It was *England*, however, which, under the reign and auspices of George III., mainly achieved the exploration of this remote and interesting portion of the globe. The series of voyages fitted out by government began with those of Byron, Wallis, and Carteret. Wallis was the first who certainly touched on the beautiful shores of Otaheite; and a number of detached islands were brought to light by these navigators. But the three voyages of Cook, between 1767 and 1779, formed the grandest era of Oceanic discovery. If the Society and Friendly Islands had been already known, he was the first who made careful observations on the character and social state of the remarkable tribes by whom they are inhabited. The important group of the Sandwich Islands was entirely discovered by him, though, from an unhappy misunderstanding, they proved the fatal scene of his untimely death. The operations of the same illustrious navigator in the Australasian islands, on the shores of America, and in the arctic seas north and south of these latitudes, do not belong to the present subject. At the close of the career of Cook, all the leading outlines of the Polynesian region had been explored; and the efforts of Vancouver, his successor, were chiefly employed in completing the survey of the north-west coast of America. Yet ample and curious gleanings were still left for Bougainville, the contemporary of Cook; for Pérouse, Labillardière, and D'Entrecasteaux, afterwards sent out by the French government, who still more recently employed Freycinet, Duperrey, and D'Urville. Something still remained for the Russian navigators Krusenstern and Kotzebue, and for our countryman Captain Beechey, not to mention other names of secondary importance. There probably remain still detached islands, and even small groups, in this great expanse of ocean, to reward the search of future navigators.

6506. *European intercourse*, during the present century, has effected a remarkable change upon these islands. Among the most active agents have been the missionaries; a party of whom, sent out by the London society, were in 1797 landed in Otaheite, by Captain Wilson, from the ship *Duff*. Their labours were not crowned with almost any success, till after the lapse of nearly twenty years, when, in consequence of events which will be noticed in treating of that island, they succeeded in overthrowing idolatry, with the bloody and superstitious rites connected with it, and in acquiring an almost paramount influence over prince and people. This influence they have, in subservience to their main object, employed in studiously instructing the natives in civilised habits, and in the arts and industry of Europe; efforts which have been attended with a certain though not complete success. A nearly similar change, within the last ten years, has been effected in the Sandwich Islands, chiefly by the agency of American missionaries. Another cause has acted powerfully upon this quarter of the world. Since Britain and other great maritime nations have extended their navigation to the most distant seas, these islands, once considered so remote, have been included within the regular commercial lines by which the ocean is traversed. As the route from Britain to her Australian settlements by Cape Horn is nearly equidistant with that by the Cape of Good Hope, vessels frequently prefer it, and are thus led to touch for refreshment at the Society Islands. The Sandwich Islands are situated in the route to the whale fishery in the Northern Pacific, and in that of the fur trade from north-west America to China. Hence their harbours are sometimes crowded with vessels, and American merchants have even settled in their ports. The mariners and missionaries, two very opposite characters, do not act in unison, or report very favourably of each other; but they have combined in producing

a somewhat grotesque mixture of the arts, manners, and civilisation of Europe, with the rude and licentious habits to which the people were previously addicted.

SECT. IV. *Political Geography.*

6507. *The political state* of these islands is simple, though not exactly what might have been expected in such a stage of social life. The people do not enjoy the rude independence of savage life, nor are any of the governments moulded into a republican form. They are ruled by chiefs, in an absolute or at least arbitrary manner, with a power only controlled by the influence of inferior chiefs who hold sway over particular districts. These higher classes, being exempted from labour, and better fed than their inferiors, are so much taller and handsomer, that they appear almost like a different race. Yet, amid this great distinction of ranks, no very strict police is maintained; and the punishment of crimes is in general left to the private resentment of the injured party.

SECT. V. *Productive Industry.*

6508. *The natural advantages* possessed by these islands, as to soil and climate, are not, perhaps, surpassed by those of any other region. Their situation, entirely within the tropics, might have exposed them to be scorched beneath the solar influence; but the vapours exhaled from the vast ocean which washes their shores, and the interior eminences, secure a copious supply of humidity, which, combined with the warmth, produces a most luxuriant vegetation. Some of the mountains are the seat of powerful volcanic action, others are steep and rocky; but many are clothed to the summit with majestic forests, and the plains which they water are adapted to the finest species of tropical produce. Their small extent, however, and remote situation, preclude the expectation that they will ever compete with tropical America or India, in supplying Europe with these valuable commodities.

6509. *Agriculture* is by no means altogether neglected; though its operations are in many places nearly superseded by the spontaneous profusion with which nature furnishes the means of subsistence, and even of luxury. Otaheite and the neighbouring islands are covered, almost without culture, with forests of the coconut palm and the bread-fruit tree. Nearly their only labour consists in raising, upon small cleared spots, the potato and the yam, as additions to their diet. The only domestic animals are the hog and the dog, both used as food, and forming luxuries which appear only at the tables of the rich. The missionaries have made attempts to introduce the larger and more useful quadrupeds, but without effect, through the carelessness and improvidence of the natives. In the Friendly Islands a more industrious spirit is perceptible; the fields are well cultivated, and laid out with great neatness and order. The Sandwich Islanders, having a soil comparatively arid and barren, have exerted still greater diligence, not only in tillage and enclosure, but in extensive and elaborate processes for irrigation. The absence, Captain Beechey observes, of the green and shady forests of Otaheite, produces, at first view, an unfavourable impression; but, on mounting the hills, every valley is seen covered with plantations of *taro*, the vegetable substance on which these islanders chiefly subsist. According to very recent accounts, European settlers have introduced into Otaheite the cultivation of sugar, of good quality, sufficient for the supply of the surrounding islands.

6510. *Manufactures and arts* are by no means in so forward a state; yet the natives produce some fine fabrics for the accommodation and ornament of the chiefs. From the bark of certain trees are prepared cloths of considerable beauty; while from other substances very fine mats are plaited. Feathers are often framed into splendid and fantastic head-dresses. The progress in the useful arts is the more meritorious, as the natives are destitute of the most important instrument, iron; a want so much felt, that, at their first intercourse with Europeans, the smallest and rudest fragments of that metal were received in exchange for a large value in commodities, and were prized almost like silver and gold in Europe. It is surprising how tolerably the deficiency was supplied by implements of stone, hard wood, or bone, which were rendered fit for all the purposes of agriculture and industry. In particular, they had succeeded with these imperfect means in constructing spacious and commodious canoes, fitted not only for navigating round their coasts, and from one neighbouring island to another, but for performing with safety voyages over a great extent of the Pacific. Some, destined for state or for war, are highly, and, indeed, fantastically ornamented; others are diligently employed in fishing, whence the people derive their chief supply of animal food. The military implements, as usual in such societies, are variously and skilfully framed. The missionaries have shown an enlightened zeal to introduce European arts and industry. A carpenter and a weaver were sent to Otaheite; and even a cotton factory, with the full concurrence of the chiefs, was established at Eimeo. The people, under the first impulse of novelty, worked hard, and produced a cloth somewhat coarse, but solid and durable. They soon, however, began to tire of continued application, and the fabric has not yet made much progress. Captain Beechey dreads that the composure and indifference which they manifest on such subjects will be the bane of their future prosperity. It is very well, they say, for Europeans to work, who need fine clothes and fine ships, but they are satisfied with the abundance in which nature has placed them. It may be hoped, however, that the continuance of the intercourse with Europeans will inspire a taste for their arts and luxuries, and a willingness to make exertions in order to procure them.

6511. *Commerce*, unless of the most limited internal kind, had no existence till very recently. These islands, however fertile, have no commodities which can bear the cost of a distant conveyance, except the sandal wood of the Sandwich Islands, which finds a ready market in China, but is beginning to be exhausted. Their ports are frequented almost solely by ships on their way to the whale-fisheries or across the Pacific. These vessels, arriving after a long and exhausting voyage, stand in need of provisions and supplies, and are often disposed to spend some time in refitting and restoring the health of their crews: they afford thus a considerable market for the timber, fruits, and live stock produced on the islands. According to a late statement in the *Singapore Chronicle*, the number of vessels annually touching at Otaheite amount to 200; and the Sandwich Islands are said to be frequented by more than double that number. From Captain Beechey's report, the time appears to be past when a few beads and bits of broken iron were sufficient to procure a copious supply; nothing but good cloth and hard dollars bear now a value in this market.

SECT. VI. *Civil and Social State.*

6512. *The population* of this numerous insular range has never been estimated, unless by the most uncertain conjectures. Those formed by Cook and Forster were so large, that Hassel, calculating from them, assigns to the whole no less than 1,400,000. The observations of recent travellers, and particularly of the missionaries, leave no doubt that this number is very grossly exaggerated. We cannot quote any opinion of M. Balbi, who has mixed Polynesia with the Oriental Archipelago. There appear no means of arriving at precision on the subject; but we have little doubt that 500,000 would be rather above than under the entire population of this region.

6513. *Social life*, among these islanders, presents peculiar and picturesque aspects. Instead of those fierce and gloomy propensities which usually sway the breast of savage tribes, their manners are distinguished by a courtesy, gaiety, and amenity, which, combined

with the beauty and abundance with which the land is gifted, made it appear to the first voyagers like a terrestrial paradise. These flattering appearances, however, proved in many respects to be very fallacious. Amid the lavish kindness with which Europeans were greeted, they soon discovered an universal propensity to pilfering, while the virtue of the female sex was not proof against nails, buttons, or the most insignificant toys. These faults were, doubtless, aggravated by the attractive nature of these new and tempting objects; but it was, moreover, soon evident, that their dances and other amusements were conducted in a manner the most revolting to decorum, and that there existed in Otaheite a society called *arreoy*, who made it a regular system to have wives in common, and to put their offspring to death. Nor was infanticide the only practice marked by the ferocity of savage life. In many of the islands cannibalism is still practised, and in the most polished there remain traces of its former existence. Even in Otaheite, war is carried on in the most atrocious spirit of vengeance. The victor, after slaying his unresisting enemy, dreadfully mangles his body, exclaiming, "You killed my father! you robbed me of my wife!" &c. The people of the Sandwich and Friendly Islands were at first considered more respectable; but their character, on further acquaintance, was found to be stained with practices equally revolting.

6514. *The native religion* of these islanders may be ranked amongst the darkest forms of superstition. It not only gives no support to virtue, but affords full sanction to the most cruel and dissolute practices. Even the flagitious society of *arreoy* was supposed to possess a peculiar sanctity. Not only animals were offered in profusion, but human victims were

universally sacrificed on the bloody altars of the Polynesian divinities. Their *morais*, or temples (*fig. 1094.*), are long low enclosures, commonly of stone, in the depth of forests, and surrounded with trees. One of the observances which most powerfully influenced their habitual existence was that of *taboo*, a species of prohibition, which a person, in honour of his favourite divinity, may impose upon himself, upon any part of his body, his house, his boat, or whatever belongs to him. The chief has an

1094

MORAI OR TEMPLE.

extensive power to taboo any individual or any part of the island under his jurisdiction. The tabooed object must remain sacred; it must not be used, touched, or trod upon by any human being, and the person who violates this prohibition imagines himself liable to the mysterious wrath of the being in whose honour it has been imposed. He is exposed also to the furious and often bloody vengeance of the author of the taboo, who considers his guardian power thus dishonoured. This observance is sometimes usefully applied to the protection of exposed property and cultivated fields, but, in general, it both imposes severe privation, and gives birth to cruel enmities and bloody outrage.

6515. *The missionaries*, as already observed, have attained a predominant influence in the two principal of these groups. Messrs. Tyerman and Bennett, in their parting address, say, seemingly with perfect truth, — "In things both spiritual and temporal, the people, from the highest to the lowest, look to you for counsel, for instruction, for example." The present king of Otaheite, on his accession, took the oath to the missionaries, was anointed and crowned by them. So high is the idea attached to the character, that many natives were found impressed with the belief that King George was a missionary! Spacious churches have been built, which the natives frequent, decently dressed, and with a serious and reverential air. Still the missionaries candidly admit that much is yet wanting, both as to Christian knowledge and conduct. The observance of the Sabbath, which is the most conspicuous part of their religious practice, seems, in a good measure, connected with their ancient veneration for any thing tabooed. Captain Beechey alleges that they venerate their bibles, in some degree, rather as household gods, means of mysterious protection, than as sources of instruction. Even those who admit that birds have no longer the power of prophecy cannot be persuaded that they did not possess it previously to the missionaries' arrival. There appears to be a considerable class, branded with the name *ouri outi* (rusty iron), who observe neither the old nor the new religion, but indulge at once in native excesses, and in those of intoxication, which they have learned from Europeans. Yet, on the whole, it seems undeniable that the grossest superstitions have been demolished, that human victims no longer bleed, that the *arreoy* society is broken up, infanticide has ceased, and public decorum is generally observed. Captains Beechey and Kotzebue, who maintain that there is no real improvement in the morals of the islanders, judge, probably, from the effect of the arrival of an European vessel, which suspends their ordinary occupations, and attracts, in crowds, the least orderly and respectable classes. On the whole, however, social life, throughout these islands, appears strangely compounded of three elements, which co-exist,

not in harmonious combination, but in hostile collision: first, the rude licentiousness, dark superstition, and wild gaiety, which originally characterised the natives; then the strict system of religious and moral observance, which the missionaries have studiously introduced; lastly, the roving and reckless habits of which the example is set by the numerous mariners who now visit these shores. The missionaries have certainly introduced *letters* into these islands, where, previously, nothing of that nature existed; neither hieroglyphics, pictorial representations, nor symbols of any description. As soon as Christianity was established, they set on foot schools; and the natives applied themselves with extraordinary ardour to this new acquisition. Mr. Ellis tells us, that "aged chiefs and priests, and hardy warriors, with their spelling-books in their hands, might be seen sitting, hour after hour, on the benches in the schools, by the side, perhaps, of some smiling boy or girl, by whom they were thankful to be taught the use of letters." Yet, after the first novelty was over, considerable difficulty has been found in obtaining regular attendance, which yet is anxiously desired, not only with a view to instruction, but for forming the youth to regular habits. Still a considerable number have thus attained a competent knowledge of reading, writing, and arithmetic.

6516. *Amusements*, among a people who subsisted almost without labour, and were endowed with so gay a disposition, were varied, and pursued with excessive ardour. The most universal were the dances performed on all occasions of pleasure, worship, state, or ceremonious reception. Those of the first two descriptions were often very exceptionable; the others were generally slow and stately, with graceful, and, sometimes, fantastic movements, resembling the minuet of Europe (*fig. 1095.*). Athletic exercises, particularly wrestling,

are also very general. Sailing in canoes, bathing, and swimming, are so universal, that the natives may almost be considered an amphibious race. The missionaries have been blamed for making a too sweeping proscription of all amusements, particularly the dance; but it is stated that most of them were so closely connected with previous superstitious and licentious habits, that, if

1095

OTAHITEAN DANCE.

any latitude had been allowed, the people would soon have relapsed fully into their former disorders.

6517. *The habitations* of these islanders are remarkably simple, consisting merely of one long apartment, raised from the ground on posts, thatched with palm leaves, and left in a great measure open to the air. No partition divides the inmates from each other; the most commodious place is occupied by the master and mistress of the house, while the others are accommodated according to their respective dignities. They have no regular times of sleeping or eating, but indulge in either according to inclination. In the Sandwich Islands, at least, the missionaries mention, that they seldom entered a house during the day without some of the inmates being asleep, or during the night, without some being awake. The natives sleep in their ordinary clothes; the only furniture consists of mats spread on the floor, which, in the case of the chiefs, are often very fine, and piled above each other to the number of twenty or thirty.

6518. *The dress* of the Polynesians consisted originally of the native cloths, already described, wrapped loosely round the body, and leaving a large part of the limbs and bosom uncovered. The head-dress was richly and often fantastically ornamented with feathers and long plaits of human hair. The Sandwich Islanders were fond of thus ornamenting a singular species of masks (*fig. 1096.*), in which they delighted to disguise themselves. European connection has introduced a strange and grotesque mixture of civilised customs and ornaments. Captain Beechey describes a judge who, in imitation of his brethren in England, had got on a white oakum wig, with long curls flowing over his shoulders, while above were bright feathers and variously tinted plaits of human hair, but beneath neither shoes, stockings, nor trousers. Messrs. Tyerman and Bennet saw in the Sandwich Islands an opulent chief, who, seeking to distinguish himself by peculiar finery, had put a white shirt above a black coat, taking care that a large portion of the under garment should remain visible. Similar odd com-

binations were observed in all the habits of life. The same missionaries observed two queens conveyed with pride in one wheelbarrow, though slowly, as the bearers were often obliged to pause beneath the weight of royalty. The same ladies were observed next day collecting rushes in a neighbouring marsh, which their majesties bore on their naked backs to be strewed on the royal floor. Under the head of ornament, though not of dress, we must not omit tattooing, that singular painting of which the human skin is the canvass. To a great extent it is universal over Polynesia, and extends to several of the principal Australasian islands, particularly New Zealand. There, and in the Marquesas, the body of the chiefs is entirely tattooed over, leaving no trace of the original skin; but in Otaheite and the Sandwich Islands it is confined to particular parts, especially the thighs and part of the legs, being applied sometimes to the palms of the hands, and even to the tongue; but the face is not thus disfigured.

SANDWICH ISLANDER WITH MASK.

The representations are sometimes arbitrary, but more commonly consist of animals rudely delineated, occasionally of stars, circles, and crescents. These are supposed to indicate the rank or tribe of the person tattooed, and also the arrival at years of maturity. They are worked in with sharp instruments of stone, and the wounds variously coloured, either by the mothers, or by professional operators; and even young girls endure with fortitude exquisite torture, in the proud hope of the dignity to which it will raise them.

SECT. VII. *Local Geography.*

6519. The numerous islands which stud this part of the Pacific may be *divided into the great groups* of the Society, Sandwich, Marquesas or Mendana, Caroline, and Marianne Islands. The other clusters which have been named by navigators seem all to be branches or appendages of these great archipelagoes. We may add, however, the great coral range, and a few detached islands, that stand alone amid a wide expanse of ocean.

6520. *The Society Islands* have excited a higher interest than any other group in the South Sea. Though not the largest, they are the most beautiful, the most fruitful, and those in which civilisation and polished manners have made the greatest progress. They are also those with which Britain has held the most close and intimate connection.

6521. *Otaheite* (*fig. 1097.*), the largest and finest of these islands, ranks always as the brightest gem of the Pacific. This celebrated island, discovered probably by Quiros, under the

VIEW OF OTAKEITHA.

name of Sagittaria, rediscovered by Wallis, and fully explored by Cook, consists of two peninsulas, one about ninety, the other thirty miles in circumference. The interior rises into mountains loftier than any others in those seas, except the colossal peaks in the Sandwich Islands. Oroeno and Tobronu are respectively of the height of 10,800 and 9500 feet; but, in this genial climate, trees and verdure clothe their

almost inaccessible summits, and the scenery is equally distinguished by grandeur and beauty. These mountains compose as it were the island; only a narrow plain intervenes between them and the sea, while their cliffs in many places breast the waves. The greater part of the surface consists of beautiful hills and slopes, watered by clear streams, which dash in numerous cascades. Otaheite is nearly covered by one entire forest of bread-fruit, cocoa-nut, banana, and other valuable trees, a few spots only being cleared for the culture of the yam. The fruits ripen at different seasons, according as the mountain slopes have a northern or southern exposure. The Otaheiteans presented the most complete example, both of what is engaging in manners and dissolute in conduct, among the South Sea islanders. The profligate association of the *arreoy* was peculiar to it. In this island, however, the influence of Christianity and civilisation has been earliest and most fully felt. On the 6th of March, 1797, Captain Wilson landed from the ship *Duff* a party of missionaries, sent out by the generous zeal of the London society. Although, however, they were well treated, and listened to, they could not boast, in 1808, of having made a single genuine convert. In that year they quitted Otaheite, and left only a few of their number in Eimeo. A remarkable change, however, then ensued. Pomarre, attacked by a body of rebellious subjects, was driven out of Otaheite, and forced to take refuge in Eimeo. In this distress, his mind was opened to the instructions of the missionaries, and after being with

his family among the most zealous votaries of the ancient superstition, he made an open profession of Christianity. The cooking and eating of a turtle, always before held as a tabooed animal, first publicly announced the change. Several distinguished chiefs soon followed the example. The daring experiment, made by one of them named Hetotte, is particularly recorded by Captain Beechey. It had been hitherto an article of undoubted faith that whoever should eat any portion of the flesh of a hog offered in sacrifice would be punished with instant death. Hetotte determined to make the awful trial: he stole a portion of the sacred pork, retired to a corner, ate it, and, in dread suspense, awaited the issue. Finding, however, that, instead of the threatened doom, he experienced from this food the usual nourishment and refreshment, he not only abandoned the superstition himself, but denounced it to all his countrymen. After Eimeo had been thus christianised, Pomarre was invited back to Otaheite by a strong body of adherents. His first attempt was unsuccessful; but in 1815 he completely defeated the rebel and pagan army, and, having subjected the whole island, overthrew the temples and altars, setting up the holy log, supposed to be frequently inspired, as a post in his kitchen. His sister Aimata, who succeeded him in 1827, supports the same system; and the missionaries have acquired an influence in Otaheite, the results of which have been described in the preceding chapter. The population of the island was estimated by Cook at upwards of 120,000, which was probably from the first much exaggerated. Captain Wilson, after a careful enumeration in 1797, found little more than 16,000; and these have since diminished to one half. This depopulation seems sufficiently accounted for by Mr. Ellis from the bloody wars among themselves, with the introduction from Europe of contagious diseases and of the use of ardent spirits.

6522. *The other Society Islands* are generally fine and fruitful, but do not present any very striking distinctive characters. Eimeo, discovered by Wallis, has a peak nearly 3000 feet high, and broad ridges cross it in various directions and form a rocky coast; but wide well-wooded valleys intervene, and the port of Taloo is one of the finest in the South Sea. But Eimeo is chiefly distinguished as still the centre of that European and Christian civilisation which originated there. It contains an academy, a printing-office, and a cotton factory; all, it is to be regretted, on too small a scale, and making too little progress. Ulietea, or Raiatea, is, next to Otaheite, the largest of the group, being nearly sixty miles in circumference, and having closely adjoining to it Otaha, about half that size. Both are encircled by a coral reef, bordered by numerous islets. Ulietea is governed by a separate king; the people are smaller, darker in colour, and somewhat ruder, than those of Otaheite. Borabora, or Bolabola, is a bold, finely wooded, and picturesque island, governed by separate chiefs, and inhabited by a fierce hardy race, who afford a place of refuge to outlawed and desperate characters from other quarters. Of smaller islands, Maitea, on whose coast pearl oysters are found, Maurua or Maupili, and Toobouai, are deserving of mention.

6523. *The Archipelago of Low Islands* is the name given by Hassel and Balbi to an almost numberless range of islets, extending E.S.E. from the Society Islands, and passed in the route thither from Cape Horn. Their origin and structure are extremely remarkable. Coralline plants, growing at the bottom of the ocean, harbour a class of lithophytic insects, which, during their life, form round them a substance which, after their death, becomes hard as stone. The rockwork of one generation affords a basis to that of the succeeding, and layers are thus placed over each other till they reach the surface of the water, and form islands. As soon as the rock is exposed to the air, the insects quit it, leaving it perforated by numerous hollows; but they work for some time laterally, forming, immediately under water, concealed table reefs, which have given occasion to numerous and fatal shipwrecks. Meantime, from amid the interstices of the rocks plants spring up, and, on their decay, are converted into soil, till the new island is covered with luxuriant vegetation. These islands scarcely ever rise more than a few feet above the sea; for the low hills which some navigators have thought they observed, seem to be only the lofty form of the *pandanus*, which usually springs up on such shores. These coasts have usually parallel to them a coral reef, separated by a lagoon, into which it is often difficult to find an entrance. Of thirty-two islands observed by Captain Beechey, twenty-nine had lagoons. When these wonderful ocean-fabrics were first noticed, an impression prevailed that they were proceeding to a vast extent, and that the coralline insects were rearing a continent from beneath the Pacific; but the observations of Gaimard, Beechey, and others, rather suggest the conclusion that they are raised only under local and peculiar circumstances, not yet fully ascertained. The formation, also, seems to go on very slowly. The wreck of the *Matilda*, left in 1802 on a coral reef, was found by Captain Beechey, in 1825, unaltered in position, and without any coral having grown over it. That navigator also remarks, that these islands are found all in the direction of the trade-wind; that the windward side is the highest, while the other is only a half-drowned reef. The surface displays in general a blooming but little varied vegetation. The leading tree is the *pandanus*, and next to it the cocoa nut, both valuable, and yielding nutritive fruits. The people are little known, as the slender supplies to be obtained, and the dangerous nature of the coasts, have induced mariners to sail through them as quickly as possible. All of them are thinly peopled, some entirely desert, and some alternately occupied and abandoned. The people are considered by Hassel to be of the Malay race, and to resemble the Society Islanders; but Beechey, who held more intercourse with them than any previous navigator, describes them as more allied to the Oriental negro, and in a very low state of civilisation. The natives of Clermont-Tonnerre, Serle, and other islands, were judged to resemble the New Caledonians. The Chain Islanders were a most brutal race, cruelly oppressing their females, and confessing that they had, lately at least, been guilty of cannibalism. The people of the Gambier Islands were completely astonished at the view of a dog, never having seen any animal larger than a rat. They were most determined thieves; and, when a musket was pointed at them, imagined it was intended as a present, and ran forward to catch it. This group is distinguished as being the only one that is high and volcanic, though surrounded by coral reefs. Where the people are of fairer complexion, their moral character seems also improved. Such is the case in Lagoon Island, where the people were extremely honest, though eager in traffic, exchanging all they had for nails, bits of iron, and beads. Those of Byam Martin had an Otaheitean cast of features; and a party, wafted by a storm from that island, 600 miles distant, had brought with them Testaments, hymn books, &c. It would be impossible to attempt going over the details of these almost innumerable islets. Bow Island, 30 miles long and 5 broad, is well wooded, but the people barbarous. King George's Islands, discovered by Byron in 1765, consist of two small groups, well furnished with water and provisions, and inhabited by a numerous race, resembling the Otaheiteans, and understanding their language. Queen Charlotte's Islands, and Aurora, are of nearly similar character. In the most northerly part of the archipelago, Byron saw one which bore an appearance of brilliant vegetation; but, when he had reached it with difficulty through openings in the coral reef, he found it destitute either of water or provisions, and named it Disappointment. The Russian navigators Kotzebue and Bellinghausen discovered islands to which they gave the name of Romanzoff, Suvaroff, and Krusenstern; but they did not see any inhabitants.

6524. *Pitcairn Island*, a small detached spot, standing almost alone, near the eastern

extremity of this range, has attracted a remarkable interest, in consequence of events which made it the abode of a British population. In 1789, Captain Bligh visited Otaheite, with the view of transplanting the bread-fruit tree into the West Indies. After leaving the island, however, a violent mutiny arose among his crew, who, headed by one named Christian, turned him out with a handful of adherents, into a boat, and left them in the midst of the Pacific. Thus abandoned, it seemed almost certain that he must perish; yet, by a train of almost miraculous efforts and events, he succeeded in reaching Britain in safety. The mutineers first returned to Otaheite, and then made an attempt to settle on the small neighbouring island of Toobouai; but, dreading discovery by British vessels touching at these islands, Christian determined to seek some spot more solitary and remote. He fixed upon Pitcairn Island, discovered by Captain Carteret, and arrived there in January, 1790, with eight of his comrades, six native men, and twelve females, whom they had invited on board, and then carried off. In this ill-composed society, however, the most dreadful dissensions soon arose. Conflicts took place, especially between the natives and Europeans, and Christian became an early victim. In ten years, thirteen men had been killed, and there remained alive only one, named Adams, with six women and nineteen children. Adams, after witnessing such scenes of misery and crime, had been led to habits of serious reflection and a careful perusal of the Scriptures. He now determined thoroughly to reform himself, and, if possible, his companions. The Otaheitean females proved tractable, and were easily converted; and the children, trained in strict principles of religion, grew up a race directly opposite to that from which they sprung. Captain Beechey, in 1825, found thirty-six males and thirty females, forming a happy little society, well instructed, orderly, and friendly. They felt, however, a desire to see something more of the world of which they heard occasionally from passing navigators. Adams is since dead.

6525. *Easter Island*, or *Vaihou*, stands entirely by itself, considerably east of the above, and forming the extremity on that side of the great Polynesian range. It was first discovered, in 1722, by Roggewein, and has since been frequently visited, as it lies in the direct route from Cape Horn to the Society Islands. Though only twenty miles in circuit, it has excited much interest from its physical aspect and social state. The shore is bold and rocky, and the whole island bears the most evident marks of volcanic action. The numerous rocks are composed entirely of lava, and small extinct craters are found on almost all their summits. De Langle, who accompanied *La Pérouse*, penetrated to a large one in the interior, about five miles in circumference, and at least 800 feet deep; but the grass growing on its sides showed that the subterraneous fire had long ceased to issue. In consequence of this structure, the island is irrigated by no streams, and water is found only in ponds. Although this deficiency deprives it of the cocoa-nut and the bread-fruit tree, yet the industry of the inhabitants has given to its rocky hills a verdant and smiling appearance, and has supplied yams, potatoes, and other vegetables, in considerable plenty. The natives are a handsome race, especially the females; but the gigantic size ascribed to them by Roggewein is not confirmed by later observers, and their frames seem formed more for activity than strength. They exhibit, in the extreme, the gay and polished address, with the propensity to thieving and licentiousness, which distinguish the Society Islands; and Captain Beechey's experience showed that they did not scruple to have recourse to violence in order to compass their ends. There were found among these people some singular traces of an ancient civilisation. There were spacious morais, in the vicinity of which were found colossal statues of stone, about fourteen feet high, representing, though in a rude manner, the upper part of the human form. The present inhabitants, however, are so far from sharing the art by which these were constructed, that they have been continually defacing them till they have almost entirely disappeared, and Captain Beechey found only a few fragments remaining.

6526. On the west, also, the Society Islands have, as an appendage, a small and scattered group, which remained without a name, till Krusenstern, followed by Hassel and Balbi, gave to it that of *Cook*, its discoverer; a tribute to his memory which we shall not refuse, though it be scarcely worthy of so great a name. Cook's Islands are small, low, and of coral formation; they are deficient in water, which is found only in ponds and wells, yet they are tolerably peopled and cultivated. The state of society nearly resembles that in Otaheite, and the missionaries have succeeded in converting a considerable number. *Mangeea*, *Wateo*, *Whitoutacké*, and *Rarotoa*, are the principal. The people of this last are very civilised, and their chief has lately embraced Christianity.

6527. *The Sandwich Islands* form as it were a solitary group far north of the general range, and fully 1500 miles distant from both the *Mulgrave* and the *Marquesas*. They are thirteen in number; but of the 7000 square miles which Hassel estimates the whole to contain, 5000 are occupied by *Owhyhee*; and the others are thus comparatively very small. *Woahoo*, *Mowee*, and *Atooi*, are, however, not inconsiderable. The natural aspect of these islands is grand and awful. The mountains of *Mouna Roa* and *Mouna Koa* rise completely to an alpine height, and have their summits wrapt in perpetual snow. A party from the *Blonde* lately reached nearly, but not quite, to the summit of *Mouna Koa*. The mountain was almost entirely composed of lava, and exhibited numerous traces of extinct volcanoes. They reached, also, on the flank of *Mouna Roa*, the volcano of *Peli*, where that phenomenon appears more awful and varied than in any other part of the world. The scene here presented is thus described by Captain Lord Byron: — "Within a mile of the crater, our progress was suddenly arrested by finding ourselves on the edge of a precipitous ledge of seventy feet perpendicular height, clothed with trees and gigantic ferns. A winding but very steep path conducted to the bottom; and, after moving onwards a few hundred yards more, we came to a second ledge, whence we heard the deep roaring of the volcano, like the sounds proceeding from a blast furnace. And now, at every step, we perceived yawning chasms, of unknown depth, from some of which columns of black smoke issuing told of what was going on in the realms of fire below. At length we reached the edge of the crater; but words are totally inadequate to describe the effect produced on us by the first

sight of that dark fiery gulf. From its brink, where we stood, we looked down for more than 1300 feet, over rocks of lava and columns of sulphur, between whose antique fissures a few green shrubs and juicy berry-bearing plants had fixed themselves to a rugged plain, where many a cone, raised by the action of the fire below, was throwing up columns of living flame, and whirls of smoke and vapour, while floods of liquid fire were slowly winding through scoriæ and ashes, here yellow with sulphur, and there black, or grey, or red, as the materials which the flames had wrought on varied. Not less than fifty cones, of various height, appeared below, as the funnels of the various operations going on. At least one half of these were in activity, but it appears that the same are by no means constantly so; nay, that often older cones fall in; and new ones are formed elsewhere in the bottom of the pit. Some eject stones and fragments of rock, while from their dark and sulphur-coloured flanks, lava, and sometimes water, issues: many of the cones emit vapours, which, condensed, form beautiful beds of sulphur; others are distinguished by the wreathed columns of white and black, that indicate steam and smoke, curled round each other by the wind, but never mixing."

6528. *Captain King*, in 1779, estimated the *population* of these islands at 400,000; but, though this number is adopted by *Hassel*, we have no hesitation, with *M. Balbi*, in preferring that of *Ellis*, who reckons only 130,000. The distribution made by *Captain King* through the islands may, however, give an idea of their relative importance. He assigns to *Owhyhee* 150,000; to *Mowee*, 65,400; to *Woahoo*, 60,200; to *Atooi*, 54,000; to all the others united, 70,000. A third part of these numbers may approach the truth. The natives are tall and robust, especially the chiefs, who here, as in the other islands, appear like a superior race to the lower orders. As compared with the *Otaheiteans*, they are of a dark brown complexion; and the females do not display the same softened graces. But these islanders are distinguished above all other inhabitants of the South Sea by diligence and skill in the pursuits of industry. While the *Otaheitean*, in voluptuous ease, subsists chiefly on the spontaneous bounties of nature, the *Sandwich Islander* has carefully improved almost every spot susceptible of cultivation. The taro root, on which he chiefly subsists, requires a soil not only tilled, but inundated; the fields on which it grows, therefore, are enclosed by stone fences, and watered by irrigating canals. In manufactures, canoe-building, and fishery, these islanders display the same active industry. Their general conduct is open, honourable, and friendly; yet they are easily kindled to fierce resentment, especially by any wrong against their chiefs. Such a cause led to the disastrous conflict which terminated in the death of *Cook*; and the circumstance of one of their great men being fired at from a *West India* vessel led afterwards to the murder of *Messrs. Hergest and Gooch* of the *Dædalus*. The people have been peculiarly distinguished by their efforts to raise themselves to the level of European arts and civilisation. In this career they were first led by *Tamahama I.*, who, about the year 1794, with the assistance of *Vancouver*, and of *Young and Davis*, two English seamen, began to form a small navy, which soon amounted to twenty vessels, some of seventy tons' burden: he had disciplined a small body of troops in the European manner, and erected a fort defended by cannon. His son, *Riho-Riho*, in 1819 embraced Christianity, and abolished idolatrous worship. Still farther to promote the improvement of the country, he and his queen paid a visit to England, where they were received with the utmost courtesy; but, unfortunately, both were seized with contagious fever, and died. His son being a minor, political influence was shared by several female relations and chiefs; but the same system has been, on the whole, maintained; and though one queen endeavoured to renew the festive and tumultuary rites of the ancient superstition, the chiefs refused to concur. For some time scarcely any religion was substituted for the one abolished; but, since 1825, missionaries from the United States have made great efforts for the instruction of the natives, and have established an extensive influence. *Lord Byron* and other maritime visitors accuse them of having established too austere a system, of proscribing innocent amusements, and requiring a long daily attendance at church, which interferes with the pursuits of industry; but these complaints, prompted by the opposite character of the two parties, seem exaggerated, and missionary influence undoubtedly tends, on the whole, to advance the progress of civilisation. The commercial activity already noticed prevails chiefly at *Honororu*, in the island of *Woahoo*, the only place in these islands deserving the name of a town. It contains about 5000 inhabitants, nearly a hundred of whom are Anglo-Americans and English. Some of the houses are built of stone; and the signs of "the *Britannia*, the *Jolly Tar*, the *Good Woman*, billiards, and an ordinary at one o'clock," strikingly testify the transplantation of European habits into this remote and lately savage region.

6529. The cluster of islands which is now commonly called the *Archipelago of Mendana* consists of two groups, named the *Marquesas* and the *Washington Islands*. The former, long the only part known, was discovered in 1596 by the Spanish navigator, *Alvaro Mendana*, who gave to them the name of the *Marquis of Mendoza*, then viceroy of Peru. After being long forgotten, they were rediscovered and examined with considerable attention by *Cook*. The more northerly group was first visited, in 1791, by an American named *Ingraham*, and then in 1792 by *Marchand*; but the American's discovery being prior, his name of "*Washington Islands*" has been generally recognised. They were examined in 1804 with some attention by *Krusenstern*,

and have since been frequently touched at by British and American ships. These islands are elevated, and the mountains, rising to the height of 4000 or 5000 feet, are extremely broken and craggy, while a sandy belt extends along the sea; but the intermediate valleys are singularly fertile and picturesque, copiously watered by streams which descend in numerous cascades, one of which, in Nukahiwa, being 2000 feet high, is among the most beautiful in the world.

6530. *The population* has been estimated variously, and, indeed, extravagantly, since Forster assigned 100,000 to the mere group of the Marquesas. The more careful observation of Krusenstern and other recent navigators has reduced this number to 18,000: the same is assigned to Nukahiwa; while the other Washington Islands may raise the whole somewhat above 40,000. Nature, in providing the people with the bread fruit, the cocoa nut, and the banana, affords them subsistence almost without labour. They add only a few plantations of yams and taro, and reserve their chief labour for the plant which yields the intoxicating liquor of *kawa*, and for that from which their mats are fabricated. The domestic animals are hogs and poultry, the dog being wanting. The men of these islands are described as tall, robust, and the most finely formed of almost any known race. They would not, it is asserted, lose by a comparison with the most perfect models of ancient sculpture. Their complexion, even, is little darker than that of Europeans; but it is visible only in the youths, for the tattooing, practised over all the South Sea, is carried here to such a pitch, that the skin of the adult becomes the mere canvass of a picture. The operation begins at twelve or thirteen, but it is not till thirty or thirty-five that their person is entirely covered. The women have handsome features, but their gait is slouching and their limbs ill formed: they have an air marked by effrontery, and hold virtue in scarcely any estimation. The character of these islanders displays the usual contrasts of savage life; in their ordinary intercourse they are friendly, open, and engaging; but they carry on war with the most deadly ferocity, piercing the brain of the vanquished enemy, and eagerly drinking his blood. The islands are divided among a number of independent chiefs and tribes. The missionaries have made some attempts to communicate Christianity and civilisation, but hitherto with little success. The different islands have received from their successive visitors rather a perplexing variety of names. Ohivahoa, the largest of the Marquesan group, is called also Santa Dominica; to which may be added the more frequented one of Tabouata or St. Christina, and Tatouiva or Magdalena. The Washington group, besides its principal one, Nukahiwa, contains Ouabouga or Washington, and Ouapon, called also Adams or Trevanion.

6531. *The Friendly Islands*, a name which, notwithstanding the examples of Hassel and Balbi, we are unwilling to exchange for that of the Tonga Archipelago, forms a fine and interesting group, considerably to the west of Otaheite. With a single exception, they present nothing of that lofty aspect, or those symptoms of volcanic origin, which distinguish the large islands hitherto described. They consist of a basis of madrepore, raised apparently from the bottom of the ocean, by the well-known action of insects; and the coasts are encircled by dangerous coral reefs. The ground rises not in general more than 20 or 30 feet above the sea; nor do the highest hills exceed 100 or 150 feet. Hence they are not, like the high islands, irrigated by copious streams; and the people are in many places obliged to procure an inferior water from wells or ponds. Yet the soil is almost throughout exceedingly rich; and the natives carefully improve it, keeping their plantations in excellent order, adding to the spontaneous abundance of the banana and the bread fruit by the careful cultivation of the yam and other roots. These islands thus maintain a population which, though evidently overrated by Forster at 200,000, may probably be estimated in the Tonga group at 50,000, and in the others at 30,000 or 40,000. In the construction of their vessels they are scarcely equalled by any other natives of the South Sea. The double canoes, composed of pieces sewed together, are 60 or 70 feet long, and about 5 broad, and the two parts, 6 or 7 feet asunder, being united by a platform, render the vessel spacious and commodious, while it is capable of navigating with safety even distant seas. The natives of the Friendly Islands (*fig. 1098.*) are of a dark brown complexion; the men are muscular,

1098

NATIVES OF THE FRIENDLY ISLANDS.

with broad shoulders, and the women are often deficient in delicacy of form and features; but many of both sexes present models of almost perfect beauty, and their expression is generally mild and agreeable. Their character has been drawn in more flattering colours than that of almost any other people of the South Sea. The name given by Captain Cook expresses his opinion of their disposition. They seem to possess the amiable qualities of the Otaheiteans, with a smaller measure of their faults. If neither their honesty nor the virtue of their females could withstand the temptations of European intercourse, among themselves both appear to be exemplary; and their domestic attachments are warm. Yet a more intimate observation has discovered among them all the darkest features of savage life. An European vessel, having fallen into their power, was plundered, and the crew murdered with merciless

cruelty. Their wars are carried on with the utmost ferocity. They have a complicated system of superstition, worshipping upwards of 300 *eatooas*, or deities, which preside over the sky, the rain and other elements, and assume often the forms of serpents, lizards, and dolphins. They believe also that the British have a national god, whom they admit to be wiser and more powerful than theirs, from the fine cloth and ships he has taught them to make. A party of missionaries landed from the ship *Duff* were

at first well treated, and the chiefs, particularly Finow, showed a great interest in regard to European arts, and, among others, that of writing. The natives, however, having imbibed the superstitious idea that a pestilential disease which desolated the islands owed its origin to these strangers, put several to death; others perished in civil wars; and though a small party still remain, they do not appear to have made any material impression, either in regard to religion or civilisation. The Friendly Islands are very numerous: including those of all sizes, they are supposed not to be fewer than 150. The largest, however, is not above seven miles in length. The principal in the Tonga group are, Tongataboo, Eooa, and Annamooka, called by Tasman, their first discoverer, Amsterdam, Middleburg, and Rotterdam. In another group is Tofoa, the only mountainous island, containing a volcano, which manifests some degree of activity. Lefooga, the principal of the numerous group of the Hapae Islands, was long the residence of a chief who held sway over the others. Vavaoo, in another cluster, is the second in size of the whole archipelago, and one of the most fruitful.

6532. *The Feejee, Fidschi, or Viti Islands*, situated to the north-west of the Tonga group, are so closely continuous, that they may properly be considered as forming part of the same archipelago. They were partially discovered first by Tasman, afterwards by Cook, and have been more fully observed by Bligh and some American vessels; yet they are still very imperfectly known. To this chiefly it seems owing that they have not excited equal interest with those just described; for they are considerably larger, and equally fertile and populous. Paoo, or Tacanova, is about fifty leagues in circuit: it belongs to the class of high islands, being traversed by mountainous ridges, though several members of the group are low and encircled by coral reefs. They abound in the usual Polynesian products, particularly in sandal-wood, which American ships have begun to carry off in considerable quantities for the market of China. The people, though not negro, are of a darker complexion than those of the Tonga Islands. Yet they do not appear to rank lower in arts and civilisation; their canoes, their cloths and mats, are equal or superior to those of their neighbours. Some whom D'Entrecasteaux saw in Tonga appeared to him to have more character and intelligence than the natives of that island. The deep ferocity with which they are branded may, perhaps, arise mainly from the light under which they have been viewed, and their being known chiefly through the report of their enemies. They are certainly a martial people. On going to battle they paint their faces; and having bored the *septum* of the nose, stick into it two large feathers. Their name is terrible to the Tonga Islanders, with whom they wage frequent war. They were lately subject to Finow, but have made themselves independent; and the power is now shared among several individuals. Besides Paoo, Nawihi, Lewu, and Meywoolla, are of considerable dimensions.

6533. *The Navigators' Islands* may also be considered as belonging to the Friendly Archipelago, of which they compose the north-east portion. They were partially seen by Mendana, then by Schouten, afterwards more fully by Roggewein, who gave them the name of Bauman's Islands, changed since by Bougainville to *Navigators'*, which does not seem more applicable to these islanders than to the other Polynesians; yet the name being now established, M. Balbi will, perhaps, in vain attempt to change it to Hamoa. The interior is elevated, and the rocks seem to exhibit marks of volcanic origin; but the mountains are clothed to the summit with lofty trees, and the wooded valleys beneath, watered by numberless streams and rills, present an enchanting landscape. These trees, bearing the usual nutritious fruits, maintain the natives in plenty, which is augmented by the great number of dogs, poultry, and hogs, of which last Pérouse purchased 500 from two islands. The men are of almost colossal height, and finely formed; their complexion nearly white, though in the adults completely concealed by tattooing. In the construction of their houses and canoes they are at least equal to the other Polynesians; and their cloths are woven with a skill not equalled in Otaheite. Respecting their moral qualities, the reports have been very opposite. Roggewein paints their friendly and courteous disposition in terms as flattering as have been applied to the most engaging of the South Sea islanders; while Pérouse represents them in the darkest colours. He had, indeed, too good reason; since a party, composed of Langlès, captain of the *Astrolabe*, Lamanon the naturalist, and nine others, who had landed on Maouna, were surprised, massacred, and their bodies treated with the most dreadful indignity. Yet, notwithstanding the excellent character of the French commander, the impulses which rouse vindictive passions in the savage breast are often so mysterious, that it might be rash to draw a sweeping inference from this catastrophe. Since its occurrence, however, these islands have been rarely visited. Pala, Oyalava, and Maouna, are the largest in the group, and may rank with the most considerable in the South Sea.

6534. *The Carolines* form a very extensive and numerous range, the most western of Polynesia, and extending for upwards of 30 degrees, or about 2000 miles. They lie north, while the Society and Friendly Islands are south, of the equator. A few of them are high and peaked, though they do not attain the alpine elevation of those of Eastern Polynesia, being supposed not to rise much above 3000 feet: all the others are low and of coral formation. They have been among the latest and most imperfectly known in the South Sea. They were discovered, first in 1686, by Francisco Lazeano, driven thither by a storm from the *Ladrones*, who gave the name after Charles of Spain. Since that time there has been a considerable intercourse between the two groups; and the shipwreck of Captain Wilson, in 1783, made us acquainted with the *Pelew Islands*. The French commanders Freycinet and Duperrey have recently made valuable observations on these islands. In productions they resemble the rest of Polynesia, except that the bread fruit abounds only in the eastern islands; and the hog is unknown unless in the *Pelew* group, where it has been introduced by Europeans; so that fish forms almost the only animal food. They are situated in a most tempestuous ocean, exposed to violent hurricanes, one of which often sweeps away the entire produce of an island; yet the people are still more at home on the waves than even the rest of the South Sea islanders. Besides drawing from them a copious supply of fish, they equip large barks with sails, and by the aid only of the stars navigate across these stormy seas to the *Ladrones*. There they obtain iron and some European manufactures, part of which is afterwards exchanged with the more easterly islands for bread fruit. Hogoleu, Yap, Oualan (first visited by Captain Duperrey, and found possessed of a very considerable degree of civilisation), and Pounipet, discovered by the Russians in 1826, are high islands, and the largest in the archipelago. The group containing Ulea, Lamourzek, and Oulimirak, though composed only of low coral islands, is distinguished by the skill of the natives in navigation. Their vessels are superior to those in the rest of the archipelago; and it is by them chiefly that the communication with the *Ladrones* is maintained, by means of a small annual fleet which rendezvouses at Lamourzek.

6535. *Lord Mulgrave's Islands* form a group so closely adjoining on the east to the Carolines, that they can scarcely be considered otherwise than as a branch of that great archipelago. They were first found out by Captains Marshall and Gilbert, in a circuitous voyage from Port Jackson to Canton; afterwards more fully examined, in 1817, by Kotzebue, who discovered the important isles of Radack and Ralik. They consist of a crowd of low coral islets, raised, like the others, by a peculiar process from the bottom of the ocean. The interior rises into verdant hillocks, but the immediate coast is sandy; water is found only in deep wells, and is wanting in some islands, though others are irrigated by streamlets. Hence no luxuriant variety of vegetation is displayed, and the chief dependence is upon the pandanus, whose hill-formed trees, yielding a juicy aromatic fruit, are seen growing on the most arid shores. The cocoa nut, in scanty supply, is employed only for ropes and sails. The islands are entirely destitute of land animals except rats, which are numerous, and sometimes eaten as food. They are peopled up to the limited resources which nature affords. The natives are

described under more amiable colours than almost any other in the South Seas, as friendly, courteous, and amiable; free from the thievish propensities and dissolute conduct which are there so general. The particulars must be counted, not by islands, but by groups; those of Radack and Ralik, discovered by the Russians, being the most important. Those of Gilbert, Simpson, and Bishop, farther to the south and east, have received their names from British discoverers.

6536. *The Pelew Islands* form a western branch of the Caroline Archipelago, not materially differing in character. They are of moderate elevation, well wooded, bordered by dangerous coral reefs. They were mentioned near the beginning of last century by Cantova and the Spanish missionaries; but they became first an object of interest in Britain, by the shipwreck, in 1783, of Captain Wilson in the *Antelope*, when he was received, and his wants supplied, with the most generous kindness. Abba Thulle, the king, with an enlightened desire to improve his people by a knowledge of the arts and attainments of Europe, sent along with the captain his son the prince Lee Boo, who delighted the society of the metropolis by the amiable and intelligent simplicity of his manners; but, unfortunately, this young prince was seized with small-pox, and died. Keats, from the report of Wilson, drew up a narrative of the voyage, in which the Pelew islanders are represented under the most pleasing colours. It is remarkable, that the British navigators who since that time have frequented these shores, with the view of procuring tripang and other commodities for the Chinese market, have drawn a completely opposite picture, representing these people as displaying all the bad qualities incident to savage life; and this agrees with the early report of Cantova. Man in this social stage appears very variously, according to the point of view in which he is seen. Even Wilson witnessed an inhuman massacre of prisoners taken in battle. Cantova probably heard them described by tribes with whom they waged war; and the modern navigators may not have always acted in a manner calculated to develop a friendly disposition. They have certainly added very little to our knowledge of the group, of which Babel-thu-up, Coror, Emungs, and Pellelew are the principal. The small island of Oroolong was presented by Abba Thulle to the British, but has not been occupied.

6537. *The Ladrone or Marianne Islands* form an early known and celebrated group, almost immediately north of the Carolines. It was discovered by Magellan in the first circumnavigation of the globe in 1512. He gave it the name of *Los Ladrones*, from the thievish propensities of the natives; but the Spaniards, who, finding it in their way from Mexico to the Philippines, formed a settlement there, substituted the name of the *Mariannes*, in honour of their reigning queen. Most of the early circumnavigators, Cavendish, Dampier, Anson, as they began by proceeding to a high latitude along the American coast, when they came to cross the Pacific, found those islands in their way; while Cook and his successors, seeking discoveries in a different direction, passed direct from the Friendly Islands into Australasia; but several late French and Russian expeditions have taken the route of the Mariannes. By some navigators, and particularly by Anson, they were celebrated as completely a paradise; and though this impression was evidently much heightened by the previous long and exhausting voyages, they seem really to possess all the advantages of the most favoured Polynesian groups. They are moderately elevated; but the mountains in the centre do not rise much above 2000 feet, and from them the surface descends by terraces to the shore, which, like others in these seas, is begirt with dangerous coral reefs. It is covered, for the most part, with the rich vegetation peculiar to these climates; and though Europeans at first found the islands destitute of any useful quadruped, the Spaniards have introduced with success not only those of Europe, but the guanaco from Peru, and the deer from the Philippines. The natives in the three principal islands, estimated, on the discovery, at 40,000, were a remarkable people, who had, in some respects, made greater progress in the arts than the other South Sea islanders. They were, indeed, very inferior to the Otaheiteans in clothing, the men being almost naked, and the women wearing only a small apron; and their household furniture, though neat, was very limited: but their agriculture and canoe-building were fully equal; and they had the remarkable superiority of possessing a rude species of coin, and of having erected spacious structures dedicated seemingly to religious purposes. These were composed of an inner and outer range of pyramidal columns, crowned by a semicircular dome; the whole composed of sand and stone, cemented together and covered with gypsum. Civilisation was also indicated by the high rank held by the female sex, who were exempted not only from oppressive labour, but from the degradation connected with the practice of polygamy. The wife, if slighted, could return to her parents, carrying with her the whole of the household goods; while, if she herself proved unfaithful, the husband might indeed kill her seducer, but was obliged to send her home uninjured. When the Spaniards, in 1678, formed an establishment in these islands as a place of refreshment for the Manilla galleon, they endeavoured as usual, to impose their sway and their religion on the natives, who strenuously resisted both; and in the struggle the greater part of them were exterminated. A few found refuge in the Carolines; others fell victims to pestilential diseases; and the small remnant can scarcely be distinguished from their conquerors. Tinian, so celebrated by Anson, is overgrown with forests, amid which the ruins of its spacious edifices can with difficulty be traced. The population of the three principal islands was found, in 1816, to consist of only 5389 individuals, composed chiefly of Spaniards, Tagalas from Manilla, and Indians from Peru. Agrigan, the capital, in the island of Guam, contained 3115 of this number.

CHAP. III.

ISLANDS IN THE POLAR SEAS.

6538. To complete the description of the detached and insular portions of the globe, there remain still a considerable number of *large islands*, situated in the stormy seas by which the two *poles* are encircled. Although these regions be dreary, desolate, and almost uninhabited, they present features which strongly attract the interest and curiosity of mankind, and have induced many daring adventurers to explore and navigate these remote coasts and seas.

SECT. I. *General Outline and Aspect.*

6539. *The Polar Islands* are situated partly in the seas round the North, partly in those round the South Pole. The former, lying within the Arctic Circle, are by much the most numerous and extensive. Commencing from the eastward, we find Nova Zembla, reaching northward from the boundary of Europe and Asia; Spitzbergen, called sometimes East Greenland, the most northern land yet visited; West Greenland, a mass of territory possessing almost the magnitude of a continent, and long supposed to be part of America, from which, however, it now proves to be entirely disjoined; lastly, the range of the Georgian Islands, discovered by Captain Parry, of which the principal are Cornwallis, Bathurst, Melville, and

Banks's Land, the boundaries of which last are yet unknown. In the Antarctic Ocean, on the contrary, where a new continent was long sought and expected, no extensive body of land has yet been discovered; but there are some considerable islands, or groups, particularly New Georgia, New South Shetland, and the New Orkneys. All these tracts are either insular, or broken by deep bays and sounds, formed, probably, by the violent storms and currents which beat continually against their shores, and which are supposed, in many cases, to penetrate entirely across the most solid masses of land. The aspect of these regions is usually mountainous, presenting long and bold promontories to the stormy seas by which they are surrounded, and often also enclosing spacious and secure harbours.

6540. *The air and elements*, which, in other parts of the world, are only accessories, form here the leading objects, giving their gloomy stamp to the whole region. Snow falls occasionally in the very heart of summer, and before the end of autumn it begins to descend in a continued succession of showers, till every object is buried beneath it, and nature exhibits only a monotonous surface of dazzling white, which remains, according to the latitude, for six, seven, or eight months. At the same early period ice begins to bind, first the streams and freshwater lakes, then the enclosed bays and arms of the sea, till at length it fixes its chains even upon the broad surface of the ocean. In June and July, indeed, when the sun becomes vertical, and constantly above the horizon, the icy masses dissolve, and burst asunder often with a tremendous crash; but some portions, more firmly consolidated than the rest, remain unmelted, and produce remarkable phenomena. In particular situations on the coast, the ice of successive years is piled into glaciers, which rise often to a great height, till, their foundation being undermined by the waves, they descend into the water, and are carried out by wind and tide into the open sea: there they form to the mariner a bright and fearful spectacle (*fig. 1099.*), reflecting the rays of light in varied

ICE ISLAND.

and beautiful tints, but threatening by their contact to dash his vessel to pieces. Sometimes they are borne by winds and currents to a great distance, and even into lower latitudes, where they appal the navigator sailing through the temperate seas. In other cases, portions of the frozen surface of the sea, remaining firm while all around them is melted, become fields or *floes*, which float through the deep, and, being often driven by the tempest with terrific violence, cause instant destruction to the stoutest vessel.

6541. *The privation of light* forms a singular and gloomy circumstance in the arctic

abodes. For two, three, or four months, the sun never appears above the horizon; one continued night reigns. Yet there are not wanting objects to cheer this lengthened gloom, and to give a bright and even fairy splendour to the polar sky. The moon and stars shine through the clear frosty air with peculiar brightness; haloes and other luminous meteors are more frequent and more vivid than in lower latitudes; and, above all, the aurora borealis fills the arctic atmosphere with its coruscations of playful light. The long day of summer, during which the sun never sets, can scarcely be named as a compensation for the wintry gloom; yet, during a period of spring and autumn, when it wheels a perpetual circle immediately above the horizon, it paints the skies with hues more brilliant and varied than those which adorn those of any other climate.

SECT. II. *Natural Geography.*

6542. The Polar regions are chiefly distinguished by the almost *entire absence* of those productions which come under the head of *natural history*. The few which are found there are common to them with the continental countries, already described, that are situated in very high latitudes,—Sweden, European Russia, Siberia, the northerly regions of America, and the most southern parts of that continent.

SECT. III. *Historical Geography.*

6543. *These regions* were discovered much later than any other, and were, indeed, till a very recent era, entirely unknown. The only ancient navigator that appears to have turned his efforts in this direction, was Pytheas of Marseilles, who steered his daring sail towards the extreme northern boundaries of the earth. But when he reached Thule, which we conceive to be Shetland, the dreary aspect of nature, the gloomy mists in which he was involved, and the sinister reports of the natives, led him to believe that he had approached as near as mortal could to that formidable limit. Some learned moderns have imagined Thule to be Iceland, but, as we apprehend, without any good foundation.

6544. *During the middle ages*, the Danes and Swedes, under the terrible appellation of Northmen, undertook, on a great scale, distant voyages, and filled with their fleets all the seas of Europe. Their object, however, was not discovery, but first plunder, and then conquest; and their direction was towards the rich and smiling regions of the south, not to shores

still more bleak and dreary than their own. In 861, however, Nadodd, a pirate, discovered Iceland, whither a colony, composed of exiled Norwegian chieftains, was soon after sent. These remote settlements became even seats of science, affording a refuge to learned men amid the distracted state of Europe during the feudal ages. Colonies from Iceland settled on the coast of Greenland. Several citizens of Venice, during the flourishing era of that republic, particularly Zeno and Quirini, appear to have penetrated into the north seas, where they encountered severe shipwrecks; but they did not materially extend the range of knowledge in that direction.

6545. *The discovery of the East and West Indies*, which took place in the end of the fifteenth century, was the event which chiefly impelled modern nations into the career of northern discovery. It might at first view have been expected that it would have produced an opposite effect, and that the brilliant field thus opened might have diverted the attention from so forbidding a sphere. It happened, however, that the continents of Africa and America were so interposed, as to render it impossible for Europeans to sail to the East Indies unless by very circuitous southward routes. But if a passage could have been discovered along the north of Asia or America, it would, in a most remarkable degree, have facilitated the intercourse with those remote and opulent regions. The spirit of maritime enterprise was then at its height; the British merchants fitted out successive expeditions, which, under the guidance of illustrious naval commanders, encountered the most formidable dangers in unknown and tempestuous seas, in fruitless efforts to attain this important object. The first attempt, under Sir Hugh Willoughby, to follow a north-easterly route along the coast of Asia, met with the most disastrous issue. Being obliged to winter on the coast of Lapland, the whole crew were frozen to death. This did not deter from subsequent expeditions, under Hudson, Burroughs, and others; and by the Dutch, under Barentz; but none of these were able to reach far beyond Nova Zembla. Contemporaneous with these voyages were others still more frequent, having in view to pass along the northern coast of America, which it was long hoped might terminate at a lower latitude than it actually does. Frobisher first in this direction undertook three voyages, in which, however, he did not penetrate beyond the passages leading into Hudson's Bay. Davis afterwards conducted an equal number, in the course of which he discovered the straits which bear his name, opening into the spacious inland sea which has since been so much frequented. Others followed; and Hudson, in discovering the bay named after him, found a disastrous termination to his career. But the most important of these expeditions, in the present view, was that of Baffin, who, in 1616, performed the circuit of the wide expanse called Baffin's Bay, though he did not discover the passage thence into the Polar Sea. Meantime the daring spirit of British mariners had conceived the design of reaching India by a very different course,—by steering direct for the pole itself, and thence downwards upon the eastern seas; the shortest of all routes, if, as was asserted, it was not closed by barriers of ice and perpetual snow. Hudson, Baffin, and Fotherby distinguished themselves in this bold attempt; but they were not able to reach nearer than ten degrees from the Pole. They made, however, the discovery of Spitzbergen, or East Greenland, of some smaller islands, and of the eastern coast of West Greenland.

6546. *These voyages*, though they failed entirely as to their immediate object, led to an important result, the establishment of the *northern whale fishery*, which has become a considerable branch of modern industry. It was for some time almost monopolised by the Dutch, who had even formed a large establishment on the coast of Spitzbergen; but circumstances have now thrown it almost entirely into the hands of Britain. The observations made during the annual voyages, undertaken for this purpose, ably collected by Mr. Scoresby, have made us acquainted with various striking phenomena which nature presents on the seas and shores of the arctic world.

6547. *On the opposite side of the globe*, the Antarctic Circle encloses a region of precisely similar character, which remained to a still later period entirely unknown. The extended sphere of modern navigation, however, has brought it also at last within the range of discovery. An extraordinary interest was, for a considerable time, excited by the belief that, in this distant region there lay a great southern continent, supposed by some to equal in extent and fruitfulness any of those already known. Captain Cook's second voyage was fitted out amid the most flattering anticipations of such a discovery. But though that great navigator made some very important observations on the large islands composing Australasia, he ascertained the fact that in any temperate or even habitable latitude no such continent existed. The extreme intensity of cold was even found to commence at a much lower latitude than in the northern hemisphere. Several considerable islands have recently been discovered, though almost beyond the range of life or cultivation. In these seas, also, room has been found for the establishment of a whale fishery, which, notwithstanding the great distance, is carried on with considerable advantage.

6548. *The hope of a north-west passage*, after sinking nearly into oblivion, was revived in the present age with undiminished ardour, and prosecuted with signal displays of naval enterprise and talent. The efforts and sufferings of Ross, Parry, and Franklin have not, indeed,

fulfilled the hopes with which these navigators were sent out, but proved, rather, that such efforts must be finally given up. They have, however, made important geographical discoveries, delineating the northern outline of America, before most erroneously laid down, and exhibiting large islands lying in the Polar Sea, to the north of that continent.

SECT. IV. *Political Geography.*

6549. The few tribes which occupy these desolate coasts are scarcely united in any form of political society. The little that occurs to be said on this subject will be found in the chapter on their civil and social state.

SECT. V. *Productive Industry.*

6550. *The produce of the arctic world is of a very peculiar nature. A territory thus buried for the greater part of the year in ice and snow, with only a transient and imperfect vegetation, and where the few animals that appear during the summer gleam take an early flight into milder climes, might at first view seem incapable of yielding any thing that can minister to the use or comfort of civilised man. But while the land is thus dreary and barren, the sea and its shores teem with an inexhaustible profusion of life. The finny tribes, which, feeding on each other, do not require any vegetable support, exist here in greater multitudes, and of larger dimensions, than any other animals, either in the temperate or tropical climates. Provident nature has, in particular, fenced them against the extreme intensity of the cold by a thick coating, of a coarse but rich oleaginous nature, termed blubber, the oil extracted from which is subservient to the most important economical purposes. The substance called whalebone, being peculiarly strong and elastic, affords a material of several manufactures.*

6551. *The seal, the walrus, and several other amphibious animals, are invested with the peculiar coating above described; but by far the greatest abundance of it is found in the whale. The *Balaena mysticetus*, or great Greenland whale, is the most powerful of animals; and to attack and slay him is one of the boldest of human enterprises; yet it is undertaken with alacrity by our hardy tars. For this purpose, fleets of large ships, well equipped with boats, lines, harpoons, and spears, are annually sent into the northern seas. There, each vessel, with all its boats, is constantly on the watch; and when the alarm is given of a whale being descried, all fly to the onset. The first object is to strike into the animal the sharp instrument called the harpoon, which has a long line attached to it. When the whale feels himself struck, he usually plunges deep into the water, and runs on to a great distance under it. The line must then be freely let off, otherwise he will drag the boat and crew under water after him. If it is entangled or exhausted, it must instantly be cut; and then the whale, line, and harpoon are all lost. After a certain interval, the animal is obliged to come to the surface, in order to respire. The boats then crowd around him, and the sailors pierce him with lances, till he is completely exhausted, and, after another short descent, and some violent convulsive movements, he expires. The carcase, being attached to the sides of the ship, is flensed, or the blubber cut away, and stowed in casks; when, the whalebone being also extracted, the refuse is allowed to sink to the bottom. Great dangers are encountered in this trade, partly from the whale, one lash of whose tail has been known to throw a boat in the air, and almost cut it in two; and from the fields and mountains of ice, which, when impelled violently by the wind, reduce the stoutest vessel in a few minutes to a complete wreck, when the crew are obliged to seek safety on its frozen surface. Not unfrequently, too, about the close of the season, a ship is completely imprisoned in ice, and the sailors are compelled to abandon her, and seek, in boats, or over the ice, for another ship or the nearest land. The Dutch estimated that, on an average, four vessels in the hundred annually perished. The British loss has been generally still more severe, especially since the fishery was chiefly carried on in Davis Straits. In 1819, there were lost ten ships out of sixty-three; in 1821, eleven out of seventy-nine; and, in 1822, seven out of sixty. In 1829, the loss was only four out of eighty-nine; but the year 1830 was the most disastrous ever known in the annals of British fishery: out of ninety-one ships sent out, nineteen were entirely wrecked, and most of the others severely shattered. One single mass of ice was impelled by the tempest with such violence, that, by its shock, four of the finest vessels, strongly built and completely equipped, were, in a quarter of an hour, converted into floating fragments. Fortunately these dreadful wrecks took place without the loss of a single life.*

6552. *The commercial products of this fishery are considerable. According to tables published by the Dutch, in the course of 107 years, ending with 1778, they sent out 14,167 ships, which took 57,590 whales, the produce of which, in oil and bone, was 18,631,292*l.*, or 175,000*l.* annually. The British fishery, during its most prosperous period, very much exceeded this amount. In the five years ending 1818, it yielded an average of 68,940 tuns of oil and 3420 tons of whalebone; which, as the oil was then valued at 36*l.* 10*s.*, and the bone at 90*l.*, formed an amount of 2,834,110*l.*, or 566,822*l.* per annum. In the peculiarly fortunate year of 1814, it exceeded 700,000*l.* Since that time, the use of gas, and the substitution of rape and other oils in the woollen manufacture, has considerably reduced the demand and consequent production. In the year 1829, which may be considered as the latest average one, it was*

10,672 tuns of oil, at 25*l.* - - - 266,800
807½ tons of whalebone, at 180*l.* 109,350

£376,150

It may be observed, that the price of whalebone has nearly doubled since 1818, the demand for it continuing the same, while the supply, in consequence of the diminished consumption of oil, has been greatly reduced. Generally speaking, the fishery is, for the proprietors, a very speculative and adventurous trade: according to the skill of the officers, or to mere accident, a ship may return *clean*, or empty; or it may bring home a cargo worth 5000*l.* or 6000*l.*: an instance has occurred in which the value amounted to 11,000*l.* The shipwrecks, which are so frequent, involve at once the failure of a cargo and the entire loss of a vessel worth 6000*l.* or 8000*l.* The loss sustained by the wrecks in 1830 was estimated at upwards of 140,000*l.*

6553. *The southern whale-fishery has of late risen to a considerable and increasing importance. The object of pursuit here is the species of whale called *cachalot*, which, compared with the *mysticetus*, yields a much smaller quantity of oil; but this, being mixed with *spermaceti*, is greatly superior in value. This animal, also, under certain circumstances, voids the peculiar substance called ambergris. The following table, from Mr. M'Culloch's Dictionary, shows the extent of this trade in 1830:—*

Ports.	Year ending 5th of January, 1828.			Year ending 5th of January, 1829.			Year ending 5th of January, 1830.

SECT. VI. *Civil and Social State.*

6554. *Human society*, in this bleak extremity of the earth, exists in the rudest form, and on the most limited scale. The ungrateful soil refuses to man any support; but the huge amphibia, particularly the seal and the walrus, with which the shores are crowded, being attacked with a skill and diligence prompted by necessity, yield a precarious yet not scanty subsistence. All the arctic regions are peopled by that peculiar race called Esquimaux, whom we have already described, on the authority of Captain Parry, in our survey of the northern coasts of America. The greater number of them, not belonging to America, are found on that extensive mass of land called West Greenland. The dominion of this region is claimed by Denmark, which maintains along the shore a few scattered settlements, occupied each by a handful of Danes, who often intermarry with the natives. They employ themselves in capturing the seal, and in exchanging with the people some European goods for skins, blubber, feathers, and the tusks of the narwal. A vessel comes annually from the mother country, bringing provisions and the materials of trade, and receiving the above articles. A few missionaries, chiefly Moravian, have employed their pious labours in the conversion of the natives; but their success has been limited.

SECT. VII. *Local Geography.*

6555. *The local details* of the arctic regions are extensive and scattered, but do not present many peculiarities which will require long to detain our attention. We shall begin with the Georgian Islands, discovered by Captain Parry in the sea to the north of America.

6556. *Melville Island*, the most westerly of these, upwards of 100 miles both in length and breadth, and in latitude 75° N., is memorable as containing the spot where Captain Parry spent two years, and braved with success the extremest rigour of an arctic winter. The sun disappeared on the 4th of November, and was not seen till the 3d of February following. During this interval, land and sea were alike covered with a monotonous surface of snow, and the thermometer averaged about 60° below the freezing point. Yet the English officers, when duly clothed, and when there was no drift, were able to walk in the open air for two or three hours a day; and, by judicious precautions, their health and that of the seamen was perfectly preserved. In May the snow begins to melt, and in June it covers the country with pools; but it is not till August that the sea becomes open; and, before October, winter has again commenced. No inhabitants were found here, or on any of this range of islands. The only animals which appeared during the winter were a pack of hungry wolves, which hovered round the British vessels in hope of plunder; and it was not till the middle of May that the hunters met with some ptarmigans, and saw the footsteps of deer. Vegetable productions were few and short-lived.

6557. *A succession of islands* extend eastward from the one now described; first the small one of Byam Martin, then that of Bathurst, almost equal to Melville; and next Cornwallis, also of considerable size. Only the southern coasts were seen by Captain Parry, as he sailed along; and their aspect appears closely to resemble Melville Island. Cornwallis is separated by Wellington Channel from an extensive coast, which received the name of North Devon, and reaches to the shores of Baffin's Bay; but whether it forms a continuous tract with Greenland, or is composed of one or more islands, remains yet to be discovered. The coasts opposite to those now described, which appeared to Captain Parry to be insular, have been discovered by Captain Ross to form part of the continent of America.

6558. *Greenland*, long supposed to be part of America, till Captain Parry ascertained its complete disjunction, forms the largest known extent of land not belonging to the four continents. From Cape Farewell, in lat. 60° , it stretches northward for the ascertained length of 19 degrees, with an indefinite extent beyond; while the general breadth is about 35 degrees of longitude. It remains uncertain, indeed, whether several of the deep inlets which indent the coast, may not penetrate entirely across; yet they would thus very slightly break the vast continuity of land. But this wide region is, of all others, least valuable to man, producing scarcely anything which can minister to his comfort, or even existence. Its aspect is, throughout, of that dreary character described as belonging to the arctic world. It is claimed by Denmark, which, as already mentioned, has formed along its western coast several small settlements, of which the principal are, in the southern part, Julianshaab, Statenhuk, Godthaab, and New Hernhut, the seat of the missionaries; in the northern, Egedesminde, Umanak, Operniwick. Farther north still, Captain Ross discovered a district which he named the Arctic Highlands. The inhabitants, who had never before seen an European, were seized with the utmost astonishment, especially at the ships, which they at first imagined to be huge birds with wings. They were found to differ from the other Esquimaux in being destitute of boats; for though much of their food is drawn from the sea, they obtain it by merely walking over the frozen surface. They have the advantage, however, of possessing iron, from which they frame instruments much more powerful than those made of bone by others of their race. They differ greatly from them also in having a king, who is beloved, and to whom they pay a tribute of seals, train oil, and fish. The cliffs on their coast present the remarkable phenomenon of red snow, the nature and origin of which has excited much controversy among the learned in Europe.

6559. *The eastern coast*, extending southward from Iceland to Cape Farewell, has excited a remarkable interest in consequence of having been believed to be the seat of early colonies from that island, described as once having been in a flourishing state. But vast fields of ice, it is said, coming down upon this coast, shut it out from the civilised world, and the colony, it is feared, perished from the want of supplies. Several expeditions were sent by the Danish government to discover "lost Greenland," as it is called, but without success. Several Danish writers, indeed, now maintain that these colonies were not on the eastern but on the western coast; but this supposition does not appear to us consistent with the distances and positions, as given by Torfæus and the Icelandic sagas. To the north of Iceland, however, a range of coast, 400 miles in length, between 68° and 75° , was lately surveyed by Mr. Scoresby and Captain Clavering. The most remarkable part was called the Liverpool Coast, along which rises a mountain chain 3000 or 4000 feet high, forming precipitous cliffs, which terminate in numberless peaks, cones, and pyramids. Like other arctic shores, it is penetrated by very deep inlets, particularly one called Scoresby's Sound, a branch from which is supposed to convert the Liverpool Coast into an island. The tract on the opposite side was called Jameson's Land, bounded on the south by Cape Hooker, and beyond which another sound branched off, which appeared likely to render it also insular. This inlet appeared stretching into the interior without any apparent termination; and there is some room to conjecture that it may communicate with Jacob's Bight on the western coast, which Sir Charles Giesecké traced to the height of 150 miles. No natives were seen; but there appeared every where marks of recent inhabitation, and even small villages, composed of subterraneous winter abodes. Captain Clavering afterwards surveyed a part of the coast lying farther to the northward. He found it bold, mountainous, and deeply indented with bays; but its aspect was dreary and desolate in the extreme. Yet, on landing upon an inlet named after Sir Walter Scott, he met a party of natives bearing all the general characters of the Esquimaux race, and who, by their extreme alarm and surprise, showed that they had never before been visited by Europeans. The coast was traced as high as 75° , and was seen extending still northward as far as the eye could reach.

6560. *Spitzbergen*, called often *East Greenland*, is a large island in the Arctic Sea, lying about 600 miles east of that now described. It is about 300 miles from south to north, and 200 from east to west, and reaches beyond 80° N. lat. It is of an irregular form, and broken by deep bays and sounds, which, on the eastern side, convert two large portions into islands, called Edge and Seland. Its cliffs, several thousand feet high, are rocky, and composed in a great measure of loose stones; and though the snow in summer is melted from their summits by the heat of the sun, it continues long to lie in the deep valleys. The country is wholly un-

productive, but abounds in the deer, the walrus, and other arctic animals. Spitzbergen, however, has been much frequented by the maritime nations, having been long the chief and almost sole seat of the whale fishery. With this view its western bays were fiercely disputed, till an agreement was made by which the English and Dutch divided between them the principal stations. The latter founded the village of Smeerenberg, where they landed the whales and extracted the oil; and it became so flourishing as to be considered almost a northern Batavia. The whales, however, taught by the destructive war waged against them, deserted all the bays one after another; and it was necessary to carry on the fishery in the open sea. Even then they fled from one quarter to another, till the whole Spitzbergen sea was nearly fished out; and it became necessary, notwithstanding the increased danger, to remove the chief scene of operations to Davis Straits. The coasts of Spitzbergen have also formed the route by which Phipps, Buchan, and Parry made their attempts to penetrate to the pole. The latter reached nearly to 83° N. lat., and found the sea in August all covered with ice, but broken, sinking, and interspersed with lanes of water. At this utmost limit every trace of animal life had disappeared. A few Russian hunters take up their abode on the dreary shores of Spitzbergen, where they continue even during the winter, occupied in the pursuit of the seal and the walrus.

6561. *Nova Zembla* is another large mass of insular land, extending north from the boundary of Europe and Asia, between 68° and 74° N. lat., 53° and 70° E. long. Though more southerly than Spitzbergen, it has an aspect, if possible, still more dreary. The southern coasts are low and flat; but those to the north are bordered by mountains wrapped in perpetual snow. It is less penetrated by sounds, though one running east and west reaches entirely across, dividing it into two nearly equal parts. The coasts have been chiefly frequented by navigators, who sought in this direction a passage to India, but commonly found their career arrested on these dreary shores. Barentz and his crew wintered in a haven on the north-eastern coast, where they suffered the most extreme hardships, to which the commander finally fell a victim. The Russian government have recently sent expeditions under Lazareff, Litke, and other navigators, to complete the exploration of the coast, but have not made any attempt to form a settlement upon it.

6562. *The islands of the Southern Polar Sea*, to which M. Balbi has given the somewhat too pompous title of the *Antarctic Archipelago*, extend chiefly south-east from the extremity of the American continent. They present the same general character as the arctic lands, with some variations. Though situated in a comparatively low latitude, which in the northern hemisphere admits of habitation and culture, they are utterly dreary and desolate, buried in ice and snow, and not tenanted by a single human being. Their shores, however, are still more crowded with those huge amphibia, whose rich coating of oil renders them a tempting prize. Hence they have become the object of European avarice, which, during the few years that have elapsed since the islands were known, has made dreadful havoc among these animals, and greatly thinned their numbers. The walrus is here replaced by the sea elephant, a still huger creature, and richer in oil; and the seals have a fine furred skin, for which the Americans have obtained six or seven dollars apiece in the market of China. These shores are equally distinguished for the legions of sea-birds of gigantic size and peculiar form; among which the penguin and the albatross are the most remarkable. The lands, on the whole, are smaller than in the north, more broken into islands, and as deeply indented by bays, forming many excellent harbours.

6563. *The Malouine or Falkland Islands*, though situated only a little beyond 50° S., the latitude of England, bear all the characters of an antarctic group; rocky, destitute of inhabitants, but crowded with seals, and containing very fine ports. On one of these the English formed a settlement in 1766; but it was destroyed, in 1770, by a Spanish expedition from Buenos Ayres. Measures have lately been taken for again forming one on a small scale. There are two large islands, Falkland and Soledad, with a great number of islets. The fisheries on these coasts have lately acquired considerable importance. Mr. Weddell states, that in 1821 and 1822, they yielded 940 tons elephant oil; and that there were drawn from them and from New South Shetland together 320,000 fur seal skins. The fine harbours are often touched at by vessels passing round Cape Horn, or to the southern fisheries. The

MAGELLANIC VOLUTE.

Falkland Islands produce several peculiar shells, among which is the rare *Cymbiola magellanica*, or Magellanic Volute. (fig. 1100.) A gigantic species of Limpet, with a perforation in the middle, and beautifully rayed with brown, is also common: it is the *Fissurella picta* of Lamarek.

6564. *South Georgia*, situated to the east of the Falkland Islands, and nearly in the same latitude, is a large island, about 90 miles long by 10 broad, but bearing a character exactly similar. Discovered in 1675 by La Roche, it was carefully surveyed in 1771 by Cook, while searching for an austral continent. It was then almost forgotten till the abundance of its seals and sea elephants attracted the notice of those engaged in the southern fisheries. The pursuit was carried on with such activity, that, according to Captain Weddell, the London market was in a few years supplied hence with 20,000 tuns of oil, while 1,200,000 fur seal skins were also carried off. But the chase of the sea elephant was prosecuted with such reckless avidity, without sparing even the pregnant mothers, that they have been nearly extirpated, and the trade ruined.

6565. *New South Shetland*, with the smaller adjoining group of the *New Orkneys*, being situated in 61° and 63° S. lat., are scarcely nearer the pole than the British islands after which they are named; yet their climate is that of Greenland and Spitzbergen; islands of ice are tossing through the seas, and the land is peopled only by those animal forms peculiar to the antarctic circle. These, however, since the discovery by Captain Smith, of Blyth, in 1818, have attracted numerous adventurers, who have carried off great quantities of oil and seal skins; but by their improvident pursuit have greatly thinned the supply. There are twelve considerable isles, of which the principal are named Barrow, King George, and Livingston, with innumerable rocky islets. The land is moderately high, one peak rising to 2500 feet; while elsewhere there is a volcanic cone, which rises only to 80 feet. Deception Isle contains a very fine harbour. The *New Orkneys* consist of a large island called Pomona, or Mainland, and of many smaller ones. Farther to the east are a number of small islands, which, being at first supposed to form a continuous coast, were named *Sandwich Land*. Again, to the south of New Shetland, in about lat. 64° , a Russian captain, Bellinghausen, lately observed a range of coast, which he named *Trinity Land*, but which may probably be found to consist also of a cluster of islands. Two Russian frigates also, in 1829, penetrated to 69° S. lat., where they found two islets at some distance from each other, which they named Peter I. and Alexander I., and which form the most southerly spots of land yet known to exist.

6566. Among arctarctic islands we must also reckon *Kerguelen's*, or *Desolation*, situated far to the east of those now described, in long. 70° E., and the moderate lat. of 50° . It resembles exactly New Georgia and South Shetland. Captain Cook's party, who carefully examined it, were astonished at its scanty flora, amounting only to sixteen species, mostly mosses and lichens; but they were struck by the multitude of amphibious animals with which its shores were peopled. This has lately attracted the attention of the adventurers in the southern fishery, who, according to Captain Weddell, have recently drawn from it supplies nearly as large as from New Georgia. We may finally mention the solitary islet of *Tristan d'Acunha*, situated to the west of the Cape of Good Hope, in the low latitude of 38° . By the picturesque description of Mr. Earle, who was driven thither by shipwreck, it appears indeed to contain rich pastures, on which European cattle thrive; yet the bleak storms of a long winter, and its shores crowded with the sea elephant, the penguin, and the albatross, mark its affinity to the antarctic regions now described. A settlement formed there by the English has been abandoned; yet a very few individuals are still induced to reside on it by the facility of subsistence.

TABLE OF LATITUDES AND LONGITUDES.

Island, N. lat. $70^{\circ} 11'$, W. long. 145° by the rivulets and torrents from the Superior, slightly converging towards Bear Lake, there is a range of primitive country. For 700 miles, beginning in is occupied principally by horizontal strata of *Great Bear Lake* are of primitive feet. Masses of rock and gravel, app rock, granite, and gneiss, are found of Bear Lake is formed of boulders of west coast, and the bottom of the bay is syenite, porphyry, greenstone, amygdal corallines, grey and red sandstone. The gravelly, covering a bluish plastic clay, year. Narrow ridges of limestone rise which is otherwise level as far as the eye

5778. *Bear Lake River.* Grey sand yielding excellent common salt, fall in where the Rocky Mountains first appear rapid are sandstone. *Brown coal*, with monites in a reddish iron-shot sandstone through banks of a greyish black lime. The upper beds are calcareous conglomerate. *mineral oil*, also bituminous shale. *Sulphur* issuing from the lower limestone strata are low. The banks of the river are low.

are low.
5779. *Mackenzie River*. The banks are composed of different *brown coal*, altered of coal take fire on being exposed to the air for food when provisions are scarce. It is sustained life for a considerable time. The associated with a rock resembling bituminous posits of *brown coal* occur near the Rocky strip of marshy, boggy, uneven ground; at Saskatchewan in N. lat. 52° , and on Garry the banks of the Mackenzie, below Bear underneath are rocks of limestone. Salt formation. The Rocky Mountains appear rapids in that river, where limestone ridge rapid, the sides of the river rise into mural and castellated towers. At this remarkable river is narrowed to 300 yards, with 50 in length. The banks rise on each the level of the river. The rocks are coloured with mineral oil; and, composed of limestone occur. Below the Ramp and its banks slope away to a moderate or quartz rock, 160 feet high, repose coral. Forty miles below the sandstone river, which again contracting, gives Narrows. On emerging from the straits through which it falls into the sea, the lowlands of the deltas, and the Limestone occurs in conical hills, gradually diminish in height, and the limit in N. lat. 69° . White spruce thence becomes a frozen morass, only or eight inches from the surface.

5780. *Alluvial Islands*. — The s
between the Rocky Mountains and t
to fifty in breadth. The river fo
through which it winds its way to
but annual accumulations of drift
the annual inundations, and as far
with dwarf willows and white spruce
from Cape Bathurst in W. long.

TABLE

OF

THE HEIGHT OF THE PRINCIPAL MOUNTAINS

ON THE GLOBE.

EUROPE.		English Feet.			English Feet.
1. Mont Blanc, Alps	-	15,668	12. Ararat, Little, Armenia	-	13,500
2. Monte Rosa, Alps	-	15,527	13. Alas Tag, Altai	-	11,520
3. Finster Aarhorn, Alps	-	14,325	14. Highest Peak of Lebanon	-	11,050
4. Jungfrau, Alps	-	13,730	15. Italitzkoi, Altai	-	10,900
5. Schreckhorn, Alps	-	13,310	16. Awatcha, Kamtschatka	-	9,750
6. Oertler Spitze, Alps	-	13,065	17. Olympus, Asia Minor	-	9,100
7. Gross Glockner, Alps	-	12,980	18. Highest Peak of Nilgherries	-	8,835
8. Simplon, Alps	-	11,730	19. Sinai, Arabia	-	7,952
9. Mulhacen, Sierra Nevada	-	11,678	20. Takhtalou, Taurus	-	7,715
10. Maladetta, Pyrenees	-	11,436	21. Adam's Peak, Ceylon	-	6,650
11. Mont Perdu, Pyrenees	-	11,275	22. Sabramani, Ghauts	-	5,750
12. Penaranda, Asturias	-	11,200	23. Ida, Asia Minor	-	5,435
13. Etna, Sicily	-	10,870	24. Chaizgour, Vindhya	-	2,700
14. St. Gothard, Alps	-	10,605	25. Carmel, Palestine	-	2,250
15. Ruska, Carpathians	-	9,912	26. Tabor, Palestine	-	2,053
16. Mount Cénis, Alps	-	9,650			
17. Little St. Bernard, Alps	-	9,600	AFRICA.		
18. Monte Corno, Apennines	-	9,523	1. Highest Peak of Cameroons	-	13,000
19. Kanigou, Pyrenees	-	8,800	2. Peak of Teneriffe	-	12,176
20. Skagtlos Find, Dofrines	-	8,400	3. Bernard, Bourbon Isles	-	12,100
21. Sneehätta, Dofrines	-	8,122	4. Highest Peak of Atlas	-	11,900
22. Lomnitz, Carpathians	-	7,962	5. Lamalmon, Abyssinia	-	11,300
23. Taygetus, Greece	-	7,950	6. Compass, Sneuwberg, Africa	-	10,250
24. Olympus, Turkey	-	6,650	7. Komberg, S. Africa	-	8,330
25. Mont d'Or, Auvergne	-	6,470	8. Fogo, Cape de Verd Isles	-	8,100
26. Cantal, Auvergne	-	6,350	9. Taranta, Abyssinia	-	7,980
27. Mezène, Cevennes	-	5,920	10. Pico Ruivo, Madeira	-	6,233
28. Parnassus, Greece	-	5,850	11. Table Mountain, Africa	-	3,582
29. Ossa, Turkey	-	5,840	12. Piter Boot, Mauritius	-	2,790
30. Kiesen Koppe, Sudetes	-	5,350	13. Diana's Peak, St. Helena	-	2,710
31. Pelion, Greece	-	5,200			
32. Hecla, Iceland	-	5,010	AMERICA.		
33. Lozère, Cevennes	-	4,930	1. Sorata, Andes	-	25,400
34. Puy de Dôme, Auvergne	-	4,890	2. Illimani, Andes	-	24,200
35. Feldberg, Black Forest	-	4,750	3. Gualatieri, Andes	-	22,000
36. Haydelberg, Bohemian Forest	-	4,690	4. Chimborazo, Andes	-	21,000
37. Helicon, Greece	-	4,550	5. Cayambe, Andes	-	19,633
38. Ben Nevis, Grampians	-	4,379	6. Antisana, Andes	-	19,136
39. Ben Lawers, Grampians	-	4,051	7. Cotopaxi, Andes	-	18,867
40. Cairngorm, Grampians	-	4,050	8. Tolima, Andes	-	18,436
41. Vesuvius, Italy	-	3,932	9. Mount St. Elias, North America	-	18,000
42. Keilberg, Erzgebirge	-	3,910	10. Popocatepetl, Mexican Cordillera	-	17,780
43. Schneeberg, Fichtelgebirge	-	3,600	11. Pinchincha, Andes	-	15,931
44. Brocken, Hartz	-	3,730	12. Iztaccihuatl, Mexican Cordillera	-	15,705
45. Snowdon, Wales	-	3,568	13. Mount Fairweather, North America	-	14,736
46. Schehallien, Grampians	-	3,564	14. Cofre de Perote, Mexican Cordillera	-	13,275
47. Cader Idris, Wales	-	3,550	15. James's Peak, Rocky Mountains	-	11,500
48. Macgillicuddy's Reeks, Ireland	-	3,404	16. Sierra de Cobre, Cuba	-	9,000
49. Ben Lomond, Grampians	-	3,262	17. Grand Serrania, Hayti	-	9,000
50. Schneekopp, Thuringian Forest	-	3,220	18. Duida, Parime	-	8,250
51. Skiddaw, England	-	3,022	19. Highest Peak of Blue Mountains, Jamaica	-	7,278
52. Ingleborough, England	-	2,361	20. Mount Washington, Alleghanies	-	6,650
53. North Cape, Lapland	-	1,300	21. Mount Sarmiento, Straits of Magellan	-	6,000
			22. Mount Otter, Alleghanies	-	4,250
ASIA			23. Kaatskill, Alleghanies	-	3,150
1. Chumularee, Himalayah	-	29,000	24. Cape Horn, South America	-	1,860
2. Dhawalagiri, Himalayah	-	28,500			
3. Javaher, Himalayah	-	25,800	SOUTH SEA.		
4. Rudra, Himalayah	-	23,000	1. Mouna Roa, Sandwich Isles	-	15,980
5. Jamautri, Himalayah	-	22,500	2. Mouna Koa, Sandwich Isles	-	13,800
6. Highest Peak of Hindoo Coosh	-	20,000	3. Oroeno, Otaheite	-	8,350
7. Elburz, Caucasus	-	18,350	4. Egmont Peak, New Zealand	-	8,150
8. Ararat, Great, Armenia	-	17,700	5. Sea View Hill, Blue Mountains, New South Wales	-	6,700
9. Kazbek, Caucasus	-	15,800	6. Highest Peak of Barren Mountains, Van Diemen's Land	-	5,000
10. Gounong Pasumbra, Sumatra	-	15,270			
11. Gounong Pasaman, or Ophir Sumatra	-	14,160			

COMPARATIVE LENGTH OF THE PRINCIPAL RIVERS.

Refer- ences.	Names.	Mouth.	Course.	Source.	Length. in Miles.
A.	Forth - -	North Sea - -	Scotland - -	Ben Lomond Mountain	115
B.	Tay - -	North Sea - -	Scotland - -	Grampian Hills -	120
C.	Trent - -	North Sea - -	England - -	Staffordshire - -	125
D.	Shannon - -	Atlantic Ocean - -	Ireland - -	Mountains of Leitrim -	200
E.	Thames - -	North Sea - -	England - -	Cotswold Hills -	215
F.	Severn - -	Bristol Channel - -	England and Wales -	Plinlimmon Mountain	220
G.	Hudson - -	Atlantic Ocean - -	North America -	State of New York -	270
H.	Ebro - -	Mediterranean Sea	Spain - -	Mountains of Asturias	380
I.	Po - -	Adriatic Sea - -	Italy - -	Monte Viso - -	410
J.	Seine - -	English Channel -	France - -	Côte d'Or Mountains -	425
K.	Rhone - -	Mediterranean Sea	Switzerland and France	Mount Furca - -	460
L.	Loire - -	Bay of Biscay - -	France - -	Mont Gerbier - -	545
M.	Tagus - -	Atlantic Ocean - -	Spain and Portugal -	Sierra Morena - -	550
N.	Oder - -	Baltic Sea - -	Austria and Prussia -	Carpathian Mountains -	580
O.	Susquehanna -	Atlantic Ocean - -	United States - -	Alleghany Mountains -	620
P.	Vistula - -	Baltic Sea - -	Austria and Prussia -	Carpathian Mountains	640
Q.	Elbe - -	North Sea - -	Austria, Germany, and Prussia	Sudetic or Giant Mounts.	670
R.	Gambia - -	Atlantic Ocean - -	Africa - -	Heights of Foota Jallo	700
S.	Dniester - -	Black Sea - -	Austria and Turkey -	Carpathian Mountains -	710
T.	Dwina - -	White Sea - -	Russia - -	Heights of Vologda -	750
U.	Rhine - -	North Sea - -	France, Germany, and Holland	Mount St. Gothard -	810
V.	Colombia - -	Pacific Ocean - -	North America - -	Stony Mountains - -	910
W.	Senegal - -	Atlantic Ocean - -	Africa - -	Heights of Foota Jallo	950
X.	Don - -	Sea of Azof - -	Russia - -	Toula - -	1020
Y.	Dnieper - -	Black Sea - -	Russia - -	Heights of Smolensk -	1140
Z.	St. Lawrence -	Atlantic Ocean - -	North America - -	Upper Canada - -	1320
A. 1	Orinoco - -	Atlantic Ocean - -	South America - -	Sierra de Parime - -	1480
B. 1	Ganges - -	Bengal Bay - -	Hindoostan - -	Himalayah Mountains -	1550
C. 1	Danube - -	Black Sea - -	Germany, Austria, and Turkey	Black Forest - -	1760
D. 1	Indus - -	Indian Ocean - -	Hindostan - -	Himalayah Mountains -	1770
E. 1	Euphrates - -	Persian Gulf - -	Turkey in Asia - -	Mountains of Armenia	1900
F. 1	Tigris - -	Euphrates - -	Turkey in Asia - -	Mountains of Armenia	950
G. 1	Mackenzie - -	Arctic Ocean - -	North America - -	Rocky Mountains - -	1920
H. 1	Volga - -	Caspian Sea - -	Russia - -	Heights of Valdai - -	2040
I. 1	La Plata - -	Atlantic Ocean - -	South America - -	Heights of Itambe - -	2130
J. 1	Niger - -	Gulf of Guinea - -	Africa - -	Mountains of Loma -	2300
K. 1	Obi - -	Arctic Ocean - -	Chinese Tartary and Russia	Altai Mountains - -	2550
L. 1	Nile - -	Mediterranean Sea	Nubia and Egypt - -	Donga Mountains - -	2610
M. 1	Bahr el Azrek	Nile - -	Abyssinia and Nubia -	Lake Dembea - -	800
N. 1	Hoang-ho - -	Pacific Ocean - -	Thibet and China - -	Desert of Cobi - -	2630
O. 1	Yang-tse-kiang	Pacific Ocean - -	Thibet and China - -	Desert of Cobi - -	2990
P. 1	Mississippi - -	Gulf of Mexico - -	North America - -	Leech Lake - -	1930
Q. 1	Marafion - -	Atlantic Ocean - -	South America - -	Heights of Cicacica -	3380
R. 1	Illinois - -	Mississippi R. - -	North America - -	State of Illinois - -	500
S. 1	Missouri - -	Mississippi R. - -	North America - -	Rocky Mountains - -	2310
T. 1	Ohio - -	Mississippi R. - -	North America - -	Alleghany Mountains -	1190
